Responsible for communication to project team, craft and regional level	Project Leadership Team
Schedule and prepare for the execution of EHS specific meetings (Monthly Management Review, PEHSLT, etc.)	Project Leadership Team
Implement, maintain, measure and continually improve EH&S program	Project Leadership Team
Develop and ensure implementation of EHS Manual and associated plans (e.g. environmental compliance plan, environmental targets, abatement plans, etc.)	Project Leadership Team
Leadership and commitment	Project Leadership Team
Review and determine adequacy of resources to successfully implement the program	Project Leadership Team
Hazard identification and mitigation	Project Leadership Team
Ensure current documents are used and that records are properly prepared, maintained, retained and disposed	Project Team / EHS professionals

Skanska's SHEMS is designed to continuously improve based on internal and external factors. By using a continuous improvement model, the program is designed to be interdependent and incorporate input from all levels and functions within and outside of the organization, including workers and all interested parties. Together, we are able to ensure the health and wellbeing of all stakeholders associated with our work and control impacts to the natural environment in which we work in.

Below is a graphic of Skanska's SHEMS:

Corporate Organization Chart

Identification and Management of EHS Impacts

Objective

The objective is to identify the EHS impacts of the company's activities, products and services and to develop operational controls, indicators, measurable objectives and targets as defined in the EHS Manual. This assessment will take into account our operations, subcontractor operations, visitors and vendor activities. EHS impacts will be identified before the start of work and updated as needed.

Procedure

1. Identifying EHS Impacts and Determining Significance

1. Prior to beginning work, project teams will identify and assess all potential EHS aspects and impacts utilizing the Plant Tool to create a project specific EHS Manual. The following criteria establish the EHS aspects and impacts as significant:
 - Any EHS impact with a regulatory requirement
 - An impact deemed significant by a client
 - Potential human exposure to a hazard
 - A solid waste stream that can be profitably recycled or reused related to a Skanska green strategic indicator or initiative
 - Any situation that could result in adverse publicity or negative public opinion
2. The EHS Manual identifies the minimum requirements for all significant environmental aspects and health and safety hazards. For each EHS aspect and hazard identified, the project team will customize the project EHS Manual and ensure the following items are included:
 - Significant Environmental Aspects Objectives
 - Quantifiable Environmental Targets (where practical)
 - Health and Safety Objectives
 - Operational controls
 - Performance indicators
 - Legal and other requirements
 - Roles and responsibilities
 - Documents and records
 - Training
 - Emergency response
3. A formal life cycle approach to environmental management will be taken on projects when required by project specification or the owner's request to work within the guidelines of a Sustainability Rating System (e.g., Leadership in Energy and Environmental Design (LEED), Envision, Green Roads, Living Building, etc.).
4. All projects will be required to collect sustainability performance indicators data utilizing the SPI module in Intalex. This may include information regarding the following:
 - Fuel quantity used for site equipment (can be collected from fuel delivery tickets)
 - Electricity consumption records (typically obtained from electrical bill)
 - Construction material quantities (take off quantities or quantities used in payment requisition to the Owner is sufficient)
 - Water volume used for construction operations (potable and non-potable, metered or estimated—e.g., using water from a fire hydrant for dust control and recording meter readings)
 - Construction and demolition debris quantities and handling/processing information (typically provided by the waste hauler via weight tickets and summary report- alternatively, send waste hauler the project's waste tracking form and request it be returned monthly with weight tickets as backup)
5. Each project uses an integrated approach to manage the environmental, health and safety risks associated with the project and the individuals have been assigned specific responsibilities associated with the management of the program.
6. For each individual construction activity, a Construction Work Plan will be developed to identify and mitigate EHS risks and impacts. The CWP will be developed using Skanska's planning tool (Plant/Excel worksheet).
7. The CWP will include:
 - Plan identifies which will be a narrative description of each activity that details all elements of the task in a sequential order inclusive of means and methods.

- Identification of EHS Aspects related to the plan, and their associated initial and residual risk.
 - Triggers which include the task environment, equipment, materials and tools associated with the activity and controls to be implemented for risk mitigation.
 - Identification of competent person(s).
 - Training requirements (documentation to be provided prior to work commencing).
 - All equipment, materials, small tools and safety equipment.
 - Emergency action plan, including, but not limited to, fall protection rescue, confined space rescue, SCBA standby, HazMat team, etc.
 - Additional information as required (drawings, SDS sheets, cut sheets, etc.)
 - A Take 5 form to be utilized in the field to plan through unforeseen conditions and document any required revisions to the CWP.
8. The following hierarchy should be followed, in the prescribed order, when determining controls for each trigger:
- Elimination
 - Substitution (i.e., substitution of a product that is less hazardous, or using the same product but in a different form)
 - Engineering Controls (i.e., fitting mufflers to equipment to reduce noise at source, use of local exhaust ventilation systems, etc.)
 - Administrative Controls (e.g., utilizing enclosures, shift rotation, signage, barriers, etc.)
 - Personal Protective Equipment (PPE)
9. The CWP will determine the highest remaining risk level for each task. The risk levels will be classified as extremely high risk, high risk, moderate risk or low risk.
10. Skanska CWP's must be approved by an appropriate member of the management team. Subcontractor CWP's must be approved by subcontractor management and submitted to Skanska project management for review prior to starting work. As the risk associated with the task increases, the authorization for the activity advances through the organizational structure:
- Extremely high-risk operation—never authorized
 - High risk operation—company officer
 - Moderate risk operation—Project Manager, Superintendent and EHS
 - Low risk operation—Superintendent
11. Following management sign-off of the CWP, and before any activity begins, all crew members must be given training on the plan requirements, and are to sign the acknowledgement sheet.
12. A change in conditions requires the plan to be updated to mitigate any adverse effects from original unforeseen conditions. The review and approval process stated above will be followed as the plan is updated.

2. Ongoing Risk Assessment

1. Daily Hazard Analysis

1. All crews including self-performed and subcontractors will participate in the Daily Hazard Analysis. The DHA will:
 - Be completed either electronically through Planit or utilizing a paper copy, which is located in the Intelex Document Control module.
 - Begin with a pre-shift meeting in the area where work is to be performed.
 - Include communications from project management to crew from the pre-shift meeting.
 - Include a 360 degree look around.
 - Be conducted by the foreman at the activity's location to communicate the risks, hazards and environmental aspects associated with the CWP.
 - Discuss the required controls to ensure safe performance and mitigate any negative impact to the environment.
 - Address changing conditions including simultaneous operations or adjacent work activities.
 - Provide an opportunity for craft employees to provide feedback or concerns to project management.
 - Be completed at the end of each shift and provided to Skanska project management for review.
2. A member of the Skanska project management team will review DHAs daily and provide any required feedback and address any EHS concerns.

2. Crew Reviews

1. At a minimum, each project team member with operational responsibility will conduct one Crew Review per month of either a self-perform or subcontractor crew. Frequency of Crew Reviews may be modified by following the established EHS Policy Variance process. Subcontractor leadership should also engage in the Crew Review Process to ensure all crews are being reviewed.
2. Crew reviews may occur at the beginning of the shift and include the foremen and all of their crew members. It is recommended for projects to create a rotating schedule to ensure that all project team members with operational responsibility complete Crew Reviews.

- (
3. The Crew Review shall be documented and ensure that the CWPs are:
 - Current to the ongoing task
 - Taking into account any changing conditions (i.e., the triggers noted on the original plan are still applicable)
 - Reviewed in the field and revisions provided prior to the next shift
 - Maintained in the project's EHS files
 4. Project management will address all EHS concerns, discuss findings and ensure that CWPs are revised as necessary.

Determining Legal and Other Requirements

Objective

The objective of this procedure is to provide projects with appropriate and relevant knowledge of federal, state and local safety, health and environmental regulations that are applicable to the hazards and environmental aspects of the activities and operations at their respective worksites.

Procedure

1. Authority and Responsibility

1. This project EHS Manual assigns roles and responsibilities to Skanska USA Civil, Inc. personnel to ensure legal compliance.
2. The project management team is responsible for maintaining operations in compliance with all applicable legal requirements.
3. The project management team will ensure all Skanska personnel are adequately trained in the risks they are exposed. Likewise, subcontractors shall ensure that their employees are adequately trained in the risks to which they are exposed.
4. Information on legal requirements can be obtained from multiple sources, including PlantIt, Intellex, legal publications, bulletins, notices and person-to-person contact with government agencies and officials and other open sources.

California Occupational Safety and Health Administration - www.dir.ca.gov/DOSH

California Environmental Protection Agency - <http://calepa.ca.gov>

Certified Unified Program Agencies - <http://calcupa.org>

California Code of Regulations - www.dir.ca.gov/dlse/ccr.html

State Water Resources Control Board - www.waterboards.ca.gov

Air Resources Board - www.arb.ca.gov

5. If regulatory requirements change, or activities or operations create a new EHS Aspect or Impact, the project management team will be responsible for identifying and enforcing all applicable legal requirements.
6. The EHS Department may transmit new legal or regulatory requirements through PlantIt. A log will be maintained in PlantIt to document all applicable legal requirement updates/changes.
7. The EHS Department may prepare management instructions, handbooks, interpretive statements and maintenance manuals to assist with legal compliance.

Training

Objective

EHS training will be conducted to ensure that employees understand how to execute their tasks safely while also protecting the environment.

Legal and Other Requirements

Skanska/Client Requirements

- None

Procedure

1. Procedure

1. These are minimum training requirements and are not intended to be all-encompassing. Training requirements are also referenced in the individual EHS aspects, CWPs and other EHS documents.
2. Prior to engaging in work, all Skanska employees will be trained on the EHS impacts of the tasks being performed. Likewise, all Subcontractors shall ensure all workers are trained on applicable EHS impacts of the tasks performed by those workers.
3. Timeline for completing required Skanska trainings will be listed as part of each individual's learning plan in Skanska Learning Center.

2. Project Orientation Training

1. All site personnel will receive project-specific orientation upon arrival at the project site.
2. Visitors to the project site shall be briefed on the associated project hazards that may be encountered during their visit and escorted by project personnel.

3. Care for Life Trainings

1. Care for Life training is required for Skanska employees working on Skanska USA Civil, Inc. projects. Care for Life shall be completed within the first year of employment. Care for Life training is optional for Subcontractors. The project team will make this determination.

4. Awareness Training

1. The objective of awareness training is to enable employees to recognize potential EHS impacts and to understand Skanska's policies as defined in this EHS Manual. Workers' roles and responsibilities will be communicated during awareness training conducted by Skanska or the subcontractor as applicable.
2. A baseline training matrix has been developed (see below) to determine the minimum training requirements within the organization. The training identified in the matrix is not intended to be all-inclusive. Specific awareness training will be identified at the operating unit level.

5. Training Matrix

Topic	Who Needs Training	What Training is Needed
-------	--------------------	-------------------------

Topic	Who Needs Training	What Training is Needed
1. Project Specific EHS Orientation	All project management, supervision, and workers entering the project	<p>At a minimum the training must cover following Skanska's Corporate Policies:</p> <ul style="list-style-type: none"> ◦ Care for Life ◦ SHEMS Awareness ◦ Accountability ◦ Anti-harassment ◦ Environmental aspects ◦ Expectations for Stretch and Flex ◦ Code of Conduct ◦ Ethics <p>Site specific information may include:</p> <ul style="list-style-type: none"> ◦ Site Emergency Action Plan, ◦ Site Specific and Owner Requirements, ◦ OSHA 10/30hr Construction Outreach Training requirements ◦ Fall Protection General Awareness Training
2. Hazard Communication	All workers entering the project	<ul style="list-style-type: none"> ◦ Hazard Communication Basic Training
3. Hazardous Chemical or Substance	Workers exposed to hazardous chemicals or substances such as paints, solvents, lead, silica and asbestos	<ul style="list-style-type: none"> ◦ Specific Hazard Training
4. Respiratory Protection	Workers required to wear respiratory protection	<ul style="list-style-type: none"> ◦ OSHA 29 CFR 1910.134 and 139
5. Fall Protection	Any worker who might be exposed to a fall hazard	<ul style="list-style-type: none"> ◦ The nature of fall hazards ◦ Procedures for erecting, disassembling, maintaining and inspecting fall protection systems ◦ Use and operation of: guardrail systems, personal fall arrest systems, safety net systems, warding line systems, controlled access zones and other fall protection ◦ Fall protection standards
6. Personal Protective Equipment (PPE)	All employees	<ul style="list-style-type: none"> ◦ Refer to PPE policy or regulatory standards
7. Powered Industrial Trucks (Forklifts)	Operators of powered industrial trucks	<ul style="list-style-type: none"> ◦ Types of trucks operated ◦ Hazards of the workplace ◦ Hands-on performance evaluation

Topic	Who Needs Training	What Training is Needed
8. Confined Spaces	Any worker attending to, supervising, entering or working within a confined space	<ul style="list-style-type: none"> ◦ Hazards of the space ◦ Duties of entrants, attendants, supervisors ◦ Air monitoring
9. Permit-Required Confined Spaces	Any worker attending to, supervising, entering or working within a permit-required confined space	<ul style="list-style-type: none"> ◦ Hazards of the space ◦ Duties of entrants, attendants, supervisors ◦ Measures used to eliminate or control hazards ◦ Air monitoring requirements ◦ Emergency procedures/rescue equipment ◦ Communications ◦ Permitting procedure ◦ PPE
10. Excavations / Trenches	Workers entering or working within an excavation/trench	<ul style="list-style-type: none"> ◦ Hazards of the space (slides, cave-ins, water accumulation, etc.) ◦ Safe means of access/egress ◦ Proper support system procedures (erection, maintenance, disassembly and inspection)
11. Lockout / Tagout	Workers affected by hazardous energy sources	<ul style="list-style-type: none"> ◦ Nature of known hazardous energy sources ◦ Project-specific Lockout/Tagout procedures
12. Gas / Arc Welding & Cutting	Workers conducting welding and/or cutting	<ul style="list-style-type: none"> ◦ Procedures for unattended machines and electrode holders ◦ Operations around water ◦ Shielding arc welding ◦ The safe use of fuel gas ◦ Respiratory training ◦ Occupational exposure training (i.e. lead, welding fumes, hexavalent chromium)
13. Hot Work	Workers conducting hot work activities	<ul style="list-style-type: none"> ◦ Hazards of the area ◦ Permits ◦ Duties of fire watch ◦ How to use a fire extinguisher
14. Scaffolding	Workers working from scaffolding	<ul style="list-style-type: none"> ◦ The nature of any known hazards ◦ Proper erection, maintenance and disassembly of fall protection systems ◦ Falling object protection ◦ Material/equipment handling from scaffold ◦ Maximum load-carrying capacity ◦ Scaffold tagging system ◦ Access and egress

Topic	Who Needs Training	What Training is Needed
15. Crane Suspended Personnel Baskets	Workers working from crane baskets	<ul style="list-style-type: none"> ◦ Safety work rules ◦ 100% fall protection ◦ Lift plans contents ◦ Emergency procedures
16. Shipyards and Vessel maintenance	Workers performing maintenance of vessel, to include floating cranes, whether at our site or at a shipyard	<ul style="list-style-type: none"> ◦ Requirements of OSHA 29 CFR 1915 and 1926
17. Marine Operations	Employee working on or in the immediate vicinity of barges and other marine equipment	<ul style="list-style-type: none"> ◦ Marine operations ◦ Man-overboard procedures ◦ Vessel access ◦ Safety equipment (life buoy, PFD, safety skiff)
18. Flagger Training	Any worker directing traffic or heavy equipment	<ul style="list-style-type: none"> ◦ Proper PPE ◦ Knowledge of traffic control devices ◦ Purpose of traffic control devices ◦ Principles of traffic control devices ◦ Placement and operation of traffic control devices ◦ Maintenance of traffic control devices ◦ Authority for placement of traffic control devices
19. Mobile Elevating Work Platform (MEWP) Certified Operator Training	Any worker required to operate an aerial work platform	<ul style="list-style-type: none"> ◦ Safe operations ◦ Knowledge of safety devices ◦ Equipment inspection ◦ Hazard awareness ◦ Pre-start operational check ◦ Safe shutdown procedures
20. Silica Awareness	Any worker that is occupationally exposed to silica containing dusts generated as a result of concrete demolition, drilling, chipping or mixing operations	<ul style="list-style-type: none"> ◦ What crystalline silica is ◦ Common exposures to crystalline silica ◦ The hazards of crystalline silica ◦ What to expect in your workplace ◦ Permissible Exposure Limits ◦ Medical Monitoring Requirements
21. Small Spills and Leaks	Any worker that may potentially be involved with responding to a small spill or leak	<ul style="list-style-type: none"> ◦ Spill prevention ◦ Spill response ◦ Proper storage ◦ Proper handling ◦ Hazard identification

Topic	Who Needs Training	What Training is Needed
22. Rigging	Any worker involved with standard, major or critical lifts	<ul style="list-style-type: none"> ◦ Rigging plans ◦ Load characteristics ◦ Equipment requirements ◦ Environmental factors ◦ Inspections ◦ Lift preparation ◦ Role of the rigger ◦ Types of slings, shackles ◦ Communication systems
23. Hand / Voice Signaling	Any worker involved with communicating with heavy equipment operators to facilitate the movement of materials or equipment	<ul style="list-style-type: none"> ◦ Rigging awareness ◦ Equipment capabilities/limitations ◦ Hand signals ◦ Voice commands
24. Accident Investigations	Anyone participating in accident/incident investigations	<ul style="list-style-type: none"> ◦ How to respond to different types of accidents ◦ Conducting an investigation ◦ Techniques to get accurate results when interviewing witnesses ◦ Documenting findings and corrective actions ◦ Assessing accuracy of findings and effectiveness of corrective actions ◦ Implementing improvements

6. Competency Training

1. Competency training is not the same as an OSHA competent person. Competency training is the minimum training that each Skanska employee must complete before beginning an assigned task or function.
2. CWP's will be used as the basis for competency training. Any further training will be identified as part of the CWP process. Skanska and subcontractors will ensure their individual employees have received training prior to commencing an activity, and likewise subcontractor training will be subject to verification by Skanska at its discretion.

7. Additional Training Requirements

1. All Skanska salaried personnel with field operation responsibilities must complete and/or provide proof of OSHA 30 training within the first six (6) months of employment.
2. All Skanska employees identified as competent persons on the CWP are required to complete all associated web-based training modules or an equivalent program, approved by the local EHS Director. All training must be renewed every five (5) years.
3. Selected employees onsite will be required to have CPR/First Aid Training. The project team will determine the required number of First Aid/CPR trained employees onsite.
4. All Skanska personnel with field operation responsibilities may be required to complete one EHS training every other month.
5. Any project specific requirements for this section are listed here.
 - None

8. Documentation

1. All Skanska employee training will be documented and transmitted via email to the Skanska Learning Center administrator.
2. Subcontractor employee training records will be subject to verification by Skanska at its discretion throughout the duration of the project.

EHS Forms and Documents

- None

Training Links

- None

Communication

Objective

The objective of this procedure is to communicate our concern for the safety of all personnel, the environment and our desire to conduct business operations in a safe and environmentally sound manner to all employees, owners, suppliers and contractors. An additional objective is to communicate specific procedures and requirements to those owners, suppliers and subcontractors who provide goods and services associated with significant environmental aspects or known hazards. All written, external input regarding safety, health and environmental performance will be considered as being from an interested party. All such input will be processed in accordance with this procedure.

Procedure

1. All projects will establish a Project EHS Leadership Team, inclusive of all levels of project management and craft for both Skanska and subcontractors. The team shall:
 - Meet monthly and use project EHS Leadership Team agenda and maintain meeting minutes.
 - Conduct a site inspection and address all potential hazards/risk identified. Findings and corrective actions should be documented and evaluated for potential trends and repetitive items.
 - Hold special meetings when warranted and after all lost-time incidents.
 - Report program status to the regional office management team.
2. Internal Communication
 1. Skanska USA Civil, Inc. will communicate the following to employees:
 - Skanska's EHS policy and the SHEMS will initially be communicated through SHEMS awareness training. Changes or updates will be communicated by senior management.
 2. Each Skanska USA Civil, Inc. Region will create an EHS Leadership Team that meets on a monthly basis to set goals, policies and programs. Meetings may be held via teleconference; however, the team must meet in person at least once a quarter. See section Management Review meetings for guidance on monthly meeting requirements.
 3. The table in the Management Review/Meetings section of this Manual outlines the meeting frequency and attendees at each level of the organization in order to establish, implement and maintain a process(es) for monitoring, measuring, analyzing and evaluating performance.
3. External Communication
 1. Skanska USA Civil, Inc. will communicate the following information to external parties:
 - Our concerns about EHS issues and desires to conduct business operations in a safe and environmentally sound manner.
 - That we have an EHS Management System (SHEMS) that is accredited through an ISO 14001 and ISO 45001 Registrar. Relevant sections of the SHEMS will be communicated to subcontractors during the contract award process, orientation training and SHEMS Awareness Training.
 - That we encourage our owners, suppliers and subcontractors to provide, at the same quality and price, products and services that have safe working conditions and the least environmental consequence of all available options.
 2. Skanska will communicate the following to suppliers:
 - Where a supplier's product is creating a significant hazard/impact, the supplier should select the available option that minimizes the potential environmental impact or safety hazard.
 - Where an owner, supplier or subcontractor is supplying goods or services associated with EHS aspects, the project will work with procurement to inform that party of applicable requirements to mitigate, minimize or otherwise control the potential EHS impacts.
 3. Communications with owners, suppliers and contractors are part of the subcontract agreement.
 4. All written, external inquiries concerning EHS performance will be directed to the Skanska EHS Department and, when appropriate, to the Skanska Communications Department, which will:
 - Coordinate with the Operating Unit/Region's most senior EHS representative to evaluate the substance of the external communication and make a determination of whether the communication pertains to an existing significant aspect or hazard, or to one that may need to be added into the SHEMS.
 5. Following this evaluation, the EHS department, or designee, will respond appropriately to the external interested party in a timely manner.
 6. All external communications will be kept for consideration when establishing and reviewing safety and environmental objectives and targets for the SHEMS and will initiate any necessary changes to the SHEMS.

Documentation

1. Regional EHS Leadership Team meeting documentation will be maintained at the regional office.
2. Project EHS Leadership Team meeting documentation will be maintained in accordance with Skanska's document retention program, and will be housed with the project records.
3. The EHS Department will document the contents and outcome of the external inquiry and records will be maintained in Intelex.

Incident Investigation

Objective

The project team will conduct an incident investigation following all EHS incidents that occur on a project in order to identify root causes, develop corrective and preventive actions, and communicate lessons learned to prevent future occurrences.

Procedure

1. Following an incident, including near miss, project management and/or a Skanska EHS representative will investigate the incident and conduct a post incident review. The investigation will:
 - Provide a specific description of the incident, including any underlying deficiencies, root causes and other factors that may have caused or contributed to the incident.
 - Identify the need for corrective action and preventative action.
 - Identify opportunities for continual improvement.
 - Communicate preventative actions and lessons learned.
2. All serious accidents, near misses, lost time accidents, potential fatalities and serious environmental breaches must be followed by a Flash Report.
3. EHS Directors will review preventative actions to determine effectiveness and initiate policy changes when necessary.
4. If the incident investigation identifies a process or procedural failure, it will be addressed in accordance with the nonconformance, corrective action and preventive action section.

Documentation

1. All incident investigation documentation will be maintained in Intelex.
2. Records of system improvements will be maintained at each regional office.
3. Incident investigation and reporting should follow the protocol matrix below:

	Incident/Injury Reporting					
What	First Aid	Medical Treatment	Lost Time Incident	Potential Fatality	Near Miss Incident	Environmental Incident
From	PM/Supt.	PM/PS	Exec	Exec	PM/PS	PM/PS
To	EXEC, EHS Dir/EHS VP	EXEC, EHS Dir EHS VP, GM/REO	EHS Dire/EHS VP/EHS Chief, GM/REO/CEO	EHS Dire/EHS VP/EHS Chief, GM/REO/CEO	EXEC, EHS Dir/EHS VP, GM/REO	EXEC, EHS Dir/EHS VP, GM/REO
How						
Time	24 hours	8 hours	1 hour	2 hours	8 hours	1 hour

	General Liability Reporting		Incident Recording	
What	Auto/motor/fleet incident	Prop. damage/public liability	Written report	Statements (claimant/witness)
From	PM/PS	PM/PS	EHS Manager	EHS Manager
To	EXEC, EHS Dir/EHS VP, SVP GM	EXEC, EHS Dir/EHS VP, SVP GM	Intelix	Intelix
How				
Time	24 hours	24 hours	24 hours	24 hours

	Post Incident Meeting	Post Incident Review
What	First Aid*, Recordable, Lost-time or Near Miss Incident	Recordable, Lost-time or Near Miss incident, any incident requested by EHS Dir.
From	Project Team	All – EHS Chief, BP, Dir. Have final approval
To	Project manager, all superintendents, project engineer, safety manager, all foremen	Regional/Operating Unit Officer
How		
Time	Close of business	5 days

*where an employee leaves the site for treatment of evaluation PS or designee to accompany

Audits

Objective

The objective of this procedure is to provide guidance for conducting SHEMS audits at our jobsites, which determine proper implementation and maintenance of both the ISO 14001 and ISO 45001 standards as well the project policies and procedures.

Legal and Other Requirements

Federal, State, Local Regulations

- None

Skanska/Client Requirements

- None

Procedure

1. Project Assessment System (PAS) reviews are intended to be an informal assessment to measure conformance and identify areas of improvement when implementing SHEMS. They are not intended to replace Internal Audits (IA) as IAs are designed to measure and monitor the SHEMS objectives in order to comply with ISO standards.
2. PAS reviews are to be conducted in the following manner:
 - At a minimum and beginning at the onset of each calendar year, projects that are greater than three (3) months in duration will receive a PAS review.
 - The review should be conducted by the EHS personnel not assigned to the project in order to provide an external perspective.
 - The PAS checklist will be utilized to assess conformance to the SHEMS.
 - Findings from the PAS review are to be reviewed with the project team and should be discussed at the next Monthly Project Management Review
3. IAs are to be conducted in the following manner:
 - At a minimum and beginning at the onset of each calendar year projects that are greater than twelve (12) months in duration will receive an IA
4. The purpose of the IA is to assess:
 - Whether the project conforms to Skanska's Environmental, Health and Safety Policies, Procedures and Standards.
 - Whether the SHEMS is being effectively implemented and maintained.
5. Internal auditors will rely on the following to assess conformance to the ISO 14001 and 45001 Standards:
 - Project records related to the functioning of the SHEMS and its objectives and targets.
 - Interviews with employees.
 - Observations of operating conditions to gauge EHS status and conditions on a site.
6. The IA checklist will be utilized to assess conformance to the ISO 14001 and 45001 standards. Findings identified during the assessment will be documented in accordance with the Non-Conformance, Corrective Action and Preventative Action process.
7. Regional leadership may elect to increase the frequency of PAS reviews and IAs based on the risk and performance of the work irrespective of project duration. Regional Leadership direction to increase frequency must be documented in the Regional Monthly Management Review.

Responsibilities

1. EHS
 - Maintain a list of projects that qualify for audits
 - Maintain a schedule of audits
 - Select the auditor/audit team to ensure objectivity
 - Maintain documentation of auditor training
 - Be the point of contact for all communications with the registrar inclusive of scheduling the external audits
 - Coordinate external audit closing meeting (in person or via teleconference) with the respective Business Unit (BU) Senior Management Team and the project teams

- Communicate all external audit reports to respective BUs inclusive of any potential non-conformances and corrective actions required to be taken by the affected BU
- Ensure all findings are documented and closed out
- Maintain audits

2. Auditor/Audit Team

1. Auditors will receive auditor training and will have relevant work experience of at least five (5) years in EHS management. The audit may be conducted by a sole auditor or by a team. If conducted by a team, a lead auditor will be designated. The auditor/audit team is responsible for issuing/distributing a formal audit report within five (5) working days to the following:
 - The project team (inclusive of all who attended either the opening or closing meeting, Vice President/Project Executive, Project Manager, General Superintendent)
 - Regional EHS leads
 - Corporate EHS

Documentation

1. All audit records will be maintained in Intelex.

Nonconformance, Corrective Actions and Preventative Actions

Objective

Following any deviations from established procedures and programs related to the SHEMS or whenever a non-conformance in the SHEMS is detected, a corrective and preventive action report will be completed.

Classifications for Nonconformance

1. Major Nonconformance Classification
 1. Report any systemic failure in the implementation of the SHEMS. For example:
 - Environmental aspects and hazard identification is not taking place.
 - Required documents are not maintained.
 - Construction planning, monitoring and measuring are not being implemented or are partially being implemented at site.
 - Training and management review/EHS meetings are not being conducted as per procedure.
 - Several similar minor nonconformances exist in documentation and/or implementation of a specific procedure or element of the ISO standards.
2. Minor Nonconformance Classification
 1. A single observed nonconformance to the SHEMS that is not considered to be a breakdown. For example:
 - Obsolete versions of policy are observed at the site.
 - Gaps exist in documented evidence of conformance.
 - Obsolete versions of SHEMS and its controlled documents are being utilized.
 - Orientation is not being conducted timely and consistently.
 - Roles and responsibilities have not been defined and communicated.
3. Opportunity for Improvement (OFI) Classification
 1. A finding not determined to be a nonconformance but that could be an enhancement of EHS programs.
4. Event
 1. This is an unanticipated occurrence onsite that has the potential to become a nonconformity if not addressed.

Procedure

1. The project team is responsible for responding to a nonconformance.
 1. Nonconformance will be addressed at monthly project management review meetings.
2. The auditor/audit team is responsible for issuing/distributing a formal audit report within five (5) working days to the following:
 - The project team (inclusive of all who attended either the opening or closing meeting, Vice President/Project Executive, Project Manager, General Superintendent)
 - Regional EHS leads
 - Corporate EHS
3. Within five (5) days of the auditor's findings being reported, the project team will complete and submit for approval a Corrective Action Report (CAR), which includes a root cause analysis and corrective and preventive actions required to mitigate the nonconformance.
4. The project team is responsible for ensuring that the correction is completed.
5. Any corrective action taken to eliminate the cause of nonconformance will be appropriate to the magnitude of the finding.
6. When additional time is required to complete the investigation and to identify corrective and preventive actions, the project team will notify their EHS Director who will determine the timeline for completion of the CAR.
7. Preventative and corrective actions will be reviewed at the management review meetings to assess implementation and effectiveness, with revisions made as needed.
8. Documentation of NCRs and CARs will be maintained in Intellex.

Emergency Preparedness

Objective

The company will implement procedures to identify and respond to an EHS emergency in order to minimize the potential negative impact. Each project will be responsible for coordinating its emergency response procedures.

Procedure

1. Each project team will:
 - Consider all activities and hazards when developing the project-specific Emergency Action Plans (EAP), Crisis Management Plan (CMP) and Environmental Compliance Plans (ECP).
 - Identify a local environmental response contractor.
 - Provide the necessary resources and equipment available to manage minor EHS incidents (first aid kits, spills kits, properly trained personnel, etc.)
 - Post emergency phone numbers in visible locations on site.
 - Communicate the plan to all site personnel.
2. The EAP will include:
 - Emergency escape routes
 - Emergency signals
 - Assembly points
 - Spill kit locations
 - Designated lines of authority
3. The plan will be tested at least every six (6) months. Following any emergency response or drill, a debrief will be conducted to determine if EAP is effective.

Documentation

1. A template EAP and ECP are available for use in Intelex Document Control.

All EAP training, the critique of all emergency drills and incident reports will be recorded and maintained with the project records.

Management Review

Objective

This procedure specifies senior management review of the Safety, Health and Environmental Management System (SHEMS) at planned intervals to ensure its continuing effectiveness, suitability and adequacy, and provides for its continual improvement at the corporate and project level.

Procedure

1. All non-project based executives and above will attend Monthly Project Management Review Meetings at a frequency directed by Regional Leadership. The frequency directed by Regional Leadership will be documented in the Annual Regional Monthly Management Review.
2. Project based executives are required to attend their own Monthly Project Management Review Meeting. In addition, the executives are required to attend peer projects' Monthly Project Management Review Meetings as directed by Regional Leadership. The frequency directed by Regional Leadership will be documented in the Annual Regional Monthly Management Review.
3. Annual Skanska/Business Units/Regional Management Meeting Review will utilize the following designated agenda to comply with ISO 14001 and 45001:

Agenda:

- Values Moment. *Example – A real life experience that relates to the core values of Skanska.*
- Review open items from previous management reviews. *Previous minutes are to be reviewed. All outstanding action items are to be discussed and documented with status updates.*
- Review of changes to the SHEMS as a result of:
 - Internal or external stakeholders.
 - *Has the program been modified based on feedback from operations personnel, EHS professionals or other internal clients?*
 - *Has the program been updated based on external changes in the industry (e.g., equipment advancements, safety initiatives or new technology)?*
 - Have there been changes in law that may affect interpretations of SHEMS? Have we maintained compliance with OSHA standards?
 - Are there any significant environmental aspects or regulatory action that require a modification to the program?
 - Has the program been modified to address specific risks and opportunities that have been identified since the last management review?
- Review EHS performance: *This is to include discussion as to whether monthly or annual objectives and targets are being met (e.g., EHS Dashboard). Where issues are detected, alternative solutions should be discussed with a goal of improving performance.*
 - Review lagging and leading performance indicators (e.g. BU dashboards).
 - Audit results, closure of non-conformities and implementation of corrective actions.
 - Review audit results.
 - Review any non-conformities issued from previous internal/external ISO audits.
 - Review opportunities for improvement issued from internal/external ISO audits.
 - Review findings from recent incident investigations (potential fatalities, serious near misses/employee injuries) and the implementation of corrective and preventative actions.
 - Review effectiveness and the status of close out for corrective actions.
 - Has the program been reviewed by internal stakeholder groups to solicit feedback? Is there a mechanism to capture suggestions, recommended changes or errors in the program?
 - What opportunities and risks have been identified based on performance indicators and internal stakeholder feedback?
- Has the adequacy of resources been provided to implement the program as intended (e.g., organizational structure, leveraging technology, potential partnerships or other external resources)?
- Have there been any relevant communication(s) to internal or external stakeholders on EHS policy changes, performance updates or other feedback?
- What are areas of improvement to be focused on to drive continual improvement of the SHEMS program?

The following Conformance table illustrates SHEMS management review conformance with ISO-requirements.

ISO Requirement	BU	Project
ISO 45001 and ISO 14001: 9.3 Management Review Requirements	USA/BU/Regional Management Review Agenda Item	Project Management Review Agenda Item
a) the status of actions from previous management reviews;	2. Review open items from previous management reviews.	2. Review open items from previous management reviews.
b) Changes that are relevant to the environmental and OH&S management system including:	3. Review of changes to the SHEMS as a result of:	3. Review of changes to the SHEMS:
external and internal issues that are relevant to the environmental and OH&S management system;	a. Internal or external stakeholders. • Has the program been modified based on feedback from operations personnel, EHS professionals or other internal clients?	a. Have any changes been made to the system as a result of issues identified? Have these changes been communicated?
the needs and expectations of interested parties, including compliance obligations;	• Has the program been updated based on external changes in the industry (e.g. equipment advancements, safety initiatives or new technology)?	d. Fulfillment of its project's compliance obligations. • Review of compliance audits and field observations – positive findings and compliance issues • Review the projects Emergency Action Plan and Environmental Compliance Program
legal or other requirements;	b. Have there been changes in law that may affect interpretations of SHEMS? Have we maintained compliance with OSHA standards?	b. Are all legal requirements identified for current and upcoming work and is the project in compliance (Federal, State, Local laws / Client Requirements)?
changes in significant environmental aspects;	c. Are there any significant environmental aspects or regulatory action that require a modification to the program?	c. Ensure all environmental aspects and risks associated with the project have been identified in your project manual. Discuss any changes needed to be made or new risks identified that would require a revision to the manual.
risks and opportunities;	d. Has the program been modified to address specific risks and opportunities that have been identified since the last management review?	d. Status and quality of Construction Work Plans and Daily Hazard Analysis – Communication of risk assessments and opportunities for improvement. e. Have all training requirements for the current and upcoming work been met? Assess the risk associated with the work and ensure that all applicable training is in place or scheduled.
c) the extent to which OH&S policy and the OH&S and environmental objectives have been met;	4. Review EHS performance: a. Review lagging and leading performance indicators (e.g. USA/BU dashboards).	4. Review project EHS performance: a. Review project lagging and leading performance indicators (e.g. project dashboard). c. Monitoring and measurement results. d. Environmental targets
d) information on the OH&S and environmental performance, including trends in:	4. Review EHS performance:	4. Review project EHS performance:

incidents, nonconformities, corrective actions and continual improvement;	b. Audit results, closure of non-conformities and implementation of corrective actions. <ul style="list-style-type: none"> • Review audit results • Review any non-conformities issued from previous internal/external ISO audits • Review opportunities for improvement issued from internal/external ISO audits • Review findings from recent incident investigations (potential fatalities, serious near misses/employee injuries) and the implementation of corrective and preventative actions • Review effectiveness and the status of close out of corrective actions 	b. Audit results, closure of non-conformities and implementation of corrective actions. <ul style="list-style-type: none"> • Review audit results – PAS/internal/external • Review any non-conformities issued from previous internal/external ISO audits • Review opportunities for improvement issued from internal/external ISO audits • Review findings from recent incident investigations and the implementation of corrective and preventative actions • Review effectiveness and the status of close out of corrective actions
monitoring and measurement results;	4. Review EHS performance: a. Review lagging and leading performance indicators (e.g. USA/BU dashboards).	4. Review project EHS performance: a. Review project lagging and leading performance indicators (e.g. project dashboard). c. Monitoring and measurement results o Environmental targets
fulfillment of its compliance obligations; results of evaluation of compliance with legal requirements and other requirements	b. Audit results, closure of non-conformities and implementation of corrective actions. <ul style="list-style-type: none"> • Review audit results • Review any non-conformities issued from previous internal/external ISO audits 	d. Fulfillment of its project's compliance obligations. <ul style="list-style-type: none"> • Review of compliance audits and field observations – positive findings and compliance issues • Review the projects Emergency Action Plan and Environmental Compliance Program
audit results	<ul style="list-style-type: none"> • Review opportunities for improvement issued from internal/external ISO audits • Review findings from recent incident investigations (potential fatalities, serious near misses/employee injuries) and the implementation of corrective and preventative actions • Review effectiveness and the status of close-out of corrective actions 	b. Project Management Review	Monthly	<ul style="list-style-type: none"> • Representation from Skanska project management (e.g. PX, PM, PE, Superintendents, EHS) 	<ul style="list-style-type: none"> • See designated agenda to comply with ISO 14001/45001 - 9.3 Management Review • Can be held in conjunction with project staff/coordination meeting
Project EHS Leadership Team	Monthly	<ul style="list-style-type: none"> • Representation from Skanska project management (e.g. PX, PM, PE, Superintendents, EHS) • Craft and Subcontractor representation 	<ul style="list-style-type: none"> • Can be held in conjunction with monthly Project Management Review meeting • Some regions refer to this as the project Corporate Safety Committee meeting

Document Control

Objective

The purpose of this procedure is to ensure that only authorized and current documents are used to implement the requirements and that records are properly prepared, maintained, retained and disposed.

Procedure

1. The following is to outline protocols that apply to potential changes that may be needed to effectively implement the EHS Manual at all levels.
 1. The EHS Manual and all associated documents will be controlled at the Skanska USA Civil, Inc. level.
 2. All projects will implement the most current version of the EHS Manual available in Plant.
 3. Skanska will maintain a national library for all current documents that are applicable to the implementation of the EHS Manual. The library will be managed by the EHS Leadership team (Skanska USA Civil, Inc.).
 4. EHS related documents will be reviewed periodically and revised as needed by the EHS Leadership team (Skanska USA Civil, Inc.).
 5. Updated documents will be communicated by the EHS Leadership Team (Skanska USA Civil, Inc.) to project teams.
 6. Regional specific addenda to the EHS Manual will be identified as such and maintained at the regional level by the EHS Director.
 7. Project-specific documents will be identified and maintained at the project level.

Documentation

1. All documents and records will be legible, identifiable and easily retrieved for review.
2. Documents and records will be maintained at all projects through a combination of hard copies and electronic copies.
3. All documents and records will be retained through the life of the project or otherwise as required by law or by contract.

Policies

Accountability Policy

Objective

The project's Accountability Policy details the minimum standards all personnel (located at the site or otherwise) are required to observe regarding EHS issues. Regional policies may exceed the minimum requirements as the region deems necessary. For the purpose of this policy, a day suspended, is defined as a regularly scheduled work day suspended.

1. ***Adherence to EHS Policies Regarding Dangers***

That ARE Immediately Dangerous to Life and Health ("IDLH")

1. All personnel shall adhere to all EHS policies that protect against immediate dangers to life and health. Examples of such policies include, but are not limited to, those regarding fall protection, exposure to electricity, caught in-between hazards, struck by hazards, lockout/tag out hazards, exposure to unsafe trench excavation, failure to locate utilities pre-excavation, use of ear buds and confined space hazards and, when determined by Project Leadership, failure to adequately plan safe work through the use of the Construction Work Plan and Daily Hazard Analysis tools. While Skanska does not generally follow a progressive disciplinary practice, Skanska employees are, except as otherwise agreed in an applicable Collective Bargaining Agreement ("CBA") or Project Labor Agreement ("PLA"), subject to the following disciplinary actions for violations of any EHS policy designed to protect against immediate dangers to life and health:
 - First Offense: Three (3) day suspension without pay
 - Second Offense: Twenty (20) day suspension without pay
 - Third Offense: Termination
2. Contractor may impose more serious penalties upon its offending employees if it deems such action to be appropriate for violations covered by this provision.
3. Subcontractors are likewise responsible for managing, supervising and disciplining subcontractor workers who fail to adhere to applicable EHS policies and rules set forth in this EHS Manual, provided that Skanska may take actions necessary to address imminent threats to life and health and, if a subcontractor fails to take timely or appropriate corrective action, Skanska may, consistent with the terms of the applicable subcontract, bar from the project site any such subcontractor worker who poses a safety risk to the project.

2. ***Adherence to EHS Policies Regarding Activity***

NOT Immediately Dangerous to Life and Health ("Non – IDLH")

1. All site personnel shall adhere to all EHS policies, including, but not limited to PPE requirements, equipment/tool inspections, use of tools, rebar caps and housekeeping.
2. While Skanska does not generally follow a progressive disciplinary practice, Skanska employees are, except as otherwise agreed in an applicable ("CBA") or ("PLA"), subject to the following disciplinary actions for violations of any EHS policy that is not designed to protect against immediate dangers to life and health:
 - First Offense: Written reprimand
 - Second Offense: One (1) day suspension without pay
 - Third Offense: Three (3) day suspension without pay
3. Skanska may impose more serious penalties upon its offending employees if it deems such action to be appropriate for violations covered by this provision.
4. Subcontractors are likewise responsible for managing, supervising and disciplining subcontractor workers who fail to adhere to applicable EHS policies and rules set forth in this EHS Manual, provided that Skanska may take actions necessary to address imminent threats to life and health and, if a subcontractor fails to take timely or appropriate corrective action, Skanska may, consistent with the terms of the applicable subcontract, bar from the project site any such subcontractor worker who poses a safety risk to the project.

3. ***Imposition of Discipline on Contractor Employees***

1. The level of offense will be considered over a rolling one (1) year period looking back from the date of each offense.
2. The foregoing discipline policy shall be applicable to all Skanska supervisory personnel in relation to their respective obligation to properly and adequately manage their workforce so that they conduct themselves in a safe manner and in accordance with this EHS policy. Accordingly, should employees under the management of Skanska supervisory personnel commit multiple (i.e. more than one (1)) IDLH or Non-IDLH offense as stated above during a given one (1) year period, said multiple offenses may be construed as a violation of the workplace rule requiring supervisors to properly manage and maintain a safe working environment in accordance with this EHS policy and may result in the supervisor being subject to discipline as set forth herein.

3. With respect to supervisory personnel being indirectly associated with any single EHS policy violation constituting a danger that is either an IDLH or Non-IDLH by employees under his or her direct or indirect supervision and management, the supervisor may be disciplined by way of no less than a five (5) day suspension without pay. However, shorter suspension periods without pay for the supervisor may be considered in such situations where a supervisor could be considered directly involved due to the required roles and responsibilities outlined in the SHEMS.
 4. The above is the minimum guideline. All offenses will be reviewed and more severe discipline may be implemented when conditions warrant.
 5. Prior to any discipline being implemented, the proposed disciplinary action will be discussed with Human Resources and approved at or above the Project Executive level. The level of discipline imposed shall be documented for the employee file.
 6. All disciplinary actions resulting in a suspension are to be reviewed and approved by the Project Leadership.
 7. Skanska employees who are terminated for EHS non-compliance will not be deemed eligible for rehire for a minimum of six (6) months. The rehire of employees terminated for failure to comply with EHS policies requires Skanska approval at the senior management level, and such decision shall be made in consultation with Human Resources.
4. If in the judgment of the Skanska's project team, the extenuating circumstances of an individual incident warrant not adhering to the guidelines above, the team can petition an appropriate member of Skanska's senior management for relief from the guidelines. Only a member of Skanska's senior management, in consultation with Skanska's Legal Department and HR, can authorize deviations from these guidelines, except as expressly provided above.

Cell Phone Smart Device User Program

Objective

When site personnel use communication technology on project sites, they are expected to utilize it in a safe, prudent manner that in no way jeopardizes the safety of themselves or others or puts equipment, facilities or other materials at risk.¹

Legal and Other Requirements

Federal, State, Local Regulations

- All site personnel shall comply with all applicable federal, state and local laws and regulations regarding the use of cell phones/smart device usage while driving.

Skanska/Client Requirements

- None

Procedure

1. While Operating Vehicles or Equipment

1. The following policy applies to all project personnel, including Skanska and subcontractor employees.
2. Subcontractor management shall ensure that subcontractor employees are aware of and compliant with this Policy.
3. Members of Skanska's project management team may purchase appropriate hands-free smart devices for use by Skanska USA Civil, Inc. employees with the approval of the Project Executive for that site.
4. Members of Skanska management shall ensure that Skanska employees are aware of and compliant with this Policy and the related policy contained in any Handbooks.
5. Project Management shall ensure that cell phones, tablets and smart devices are being used in a safe manner when they must be utilized as part of the work. Project Management shall ensure that signage shall be posted where cell phones and smart device use is prohibited, and identify tasks that are not to be performed while using those devices, such as texting or emailing while driving, to the extent those activities are not already addressed by this Policy or in Handbooks.
6. In no event shall the use of wired or wireless earpieces (earbuds, Bluetooth, etc.) in connection with cell phones, smart devices or music players be permitted in active work zones.
7. The use of a cell phone for personal use (such as phone calls/social-media/data) and/or earbuds, ear pods, earphones, neck Bluetooth and any other smart device during working hours is not permitted in any construction/activity areas. The use of cell phones for personal use is limited to designated areas and/or outside of the construction site. Any person requiring the use of a cell phone, tablet or smart device as a tool for their work can only use them in a stationary position at a location in which the use of the device would not create a hazard to themselves or other employees.
8. All site personnel, while operating a company fleet vehicle, whether company owned or rented, shall utilize a cell phone "Hands Free" product, whether portable or permanently installed in a vehicle or piece of equipment.
9. Use of cell phones and smart devices in vehicles while on site is only permitted when the vehicle is parked (e.g., a cell phone or smart device may not be used when temporarily stopped at a traffic light).
10. Any person requiring the use of a cell phone, tablet or smart device as a tool for their work can only use them in a stationary position at a location in which the use of the device would not create a hazard to themselves or other employees.
11. Cell phones, tablets and smart devices may never be used when operating heavy machinery.
12. The use of personal cell phones, tablets and smart devices and/or personal audio devices is subject to the same restrictions as Skanska-issued cell phones, tablets and smart devices.
13. Personal cell phones, tablets and smart devices and/or personal audio devices may never be used when operating any equipment or machinery on an active project site.
14. The use of personal cell phones, tablets and smart devices and/or personal audio devices may be entirely prohibited, in Skanska management's discretion, while on a project worksite if such use creates a safety risk.
15. The use of personal cell phones by Skanska employees shall be limited to designated breaks and lunch periods.
16. Regardless of whether personal cell use is permitted on break or in designated areas, in no event shall the use of earbuds or headphones of any type be permitted on the project worksite. The use of earbuds or headphones shall be considered an IDLH condition and the requirements of the accountability policy shall apply.

2. In the event of an emergency requiring the use of communication equipment, comply with the project's emergency response

plan and communication protocol.

3. Any project specific requirements for this section are listed here.

- None

¹ In the event this Policy is inconsistent with any information in any Skanska Employee Handbook and/or any applicable joint venture employee handbooks (together, the "Handbooks"), the more stringent safety requirement shall govern as to Skanska employees to the extent necessary to remove the conflict or inconsistency

EHS Policies Specific to Subcontractors

Objective

Each subcontractor shall participate in and enforce the project-specific environmental, health and safety programs that shall cover all work performed by it and its sub-subcontractors. Subcontractors shall comply with all applicable federal, state and local EHS requirements.

Legal and Other Requirements

Federal, State, Local Regulations

- None

Skanska/Client Requirements

- None

Procedure

1. Project Management shall:

1. Inform subcontractors of the policies and rules contained in this EHS Manual.
2. Ensure subcontractors have met Business Unit prequalification criteria prior to being allowed to work on a project.
3. Conduct a preconstruction EHS meeting utilizing the Subcontractor Kick-Off Meeting Agenda Form with all tier subcontractors to inform them of the project-specific program. Owners and union business agents may also need to be invited, pending approval of site management and the EHS Director.
4. Provide subcontractors with access to Skanska's PlanIt tool to develop a CWP.
5. Review the subcontractor's written CWP, with the understanding that Skanska may reject any CWP that does not comply with the requirements of this EHS Manual.
6. Conduct inspections of subcontractor operations to encourage compliance with applicable regulations and policies.
7. Request that subcontractors attend Project SHEMS Leadership Team meetings.
8. Conduct subcontractor EHS meetings as they deem necessary.
9. Any project specific requirements for this section are listed here.
 - None

2. Subcontractor shall:

1. Attend the preconstruction EHS meeting held by Skanska USA Civil, Inc. project management.
2. Provide a copy of their CWPs to include task-specific activities and associated competent persons.
3. Submit all CWPs to Skanska project management for review one week prior to the commencement of each activity.
4. Ensure that subcontractor employees and workers have all necessary training for the assigned tasks.
5. Submit applicable employee training records to Skanska prior to work commencing.
6. Attend a Skanska jobsite orientation at the commencement of employment (all subcontractor employees and tier subcontractor employees).
7. Prepare Daily Hazard Analysis (DHA) prior to the commencement of each daily activity.
8. Provide all required PPE to their employees, instruct employees on proper use, and ensure use/implementation at all times.
9. Provide adequate safety measures against occupational exposures such as gases, fumes, vapors, dusts, chemicals and noise levels, including potential exposures to individuals in the vicinity of the work being performed.
10. Provide all applicable occupational monitoring documentation, including but not restricted to, exposure assessments, employee blood levels and proof of respirator fit tests (including tier subcontractors).
11. Maintain documentation that verifies that its EHS program is in compliance with applicable federal, state, local and project safety requirements. Documentation shall be made available upon request by Skanska.
12. Conduct periodic safety observations and take corrective actions for recognized hazards. Report unsafe conditions outside their scope of work to Skanska personnel.
13. Implement immediate corrective action to eliminate unsafe practices and conditions when they are observed or reported, in accordance with Skanska's Accountability Policy.
14. Investigate all incidents resulting in a near miss, personal injury, general liability, negative environmental impact and third-party claims.

15. Submit to Skanska in writing within 24 hours any incident findings, including root cause, corrective action and preventative action.
 16. Conduct weekly toolbox safety meetings (job foremen) for all site employees under their supervision with sign off and submission to the Skanska project team.
 17. Attend Skanska's Project SHEMS Leadership Team meeting on a monthly basis with the representatives of the various trades employed, to ensure that all employees understand and comply with the safety programs.
 18. Submit monthly safety performance report by the 5th of every month, to include hours worked and all incidents, or utilizing online reporting or paper copies of Skanska's Daily Report (where available).
 19. Designate an EHS representative prior to mobilization.
 - Each subcontractor expected to have less than 30 workers onsite will designate an EHS representative.
 - This onsite EHS representative will be a competent worker who has completed at least 30 hours of OSHA awareness training and who may have other onsite duties.
 20. Have a plan in place to onboard an onsite full-time EHS professional once the subcontractor's headcount reaches thirty (30) or more workers (including workers of lower tier subcontractors) on the project. Subcontractor will also provide details for additional EHS Staffing when workers may exceed 150 or when activities are deemed high risk by Skanska.
 - In the event this policy conflicts with or is inconsistent with the applicable subcontract, the more stringent requirement shall govern to the extent necessary to remove the conflict or inconsistency.
 21. Submit the resume of their proposed EHS professional or representative to be reviewed by Skanska.
 - Skanska will have the right to object to the use of the proposed EHS professional or representative if he/she does not have the training and experience required for this project.
 - The subcontractor's designated EHS professional or representative will have the authority and responsibility to ensure the proper implementation of the policies and rules in this EHS Manual.
 - Subcontractor full time onsite EHS professionals shall have the following minimum qualifications:
 - Three (3) years construction safety experience
 - Onsite full time and have no other responsibilities other than environmental, health and safety
 - Specialized training relevant to scope of work
 - Minimum of OSHA 30-hour construction safety awareness course
 - Working knowledge of EHS regulations and hazard control methods
 - Demonstrated ability to conduct EHS training
 22. Comply with project emergency action plan.
 23. Any project specific requirements for this section are listed here.
 - None
3. Designated Subcontractor EHS Professional or Representative
1. Designated EHS professionals and representatives will have the authority to stop any work they deem unsafe.
 2. Skanska reserves the right to object to designated subcontractor EHS professionals and EHS representatives if they do not strictly adhere to and enforce the requirements of this EHS Manual, including and without limitation, if they fail to:
 - Investigate any incident or near miss and report the findings to Skanska
 - Attend EHS meetings as required by Skanska
 - Conduct regular EHS meetings with workers to instruct them on project EHS practices and requirements
 - Conduct documented EHS inspections of their work activities and make available to Skanska for review
4. Subcontractor EHS Submittals
- Prior to beginning work, each subcontractor shall submit to Skanska the following items listed below. In the event this policy conflicts with or is inconsistent with the applicable subcontract, the most stringent requirement shall govern to the extent necessary to remove the conflict or inconsistency.
1. Subcontractor-prepared Construction Work Plan (CWP), at least one week prior to mobilization.
 2. Name(s) of designated EHS professional or EHS representative and a statement of his/her qualifications.
 3. Emergency contacts and telephone numbers for their senior operations person and company EHS representative who are available at all times.
 4. Verification of training completed by designated competent persons as required by the scope of work.
 5. Verification of training completed by qualified equipment operators as required by the scope of work for cranes, forklifts, aerial lifts, heavy equipment, etc.
 6. Verification that subcontractor workers designated as first responders have completed first aid and CPR training.
 7. Verification of required training completed by subcontractor workers responding to environmental incidents.
 8. Verification that current annual crane inspections by a certified third-party crane inspection firm have been completed for all cranes brought onto the project by subcontractor.
 9. Project-specific Master Chemical and Substance Inventory Sheet and Safety Data Sheets for all hazardous chemicals and materials to be used or stored on the project.

10. Verification that OSHA or other project required training, as applicable, has been completed. Examples of OSHA or project required training may include:

- Fall Protection
- Confined Space
- Respiratory Protection
- Excavations and Trenches
- Scaffolding
- Crane Signals
- Annual Hazard Communication Training
- Ladders

5. Permits or Plans as Required

Prior to commencing work on the project, each Subcontractor will submit to Skanska for review all work permits or plans pertinent to its scope of work, including the following, as applicable:

1. Confined Space Entry
2. Hot Work
3. Excavation and Trenching
4. Crane Lift Plan
5. Fall Protection Plan
6. Lockout/tagout Checklist
7. Other work plans and permits as deemed necessary

6. Maintain While Working on the Project

Throughout the course of the project, each subcontractor will maintain the following records or documents on site and submit electronically to Skanska weekly:

1. OSHA documentation related to injuries
2. EHS Inspection report
3. Subcontractors shall be responsible for the following:
 - Scaffold
 - Trench
 - Crane
 - Forklift
4. Skanska permits or forms, or their approved equivalent, such as:
 - Confined space entry
 - Hot work
 - Excavation and trenching
 - Crane lift permit
 - Fall protection plan
 - Lockout/tagout checklist
 - Other work plans and permits as deemed necessary

7. Subcontractor Pre-Mobilization Meeting

Prior to mobilization, each subcontractor shall attend a pre-mobilization meeting to discuss site specific environmental, health and safety concerns. The meeting will address the following.

1. Review the subcontractor's contract responsibilities.
2. Confirm the Skanska policy that PPE shall be provided at no expense to its employee by the subcontractor. The subcontractor shall enforce the use of PPE.
3. Review PPE: hard hats, safety glasses, hearing protection, face shields for grinding operations, welding and cutting shields, goggles, dust masks for nuisance dust, or a full respiratory protection program for respirator use for protection from hazardous atmospheric conditions, gloves, etc. Other items may be required depending on the task.
4. Review the subcontractor's method of weekly jobsite inspection.
5. Review required OSHA training with respect to scope of work, paying special attention to fall protection training.
6. Review project-specific fall protection requirements, which may exceed the Skanska six-foot rule.
7. Review other training required by the scope of work, which may include ladders, scaffolding, confined space, excavations, respiratory protection, rigging and hand signals, tools, etc.
8. Confirm that task-specific preplanning meetings are required for all high risk activities.
9. Review competent and qualified person sign-off.
10. Review the use of the Guardrail Removal Permit and its appropriate application. This permit is optional but may be required if determined by the project team. If a component of a guardrail system must be removed, the competent

person can complete a Guardrail Removal Permit. The permit ensures adequate communication of guardrail removal and that other means of fall protection are in place to protect affected employees while the guardrail is removed. If guardrails are removed without permission, Skanska will assume that the subcontractor is responsible for reinstalling the guardrails, and will charge the subcontractor's account accordingly.

11. Review Skanska Fire Protection/Prevention requirements: The subcontractor must provide a fire extinguisher and fire watch in accordance with Skanska's Hot Work permit requirements.
12. Review Skanska's project-specific EAP and site evacuation plan.
13. Confirm that all medical emergencies and accidents must be reported to Skanska immediately
14. Confirm that Skanska will coordinate 911 responses. Subcontractors are required to submit injury report, insurance accident report forms and hospital release forms in a timely manner.
15. Confirm that all property damage incidents must be reported to Skanska immediately.
16. Review Skanska's Accountability Policy for environmental, health and safety violations. Subcontractors shall take corrective action to abate unsafe conditions immediately.
17. Review process for Weekly Tool Box Talks to be submitted with employee sign-off.
18. Confirm that each subcontractor is responsible for providing drinking water for its own employees.
19. Confirm that each subcontractor is responsible for providing its own first aid kit, as well as a designated First Aid/CPR person(s) with current training.
20. Confirm that subcontractors are responsible for protecting their own workers.
21. Confirm that all workers must attend project orientation, sign in and receive a Skanska hardhat sticker regarding such orientation.
22. Any project specific requirements for this section are listed here.

Fit For Duty

Objective

Site personnel are expected to report to work fit for duty, which means able to perform job duties legally and safely.

Procedure

1. Project management, in conjunction with Skanska USA Civil, Inc.'s Human Resources Department, will be responsible for ensuring that Skanska employees are fit for duty. It is the responsibility of subcontractors to ensure that their subcontractor employees are fit for duty. All site personnel on the project must be capable of carrying out their assigned task(s) in a legal and safe manner.
2. Foremen will be responsible for the following:
 1. Foremen will assign each worker tasks for which they are physically fit and mentally capable.
 2. Foremen will ensure that each employee reporting to work is not under the influence of drugs or alcohol.

During Stretch and Flex and the Daily Hazard Analysis (DHA), all foremen will observe their crew members to assure they are capable of performing each stretch and are not in distress. Employees are responsible for maintaining their own individual levels of fitness required to conduct their daily work.

Personal Protection Equipment - PPE

Objective

All site personnel shall, at a minimum, wear the following personal protective equipment while on the project site (except inside the jobsite office and designated safe zones.)

Legal and Other Requirements

Federal, State, Local Regulations

- ANSI Class III reflectivity standard - when working in traffic and/or at night
- ANSI Class II reflectivity standard - vest or shirt with reflective striping
- ANSI Z89.1 - Hardhat standard
- ANSI 105 cut level III - Glove standard
- ANSI Z87 - Eyewear standard
- ASTM F243-18 - Footwear Protection Criteria
- ANSI Z41.1-1967 - Safety Toe Footwear

Procedure

1. Head Protection

1. Hardhats will be worn at all times on this project, in accordance with the following:
 - Hardhats will be worn according to manufacturer requirements.
 - The Skanska USA Civil, Inc. or Skanska name and the wearer's personal name (first and last) will be displayed on the hardhat.
 - Expired hardhats, as determined by manufacture date, will not be worn.
 - Hardhats must meet ANSI Z89.1 requirements.

2. Eye and Face Protection

1. Eye and face protection safety glasses with side-shields that meet ANSI Z87 criteria are to be worn at all times. Prescription glasses must meet ANSI Z87 requirements, or employees will be required to wear over the glasses (OTG) safety eyewear.
2. In addition, the following eye/face protective equipment, at a minimum, must be used when performing the following work activities:

Activity	Safety Equipment
Welding	Welding hood and safety glasses
Burning	Burning goggles with face shield
Abrasive grinding or cutting	Safety glasses and face shield
Drilling	Goggles or safety glasses and face shield
Reaming	Face shield and safety glasses
Chemical handling	Goggles and face shield
Follow PPE guidelines as detailed in eye/glove chart detailed above.	

3. Foot Protection

1. Safety-toed work boots with a minimum of six (6) inch ankle support must be worn on all jobsites. Work boots that are in good condition must be worn (heel and sole will not show excessive wear) and puncture resistant sole is highly recommended. All other foot wear is not acceptable.

4. High-Visibility Attire

1. All persons on the project site must wear a high visibility vest or shirt that has reflective striping consistent with ANSI Class II requirements.
2. ANSI Class III reflectivity requirements must be met when working in traffic at night.

5. Work Attire

1. Shirts will have a minimum sleeve length of three (3) inches. Tank tops and cut-off shirts are not permitted. Long pants that fit properly around the waist and ankles and that are not excessively worn are required. Pants that are worn low on

the hips or thigh are not allowed. The length of the pants will be such as to not present a tripping hazard. Shorts are not permitted.

6. Hand Protection

1. All personnel on the project shall wear ANSI cut level 3 gloves at all times. Each task shall be analyzed to determine if a higher cut level of glove is required. Specialty gloves may be required for handling sharp materials, chemicals, electrical work, etc.
2. Specific tasks requiring high dexterity may be exempt from the requirement if agreed upon in advance by Skanska Supervision and appropriate controls are identified in the CWP. These exempt employees shall wear ANSI cut level 3 gloves when not performing high dexterity tasks.
3. This requirement applies to all craft workers, supervisors, managers, visitors, vendors or any other individual onsite.
4. Fingerless or modified gloves are not allowed.

7. Additional Protections

1. Respiratory protection and hearing protection are covered in the Health section of this manual.

Taking into consideration the hazards associated with a particular project or task, Skanska USA Civil, Inc. may require site personnel to wear additional personal protective equipment to reduce the likelihood of a work-related injury or illness.

Training Links

- [Eye Safety \[Competent Person\]](#) - [Eye Safety \[Competent Person\]](#)

Stop Work Authority

Procedure

1. Employees have been given the authority, without fear of reprimand or retaliation, to immediately:
 - Stop any work activity that presents a danger to any employees, the public or the environment.
 - Get involved, question and rectify any situation that is identified as not being in compliance with Skanska's environmental, health and safety policies.
 - Report any unsafe conditions or potential negative environmental impacts.
 - Question any work activity that involves violation of established environmental, health and safety policies.

Substance Abuse Policy

Objective

The project has an alcohol and drug-free workplace program to ensure that our business is functioning safely, efficiently and cost-effectively. The project will require all employees and job applicants to participate in, consent to and comply with the dictates of this program as a condition of employment and continued employment. For those who refuse to cooperate fully with the terms and conditions of this program, the project will take appropriate measures to address the situation promptly and will not tolerate substance abuse. This policy applies to all the project, subcontractors at any tier, vendor and other third-party employees, including management working on or visiting the project.

Legal and Other Requirements

Federal, State, Local Regulations

- None

Skanska/Client Requirements

- None

Procedure

1. Jobsite Requirements

1. Whenever employees are working, operating Skanska vehicles or equipment, present on Skanska premises or present in any other location performing services for Skanska, they are prohibited from:
 - Using, possessing, buying, selling, manufacturing, distributing, dispensing or transferring illegal drugs or controlled substances.
 - Being under the influence of controlled substances.
2. Workers are expected to follow the medical advice given with prescribed medication.
3. Violation of this requirement will result in termination.

2. Testing

1. Skanska reserves the right to request drug and alcohol screenings from employees.
2. Skanska will conduct drug and alcohol testing within the parameters of any applicable state and federal laws and will use scientifically valid methods and procedures.
3. Skanska reserves the right to use onsite testing procedures per requirements of the project and Owner Contract, for both its employees and subcontractor employees where Skanska is required to do so.
4. Applicants for all positions will be notified that they may be required, once offered a position, to successfully pass a drug test as a condition of being hired.
5. Applicants will be required to sign a consent form and present a valid photo identification card (driver's license).
6. A positive drug test or refusal to participate in a drug test, or any effort to tamper with a sample or to alter a test result, will disqualify an applicant from employment.
7. This provision will apply to all former employees who are eligible to reapply for employment with Skanska after six months.

3. Reasonable Suspicion Testing

1. Employees and subcontractors will be required to submit to a drug and/or alcohol test when a supervisor and/or manager of that employee has reasonable suspicion of prohibited drug and/or alcohol use. Reasonable suspicion will be documented and will not be based on rumor, speculation or unsubstantiated information.

4. Post-Accident Testing

1. All employees and subcontractors who may have potentially caused or contributed to an incident or injury during work time in a Skanska office or at a Skanska jobsite will be subject to drug and alcohol testing.
2. A post-accident drug and alcohol test must take place within three (3) hours of the time of the accident. A Skanska employee who fails to report a work-related accident is in violation of this program and is subject to disciplinary action, up to and including termination.

5. Organizational Response to Policy Violation

1. An employee or job applicant who receives a confirmed positive test result may contest or explain the result to the medical review officer within five working days after receiving written notification of the test result. If an employee's or job applicant's explanation or challenge is unsatisfactory to the medical review officer, the medical review officer shall report

a positive test result back to Skanska.

2. In the event of a positive test result, after appeal, the Skanska employee shall be removed from the project and subject to termination, pending review by Human Resources.

6. Right to Search

1. Employees and their property, including but not limited to lunch boxes and toolboxes, are subject to search while on Skanska premises. Searches may be conducted without prior warning and may include entire work groups or specific individuals, if management has reason to suspect the employee is in violation of this program. Trained narcotic dogs may be used in searches. Searches of employees and their clothing will be by a person of the same gender.
2. Employees who refuse to cooperate will not be forcibly detained or searched, but failure to cooperate will result in disciplinary action up to and including termination.

7. Confidentiality

1. All information, interviews, reports, statements, memoranda, documentation, and drug and alcohol test results, written or otherwise, are confidential. Skanska and any of its agents associated with drug and alcohol testing who receive or have access to information concerning test results shall keep all information confidential. No such information shall be released without the written consent of the employee unless the release is on a need-to-know basis, is required by law, and is relevant to a legal claim asserted by the employee, or as otherwise provided by law.
2. In the event of a positive drug test, the reason for termination shall be referred to as "employee failed to comply with company program."
3. Skanska workers' compensation carrier may be notified of results of post-accident tests that may affect Skanska insurance program as provided for by state laws.

8. Reservation of Rights

1. Skanska reserves the rights to administer, interpret, change or rescind the program in whole or in part, with or without notice or consideration. In addition, changes to applicable state and federal laws or regulations may require Skanska to modify or supplement the program.
2. The program does not create an employment contract and should not be interpreted or considered as such.
3. This program does not, in any way, change the nature of the at-will employment relationship on the part of the employee or Skanska.

Responsibilities

1. Project Management

1. Address employee questions or requests for information relative to Skanska USA Civil, Inc.'s substance abuse policy.
2. Document any reasonable suspicion of prohibited drug and/or alcohol use by employees or subcontractors that requires a drug/alcohol test.
3. Provide copy of positive/negative result to employee.
4. Any project specific requirements for this section are listed here.
 - None

2. Subcontractor

1. Each subcontractor will promote a drug free workplace with their employees and will communicate what constitutes prohibited activities.
2. Ensure all workers involved in an incident have a post incident drug/alcohol test within three (3) hours of the incident and report the results to Skanska. At a minimum, the drug test will follow current Substance Abuse Mental Health Services Administration (SAMHSA) five panel guidelines; the alcohol test will follow Department of Transportation (DOT) guidelines.
3. Any project specific requirements for this section are listed here.
 - None

Vehicle Policy

Objective

The purpose of this policy is to establish rules and regulations for safe operation of motor vehicles when used on a project site.

Legal and Other Requirements

Federal, State, Local Regulations

- All site personnel shall comply with all applicable federal, state and local laws and Regulations regarding the safe operation of equipment and motor vehicles

Skanska/Client Requirements

- None

1. Rights and Responsibilities

1. Project management will identify who will fulfill the responsibilities of monitoring and measuring the operational controls listed below. Site personnel will be responsible for complying with any imposed project-specific requirements by the Client or Skanska USA Civil, Inc.
2. Skanska Project Management
Members of management shall:
 - Enforce the policies and rules set forth in this EHS Manual.
 - Ensure that proper access, egress and safe parking areas are available at the project site.
 - Verify that daily walk-around inspections are being performed.
3. EHS Staff
Members of the EHS staff shall:
 - Audit the inspection and maintenance records of company-owned vehicles.
 - Recommend the appropriate safety accessories for company-owned vehicles when required (e.g., flashing beacons, whip flags, fire extinguisher size, etc.)
 - Enforce the rules set forth in this EHS Manual.
4. Subcontractors
Subcontractors shall:
 - Ensure that their subcontractor employees operating a motor vehicle on an active project site are properly licensed and qualified to drive a motor vehicle.
 - Ensure that vehicles utilized on an active project site meet the project safety requirements.
 - Ensure that all subcontractor employees operating a vehicle on an active project site comply with the applicable policies and rules set forth in this EHS Manual.
 - Coordinate with project vehicle routes, conflicts in parking, and access and egress logistics.
5. In the event this Policy conflicts with or is inconsistent with any information in any Skanska Handbook, the more stringent requirement shall apply.

2. Operational Controls/Documents

1. The following documents should be maintained as part of the project files. To the extent these documents are within the control of subcontractors, subcontractors shall maintain them and make them available for inspection by Skanska's EHS staff at the project site:
 - Manufacturer's operating manual
 - Driver's License
 - Construction Work Plan
 - Maintenance of Traffic (MOT)
 - Traffic Control Program (TCP)
 - Maintenance and Protection of Traffic (MPT)
 - Vehicle equipment and maintenance records
2. Motor Vehicle Records (MVR) shall be reviewed prior to issuing a vehicle. MVRs may also be reviewed periodically throughout vehicle use (for vehicles covered by this policy).
3. Any vehicle or equipment that bears a license plate is required to be operated by an operator with a valid driver's

license.

4. Any project specific requirements for this section are listed here.

- None

5. Performance Indicators/Records

Performance indicators are the means by which projects monitor and measure their compliance with operational controls and the status of achieving objectives and targets. Accordingly, the following records should be maintained as part of the project files:

- Daily vehicle inspections (when applicable)
- Maintenance records
- Incident reports involving vehicles
- Any project specific requirements for this section are listed here.
 - None

3. Procedure and Rules

Rules for Safe Operation of Vehicles

The following procedures and rules apply to all Skanska and subcontractor drivers and vehicles, whether the vehicle is owned by the company or covered by a company auto allowance, used during the construction process, (e.g., material delivery and transport, hauling of debris, service and maintenance vehicles) or for related business purposes:

1. Every vehicle shall have a seatbelt for every occupant being transported.
2. Every vehicle over one ton in hauling capacity shall have a fire extinguisher and first aid kit.
3. Parked equipment one (1) ton or greater in capacity shall have a wheel chocked and parking brake set.
4. Every construction vehicle entering an active work zone must be equipped with an audible reverse signal alarm, and in urban areas, a "white noise" alarm is recommended. For non-construction vehicles, the driver will signal twice using the vehicle's horn prior to reversing near an active work zone; a spotter is required when there is an obstructed view to the rear.
5. A trained spotter shall be used whenever a heavy duty vehicle is put in reverse.
6. A trained spotter shall be used whenever a light duty vehicle (e.g., pickup truck) is put in reverse and conditions surrounding such use present a significant risk to person or property.
7. If a vehicle has an obstructed view to the rear, a trained spotter shall be used to direct the backing operations.
8. The spotter can only be removed if a CWP detailing the controls for safely backing without a spotter has been reviewed and approved by project management.
9. A worker shall not serve as a spotter unless properly trained and qualified to do so, and be designated and identifiable.
10. It is the responsibility of each vehicle operator to perform a daily walk-around and vehicle inspection. Drivers are responsible for checking the mechanical condition of the vehicle, fire extinguishers or any other mandated equipment and keeping company-owned vehicles clean.
11. All tools and equipment must be secured prior to being transported.
12. All site personnel are required to know and comply with local, state and federal traffic laws for the locations in which they will operate their vehicles.
13. Any Skanska employee must notify his/her supervisor immediately if he/she is issued a citation while operating a vehicle during the construction process or for project-related purposes, whether the vehicle is Skanska-owned or covered by an auto allowance.
14. Continued violations of these rules by Skanska employees could result in the loss of a Skanska vehicle or auto allowance or potential further disciplinary action up to and including termination.
15. Neither Skanska vehicles nor private vehicles used for Skanska purposes under auto allowances may be operated when the Skanska employee is under the influence of alcohol or drugs.
16. Skanska employees are subject to disciplinary action if they are involved in an accident for which they are charged with a traffic violation or crime, or found liable in a civil lawsuit, including but not limited to drug or alcohol use, unacceptable driving record or evidence of any unsafe conditions or circumstances. All charges of traffic violations involving Skanska vehicles or private vehicles while used for Skanska purposes under auto allowances are to be immediately reported to a member of the project management team. Accidents must be reported in accordance with established Skanska corporate policies and procedures.
17. Except in an emergency, only authorized drivers may operate a vehicle.
18. Decals and unit-assigned numbers are not to be removed from Skanska-owned vehicles under any circumstance without written authorization of a Skanska equipment manager.
19. All Skanska employee drivers are expected to conduct themselves appropriately, professionally and in a safe manner when operating a Skanska vehicle or private vehicle used for Skanska's purposes. Skanska employees found in violation of any of these rules will be subject to disciplinary action, up to and including dismissal. Subcontractors are likewise responsible for disciplining subcontractor workers who fail to adhere to applicable EHS policies and rules set forth in this EHS Manual, provided that Skanska may take actions necessary to address imminent threats to life and health and, if a subcontractor fails to take timely or appropriate corrective action, Skanska may, consistent with the terms of the applicable subcontract, bar from the project site any such subcontractor worker who poses a safety risk to

the project.

20. Any project specific requirements for this section are listed here.

- None

4. **Job Vehicles/Trucks**

1. All company vehicle assignments will be made to the jobs as required. As with any other equipment, the project manager will request vehicle job assignments when the job is mobilized. The equipment manager will assign vehicles to the jobs. Job vehicles will be used on the job by qualified drivers and will remain on the job overnight.

2. Any project specific requirements for this section are listed here.

Safety

Concrete and Masonry

Objective

The purpose of this program is to develop, implement, maintain and enforce safe work practices when working with concrete and masonry products.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1926.701 Subpart Q - Concrete and Masonry Construction - General requirements](#)
- [OSHA 29 CFR 1926.703 Subpart Q - Concrete and Masonry Construction - Requirements for cast-in-place Concrete](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 4 §1532.3](#)
- [OSHA 29 CFR 1926.700 Subpart Q - Concrete and Masonry Construction - Scope, application, and definitions](#)
- [OSHA 29 CFR 1926.706 Subpart Q - Concrete and Masonry Construction - Requirements for masonry construction](#)
- [OSHA 29 CFR 1926.705 Subpart Q - Concrete and Masonry Construction - Requirements for lift-slab operations](#)
- [OSHA 29 CFR 1926.704 Subpart Q - Concrete and Masonry Construction - Requirements for precast concrete](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 29 §1709-1722.1](#)
- [OSHA 29 CFR 1926.702 Subpart Q - Concrete and Masonry Construction - Requirements for equipment and tools](#)

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. Do not place construction loads on a concrete structure until it has been determined that it can support the load.
2. Do not permit employees, other than those essential to the work, behind the jack during post-tensioning operations. Erect signs and barriers to limit employee access.
3. Set up walkways for safe access/egress when feasible.
4. For any mixing, chipping, grinding or other dust-producing activities related to concrete or mortar, refer to the Silica and Respiratory Protection sections of this manual.
5. Any project specific requirements for this section are listed here.
 - None

2. Equipment and Tools

1. Concrete mixers with one cubic yard or larger loading skips shall be equipped with a mechanical device to clear the skip of materials and guardrails installed on each side of the skip.
2. Powered and rotating concrete trowelling machines that are manually guided shall be equipped with a control switch (a.k.a. "dead man" switch) that will automatically shut off the power whenever the hands of the operator are removed from the equipment handles.
3. Stick line/distribution systems shall:
 - Be secured to prevent the release of stored energy.
 - Be cleared of any residual concrete upon completion of work or during extended periods of idle time.
 - Utilize thrust blocks during vertical operations or operations that include changes in direction based on engineering calculations.
4. Concrete buggy handles will not extend beyond the wheels on either side of the buggy.
5. Concrete pumping systems using discharge pipes will be provided with pipe supports designed for one hundred percent (100%) overload.
6. Route elevated concrete buckets so that employees are not exposed to hazards associated with falling concrete and/or buckets.
7. Do not permit employees to work under concrete buckets while buckets are being elevated or lowered.

8. Use taglines to control concrete tools (e.g., bucket, formwork, skip pans, etc.).
9. Use air horns, whistle or similar to signal when concrete tools (e.g., bucket, formwork, skip pans, etc.) are being hoisted overhead.
10. Concrete buckets equipped with hydraulic or pneumatic gates shall have positive safety latches to prevent premature or accidental dumping and ensure that the release is self-closing.
11. Concrete buckets shall be designed to prevent concrete from hanging up on top and the sides.
12. Equip buckets with a discharge device that an employee can operate without being exposed to the load.
13. Sections of tremies and similar concrete conveyances will be secured with wire rope (or equivalent materials) in addition to the regular couplings or connections.
14. Ensure that all concrete and masonry tools are inspected prior to use.
15. Bull float handles will be constructed of nonconductive material or insulated with a nonconductive sheath.
16. When using bull floats, inspect the area to ensure there is no energized equipment or power lines nearby that the handles could touch.
17. Finishers shall wear kneepads and impervious gloves when hand-finishing concrete.
18. Masonry saws shall be guarded with a semicircular enclosure over the blade. A method for retaining blade fragments will be incorporated in the design of the semicircular enclosure.
19. Do not permit employees to perform maintenance or repair on equipment unless all potentially hazardous energy sources have been locked out and tagged in accordance with Skanska's lockout/tagout policy.
20. Employees who operate vibrators, pump nozzles and concrete buckets shall wear appropriate eye and foot protection based on risk assessment. Long sleeve shirts are recommended to protect against concrete burns and dermatitis to bare skin.
21. Any project specific requirements for this section are listed here.
 - None

3. Cast-In-Place Concrete

1. Ensure drawings or plans, including all revisions for the jack layout, formwork (including shoring equipment), working decks and scaffolds are available at the jobsite
2. Inspect all shoring equipment (including equipment used in re-shoring operations) prior to erection, and once erected, immediately prior to, during and after concrete placement. If it is found damaged, reinforce immediately.
3. Establish controlled access zones under concrete placement area with "Do Not Enter" signage
4. The sills for shoring shall be sound, rigid and capable of carrying the maximum intended load
5. All base plates, shore heads, extension devices and adjustment screws shall be in firm contact and secured when necessary with the foundation and the form.
6. Eccentric loads on shore heads and similar members shall be prohibited unless these members have been designed for such loading.
7. When single post shores are used on top of another (tiered):
 - A qualified designer shall prepare the design of the shoring, and an engineer qualified in structural design shall inspect the erected shoring.
 - The single post shores shall be vertically aligned, spliced to prevent misalignment and adequately braced in two mutually perpendicular directions at the splice level. Each tier shall also be diagonally braced in the same two directions.
8. No adjustments of single post shores to raise formwork shall be made after the placement of concrete
9. Erect re-shoring, as the original forms and shores are removed, whenever the concrete is required to support loads in excess of its capacity.
10. Construct walkways along form walls in accordance with OSHA scaffold and fall protection standards.
11. Any project specific requirements for this section are listed here.
 - None

4. Vertical Slip Forms

1. Formwork shall be designed, fabricated, erected, supported, braced and maintained so that it will be capable of supporting, without failure, all vertical and lateral loads anticipated to be applied to the formwork.
2. The steel rods or pipes on which jacks climb, or by which the forms are lifted, shall be specifically designed for that purpose and adequately braced where not encased in concrete.
3. Design forms will be designed to prevent excessive distortion of the structure during the jacking operation.
4. All vertical slip forms shall be provided with scaffolds or work platforms where employees are required to work or pass.
5. Position jacks and vertical supports in such a manner that the loads do not exceed the rated capacity of the jacks.
6. The jacks or other lifting devices shall be provided with mechanical dogs or other automatic holding devices to support the slip forms whenever failure of the power supply or lifting mechanism occurs.
7. Maintain the form structure with all design tolerances specified for plumb during the jacking operation.

8. Do not exceed the predetermined safe rate of lift.
9. Any project specific requirements for this section are listed here.
 - None

5. Reinforcing Steel

1. Take measures to prevent unrolled wire mesh from recoiling.
2. Protect all vertical and horizontal rebar, form stakes, metal and/or plastic conduit and/or small pipe stub-ups with approved caps or other industry accepted and tested alternatives to protect against impalement and injury.
3. Ensure that reinforcing steel and forms for walls, piers, columns, stairs and similar vertical structures are adequately supported to prevent overturning and collapse, and are designed and installed under the supervision of a qualified person.
4. Any project specific requirements for this section are listed here.
 - None

6. Removal of Formwork

1. Do not remove forms and shores (except those used for slabs on grade and slip forms) until it has been determined that the concrete has gained sufficient strength to support its weight and superimposed loads.
2. Do not remove re-shoring until the concrete being supported has attained adequate strength to support its weight and all loads in place upon it.
3. All projects are to follow the Red Bolt Policy for removal of vertical formwork. See Red Bolt Policy below.
4. Any project specific requirements for this section are listed here.
 - None

7. Precast Concrete Erection

1. Adequately support precast concrete wall units, structural framing and tilt-up wall panels to prevent overturning and to prevent collapse until permanent connections are completed.
2. Use proper lifting devices, such as lifting lugs, for precast. Prepare a Lift Plan in conjunction with the Construction Work Plan (CWP).
 - Lifting inserts attached to tilt-up precast concrete members shall support at least two times the maximum intended load.
 - Lifting attached to precast concrete members, other than the tilt-up members, shall support at least four times the maximum intended load.
 - Lifting hardware shall support at least five times the maximum intended load.
3. Do not permit employees under precast concrete members being lifted or tilted into position except those employees required for the erection of those members.
4. Any project specific requirements for this section are listed here.
 - None

8. Lift Slab

1. All lift slab operations shall be designed by a registered professional engineer with experience in this field.
2. Any project specific requirements for this section are listed here.
 - None

9. Masonry Construction

1. Establish a limited access zone whenever a masonry wall is being constructed.
2. The limited access zone shall:
 - Be established prior to the start of construction of the wall.
 - Be equal to the height of the wall to be constructed plus four (4) feet and run the entire length of the wall.
 - Be established on the side of the wall that does not have a scaffold.
 - Be restricted to entry by employees actively engaged in constructing the wall.
 - Remain in place until the wall is adequately supported.
3. Adequately brace all masonry walls over eight (8) feet in height to prevent overturning and to prevent collapse unless the wall is adequately supported so that it will not overturn or collapse. Keep the bracing in place until permanent supporting elements of the structure are in place.
4. Do not lean or stack material against the wall until fully supported.
5. Any project specific requirements for this section are listed here.
 - None

10. Red Bolt Policy

1. All formwork shall be stripped in a controlled manner.
2. Each project shall administer the "Red Bolt Policy."
 - A Competent Person will determine whether or not the Red Bolt Policy shall be administered based on the weight,

size and/or configuration of the forms.

- The Construction Work Plan shall identify the Competent Person for each shift that the work will be performed.
 - The Construction Work Plan shall include a description of the Red Bolt Policy tagging system.
 - The Competent Person shall identify the pre-determined bolts, braces or engineered systems that can only be removed once a lifting device is properly rigged to the form.
 - The pre-determined bolts, braces or engineered systems shall be identified with red bolt tags, red spray paint, etc.
 - Only the Competent Person shall authorize the removal of the bolts, braces or engineered systems.
3. The Daily Hazard Analysis shall be used by the stripping crew to describe their means and methods, including the stripping sequence and identification of red bolts, braces or engineered systems.

Confined and Enclosed Spaces

Objective

The purpose of this program is to protect workers from the hazards associated with permit-required and non-permit required confined spaces on our jobsites. Projects will take the necessary steps to correctly evaluate confined spaces in order to safely enter and perform our work. All workers taking part in an entry will be trained in accordance with the requirements of this program.

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. Evaluate the work environment using the Confined Space Evaluation Checklist to determine if it is a confined space. A confined space meets the following conditions:
 - Is large enough for an employee to enter fully and perform assigned work
 - Is not designed for continuous occupancy by the employee
 - Has a limited or restricted means of entry or exit
2. The Confined Space Evaluation Checklist will also determine if the space is a permit-required confined space or a non-permit-required confined space. A permit-required confined space meets one or more of the following conditions:
 - Contains or has the potential to contain a hazardous atmosphere
 - Contains a material with the potential to engulf someone who enters the space
 - Has an internal configuration that might cause an entrant to be trapped or asphyxiated by inwardly converging walls or by a floor that slopes downward and tapers to a smaller cross section
 - Contains any other recognized serious safety or health hazards
3. If the space is deemed a permit-required confined space, the Confined Space Entry Permit must be completed before entry.
4. Follow all procedures identified for safe entry according to this program.
5. Any project specific requirements for this section are listed here.
 - None

2. Non-permit required confined space

1. Pre-Entry

1. Identify tasks to be performed in the space and their potential hazards.
2. Secure the following equipment prior to entry:
 - Testing and monitoring equipment.
 - Ventilation equipment needed to maintain acceptable entry conditions.
 - Adequate lighting equipment.
 - Rescue and emergency equipment as needed.
 - Any other equipment necessary for safe entry into and rescue from space.
3. Isolate the space and implement measures to prevent unauthorized entry.
4. Complete the air-monitoring log on the Confined Space Entry Permit and maintain at the jobsite for inspection. Properly calibrate air-monitoring equipment and maintain records of calibration.
 - Test the space for atmospheric hazards in this order: oxygen content, combustible gases, vapors, dusts, and toxic gases.

- If necessary, purge, flush or ventilate the space to eliminate or control atmospheric hazard for at least thirty (30) minutes prior to retesting air quality.
 - 5. Implement Lockout/tagout as necessary.
 - 6. If necessary, select rescue and retrieval methods and/or notify proper emergency services that may be required to respond.
2. Entry
- 1. Only confined space trained personnel shall enter non-permit required confined spaces.
 - 2. Follow all entry procedures including, but not limited to:
 - Verification of acceptable entry conditions
 - Continuous air monitoring and documentation of readings every 15 minutes
 - Implementation of forced air ventilation if necessary
 - Proper use of equipment required
 - Any other procedures deemed necessary for safe operations
 - 3. Evacuate the space if a prohibited condition is detected inside or outside the space, entrant exhibits signs of hazard exposure or evacuation orders are given.
3. Permit-required confined space
1. Pre-Entry
- 1. Identify tasks to be performed in the space and their potential hazards.
 - 2. Secure the following equipment prior to entry:
 - Testing and monitoring equipment
 - Ventilation equipment needed to maintain acceptable entry conditions
 - Any necessary communications equipment
 - Personal protective equipment when feasible engineering and work practice controls do not adequately protect employees
 - Adequate lighting equipment
 - Non-sparking hand tools
 - Barriers and shields as required
 - Rescue and emergency equipment needed
 - Any other equipment necessary for safe entry into and rescue
 - In an explosive environment, use explosion-proof mechanical equipment and lighting (Class one (1) Div one (1))
 - 3. Isolate the space and implement measures to prevent unauthorized entry.
 - 4. Complete the air-monitoring log on the Confined Space Entry Permit and maintain at the jobsite for inspection. Properly calibrate air monitoring equipment and maintain records of calibration.
 - Test the space for atmospheric hazards in this order: oxygen content, combustible gases, vapors, dusts and toxic gases.
 - Purge, flush or ventilate the space to eliminate or control atmospheric hazard for at least thirty (30) minutes prior to retesting air quality.
 - No employee will be allowed to enter an oxygen-deficient or potentially toxic/explosive confined space until project management approves the Construction Work Plan.
 - 5. Implement Lockout/tagout as necessary.
 - 6. Identify appropriate controls if hot work is to be performed in the space.
 - 7. Select rescue and retrieval methods and/or notify proper emergency services that may be required to respond. In addition:
 - Evaluate a prospective rescuer's ability to respond to a rescue summons in a timely manner.
 - To facilitate non-entry rescue, use retrieval systems or methods whenever an authorized entrant enters a confined space. Retrieval equipment is not required when its use would increase the overall risk of entry or would not contribute to rescue such as with confined spaces with side openings. Side openings in a confined space are those within three and a half (3½) feet off the bottom. Retrieval systems must meet the following requirements:
 - Each authorized entrant must use a chest or full body harness with the retrieval line attached at the center of the entrant's back near shoulder level, or above the entrant's head. Wristlets may be used in lieu of the chest or full body harness if the use of a full body harness is infeasible or creates a greater hazard. The wristlets must be the safest and most effective alternative in this case.
 - The other end of the retrieval line must be attached to a mechanical device or fixed point outside the permit space in such a manner that rescue can begin as soon as the rescuer becomes aware that rescue is necessary. A mechanical device must be available to retrieve personnel from vertical-type permit spaces more than five (5) feet deep.

8. Select a communication method based on configuration of space and work task.
 9. Before entry is authorized, the entry supervisor must complete and sign the entry permit. The permit must be posted for attendants and entrants to review. The duration of the permit may not exceed the time required to complete the work, or eight hours.
 10. During pre-entry, the entry supervisor must:
 - Evaluate the confined space to determine known and potential hazards.
 - Identify acceptable entry conditions.
 - Verify appropriate equipment (retrieval, personal protective equipment, air monitors, etc.) based on hazards in the confined space.
 - Verify that rescue services are available and the means for summoning them are operable.
 - Assign qualified and trained individuals as authorized entrants and attendants.
 - Keep all Safety Data Sheets (SDS) for hazardous chemicals involved with entry available for emergency personnel if an employee is overexposed to a substance.
 - Provide pedestrian, vehicle or other barriers as necessary to protect entrants from external hazards.
 - Provide adequate lighting equipment.
 - Provide equipment needed for safe access.
 - Before signing the permit allowing entry to begin, verify the following:
 - The permit has been completed.
 - All tests specified by the permit have been conducted.
 - All procedures and equipment specified by the permit are in place.
 - For confined space work extending beyond eight (8) hours, determine when responsibility for a confined space entry operation is transferred, at intervals dictated by the hazards and operations performed within the space, to maintain safe confined space operations.
 11. During pre-entry the attendant must:
 - Verify acceptable entry conditions.
 - Monitor air continuously.
 - Implement forced air ventilation if necessary.
 - Communicate with entrants.
 - Ensure rescue controls are in place.
 - Comply with any other procedures deemed necessary for safe operations.
 12. Only authorized personnel shall enter confined spaces. Authorized entrants must review posted permit and verify the following before entry:
 - Acceptable entry conditions
 - Continuous air monitoring
 - Implementation of forced air ventilation if necessary
 - Proper use of equipment required
 - Communication with attendant and other entrants
 - Any other procedures deemed necessary for safe operations
2. Entry
1. During entry, the entry supervisor must:
 - Remove unauthorized persons who enter or who attempt to enter the confined space during entry operations.
 - Terminate the entry and cancel the permit when a prohibited condition is detected, or a condition that is not allowed under the entry permit criteria arises inside or near the confined space.
 - Verify that operations covered by the entry permit have been completed.
 2. During entry, the attendant must:
 - Remain outside the confined space during entry operations until relieved by another approved attendant.
 - Continuously maintain an accurate count of authorized entrants in the confined space and note time of entry and exit.
 - Test or monitor the space continuously to determine if acceptable entry conditions are being maintained. Document readings every fifteen (15) minutes on the air monitoring log.
 - Monitor activities inside and outside the space to determine if it is safe for entrants to remain in the space.
 - Ensure continuous communication between themselves and the entrants in order to monitor their status.
 - If unauthorized persons approach or enter a confined space while entry is in progress, take the following actions:
 - Warn the unauthorized person(s) that they must stay away from the confined space.

- Advise the unauthorized persons that they must exit immediately if they have entered the confined space.
 - Inform the authorized entrants and the entry supervisor if an unauthorized person(s) has entered the confined space.
 - Order evacuation if any of the following conditions occur:
 - A prohibited condition is detected.
 - The behavioral effects of hazard exposure are detected in an authorized entrant.
 - A situation outside the space could endanger the authorized entrants.
 - He/she cannot effectively and safely perform all the required duties of an attendant.
 - Summon rescue and other emergency services as soon as it is determined that authorized entrants may need assistance to escape from space hazards.
 - Perform non-entry rescues with retrieval equipment.
3. During entry, entrants must:
- Alert attendant when:
 - Any warning sign or symptom of exposure to a hazard is recognized.
 - A prohibited condition is detected.
 - Evacuate the permit space immediately when:
 - An order to evacuate is given by the attendant or the entry supervisor.
 - Any warning sign or symptom of exposure to a hazard is recognized.
 - A prohibited condition is recognized.
 - An evacuation alarm is sounded.

3. Post-Entry

1. The entry supervisor must cancel the permit and file it with the safety department for one year to facilitate a review of the confined space program. Document any problems during entry operations, in order to make continuous improvements to the confined space program.
2. Remove all entrants and equipment from space.
3. Replace the cover, hatch, door, etc., in space to prevent unauthorized entry.

Cranes and Cranes Rigging

Objective

This document is intended to standardize the efforts and actions required by project teams to safely and properly plan and manage the crane operations on each site. Therefore, this document, together with applicable project or agency specifications and OSHA regulations, will guide all project teams on the safe operation of and the administrative requirements for cranes.

Skanska/Client Requirements

- None

Procedure

1. General Policy

The following standards, definitions and procedures support the acquisition, erection, operation and maintenance of all cranes under Skanska USA Civil, Inc. control on Skanska projects. This document is designed to be included as part of the EHS Manual. It includes basic requirements for the operation of cranes in all regions. Project and regional-specific requirements can be added at the end of each major section.

1. Objective

On joint-venture projects where Skanska is not the lead managing partner, the lead managing partner's crane policy will take precedence; however, when not the lead managing partner, Skanska employees will make every effort to comply with Skanska's practices.

2. Scope of Applicable Equipment

The requirements of this standard apply to equipment designed to hoist, lower and horizontally move a suspended load

which includes mobile cranes, truck cranes, rough terrain cranes, crawler cranes, pile drivers, tower cranes and gantry cranes, but is not intended to provide guidelines for mobile equipment for which the hoisting of loads is a secondary purpose (e.g., an excavator equipped with a hook on the bucket).

3. Applicable Regulations and Other Requirements

See Legal and Other Requirements section above.

4. Definitions

A/D director(Assembly / disassembly director)

Individual who meets this policy's requirements for an A/D director, irrespective of the person's formal job title or whether the person is non-management or management personnel.

Anti-collision system

An electronic device used to help the operator avoid swing collisions with other cranes and set swing boundaries and zones for safe operation.

Articulating crane

A crane whose boom consists of a series of folding, pin-connected structural members, typically manipulated to extend or retract using power from hydraulic cylinders.

Assembly / disassembly

The assembly and/or disassembly of equipment covered under this policy. With regard to tower cranes, "erecting and climbing" replaces the term "assembly" and "dismantling" replaces the term "disassembly". Regardless of whether the crane is initially erected to its full height or is climbed in stages, the process of increasing the height of the crane is an erection process.

Assist crane

A crane used to assist in assembling or disassembling a crane.

Attachments

Any device(s) that expand(s) the range of tasks that can be done by the equipment. Examples include, but are not limited to, augers, drills, magnets, pile-drivers and boom-attached personnel platforms.

Audible signal

A signal made by a distinct sound or series of sounds. Examples include, but are not limited to, sounds made by bells, horns or whistles.

Blocking (also referred to as "cribbing")

Wood or other material used to support equipment or a component and distribute loads to the ground. It is typically used to support lattice boom sections during assembly / disassembly and under outrigger and stabilizer floats.

Boatswain's chair

A single-point, adjustable suspension scaffold consisting of a seat or sling (which may be incorporated into a full body harness) designed to support one employee in a sitting position.

Boom (equipment other than tower crane)

An inclined spar, strut or other long structural member that supports the upper hoisting tackle on a crane or derrick. Typically, the length and vertical angle of the boom can be varied to achieve increased height, or height and reach, when lifting loads. Booms can usually be grouped into general categories of hydraulically extendible, cantilevered type, latticed section, cable-supported type or articulating type.

Boom (tower cranes)

On tower cranes, if the "boom" (i.e., principal horizontal structure) is fixed, it is referred to as a jib; if it is moveable up and down, it is referred to as a boom.

Boom angle indicator

Device that measures the angle of the boom relative to horizontal.

Boom hoist limiting device

Includes boom hoist disengaging device, boom hoist shut-off, boom hoist disconnect, boom hoist hydraulic relief, boom hoist kick-outs, automatic boom stop device or derricking limiter. This type of device disengages boom hoist power when the boom reaches a predetermined operating angle. It also sets brakes or closes valves to prevent the boom from lowering after power is disengaged.

Boom length indicator

Indicates the length of the permanent part of the boom (such as ruled markings on the boom) or, as in some computerized systems, the length of the boom with extensions / attachments.

Boom stop

Includes boom stops (belly straps with struts / standoff), telescoping boom stops, attachment boom stops and backstops. These devices restrict the boom from moving above a certain maximum angle and toppling over backward.

Boom suspension system

System of pendants, running ropes, sheaves and other hardware that supports the boom tip and controls the boom angle.

Center of gravity

Point in an object around which its weight is evenly distributed. If you could put a support under that point, you could balance the object on the support.

Certified welder

Welder who meets nationally recognized certification requirements applicable to the task being performed.

Climbing

Process in which a tower crane is raised to a new working height either by adding tower sections to the top of the crane (top climbing) or by a system in which the entire crane is raised inside the structure (inside climbing).

Come-a-long

A mechanical device typically consisting of a chain or cable attached at each end that is used to facilitate movement of materials through leverage.

Competent person

One who is capable of identifying existing and predictable hazards in the surroundings or working conditions that are unsanitary, hazardous or dangerous to employees and who has authorization to take prompt corrective measures to eliminate them. Training records are maintained and available.

Controlled load lowering

Lowering a hoisted load with maximum control using the gear train or hydraulic components of a hoist mechanism. Controlled load lowering requires the use of the hoist drive motor, rather than the load hoist brake, to lower the load.

Counterweight

A weight used to supplement the weight of equipment in providing stability for lifting loads by counterbalancing those loads.

Crane location plan (CLP)

A drawing specific to a jobsite that identifies known hazards for underground and overhead crane operations. It specifies an individual area's ability to support the ground pressure produced by operating a crane. The drawing provides a visual representation of where specific cranes are approved to operate and are not approved to operate. The drawing is adjusted routinely to account for changes in site conditions and other factors that affect the safe operation of a crane on the site. The CLP must be approved by a qualified person.

If Skanska is the controlling entity on a jobsite, Skanska must also make the location of underground hazards in the set-up area (e.g., voids, tanks, utilities) available to the user and the operator of all cranes on the jobsite. If hazards are identified in documents (e.g., site drawings, as-built drawings and soil analyses) that are in the possession of Skanska (whether at the site or offsite) or are hazards that are otherwise known to Skanska. Note: this does not relieve each respective user and operator of cranes on the jobsite (e.g., subcontractors) from their responsibility to meet the requirements as stated above.

Crawler crane

Equipment with base mounting that incorporates a continuous belt of sprocket-driven track.

Crossover points

Locations on a wire rope spooled on a drum where one layer of rope climbs up on and crosses over the previous layer. This takes place at each flange of the drum as the rope is spooled onto the drum, reaches the flange and begins to wrap back in the opposite direction.

Dedicated channel

Line of communication assigned by the employer who controls the communication system to only one signal person and crane / derrick or to a coordinated group of cranes / derricks / signal person(s).

Dedicated pile-driver

A machine designed to function exclusively as a pile-driver. These machines typically have the ability to both hoist

and pile—drive the material.

Dedicated spotter (powerlines)

To be considered a dedicated spotter, the requirements of a signal person must be met. The dedicated spotter's sole responsibility is to watch the separation between the power line and the equipment, load line and load, including rigging and lifting accessories. They also ensure, through communication with the operator, that the applicable minimum approach distance is not breached.

Directly under the load

When a part or all of an employee is directly beneath the load.

Dismantling

Includes partial dismantling (i.e., dismantling to shorten a boom or substitute a different component).

Drum rotation indicator

A device on a crane or hoist that indicates in which direction and at what relative speed a particular hoist drum is turning.

Electrical contact

Occurs when a person, object or equipment makes contact or comes in close proximity with an energized conductor or equipment that allows the passage of current.

Encroachment

Where any part of the crane, load line or load (including rigging and lifting accessories) breaches the minimum clearance distance required to be maintained from a power line.

Floating cranes / derricks

Equipment designed by the manufacturer (or employer) for marine use by and is permanently attachment to a barge, pontoons, vessel or other means of flotation.

Free fall (of the load line)

When only the brake is used to regulate the descent of the load line (i.e., the drive mechanism is not used to drive the load down faster or retard its lowering).

Free surface effect

The uncontrolled transverse movement of liquids in compartments which reduces a vessel's transverse stability.

Hoist

A mechanical device for lifting and lowering loads by winding a line onto or off a drum.

Hoisting

The act of raising, lowering or otherwise moving a load in the air with equipment. As used in this policy, "hoisting" can be done by means other than wire rope / hoist drum equipment.

Insulating link / device

An insulating device listed, labeled or accepted by a nationally recognized testing laboratory.

Jib (tower cranes)

On tower cranes, if the "boom" (i.e., principal horizontal structure) is fixed, it is referred to as a jib; if it is moveable up and down, it is referred to as a boom.

Jib stop (also jib backstop)

The same type of device as a boom stop but for a fixed or luffing jib.

Lift director

Directly oversees the work being performed by a crane and the associated rigging crew. The lift director is someone appointed on the jobsite and can be in the capacity of a project manager, project superintendent, foreman or project crane coordinator (PCC).

Lift plan

A construction plan that outlines the step-by-step aspects of a particular lift in detail. It includes a rigging plan and a signal plan.

List

The angle of inclination about the longitudinal axis of a barge, pontoon, vessel or other means of flotation.

Load

Object(s) being hoisted and/or the weight of the object(s); both uses refer to the object(s) and the load-attaching equipment (e.g., the load block, ropes, slings, shackles, and any other ancillary attachment).

Load moment (or rated capacity) limiter

A system that aids the equipment operator by sensing (directly or indirectly) the overturning moment on the equipment (i.e., load multiplied by radius). It compares this lifting condition to the equipment's rated capacity and when the rated capacity is reached, shuts off power to those equipment functions that can increase the severity of loading on the equipment (e.g., hoisting, telescoping out or luffing out). Typically, those functions that decrease the severity of loading on the equipment remain operational (e.g., lowering, telescoping in or luffing in).

Locomotive crane

A crane mounted on a base or car equipped for travel on a railroad track.

Luffing jib limiting device

Similar to a boom hoist limiting device except that it limits the movement of the luffing jib.

Marine hoisted personnel transfer device

A device, such as a "transfer net", that is designed to protect the employees being hoisted during a marine transfer and to facilitate rapid entry into and exit from the device. Such devices do not include boatswain's chairs when hoisted by equipment covered in this document.

Marine worksite

A construction worksite located in, on or above the water.

Mobile crane

A lifting device incorporating a cable-suspended latticed boom or hydraulic telescopic boom designed to be moved between operating locations by transport over the road.

Multi-purpose machine

A machine designed to be configured in various ways, at least one of which allows it to hoist (by means of a winch or hook) and horizontally move a suspended load. For example, a machine that can rotate and can be configured with removable forks / tongs (for use as a forklift).

Nonconductive

An object that, because of the nature and condition of the materials used and the conditions of use (including environmental conditions and condition of the material), has the property of not becoming energized (i.e., it has high dielectric properties offering a high resistance to the passage of current under the conditions of use).

Operational controls

Levers, switches, pedals and other devices for controlling equipment.

Operator

A person who is operating the equipment or a winch pack, jib (with a hook at the end) or jib used in conjunction with a winch. Operators shall be certified by an accredited agency (such as NCCCO or CIC).

Operational aids

are devices that assist the operator in the safe operation of the crane by providing information or automatically taking control of a crane function.

Overhead and Gantry cranes

includes overhead / bridge cranes, semi-gantry, cantilever gantry, wall cranes, storage bridge cranes, launching gantry cranes and similar equipment irrespective of whether it travels on tracks, wheels or other means.

Pendants

Includes both wire and bar types. Wire type: A fixed length of wire rope with mechanical fittings at both ends for pinning segments of wire rope together. Bar type: Instead of wire rope, a bar is used. Pendants are typically used in a latticed boom crane system to easily change the length of the boom suspension system without completely changing the rope on the drum when the boom length is increased or decreased.

Portal crane

A type of crane consisting of a rotating upper structure, hoist machinery and boom mounted on top of a structural gantry which may be fixed in one location or have travel capability. The gantry legs or columns usually have portal openings in between to allow passage of traffic beneath the gantry.

Project crane coordinator (PCC)

The PCC is typically not a full-time position, but rather a multipurpose member of the project staff tasked with crane management for the jobsite. Some of the PCC's duties include verification of completion of daily periodic inspections, verification of operator's licensing and qualification, and completion of routine tasks maintaining the project's compliance with this document.

Proximity alarm

Device that provides a warning of proximity to a power line.

Qualified evaluator (not a certified third party)

Person employed by the signal person's employer who has demonstrated that he/she is competent in accurately assessing whether individuals meet the qualification requirements in this policy for a signal person, rigger and inspector.

Qualified evaluator (certified third party)

An entity that due to its independence and expertise, has demonstrated that it is competent in accurately assessing whether individuals meet the qualification requirements in this policy for a signal person, rigger and inspector.

Qualified Inspector

Skanska or crane rental / Owner company employee who is designated as a manufacture authorized inspector.

Qualified person

Person who, by possession of a recognized degree, certificate or professional standing, or who by extensive knowledge, training and experience, successfully demonstrates the ability to solve / resolve problems relating to the subject matter, the work or the project.

Qualified rigger

Rigger who meets the criteria for a qualified person. Note: Qualified rigger shall be certified per local code or have received competency training through a Skanska approved curriculum.

Range control limit device

Device that can be set by an equipment operator to limit movement of the boom or jib tip to a plane or multiple planes.

Range control warning device

Device that can be set by an equipment operator to warn that the boom or jib tip is at a plane or multiple planes.

Rated capacity

The maximum working load permitted by the manufacturer under specified working conditions. Such working conditions typically include a specific combination of factors such as equipment configuration, radii, boom length and other parameters of use.

Rated capacity indicator

An indicator that tells the operator what percent of capacity they are at. Refer to indicator on the crane.

Rated capacity limiter

See load moment limiter.

Regional crane coordinator (RCC)

The regional crane coordinator may be a full-time position with duties that include oversight and planning of all monthly and annual crane inspections and the overall regional compliance with this document. The RCC shall track the location and status of all cranes and their inspections. Each region will have an RCC.

Repetitive lift-up points

When operating on a short cycle operation, the rope used on a single layer and spooled repetitively over a short portion of the drum.

Rigging plan

Portion of the lift plan related to the method and materials used to rig a load. It specifically details all rigging to be used in the lift.

Running wire rope

A wire rope that moves over sheaves or drums.

Runway

A firm, level surface designed, prepared and designated as a path of travel for the weight and configuration of the crane being used to lift and travel with the crane-suspended load. An existing surface may be used as long as it meets these criteria.

Side boom crane

Track-type or wheel-type tractor with a boom mounted on the side used for lifting, lowering or transporting a load suspended on the load hook. The boom or hook can be lifted or lowered in a vertical direction only.

Signal person

The individual who gives signals to the crane operator. Must be trained per 29 CFR 1926.1428(c) and designated. Qualified signalperson: One who meets the OSHA definition to signal a crane / derrick.

Signal plan

The portion of the lift plan related to signaling throughout the duration of the lift; outlines all signal-related details for the lift.

Special hazard warnings

Warnings of site-specific hazards (e.g., proximity of power lines).

Tagline

A rope (usually fiber) attached to a lifted load for purposes of controlling load spinning and pendular motions or used to stabilize a bucket or magnet during material handling operations.

Tender

Individual responsible for monitoring and communicating with a diver.

Third-party inspector

Certified crane inspector (or qualified inspector approved by the RCC) contracted for a specific purpose, such as the oversight of the erection of a tower crane, monthly and annual inspections on rubber tire, crawler, or barge cranes and Non-Destructive Testing.

Tilt up or tilt down operation / tripping

Raising / lowering a load from the horizontal to vertical or vertical to horizontal position while using one or more lines or using more than one piece of equipment (e.g., cranes, excavators, loaders, dozers).

Tower crane

Type of lifting structure that uses a vertical mast or tower to support a working boom (jib) in an elevated position. Loads are suspended from the working boom.

Travel bogie (tower cranes)

An assembly of two or more axles arranged to permit vertical wheel displacement and equalize the loading on the wheels.

Trim

Angle of inclination about the transverse axis of a barge, pontoon, vessel or other means of floatation.

Two blocking

A condition in which a component that is uppermost on the hoist line, such as the load block, hook block, overhaul ball or similar component, comes in contact with the boom tip, fixed upper block or similar component. This binds the system and continued application of power can cause failure of the hoist rope or other component.

Upper works

The revolving frame of equipment on which the operating machinery (and in many cases the engine) is mounted, along with the operator's cab. The counterweight is typically supported on the rear of the upper structure and the boom or other front end attachment is mounted on the front.

Wire rope

A flexible rope constructed by laying steel wires into various patterns of multi-wired strands around a core system to produce a helically wound rope.

5. General Policy: Regional / Project-Specific Requirements**State**

- None

Regional/Project

- None

2. Site Prep**1. Required Documentation**

It is the responsibility of the PCC and Superintendent to ensure the following documentation is available in the crane of the cab for review prior to crane operations. Crane inspection documentation shall also be available at the Skanska project office.

1. Current Annual Inspection
2. Current Monthly Inspection

3. Manufacturer's Load Chart
4. Manufacturer's Operating Manual
5. Lift Plans
6. Daily Inspection

2. Owner Notification Requirements

It is the responsibility of the project team to comply with client specific requirements regarding crane operations.

3. Geotechnical and Crane Location Plan (CLP) Requirements

1. Prior to commencing crane operations, the project team shall develop a Crane Location Plan (CLP). The CLP will provide the following:

A qualified person must confirm the geotechnical properties are capable of supporting the crane(s) at all crane working locations.

After a rain event that could compromise the stability of the Crane location, an assessment must be performed by a qualified person to confirm the integrity of the Crane location has not been compromised

1. All cranes greater than 250 ton will be placed on crane mats unless the requirement of 2.3.2 is met.
2. The location(s) that the crane will be assembled and disassembled
3. The location(s) that the crane will be operating
4. Identification of potential underground concerns (e.g. utilities, tanks, voids)
5. The CLP will be reviewed each month during the Monthly Crane and Rigging Meeting. If a crane is required to perform operations outside of the designated area defined on the CLP or if a change in ground conditions occurs that could impact the crane's stability, the CLP must be updated to reflect new work location(s) or changed ground conditions. The PCC or Superintendent is responsible for ensuring the geotechnical properties are capable of supporting the crane in the new work area or the area in which the ground conditions have changed.
6. When a crane is moved, a spotter shall be utilized to assist the crane operator with visibility as well as to ensure all personnel and possible obstructions are clear of the crane's path. Prior to crane relocation, the crane's route will be reviewed by the operator and the spotter.

4. Monthly Project Crane Meeting

Each month, the project team will conduct a documented Monthly Crane and Rigging Meeting utilizing the Project Crane and Rigging Meeting Agenda form.

5. Site Prep: Regional / Project-Specific Requirements

- None

3. Operations

1. Authority to Stop Operation / Emergency Stop

All employees have the authority to stop a crane operation when there is a concern for safety. All employees have the right to give an emergency stop signal.

2. Notifications

When there is a need for a Skanska owned or rented crane, the project team shall provide the RCC with a procurement notice 2 weeks prior to intended use date.

3. Safety Devices

All cranes shall have functioning safety devices. If a safety device is not working properly, the device and the crane shall

be taken out of service. The required safety devices are listed on the applicable crane inspection form.

4. Assembly / Disassembly (A/D)

Skanska and/or Manufacturer's Procedures

1. A/D operations must be directed by a professional who meets the criteria for both a competent person and qualified person. Or by a competent person that is assisted by one or more qualified persons.
2. A/D operations are considered a critical pick.
3. An A/D director who understands the applicable A/D procedures will be identified in the CWP and will be on site at all times during A/D operations.
4. Prior to A/D, the A/D director shall review the applicable A/D procedures and ensure compliance with applicable procedures throughout the A/D process.
5. Synthetic slings may only be used for A/D rigging when specifically approved or directed by the manufacturer
6. A/D procedures shall prevent the unintended movement and collapse of any part of the crane by providing adequate support and stability
7. A/D procedures shall not position employees in an area where a crushing hazard exists from unintended movement or collapse.
8. The RCC should review the assembly / disassembly procedures with the A/D Director to ensure correct manufacture's procedures are on-site and being followed, particular the use of a stowed jib.

5. Assembly / Disassembly Crew Responsibilities

Prior to commencing A/D operations, a detailed CWP shall be developed and reviewed with the crew performing the A/D activities. The CWP shall be used to develop the lift plans associated with A/D. Changes to the construction activities or in the event of unforeseen conditions, the CWP shall be updated and the crew will be instructed on the new CWP.

1. Protecting Assembly / Disassembly Crew Members out of Operator View

Prior to an employee positioning themselves in an area that is out of the view of the crane operator where a crushing hazard exists from the potential movement of the crane, the exposed worker shall inform the operator of their intended work location. The operator shall not move the crane until informed by the exposed employee the crushing hazard no longer exists.

2. Working under the Boom, Jib or Other Components

When pins (or similar devices) are being removed, employees shall not be under crane components that could result in a crushing injury.

Exception: If the A/D director demonstrates that site constraints require one or more employees to be under the boom, jib or other components when pins (or similar devices) are being removed. The A/D director must implement procedures that minimize the risk of unintended dangerous movement and minimize the duration and extent of exposure under the hazard. At a minimum, the components must be adequately blocked and, when possible, supported by an assist crane.

3. Capacity Limits

During all phases of A/D, rated capacity limits for loads imposed on the equipment, equipment components, rigging, lifting lugs and equipment accessories must not be exceeded.

4. Blocking Material

When blocking is used to support lattice booms or components, the size, amount, condition and method of stacking the blocking must be sufficient to sustain the loads and maintain stability.

5. Proper Location of Blocking

When blocking is used to support lattice booms or components, blocking must be placed to protect the structural integrity of the equipment and to prevent movement and collapse.

6. Boom and Jib Lift Points

The point(s) of attachment of rigging to a boom (or boom sections or jib or jib sections) must be suitable for preventing structural damage and facilitating safe handling of these components.

7. Center of Gravity

The center of gravity of the load must be identified if it is integral to maintaining stability. Where there is insufficient information to accurately identify the center of gravity, measures designed to prevent unintended dangerous movement resulting from an inaccurate identification of the center of gravity must be used.

8. Stability upon Pin Removal

The boom sections, boom suspension systems (such as gantry A-frames and jib struts) and components must be rigged or supported to maintain stability upon the removal of the pins.

9. Snagging

Suspension ropes and pendants must not be allowed to catch on the boom or jib connection pins or cotter pins,

including keepers and locking pins.

10. **Struck by Counterweights**

Rigging and blocking must be sufficient to minimize the potential for unintended movement from inadequately supported counterweights and from hoisting counterweights.

11. **Boom Hoist Brake Failure**

Each time the boom hoist brake is being relied on to prevent boom movement during A/D; the brake must first be tested. If the brake proves insufficient, a boom hoist pawl, other locking device / back-up braking device or another method of preventing dangerous movement of the boom, such as blocking or an assist crane, and a boom hoist brake failure must be used.

12. **Loss of Backward Stability**

Backward stability must be ensured before swinging the upper works, travel and when attaching or removing equipment components.

13. **Wind Speed and Weather**

The manufacturer's requirements regarding the effects of wind speed shall be identified and adhered to.

14. **Cantilevered Boom Sections**

Manufacturer limitations on the maximum amount of boom supported only by cantilevering must not be exceeded. If the manufacturer's limitations are not available, a registered professional engineer (RPE) familiar with the type of equipment involved must determine the limitation and provide it in writing. The limitation must not be exceeded.

15. **Weight of Components**

The weight of each of the components must be readily available.

16. **Components and Configuration**

The selection of components and configuration of the equipment that affect the capacity or safe operation of the equipment must be in accordance with manufacturer specifications. If specifications are unavailable, a RPE familiar with the type of equipment involved must approve, in writing, the selection and configuration of components. Upon completion of assembly, the equipment must be inspected by a qualified inspector.

17. **Shipping Pins**

Reusable shipping pins, straps, links and similar equipment must be removed. Once removed, they must either be stowed or otherwise stored so they do not present a falling object hazard.

18. **Pile Driving**

Equipment used for pile driving must not have a jib attached during pile driving operations.

19. **Outriggers and Stabilizers**

When the load to be handled and the operating radius require the use of outriggers or stabilizers or at any time when outriggers or stabilizers are used, all of the following requirements must be met (except as otherwise indicated):

1. The outriggers or stabilizers must be either fully extended or, if the manufacturer's procedures permit, deployed as specified in the load chart. The use of outriggers not fully extended will be considered a critical lift.
2. The outriggers must be set to remove the equipment weight from the wheels, except for locomotive cranes. This provision does not apply to stabilizers.
3. When outrigger floats are used, they must be attached to the outriggers. When stabilizer floats are used, they must be attached to the stabilizers.
4. Each outrigger or stabilizer must be visible to the operator or to a signal person during extension and setting

20. **Outrigger and Stabilizer Material**

Outrigger and stabilizer blocking must:

1. Be placed only under the outrigger or stabilizer float / pad of the jack or, where the outrigger or stabilizer is designed without a jack, under the outer bearing surface of the extended outrigger or stabilizer beam
2. Be a minimum 4" solid oak or the equivalent and be sized such that individual pad blocking covers an area equal to three times the overall pad dimension. All blocking will be tightly spaced and in contact with the outrigger pad (cross blocking may be required) or be suitably engineered to carry anticipated loads with a given soil capacity. Equivalent blocking shall be engineered type meeting the same capacity as 4" solid oak, such as composite crane mats.
3. Follow manufacturer's procedures when using locomotive cranes. When lifting loads without using outriggers or stabilizers, the manufacturer's procedures must be met regarding truck wedges or screws.

21. **Operation**

Crane users will comply with all manufacturer procedures applicable to the operational functions of the crane, including its use with attachments. Before starting the engine, the operator will verify that all controls are in the proper starting position and that all personnel are in the clear. The operator must be familiar with the equipment and its proper operation. If adjustments or repairs are necessary, the operator will promptly inform the appropriate party. Where there are successive shifts, the next operator shall also be informed. Safety devices and operational aids will not be used as a substitute for the exercise of professional judgment by the operator.

6. Cell Phones or Other Devices

Only where specifically permitted in writing as part of a CWP, cell phones / tablets / smart devices may be used in connection with work operations where such usage is required to carry out the work but then only in strict accordance with the guidelines set forth for such usage in the CWP.

See Cell Phone / Tablets / Smart Device User Policy located in the EHS Manual.

7. Grounding

1. While working in close proximity (twenty feet or less) to sources of electrical discharge, cranes are to be operated in compliance with OSHA 1926.1501 (a) (15) (vii) to ensure work crew safety.
2. Additionally, all sites must have materials necessary to properly ground cranes and loads as specified in OSHA 1926.1501 (a) (15) (vii) readily available.
3. Grounding procedures must ensure the grounding electrode (rod) or grounding connection has a resistance to ground of 25 ohms or less.

8. Leaving the Equipment Unattended

Leaving the controls while a load is suspended is prohibited.

9. Load Control

1. Where available, hoisting routes that minimize the exposure of employees to hoisted loads must be used, to the extent consistent with public safety. While the operator is not moving a suspended load, no employee shall be within the fall zone, except for employees:
 1. Engaged in hooking, unhooking or guiding a load
 2. Engaged in the initial attachment of the load to a component or structure
 3. Operating a concrete hopper or concrete bucket
2. When employees are engaged in hooking, unhooking, guiding the load or in the initial connection of a load to a component or structure and are within the fall zone, all of the following criteria shall be met:
 1. The materials being hoisted must be rigged to prevent unintentional displacement
 2. Hooks with self-closing latches or their equivalent must be used

10. Receiving a Load

1. Only those employees needed to receive a load are permitted to be within the fall zone when a load is being landed. These employees must be on the construction work plan.
2. During a tilt-up or tilt-down operation:
 1. No employee can be directly under the load. Only employees essential to the operation are permitted in the fall zone (but not directly under the load).
An employee is essential to the operation if the employee is conducting one of the following operations and the employer can demonstrate it is infeasible for the employee to perform that operation from outside the fall zone:
 2. Physically guiding the load
 3. Closely monitoring and giving instructions regarding the load's movement
 4. Either detaching it from or initially attaching it to another component or structure (such as, but not limited to, making an initial connection or installing bracing)
3. Note: Boom free fall is prohibited when an employee is in the fall zone of the boom or load, and load line free fall is prohibited when an employee is directly under the load.

11. Free Fall and Controlled Load Lowering

1. Boom Free Fall Prohibitions

The use of equipment in which the boom is designed to free fall (live boom) is prohibited in each of the following circumstances:

1. An employee is in the fall zone of the boom or load
2. An employee is being hoisted

3. The load or boom is directly over a power line, or over any part of the area extending the Table A clearance distance to each side of the power line
4. The load is over a shaft or a cofferdam, except where there are no employees in the fall zone

2. Preventing Boom Free Fall

Where the use of equipment with a boom that is designed to free fall (live boom) is prohibited, the boom hoist will have a secondary mechanism or device designed to prevent the boom from falling in the event the primary system used to hold or regulate the boom hoist fails, as follows:

1. Friction drums will have:
 1. A friction clutch and, in addition, a braking device to allow for controlled boom lowering
 2. A secondary braking or locking device that is manually or automatically engaged to back up the primary brake while the boom is held (such as a secondary friction brake or a ratchet and pawl device)
2. Hydraulic drums will have an integrally mounted holding device or internal static brake to prevent boom hoist movement in the event of hydraulic failure
3. Neither clutches nor hydraulic motors will be considered brake or locking devices for purposes of this document
4. Hydraulic boom cylinders will have an integrally mounted holding device

3. Preventing Uncontrolled Retraction

Hydraulic telescoping booms will have an integrally mounted holding device to prevent the boom from retracting in the event of hydraulic failure.

4. Load Line Free Fall

In each of the following circumstances, controlled load lowering is required and free fall of the load line hoist is prohibited:

1. An employee is directly under the load
2. An employee is being hoisted
3. The load is directly over a power line or over any part of the area extending the Table A clearance distance to each side of the power line (refer to the Electrical section)
4. The load is over a shaft or cofferdam where people may be present

12. Compliance with Rated Capacity

The equipment will not be operated in excess of its rated capacity.

13. Load Weight

1. The weight of the load will be determined from a reliable source (such as the manufacturer of the contents of the load), by a reliable calculation method (such as calculating a steel beam from measured dimensions and a known per foot weight) or by other equally reliable means.
2. All load information will be provided to the operator via the Skanska lift plan / CWP prior to the lift. The operator will verify that the load is within the rated capacity of the equipment by slowly beginning to hoist the load to determine its weight, using a load weighing device, load moment indicator, rated capacity indicator or rated capacity limiter.
3. Additionally:
 1. The boom or other parts of the equipment will not contact any obstruction
 2. The equipment will not be used to drag or pull loads sideways
 3. The operator will test the brakes each time a load that is 90 percent or more of the maximum line pull is handled by lifting the load a few inches and applying the brakes. In duty cycle and repetitive lifts where each lift is 90 percent or more of the maximum line pull, this requirement applies to the first lift but not to successive lifts.
 4. Neither the load nor the boom will be lowered below the point where less than two full wraps of rope remain on their respective drums
 5. A tag or restraint line will be used if necessary to prevent rotation of the load that would be hazardous
 6. The brakes will be adjusted in accordance with manufacturer procedures to prevent unintended movement
 7. The operator will obey a stop or an emergency stop signal, irrespective of who gives it

14. Use of Load Chart

The competent personnel involved in designing and executing a lift, including the operator, must know how to use a load chart. This includes understanding:

1. The terminology necessary to interpret load charts
2. How to ensure that the load chart is the appropriate chart for the equipment in its particular configuration and application
3. The operational limitations of load charts and footnotes
4. How to relate the chart to the configuration of the crane, crawlers, outriggers / stabilizers extended or retracted, jib erected or offset and various counterweight configurations
5. The difference between structural capacity and capacity limited by stability
6. What is included in capacity ratings
7. The range diagram and its relationship to the load chart
8. The work area chart and its relationship to the load chart
9. Where to find and how to use the "parts-of-line" information
10. How to use the load chart together with the load indicators and/or load moment devices

15. Work Area Control

1. The following requirements apply where there are accessible areas in which the equipment's swing radius or rotating superstructure, whether permanently or temporarily mounted, poses a reasonably foreseeable risk of:
 1. Striking and injuring an employee
 2. Pinching / crushing an employee against another part of the equipment or another object
2. **To Prevent Employees from Entering These Hazard Areas**
 1. Skanska / crane user must inform each employee assigned to work on or near the equipment ("authorized personnel") of how to recognize struck-by and pinch / crush hazard areas posed by the rotating superstructure. Control lines, warning lines, railings or similar barriers to mark the boundaries of the hazard areas will be erected and maintained.
 2. Exception: When Skanska / crane user can demonstrate that it is neither feasible to erect such barriers on the ground nor on the equipment, the hazard areas must be clearly marked by a combination of warning signs (such as "Danger — Swing / Crush Zone") and high visibility markings on the equipment that identify the hazard areas. In addition, Skanska / crane user must train each employee to understand what these markings signify.
3. **Protecting Employees in the Hazard Area**
 1. Before an employee enters a location in the hazard area that is out of view of the operator, the employee (or someone instructed by the employee) must ensure that the operator is informed that he/she is going to that location.
 2. Where the operator knows that an employee went to a location covered by this section, the operator must not rotate the superstructure until the operator is informed in accordance with a prearranged system of communication that the employee is in a safe position.
 3. Where any part of a crane / derrick is within the working radius of another crane / derrick, the controlling entity must institute a system to coordinate operations.
 4. If there is no controlling entity, the employer (if there is only one employer operating the multiple pieces of equipment), or employers, must institute such a system.

16. Pre-Operational / Pre-Lift Meeting

1. For any operation requiring the use of a crane, a pre-operational meeting is required to review the appropriate lift plan prior to making any lifts.
2. The meeting should include the operator, signal person and all crew members involved in rigging and handling the load.
3. The lift director identified in the CWP will hold the Pre-lift meeting. During the meeting, the lift director's responsibility will be to directly oversee the work being performed by the crane and the associated rigging crew. Initial and change.
4. This meeting will be used to make sure everyone involved in the lift is well versed on all details, including what rigging will be used, how the load will be rigged, the exact lift path of the load, who will be giving signals, the method of signaling, where the signaler will be located, etc. It should never be assumed that any member of the crew is aware of any single aspect of the lift. Therefore all aspects should be reviewed at the pre-operational /

pre-lift meeting.

17. Lift and Carry

1. A lift and carry is always treated as a critical lift and must be approved by the appropriate management personnel.
2. A competent person must supervise the operation, determine if it is necessary to reduce rated capacity and make determinations regarding load position, boom location, ground support, travel route, overhead obstructions and speed of movement necessary to ensure safety.
3. For equipment with tires, tire pressure and the load location specified by the manufacturer must be maintained.
4. The rotational speed of the equipment must be controlled that the load does not swing out beyond the radius at which it can be controlled.

18. Operator Requirements and Responsibilities

All crane operator shall be certified by a nationally accredited certification authority such as NCCCO (National Commission for the Certification of Crane Operators), Crane Institute Certification (CIC), National Center for Construction, Education and Research (NCCER) or equivalent and provide to the PCC satisfactory evidence to establish their qualification to operate the specific equipment. The operator is responsible for the safe operation of the crane and successful execution of lifts.

19. Operations: Regional / Project-Specific Requirements

- None

4. Lift Planning

Operations requiring the use of a crane require the project team to develop a lift plan utilizing the Lift Plan section of the CWP. The use of an alternative lift plan, other than the CWP, is allowed, as long as all the CWP elements are addressed in the alternative lift plan. The details of the alternative lift plan must still be included in the lift plan tab of the CWP. Upon completion of the lift plan, it will be utilized to train those involved in the crane operation on the specifics of the lift and the safety controls that will be implemented. Lift plans that are classified as a critical lift or involve the lifting of personnel require the RCC's review. If a revision to the lift plan is required, the operation must stop and the current lift plan must be updated and the PCC must be notified prior to any further action taking place.

1. Lift Classification

A classification of the lift must be determined after evaluating the weight of the object, capacity of the crane and the radius throughout the lift. It is important to note that "capacity" refers to the capacity listed on the load chart posted in the cab of the crane.

2. Planned Personnel Lifts

The use of a crane to hoist employees on a personnel platform will be prohibited except when the use of conventional means of reaching a task would be more hazardous or is not possible because of jobsite conditions. In such cases, the project team must request a dispensation for the use of personnel platforms by the Skanska EHS Department and the RCC. The CWP must address the use of the personnel platform or man basket and the Planned Personnel Lift Summary Sheet shall be completed and signed by required Skanska management team.

The personnel platform or man basket must be designed and stamped by a PE.

1. Use of Personnel Platform

The use of personnel platforms shall meet the requirements set forth in this manual. An exception is drill shafts (refer to the Lift Planning – Planned Personnel Lift section for information).

2. Equipment Criteria

1. Use of suspended personnel platforms

The total load (with the platform loaded, including the hook, load line and rigging) must not exceed 50 percent of the rated capacity for the radius and configuration of the equipment, except during proof testing. Check the Lift Plan section of the CWP to reduce lifting capacity to 50 percent.

When the occupied personnel platform is in a stationary working position, the load and boom hoist brakes, swing brakes and operator-actuated secondary braking and locking features, such as pawls or dogs, or automatic secondary brakes must be engaged.

2. Use of boom-attached personnel platforms

The total weight of the loaded personnel platform must not exceed 50 percent of the rated capacity for the radius and configuration of the equipment except during proof testing.

3. Hoisting personnel without a personnel platform

The total load, including the hook, load line, rigging and any other equipment that impose a load, must not exceed 50 percent of the rated capacity for the radius and configuration of the equipment when hoisting personnel without a personnel platform, except during proof testing.

3. Devices

1. Equipment (except for derricks and articulating cranes) with a variable angle boom must be equipped with all of the following:
 1. A boom angle indicator, readily visible to the operator
 2. A boom hoist limiting device
2. Articulating cranes must be equipped with a properly functioning automatic overload protection device.
3. Equipment with a luffing jib must be equipped with:
 1. A jib angle indicator, readily visible to the operator
 2. A jib hoist limiting device
4. Equipment with telescoping booms must be equipped with a device to indicate the boom's extended length clearly to the operator or must have measuring marks on the boom.
5. Anti two-block
 1. A device that automatically prevents damage and load failure from contact between the load block, overhaul ball or similar component and the boom tip (or fixed upper block or similar component) must be used. The device(s) must prevent such damage / failure at all points where two-blocking could occur.
 2. Exception: This device is not required when hoisting personnel in pile driving operations; rather it specifies how to prevent two-blocking during such operations.
 3. Removal of the Anti two-block must have approval by the RCC and a Vice President
6. Controlled load lowering
 1. The load line hoist drum must have a system, other than the load line hoist brake, that regulates the lowering rate of speed of the hoist mechanism. This system or device must be used when hoisting personnel.
 2. Free fall of the load line hoist is prohibited. The use of equipment in which the boom hoist mechanism can free fall is also prohibited.
 3. Personnel hoisting operations must not begin unless the devices listed in this section are in proper working order. If a device stops working properly during such operations, the operator must safely stop operations. Personnel hoisting operations must not resume until the device is again working properly. Alternative measures are not permitted.
 4. Direct attachment of a personnel platform to a luffing jib is prohibited.

4. Personnel Platform Criteria

1. The system used to connect the personnel platform to the equipment must allow the platform to remain within 10 degrees of level, regardless of boom angle.
2. The suspension system must be designed to minimize tipping of the platform due to movement of employees occupying the platform.
3. The personnel platform itself (excluding the guardrail system and personal fall arrest system anchorages) must be capable of supporting, without failure, its own weight and at least five times the maximum intended load.
4. All welding of the personnel platform and its components must be performed by a certified welder familiar with the weld grades, types and material specified in the platform design.
5. The personnel platform must be equipped with a guardrail system that meets the requirements of OSHA 1926 Subpart M, and it must be enclosed at least from the toe board to mid-rail with either solid construction material or expanded metal having openings no greater than 1/2 inch (1.27 cm).
6. Points to which personal fall arrest systems are attached must meet the anchorage requirements in OSHA 1926.502. A grab rail must be installed inside the entire perimeter of the personnel platform except for access gates / doors.
7. If installed, access gates / doors of all types (including swinging, sliding, folding or other types) must:
 1. Not swing outward. If, due to the size of the personnel platform, such as a one-person platform, it is not feasible for the door to swing inward and allow safe entry for the platform occupant, then the access gate / door may swing outward
 2. Be equipped with a device that prevents accidental opening
 3. Have headroom sufficient to allow employees to stand upright in the platform

8. In addition to the use of hard hats, employees must be protected by overhead protection on the personnel platform when employees are exposed to falling objects.
9. The platform overhead protection must not obscure the view of the operator or platform occupants (such as wire mesh that has up to 1/2" openings), unless full protection is necessary.
10. All edges exposed to employee contact must be smooth enough to prevent injury.
11. The weight of the platform and its rated capacity must be conspicuously posted on the platform with a plate or other permanent marking.

5. Personnel Platform Loading

1. The personnel platform must not be loaded in excess of its rated capacity. Personnel platforms must be used only for employees, their tools and the materials necessary to do their work. Platforms must not be used to hoist materials or tools when not hoisting personnel.
Exception: Materials and tools to be used during the lift, if secured and distributed in accordance with paragraph (8.1.6) (c) of OSHA 1926, may be in the platform for trial lifts.
2. Materials and tools must be:
 1. Secured to prevent displacement
 2. Evenly distributed within the confines of the platform while it is suspended
3. The number of employees occupying the personnel platform must not exceed the maximum number the platform was designed to hold or the number required to perform the work, whichever is less.

6. Attachment and Rigging

Hooks and other detachable devices:

1. Hooks used in the connection between the hoist line and the personnel platform (including hooks on overhaul ball assemblies, lower load blocks, bridle legs or other attachment assemblies or components) must be:
 1. Of a type that can be closed and locked, eliminating the throat opening
 2. Closed and locked when attached
2. Shackles used in place of hooks must be a Crosby shackle, with either a bolt, nut and retaining pin in place or of the screw type with the screw pin secured preventing accidental removal
3. Where other detachable devices are used, they must be of the type that can be closed and locked to the same extent as the devices addressed in the beginning of this section. Such devices must be closed and locked when attached.
4. When a rope bridle is used to suspend the personnel platform, each bridle leg must be connected to a master link or shackle in a manner that ensures that the load is evenly divided among the bridle legs
5. Rigging hardware (including wire rope, shackles, rings, master links and other rigging hardware) and hooks must be capable of supporting, without failure, at least five times the maximum intended load applied or transmitted to that component. Where rotation-resistant rope is used, the slings must be capable of supporting without failure at least ten times the maximum intended load.
6. Eyes in wire rope slings must be fabricated with thimbles
7. Bridles and associated rigging for suspending the personnel platform must be used only for the platform and the necessary employees, their tools and materials necessary to do their work.
8. The bridles and associated rigging must not have been used for any purpose other than hoisting personnel

7. Trial Lift and Inspection

1. A trial lift with the unoccupied personnel platform loaded at least to the anticipated lift weight must be made from ground level or from any other location where employees will enter the platform, to each location at which the platform will be hoisted and positioned. Where there is more than one location to be reached from a single set-up position, either individual trial lifts for each location or a single trial lift, in which the platform is moved sequentially to each location, must be performed. The method selected must be the same as the method that will be used to hoist the personnel. The trial lift must be performed immediately prior to each shift in which personnel will be hoisted. In addition, the trial lift must be repeated prior to hoisting employees in each of the following circumstances:
 1. The equipment has been moved and set up in a new location or returned to a previously used location
 2. The lift route has changed, unless the competent person determines that the new route presents no new factors affecting safety
2. The competent person must determine that:
 1. Safety devices and operational aids required by this section are activated and functioning properly
 2. Nothing interferes with the equipment or the personnel platform in the course of the trial lift
 3. The lift will not exceed 50 percent of the equipment's rated capacity at any time during the lift
 4. The load radius to be used during the lift has been accurately determined
3. Immediately after the trial lift, the competent person must:
 1. Conduct a visual inspection of the equipment, base support or ground and personnel platform to determine whether the trial lift has exposed any defect or problem or produced any adverse effect

2. Confirm that, upon the completion of the trial lift process, the test weight has been removed
4. Immediately prior to each lift:
 1. The platform must be hoisted a few inches with the personnel and materials / tools on board and inspected by a competent person to ensure that it is secure and properly balanced
5. The following conditions must be determined by a competent person to exist before the lift of personnel proceeds:
 1. Hoist ropes must be free of deficiencies
 2. Multiple part lines must not be twisted around each other
 3. The primary attachment must be centered over the platform; if the load rope is slack, the hoisting system must be inspected to ensure that all ropes are properly seated on drums and in sheaves
6. Any condition found during the trial lift and subsequent inspections that fails to meet a requirement of this policy or otherwise creates a safety hazard must be corrected before hoisting personnel.
8. **Proof Testing**
 1. Prior to hoisting employees on the personnel platform and after any repair or modification, the platform and rigging must be proof tested to 125 percent of the platform's rated capacity. The proof test may be done concurrently with the trial lift.
 2. The platform must be lowered by controlled load lowering then braked and held in a suspended position for a minimum of five minutes with the test load evenly distributed on the platform.
 3. After proof testing, a competent person must inspect the platform and rigging to determine if the test has been passed. If any deficiencies are found that pose a safety hazard, the platform and rigging must not be used to hoist personnel unless the deficiencies are corrected, the test is repeated and a competent person determines that the test has been passed.
 4. Personnel hoisting must not be conducted until the competent person determines that the platform and rigging have successfully passed the proof test.
9. **Work Practices**
 1. Hoisting of the personnel platform must be performed in a slow, controlled, cautious manner with no sudden movements of the equipment or the platform.
 2. Platform occupants must:
 1. Keep all parts of the body inside the platform during raising, lowering and horizontal movement. This provision does not apply to an occupant of the platform when necessary to position the platform or while performing the duties of a signal person
 2. Refrain from standing, sitting on or working from the top or intermediate rail or toe board or use any other means / device to raise their working height
 3. Refrain from pulling the platform out of plumb in relation to the hoisting equipment
 4. Secure the platform to the structure where work is to be performed before exiting or entering a hoisted personnel platform that is not landed, unless the crane user can demonstrate that securing to the structure would create a greater hazard
 3. If the platform is tied to the structure, the operator must not move the platform until he/she receives confirmation that it is freely suspended.
 4. Tag lines must be used when necessary to control the platform.
 5. **Platforms without controls**
Where the platform is not equipped with controls, the equipment operator must remain at the equipment controls, onsite and in view of the equipment at all times while the platform is occupied.
 6. **Platforms with controls**
Where the platform is equipped with controls, all of the following must be met at all times while the platform is occupied:
 1. The occupant using the controls in the platform must be a qualified person with respect to their use, including the safe limitations of the equipment and hazards associated with its operation
 2. The equipment operator must be at a set of equipment controls that include boom and swing functions of the equipment and must be onsite and in view of the equipment
 3. The platform operating manual must be in the platform or on the equipment
 7. **Wind**
When wind speed, sustained or gusts, exceeds 20 mph at the personnel platform, a qualified person must determine if, in light of the wind conditions, it is safe to lift personnel. If it is not, the lifting operation must not begin, or if already in progress, it must be terminated.
 8. **Other Weather and Environmental Conditions**
A qualified person must determine if, in light of indications of dangerous weather conditions, or other impending or existing danger, it is safe to lift personnel. If it is not, the lifting operation must not begin, or if already in progress, must be terminated. Employees being hoisted must remain in direct communication

with the signal person or the operator.

9. Fall Protection

Except over water, employees occupying the personnel platform must be provided and use a personal fall arrest system. The system must be attached to a structural member within the personnel platform. When working over or near water, the requirements of OSHA 1926.106 apply. The fall arrest system, including the attachment point (anchorage), must meet the requirements in OSHA 1926.502.

10. Other Load Lines

No lifts will be made on any other of the equipment's load lines while personnel are being hoisted, except in pile driving operations.

11. Factory-Produced Boom-Mounted Personnel Platforms that Incorporate a Winch as Original Equipment

Loads are permitted to be hoisted by such a winch while employees occupy the personnel platform only where the load on the winch line does not exceed 500 pounds and does not exceed the rated capacity of the winch and platform.

12. Traveling—Equipment other than Derricks

Hoisting of employees while the equipment is traveling is prohibited, except for:

1. Equipment that travels on fixed rails
2. Where the employer demonstrates that there is no less hazardous way to perform the work. This exception does not apply to rubber-tired equipment
Where employees are hoisted while the equipment is traveling, all of the following criteria must be met:
3. Equipment travel must be restricted to a fixed track or runway
4. Where a runway is used, it must be a firm, level surface designed, prepared and designated as a path of travel for the weight and configuration of the equipment being used to lift and travel with the personnel platform. An existing surface may be used as long as it meets these criteria.
5. Equipment travel must be limited to boom length
6. The boom must be parallel to the direction of travel, except where it is safer to do otherwise
7. A complete trial run must be performed to test the route of travel before employees are allowed to occupy the platform. This trial run can be performed at the same time as the trial lift which tests the lift route

13. Traveling—Derricks Prohibited

Derricks are prohibited from traveling while personnel are hoisted.

10. Pre-Lift Meeting

A pre-lift meeting must be held to review the applicable requirements of this section and the procedures that will be followed. It will be attended by the equipment operator, signal person (if used for the lift), employee(s) to be hoisted and the person responsible for the task to be performed. The pre-lift meeting will be held prior to the trial lift at each new work location and must be repeated for any employees newly assigned to the operation.

11. Hoisting Personnel near Power Lines

Hoisting personnel within 25 feet of a power line that is up to 350 kV and hoisting personnel within 50 feet of a power line that is over 350 kV is prohibited, except for work covered by the Power Transmission and Distribution section.

12. Hoisting Personnel in Drill Shafts

When hoisting employees into and out of drill shafts that are up to and including 8 feet in diameter, all of the following requirements must be met:

1. The employee must be in either a personnel platform or on a boatswain's chair.
2. If using a personnel platform, paragraphs (a) through (n) of 1926.1400 apply.
3. If using a boatswain's chair, the following paragraphs of OSHA 1926.1400 apply:
(a), (c), (d) (1), (d) (3), (d) (4), (e) (1), (e) (2), (e) (3), (f) (1), (f) (2) (i), (f) (3) (i), (g), (h), (k) (1), (k) (6), (k) (8), (k) (9), (k) (11) (i), (m), (n).
Where the terms "personnel platform" or "platform" are used in these paragraphs, substitute "boatswain's chair".
4. A signal person must be stationed at the shaft opening.
5. The employee must be hoisted in a slow, controlled descent and ascent.
6. The employee must use personal fall protection equipment, including a full body harness, attached independent of the crane / derrick.
7. The fall protection equipment must meet the applicable requirements in OSHA 1926.502.
8. The boatswain's chair itself (excluding the personal fall arrest system anchorages) must be capable of supporting, without failure, its own weight and at least five times the maximum intended load.
9. No more than one person must be hoisted at a time.

13. Hoisting Personnel for Pile Driving Operations

When hoisting an employee in pile driving operations, the following requirements must be met:

1. The employee must be in a personnel platform or boatswain's chair.
2. For lattice boom cranes, clearly mark the cable (so that it can easily be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two-blocking or use a spotter who is in direct communication with the operator to inform the operator when this point is reached.
3. For telescopic boom cranes, clearly mark the cable (so that it can be easily seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two blocking and use a spotter who is in direct communication with the operator to inform the operator when this point is reached.
4. If using a personnel platform, paragraphs OSHA 1926.1400 (b) through (n) of this section apply.
5. If using a boatswain's chair, the following paragraphs of OSHA 1926.1400 apply:
(a), (c), (d) (1), (d) (3), (d) (4), (e) (1), (e) (2), (e) (3), (f) (1), (f) (2) (i), (f) (3) (i), (g), (h), (j), (k) (1), (k) (6), (k) (8), (k) (9), (k) (11) (i), (m), and (n).
6. Where the terms "personnel platform" or "platform" are used in these paragraphs, substitute "boatswain's chair."
7. The employee must be hoisted in a slow, controlled descent and ascent.
8. The employee must use personal fall protection equipment, including a full body harness, independently attached to the lower load block or overhaul ball.
9. The fall protection equipment must meet the applicable requirements in OSHA 1926.502.
10. The boatswain's chair itself (excluding the personal fall arrest system anchorages) must be capable of supporting, without failure, its own weight and at least five times the maximum intended load.
11. No more than one person may be hoisted at a time.

14. Operational Aids

1. The devices listed as operational aids are required on all equipment covered under Skanska's crane policy, unless otherwise specified.
2. Operations will not begin unless the listed operational aids are in proper working order, except where Skanska / crane user meets the specified temporary alternative measures. More protective alternative measures specified by the crane / derrick manufacturer, if any, shall be followed.
3. If a listed operational aid stops working properly during operations, the operator will safely stop operations until the temporary alternative measures are implemented or the device is again working properly. If a replacement part is no longer available, the use of a substitute device that performs the same type of function is permitted and is not considered a modification under OSHA 1926.1434 – Category I operational aids and alternative measures.
4. Operational aids that are not working properly will be repaired no later than seven days after the deficiency occurs.
Exception: If the employer documents that it has ordered the necessary parts within seven days of the occurrence of the deficiency, the repair will be completed within seven days of receipt of the parts.

15. Boom Hoist Limiting Device

For equipment manufactured after December 16, 1969, a boom hoist limiting device is required. Temporary alternative measures (use at least one) are as follows:

1. Use a boom angle indicator
2. Clearly mark the boom hoist cable (so that it can easily be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to keep the boom within the minimum allowable radius. In addition, install mirrors or remote video cameras and displays if necessary for the operator to see the mark.
3. Clearly mark the boom hoist cable (so that it can easily be seen by a spotter) at a point that will give the spotter sufficient time to signal the operator and have the operator stop the hoist to keep the boom within the minimum allowable radius.
4. If the equipment was manufactured on or before December 16, 1969 and was not originally equipped with a boom hoist limiting device, at least one of the measures in paragraphs (d)(1)(i)(A) through (C) of OSHA 1926.1400 shall be used on a permanent basis

16. Luffing Jib Limiting Device

Equipment with a luffing jib will have a luffing jib limiting device. Temporary alternative measures are the same as in paragraph (d) (1) (i) of OSHA 1926.1400, except to limit the movement of the luffing jib rather than the boom hoist.

17. Anti Two-Blocking Device

1. Telescopic boom cranes

1. Telescopic boom cranes manufactured after February 28, 1992, will be equipped with a device that automatically prevents damage from contact between the load block, overhaul ball or similar component and the boom tip (or fixed upper block or similar component). The device(s) must prevent such damage at all points where two-blocking could occur.
2. Temporary alternative measures: Clearly mark the cable (so that it can easily be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two-blocking, and use a spotter when extending the boom.

2. Lattice boom cranes

1. Lattice boom cranes manufactured after Feb 28, 1992, will be equipped with a device that either automatically prevents damage and load failure from contact between the load block, overhaul ball or similar component and the boom tip (or fixed upper block or similar component) or warns the operator in time for the operator to prevent two-blocking. The device(s) must prevent such damage / failure or provide adequate warning for all points where two-blocking could occur.
2. Lattice boom cranes and derricks manufactured one year after the effective date of this standard will be equipped with a device that automatically prevents damage and load failure from contact between the load block, overhaul ball, or similar component and the boom tip (or fixed upper block or similar component). The device(s) must prevent such damage / failure at all points where two-blocking could occur.
3. Exception: The requirements of this section do not apply to such lattice boom equipment when used for dragline, clamshell (grapple), magnet, drop ball, container handling, concrete bucket and marine operations that do not involve hoisting personnel and pile driving work.
4. Temporary alternative measures: Clearly mark the cable (so that it can easily be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two blocking or use a spotter.

3. Category II operational aids and alternative measures

1. Operational aids that are not working properly will be repaired no later than 30 days after the deficiency occurs.
2. Exception: If the employer can document that it has ordered the necessary parts within seven days of the occurrence of the deficiency and the part is not received in time to complete the repair in 30 days, the repair will be completed within seven days of receipt of the parts.

4. Boom Angle or Radius Indicator

1. The equipment will have a boom angle or radius indicator readable from the operator's station.
2. Temporary alternative measures: Radii or boom angle will be determined by measuring the radii or boom angle with a measuring device.

5. Jib Angle Indicator (if the equipment has a luffing jib)

Temporary alternative measures: Radii or jib angle will be determined by ascertaining the main boom angle and then measuring the radii or jib angle with a measuring device.

6. Boom Length Indicator

When the equipment is equipped with a telescopic boom, except where the rated capacity is independent of the boom length, one of the following methods will be used:

1. Mark the boom with measured marks to calculate boom length
2. Calculate boom length from boom angle and radius measurements
3. Measure the boom with a measuring device

7. Load weighing and similar devices

1. Equipment (other than derricks) manufactured after March 29, 2003 with a rated capacity over 6,000 pounds will have at least one of the following:
 1. Load weighing device
 2. Load moment (or rated capacity) indicator
 3. Load moment (or rated capacity) limiter
2. Temporary alternative measures: The weight of the load will be determined from a reliable source (e.g., the load's manufacturer), by a reliable calculation method (i.e., calculating a steel beam from measured dimensions and a known per foot weight) or by other equally reliable means. This information will be provided to the operator prior to the lift.
3. The following devices are required on equipment manufactured after January 1, 2008:
 1. Outrigger position (horizontal beam extension) sensor / monitor. If the equipment has outriggers the operator will verify that the position of the outriggers is correct (in accordance with manufacturer procedures) before beginning operations requiring outrigger deployment.
 2. Hoist drum rotation indicator. If the drum is not visible from the operator's station mark the drum. In addition, install mirrors or remote video cameras and displays if necessary for the operator to see the mark.

3. Critical Lift

1. A lift is a critical lift when:

1. More than 75 percent of the crane's load chart as configured is being utilized during the lift

2. The lift requires more than one crane
3. The load on the crane cannot be accurately determined including pulling or side loading
4. Equipment that has an operator's seat is being lifted
5. Lift and Carry: The lift is considered a critical lift and the critical lift checklist must be completed.
6. Using a crane with partially extended outriggers
7. The lift is to be performed where the possibility of contacting overhead power lines is present.
8. Documented approval shall be obtained by the RCC, PCC, Project Manager and EHS prior to a critical lift.

2. Plan Development

Planning for a crane operation in which more than one crane will be supporting the load must meet the following requirements:

1. The plan must be developed by a qualified person
2. Where the qualified person determines that engineering expertise is needed for the planning, Skanska must ensure that it is provided

3. Plan Implementation

1. The multiple-crane lift must be supervised by a person who meets the criteria for both a competent person and a qualified person, or by a competent person who is assisted by one or more qualified persons
2. The supervisor must review the plan with all workers who will be involved with the operation
3. Some local governing agencies may require notification before a multiple crane lift

4. Major Lift

1. A lift is a major lift when:

The item lifted has a significant impact to the project schedule or budget.

Depending on the weight of the object and the capacity of the crane, a lift could be classified as both a critical and major lift, in which case the critical lift checklist and approvals are required.

5. Standard Lift

If the weight of the object and its radius throughout the duration of the lift are such that it is less than 75 percent capacity of the crane's capacity, and if none of the major or critical lift items are present, then it is a standard lift. A CWP and Lift Plan must be completed.

6. Repetitive / Similar Lifts

1. If a crew makes the same lift throughout the day, they need only go through the standard lift process once at the beginning of the day. For example, if the task is to remove spoils from an area with a 45-ton cherry lifter and a skip pan, then the weight of the skip pan and radius needs to be evaluated once.
2. A pre-operational meeting must take place before the first lift, and the crew can continue to work at the same operation with the same plan and no additional pre-operational meetings are required, with the exception that all rigging must be visually inspected prior to every lift.
3. However, if any significant aspect of the operation changes (a larger skip pan is substituted for the one in the plan, the spoils need to be placed in a location that requires a longer boom and larger radius, the nature of the spoils change and therefore the weight of the load changes, or any change is made to any single detail of the operation), an On-the-Spot lift plan shall be made and the prelift meeting should take place again.

7. Multiple Crane Lifts

A lift with more than one crane qualifies as a Critical Lift. See the Critical Lift Section.

8. Lift Planning: Regional / Project-Specific Requirements

- None

9. On-the-Spot Lift Plan

If during crane operations a load needs to be lifted that wasn't part of the CWP associated with the lift plan, but meets the definition of a "Standard Lift", an On-the-Spot lift plan must be created and pre-lift meeting shall take place.

5. Maintenance and Inspection

1. Inspection and Oversight Requirements

1. Prior to crane operations, the PCC shall verify that the crane has a current annual and monthly inspection and present in the cab of the crane.
2. For Skanska owned or rented cranes that are not current with the required inspections, the RCC will be notified who will schedule the inspection.
3. Subcontractors will be responsible for ensuring their cranes are current with the required inspections. Cranes shall not operate until inspections are current.

2. On-Hire / Off-Hire Inspections

1. It is the responsibility of the PCC to ensure Skanska owned and cranes being rented by Skanska receive an on-hire inspection when it arrives to the project, utilizing the On / Off Hire Checklist. The intent is to identify and document incidental damage to the crane in order to protect Skanska from potential claims for pre-existing damage. Photos of damage shall be taken.
2. Prior to a Skanska owned or rented crane leaving the project, an off-hire inspection shall be conducted to document the condition of the crane with new photographs showing all previously existing damage as well as any new damage. Both reports will be included in the crane file maintained by the RCC.

3. Inspection Requirements

1. Inspection Requirements
 1. If a company-owned or rented crane does not have a current monthly inspection, the RCC will determine whether the crane will need to have a monthly inspection completed on that crane.
 2. The on-hire inspection should be completed as soon as the crane is assembled and prior to going to work.
 3. A full monthly inspection will be completed on rentals longer than five consecutive days.
 4. If a rental is less than five consecutive days, then daily inspections should be performed by the appropriate parties.
 5. If a crane is performing in a "Low Boom / High Duty cycle" configuration, a weekly inspection shall be required. These inspections shall focus on the areas of the crane cables that are most frequently being exposed to high wear repeatedly over the sheaves.

The following mandatory inspections apply to all cranes on Skanska USA Civil, Inc. projects:

2. Daily / Pre-Shift Inspections

1. It is the responsibility of the PCC to ensure a documented pre-shift inspection is conducted by the crane operator. A Skanska crane inspection form or equivalent shall be utilized to document the inspection.
2. For Skanska owned or rented cranes, all deficiencies must be reported to the RCC immediately. Deficiencies that are related to safety will result in the immediate removal of the crane from service until the deficiencies are corrected. Non-safety related deficiencies will be repaired as soon as deemed practical. A copy of the completed daily inspection form should be left in the cab of the crane or filed and made available at the jobsite.

3. Monthly Inspections

1. Monthly inspections must be conducted by a qualified inspector or an approved third-party inspection company.
2. Inspections for Skanska owned or rented cranes are to be scheduled by the RCC, who is responsible for keeping a current database of cranes on all projects and identifying when inspections are required and completed.
3. Any deficiencies identified during the inspection must be communicated to the PCC, who is required to provide documentation describing the deficiency as well as the corrective action taken to remedy it.
4. All deficiencies found must be reported to the RCC immediately.
5. Deficiencies that are safety related will result in the immediate removal of the crane from service until the deficiencies are corrected.
6. Non-safety related deficiencies will be repaired as soon as deemed practical.
7. A copy of the completed inspection form should be left in the cab of the crane or at the job site.

4. Annual Inspections / Nondestructive Testing

1. All cranes must have a current annual inspection conducted by a certified third-party crane inspection company or by a qualified Skanska inspector. Lattice boom cranes and hydraulic cranes that are erected onsite shall be inspected upon completion of the erection of the crane by a certified third-party crane inspection company or by a qualified Skanska inspector. Annual inspections and post erection inspections will be coordinated by the RCC or the crane user.
2. A nondestructive test, such as magnetic particle, ultrasound, x-ray or other means necessary to establish the structural integrity of boom and members, may be required at the discretion of the RCC and/or the certified third party inspector. Discretion on the need and requirement for Non-Destructive Testing of welds, etc. will be based on: the overall condition of the crane, age of the crane, local or State requirements and the consultation with the certified third-party inspector.
3. On lattice boom cranes, when intending to increase the boom length, the section of boom to be installed must be inspected by a certified third party to determine if nondestructive testing may be required at the discretion of the RCC and/or the certified third party inspector. Discretion on the need and requirement for Non-Destructive Testing of welds, etc. will be based on: the overall condition of the crane, age of the crane, local or State requirements and the consultation with the certified third-party inspector.
4. Deficiencies identified during the inspection must be communicated to the PCC, who is required to provide documentation describing the deficiency as well as the corrective action taken to remedy it. All deficiencies found must be reported to the RCC immediately. Deficiencies that are safety related will result in the immediate removal of the crane from service until the deficiencies are corrected. Non-safety related deficiencies will be repaired as soon as deemed practical.
5. When crane operations or the crane environment increase the "wear and tear" on the crane (e.g., pile driving, pulling sheets, barge-mounted mobile cranes), additional or more frequent inspections may be required as determined by the RCC in conjunction with the project team.
6. If any unusual incident or accident occurs on a project involving a crane which may affect the strength, stability or may potentially have damaged loadbearing components, the crane will be removed from service until the satisfactory completion of an inspection by a qualified Skanska inspector or a third-party inspection company.

5. Modified Equipment Inspection

No modifications will be made to a crane without the manufacturer's approval or written approval from a RPE.

6. Repaired / Adjusted Equipment

Equipment that has had a repair or an adjustment that relates to safe operation (e.g., a repair or adjustment to a safety device or operator aid, or to a critical part of a control system, power plant, braking system, load-sustaining structural components, load hook, or in-use operating mechanism) must be inspected by a qualified person after such a repair or adjustment has been completed, prior to initial use.

The inspection must meet all of the following requirements:

1. The qualified person must determine if the repair / adjustment meets manufacturer equipment criteria (where applicable and available).
2. Where manufacturer equipment criteria are unavailable or not applicable, the qualified person must:
 1. Include functional testing of the repaired / adjusted parts and other components that may be affected by the repair / adjustment.
 2. Determine if a RPE is needed to develop criteria for the repair / adjustment. If an RPE is not needed, criteria will be developed by the qualified person.
 3. Determine if the repair / adjustment meets the criteria developed in accordance with OSHA 1926.1412 (b).
3. The inspection must include functional testing of the repaired / adjusted parts and other components that may be affected by the repair / adjustment.

7. Post-Assembly Inspection

Upon completion of assembly, the equipment must be inspected by a certified third-party crane inspection company or by a qualified Skanska inspector to ensure that it is configured in accordance with manufacturer equipment criteria. Where manufacturer equipment criteria are unavailable, an inspector must determine if an RPE familiar with the type of equipment involved is needed to develop criteria for the equipment configuration. If an RPE is not needed, Skanska must ensure that the criteria are developed by the qualified person. If an RPE is needed, Skanska must ensure that they are developed by an RPE.

Equipment must not be used until an inspection and function test are complete and the equipment is configured in accordance with the applicable criteria.

8. Equipment Modifications Modifications or additions that affect the capacity or safe operation of the equipment

are prohibited, except when the manufacturer approves the modification in writing. Upon completion of the modification, the load charts, instructions manuals / plates / tags / decals will be updated to reflect the modifications.

9. Manufacturer Refusal to Review Request

If the manufacturer is provided a detailed description of the proposed modification and is asked to approve the modification but declines to review the technical merits of the proposal or fails to acknowledge the requestor within 30 days of the review, then an RPE who is a qualified person with respect to the equipment involved must approve the modification and specify the equipment configurations to which that approval applies and modify the load charts, procedures, instruction manuals and instruction plates / tags / decals as necessary to align with the modification without reducing the original safety factor of the equipment.

10. Unavailable Manufacturer

Modifications or additions that affect the capacity or safe operation of the equipment are prohibited where the manufacturer, after a review of the technical safety merits of the proposed modification, rejects the proposal and explains the reasons for the rejection in a written response. If the manufacturer rejects the proposal but does not explain the reasons for the rejection in writing, the employer may treat this as a manufacturer refusal to review the request under the Maintenance and Inspection – Inspection Requirements section of this policy.

11. Severe Service

1. Where the severity of use / conditions is such that there is a reasonable probability of damage or excessive wear (e.g., loading that may have exceeded rated capacity, shock loading that may have exceeded rated capacity, prolonged exposure to a corrosive atmosphere), the crane shall be removed from service and inspected by a by a certified third-party crane inspection company or by a qualified Skanska inspector for structural damage to determine if the equipment can continue to be used safely.
2. If a deficiency is found and it is deemed unsafe, the crane shall be removed from service until the deficiency is repaired and re-inspected by a Skanska qualified person or a certified third-party inspection company

12. Equipment not in Regular Use

Prior to use, cranes that have been idle for three months or more will receive a monthly inspection by a certified third-party crane inspection company or by a qualified Skanska inspector.

4. Tagout

1. Tagging Out of Service Equipment / Functions

Cranes that have been taken out of service will be receive a tag in the cab in a conspicuous location stating the specific function that is out of service and if necessary, that the crane is out of service and is not to be used.

2. Response to “Do Not Operate” / Tagout Signs

If there is a warning (tag-out or maintenance / do not operate) sign on the equipment or starting control, the operator will not activate the switch or start the equipment until the sign has been removed by a person authorized to remove it.

3. Maintenance and Repair Employees

Maintenance, inspection and repair personnel without NCCCO Operators certification, or equivalent, are permitted to operate the equipment only where the following requirements are met:

1. The operation is limited to those functions necessary to perform maintenance, inspect or verify the performance of the equipment
2. The personnel are familiar with the operation, safe limitations, characteristics and hazards associated with the type of equipment
3. Maintenance and repair personnel meet the definition of a qualified person with respect to the equipment and maintenance / repair tasks performed

5. Wire Rope Inspection

1. Shift inspection

A visual inspection of all wire ropes (running and standing) that are likely to be used during the shift shall take by a competent person prior the equipment being used. Untwisting (opening) of wire rope or booming down is not required as part of this inspection. Observed deficiencies shall be categorized as the following:

1. Apparent Deficiencies

Category I

Apparent deficiencies in this category include significant corrosion, electric arc damage (from a source other than power lines) or heat damage, improperly applied end connections or significantly corroded, cracked, bent or worn end connections (such as from severe service).

Category II

Apparent deficiencies in this category are visible, broken wires, as follows:

1. In running wire ropes: Six randomly distributed broken wires in one rope lay or three broken wires in one strand in one rope lay, where a rope lay is the length along the rope in which one strand makes a complete revolution around the rope
2. In rotation resistant ropes: Two randomly distributed broken wires in six rope diameters or four randomly distributed broken wires in 30 rope diameters
3. In pendants or standing wire ropes: More than two broken wires in one rope lay located in rope beyond end connections and/or more than one broken wire in a rope lay located at an end connection
4. A diameter reduction of more than five percent from nominal diameter.

Category III

Apparent deficiencies in this category include rotation-resistant wire rope core protrusion or any other distortion indicating core failure, and prior electrical contact with a power line.

2. A Broken Strand

1. Critical Review Items

The competent person must give particular attention to all of the following:

1. Rotation-resistant wire rope in use
2. Wire rope being used for boom hoists and luffing hoists, particularly at reverse bends
3. Wire rope at flange points, crossover points and repetitive lift-up points on drums
4. Wire rope at or near terminal ends
5. Wire rope in contact with saddles, equalizer sheaves or other sheaves where rope travel is limited

3. Removal from Service

1. If a deficiency in Category I is identified, an immediate determination must be made by the competent person as to whether the deficiency constitutes a safety hazard. If the deficiency is determined to constitute a safety hazard, operations involving use of the wire rope in question must be prohibited until the wire rope is replaced.

If the deficiency is localized, the problem is corrected by severing the wire rope in two; the undamaged portion may continue to be used. Joining lengths of wire rope by splicing is prohibited. If a rope is shortened, the competent person must ensure that the drum will still have two wraps of wire when the load and/or boom are in its lowest position.

2. If a deficiency in Category II is identified, operations involving use of the wire rope in question must be prohibited until it complies with the wire rope manufacturer's established criterion for removal from service or a different criterion that the wire rope manufacturer has approved in writing for that specific wire rope, or until the wire rope is replaced.

If the deficiency is localized, the problem is corrected by severing the wire rope in two; the undamaged portion may continue to be used. Joining lengths of wire rope by splicing is prohibited. If a rope is shortened, the competent person must ensure that the drum will still have two wraps of wire when the load and/or boom are in its lowest position.

3. Significant distortion of the wire rope structure such as kinking, crushing, un-stranding, bird caging, signs of core failure or steel core protrusion between the outer strands is grounds for removal from service.
4. If a deficiency in Category III is identified, operations involving use of the wire rope in question must be prohibited until the wire rope is replaced.

If the deficiency (other than power line contact) is localized and the problem is corrected by severing the wire rope in two, the undamaged portion may continue to be used. Joining lengths of wire rope by splicing is prohibited. Repair of wire rope that contacted an energized power line is also prohibited. If a rope is shortened, the competent person must ensure that the drum will still have two wraps of wire when the load and/or boom are in its lowest position.

Where a wire rope is required to be removed from service per this section, either the equipment (as a whole) or the hoist with that wire rope must be tagged-out, until the wire rope is repaired or replaced.

4. Monthly Inspection

Each month an inspection must be conducted in accordance with the Maintenance and Inspection – Wire Rope Inspection section of this policy. The inspection must include any deficiencies that the inspector who conducted the annual inspection determines under the Maintenance and Inspection – Wire Rope Inspection section must be monitored.

1. Wire ropes on equipment must not be used until an inspection demonstrates that no corrective action under the Maintenance and Inspection – Wire Rope Inspection section is required
2. The inspection must be documented

5. Annual / Comprehensive Inspection

1. At least every 12 months, wire ropes in use on equipment must be inspected by a certified third-party crane inspection company or by a qualified Skanska inspector as defined in this policy. The inspection must identify deficiencies of the types listed below. The inspection must be complete and thorough, covering the surface of the entire length of the wire ropes, with particular attention given to all of the following:
 1. Critical review items
 2. Those sections that are normally hidden during shift and monthly inspections
 3. Wire rope subject to reverse bends
 4. Wire rope passing over sheaves
2. Exception: In the event an inspection is not feasible due to existing set-up and configuration of the equipment (such as where an assist crane is needed) or due to site conditions (such as a dense urban setting), such inspections must be conducted as soon as it becomes feasible but no longer than an additional 6 months for running ropes and for standing ropes at the time of disassembly.
3. If a deficiency is identified, an immediate determination must be made by the certified third-party crane inspection company or by a qualified Skanska inspector as to whether the deficiency constitutes a safety hazard. If the deficiency is determined to constitute a safety hazard, operations involving use of the wire rope in question must be prohibited until the wire rope is replaced. If the deficiency is localized, the problem is corrected by severing the wire rope in two; the undamaged portion may continue to be used. Joining lengths of wire rope by splicing is prohibited. If a rope is shortened, Skanska must ensure that the drum will still have two wraps of wire when the load and/or boom are in its lowest position. If the qualified person determines that, though not presently a safety hazard, the deficiency needs to be monitored, the employer must ensure that the deficiency is checked in the monthly inspections. The inspection must be documented.

6. Rope Lubricants

Lubricants that hinder inspection must not be used. All documents produced under this section must be available, during the applicable document retention period, to all persons who conduct inspections under this section.

7. Wire Rope Selection and Installation Criteria

Original equipment wire rope and replacement wire rope must be selected and installed in accordance with the requirements of this section. Selection of replacement wire rope must be in accordance with the recommendations of the wire rope manufacturer, the equipment manufacturer or a qualified person.

1. Wire Rope Design Criteria

Wire rope (other than rotation-resistant rope) must comply with either Option 1 or Option 2 of this section, as follows:

Option 1:

Wire rope must comply with section 5–1.7.1 of ASME B30.5– 2004 (incorporated by reference, see OSHA 1926.6) except that section's paragraph (c) must not apply.

Option 2:

Wire rope must be designed to have, in relation to the crane's / derrick's rated capacity, a sufficient minimum breaking force and design factor so that compliance with the applicable inspection provisions in OSHA 1926.1413 will be an effective means of preventing sudden rope failure

Wire rope must be compatible with the safe functioning of the equipment.

2. Boom Hoist Reeving

Fiber core ropes must not be used for boom hoist reeving, except for derricks.

Rotation-resistant ropes must be used for boom hoist reeving only where the requirements of this section are met.

8. Rotation-Resistant Ropes

Definitions

Type I rotation-resistant wire rope (Type I)

Type I rotation-resistant rope is stranded rope constructed to have little or no tendency to rotate or, if guided, transmits little or no torque. It has at least 15 outer strands and comprises an assembly of at least three layers of strands laid helically over a center in two operations. The direction of lay of the outer strands is opposite to that of the underlying layer.

Type II rotation-resistant wire rope (Type II)

Type II rotation-resistant rope is stranded rope constructed to have significant resistance to rotation. It has at least 10 outer strands and comprises an assembly of two or more layers of strands laid helically over a center in two or three operations. The direction of lay of the outer strands is opposite to that of the underlying layer.

Type III rotation resistant wire rope (Type III)

Type III rotation-resistant rope is stranded rope constructed to have limited resistance to rotation. It has no more than nine outer strands and comprises an assembly of two layers of strands laid helically over a center in two operations. The direction of lay of the outer strands is opposite to that of the underlying layer.

9. Requirements

1. Types II and III with an operating design factor of less than 5 must not be used for duty cycle or repetitive lifts.
2. Rotation-resistant ropes (including Types I, II and III) must have an operating design factor of no less than 3.5.
3. Type I must have an operating design factor of no less than 5, except where the wire rope manufacturer and the equipment manufacturer approves the design factor, in writing.
4. Types II and III must have an operating design factor of no less than 5, except where the requirements of paragraph OSHA 1926.1414(e)(3) are met.
5. When Types II and III with an operating design factor of less than 5 are used (for non-duty cycle, non-repetitive lifts), the following requirements must be met for each lifting operation:
 1. A qualified person must inspect the rope. The rope must be used only if the qualified person determines that there are no deficiencies constituting a hazard. In making this determination, more than one broken wire in any one rope lay must be considered a hazard.
 2. Operations must be conducted in such a manner and at such speeds as to minimize dynamic effects
 3. Each lift made under OSHA 1926.1414(e) (3) must be recorded in the monthly and annual inspection documents. Such prior uses must be considered by the qualified person in determining whether to use the rope again.

Additional requirements for rotation resistant ropes for boom hoist reeving:

4. Rotation-resistant ropes must not be used for boom hoist reeving, except where the requirements of this section are met
5. Rotation-resistant ropes may be used as boom hoist reeving when load hoists are used as boom hoists for attachments such as luffing attachments or boom and mast attachment systems. Under these conditions, all of the following requirements must be met:
 - a. The drum must provide a first layer rope pitch diameter of not less than 18 times the nominal diameter of the rope used.
 - b. The requirements in OSHA 1926.1426(a) (irrespective of the date of manufacture of the equipment) and OSHA 1926.1426(b) are met.
 - c. All sheaves used in the boom hoist reeving system must have a rope pitch diameter of not less than 18 times the nominal diameter of the rope used.
 - d. The operating design factor for the boom hoist reeving system must be not less than 5.
 - e. The operating design factor for these ropes must be the total minimum breaking force of all parts of rope in the system divided by the load imposed on the rope system when supporting the static weights of the structure and the load within the crane's / derrick's rated capacity.

- f. When provided, a power controlled lowering system must be capable of handling rated capacities and speeds as specified by the manufacturer.
- g. Wire rope clips used in conjunction with wedge sockets must be attached to the unloaded dead end of the rope only, except that the use of devices specifically designed for dead--ending rope in a wedge socket is permitted.
- h. Socketing must be done in the manner specified by the manufacturer of the wire rope or fitting.
- i. Prior to cutting a wire rope, seizing must be placed on each side of the point to be cut. The length and number of seizing must be in accordance with the wire rope manufacturer's instructions.

10. Maintenance and Inspection: Regional / Project-Specific Requirements

- None

6. Electrical

1. Power Line Safety – Assembly and Disassembly

1. Regarding assembly and/or disassembly, all Table A clearances apply.
2. Before beginning equipment A/D, Skanska / crane user must have a CWP identifying the electrical hazards associated with the work. Identify the work zone by either:
3. Demarcating boundaries (such as with flags, or a device such as a range limit device or range control warning device) and prohibiting the operator from operating the equipment past those boundaries
4. Defining the work zone as the area 360 degrees around the equipment, up to the equipment's maximum working radius
5. For power lines < 350kV, determine if any part of the equipment, load line or load (including rigging and lifting accessories), if operated up to the equipment's maximum working radius in the work zone, could get closer than 20 feet to a power line. If so, Skanska / crane user must meet the following requirements in Option 1, Option 2, or Option 3 of this section, as follows.
6. For power Lines > 350kV – Option 3 only.

Option 1:

Insure power is de-energized and grounded

Confirm from the utility owner / operator that the power line has been de-energized and visibly grounded at the jobsite.

Option 2:

Insure a 20-foot clearance.

Ensure that no part of the equipment, load line or load (including rigging and lifting accessories) gets closer than 20 feet to the power line by implementing the measures specified in paragraph 11.7.2.2, Titled Preventing encroachment / electrocution.

Option 3:

Insure a clearance which abides by Table A.

TABLE A—Minimum Clearance Distances

Note: The value that follows "to" is up to and includes that value. For example, "up to 200" means up to and including 200kV.

Voltage (nominal, kV, alternating current)		Minimum clearance distance (feet)
< 50	10
Over 50 up to 200	15
Over 200 to 350	20

Voltage (nominal, kV, alternating current)		Minimum clearance distance (feet)
Over 350 to 500	25
Over 500 to 750	35
Over 750 to 1,000	45
Over 1,000	as established by the utility owner / operator or registered professional engineer who is a qualified person with respect to electrical power transmission and distribution

7. Preventing Encroachment Electrocutation

Where encroachment precautions are required under Option (2) or Option (3) of this section, all of the following requirements must be met:

1. Conduct a planning meeting with the assembly / disassembly (A/D) director, operator, A/D crew and the other workers who will be in the A/D area to review the location of the power line(s) and the steps that will be implemented to prevent encroachment / electrocution
2. Tag lines must be non-conductive
3. At least one of the following additional measures must be in place. The measure selected from this list must be effective in preventing encroachment. The additional measures are:
 1. Use a dedicated spotter who is in continuous contact with the equipment operator. The dedicated spotter must:
 - a. Be equipped with a visual aid to assist in identifying the minimum clearance distance. Examples of a visual aid include, but are not limited to, clearly visible line painted on the ground, a clearly visible line of stanchions a set of clearly visible line-of-sight landmarks (e.g., a fence post behind the dedicated spotter and a building corner ahead of the dedicated spotter).
 - b. Be positioned to effectively gauge the clearance distance
 2. Where necessary, use equipment that enables the dedicated spotter to communicate directly with the operator
 3. Give timely information to the operator so that the required clearance distance can be maintained
 4. Use a proximity alarm that is set to give the operator sufficient warning to prevent encroachment.
 - a. A device that automatically warns the operator when to stop movement, such as a range control warning device. Such a device must be set to give the operator sufficient warning to prevent encroachment.
 - b. A device that automatically limits range of movement, set to prevent encroachment
 - c. An elevated warning line, barricade or line of signs in view of the operator, equipped with flags or similar high-visibility markings

8. Assembly / Disassembly below Power Lines Prohibited

During A/D, no part of a crane / derrick, load line or load (including rigging and lifting accessories), whether partially or fully assembled, is allowed below a power line unless the crane user has confirmed that the utility owner / operator has de-energized and (at the jobsite) visibly grounded the power line.

9. Assembly / Disassembly inside Table A Clearance Prohibited

During A/D, no part of a crane / derrick, load line or load (including rigging and lifting accessories), whether partially or fully assembled, is allowed closer than the minimum approach distance under Table A (see below) to a power line unless the employer has confirmed that the utility owner / operator has de-energized and (at the jobsite) visibly grounded the power line.

10. Voltage Information

Where Option 3, in the Electrical – Power Line Safety – Equipment Operations section is used, the utility owner / operator of the power lines must provide the requested voltage information within two working days of the employer's request.

11. Power Lines Presumed Energized

Skanska / crane user must assume that all power lines are energized unless the utility owner / operator confirms that the power line has been and continues to be de-energized and visibly grounded at the jobsite.

12. Posting of Electrocution Warnings

There must be at least one electrocution hazard warning conspicuously posted in the cab so that it is in view of the operator and, except for overhead gantry and tower cranes, at least two on the outside of the equipment.

2. Power Line Safety—Equipment Operations

1. Hazard Assessments and Precautions inside the Work Zone

- Before beginning equipment operations, Skanska / crane user must have a CWP identifying the electrical hazards associated with the work. Identify the work zone by either:
 - Demarcating boundaries (e.g., with flags or a device such as a range limit device or range control warning device) and prohibiting the operator from operating the equipment past those boundaries
 - Defining the work zone as the area 360 degrees around the equipment, up to the equipment's maximum working radius
- For power lines < 350kV: Determine if any part of the equipment, load line or load (including rigging and lifting accessories), if operated up to the equipment's maximum working radius in the work zone, could get closer than 20 feet to a power line. If so, Skanska / crane user must meet the following requirements in Option 1, Option 2 or Option 3 of this section, as follows.
- For power Lines > 350kV: Refer to Option 3 only.

Option 1:

Insure power is de-energized and grounded.

Confirm from the utility owner / operator that the power line has been de-energized and visibly grounded at the jobsite.

Option 2:

Insure a 20-foot clearance.

Ensure that no part of the equipment, load line or load (including rigging and lifting accessories) gets closer than 20 feet to the power line by implementing the measures specified in the Electrical – Power Line Safety – Equipment Operations section.

Option 3:

Insure a clearance which abides by Table A.

TABLE A—Minimum Clearance Distances

Note: The value that follows "to" is up to and includes that value. For example, "up to 200" means up to and including 200kV.

Voltage (nominal, kV, alternating current)		Minimum clearance distance (feet)
< 50	10
Over 50 up to 200	15
Over 200 to 350	20
Over 350 to 500	25
Over 500 to 750	35
Over 750 to 1,000	45
Over 1,000	as established by the utility owner / operator or registered professional engineer who is a qualified person with respect to electrical power transmission and distribution

- Determine if any part of the equipment, load line or load (including rigging and lifting accessories), while operating up to the equipment's maximum working radius in the work zone, could get closer than the minimum approach distance of the power line permitted under Table A. If so, then Skanska / crane user must follow the requirements for preventing encroachment / electrocution of this section to ensure that no

part of the equipment, load line, or load (including rigging and lifting accessories), approaches the overhead source.

Diagram A.1

Diagram A.2

Diagram A.3

Diagram A.1-A.3 are examples of Table A – Minimum clearance while operating

2. Preventing Encroachment / Electrocuting Equipment Operations

Here encroachment precautions are required under Option 2 or Option 3 of this section, all of the following requirements must be met:

1. Conduct a planning meeting reviewing the CWP with the operator and the other workers who will be in the area of the equipment or load to review the location of the power line(s) and the steps that will be implemented to prevent encroachment / electrocution
2. Tag lines must be non-conductive
3. Erect and maintain an elevated warning line, barricade or line of signs, in view of the operator, equipped with flags or similar high-visibility markings at 20' from the power line (if using Option 2 of this section) or at the minimum approach distance under Table A, above (if using Option 3 of this section).
4. Implement at least one the following measures:
 1. A proximity alarm, set to give the operator sufficient warning to prevent encroachment
 2. A dedicated spotter who is in continuous contact with the operator. Where this measure is selected, the dedicated spotter must:
 - a. Be equipped with a visual aid to assist in identifying the minimum clearance distance. Examples of a visual aid include, but are not limited to, a clearly visible line painted on the ground, a clearly visible line of stanchions or a set of clearly visible line-of-sight landmarks (e.g., a fence post behind the dedicated spotter and a building corner ahead of the dedicated spotter).
 - b. Be positioned to effectively gauge the clearance distance. Where necessary, use equipment that enables the dedicated spotter to communicate directly with the operator. Give timely information to the operator so that the required clearance distance can be maintained.
5. A device that automatically warns the operator when to stop movement, such as a range control warning device. Such a device must be set to give the operator sufficient warning to prevent encroachment.
6. A device that automatically limits range of movement, set to prevent encroachment.
7. An insulating link / device installed at a point between the end of the load line (or below) and the load.

3. Voltage Information

Where Option 3 of this section is used, the utility owner / operator of the power lines must provide the requested voltage information within two working days of the employer's request.

4. Operations below Power Lines

No part of the equipment, load line or load (including rigging and lifting accessories) is allowed below a power line; unless the crane user has confirmed that the utility owner / operator has de-energized and (at the jobsite) visibly grounded the power line.

Exceptions:

1. For equipment with non-extensible booms: The uppermost part of the equipment, with the boom at true vertical, would be more than 25' below the plane of the power line and more than the minimum clearance distance below the plane of the power line, as established in Table A.
2. For equipment with articulating or extensible booms: The uppermost part of the equipment, with the boom in the fully extended position, at true vertical, would be more than 25' below the plane of the power line or more than the minimum clearance distance below the plane of the power line, as established in Table A of this section.

5. Power Lines Presumed Energized

1. Skanska / crane user must assume that all power lines are energized unless the utility owner / operator confirms that the power line has been and continues to be de-energized and visibly grounded at the jobsite.
2. When working near transmitter / communication towers where the equipment is close enough for an electrical charge to be introduced to the equipment or materials being handled, the transmitter must be de-energized or the following precautions must be taken:
 1. The equipment must be provided with an electrical ground
 2. Tag lines must be non-conductive

6. Training

To be prepared in the event of electrical contact with a power line, Skanska / crane user must ensure each operator and crew member assigned to work with the equipment are trained on all of the following:

1. Information regarding the danger of electrocution from the operator simultaneously touching the equipment and the ground

2. The importance to the operator's safety of remaining inside the cab except where there is an imminent danger of fire, explosion or other emergency that necessitates leaving the cab
3. The safest means of evacuating from equipment that may be energized
4. The danger of the potentially energized zone around the equipment (step potential)
5. The need for crew in the area to avoid approaching or touching the equipment and the load
6. Safe clearance distance from power lines
7. The limitations of an insulating link / device, proximity alarm and range control (and similar) device, if used
8. The procedures to be followed to properly ground equipment and the limitations of grounding
9. Power lines are presumed to be energized unless the utility owner / operator confirms that the power line has been and continue to be de-energized and visibly grounded at the jobsite.
10. Power lines are presumed to be uninsulated unless the utility owner / operator or a registered engineer who is a qualified person with respect to electrical power transmission and distribution confirms that a line is insulated.
11. Employees working as dedicated spotters must be trained to effectively perform their task, including training on the applicable requirements of this section. Devices originally designed by the manufacturer for use as a safety device, operational aid or a means to prevent power line contact or electrocution when used to comply with this section, must meet the manufacturer's procedures for use and conditions of use.
12. The crane user must determine that it is not feasible to do the work without breaching the minimum approach distance under Table A
13. The crane user may determine that, after consultation with the utility owner / operator, it is infeasible to de-energize and ground the power line or relocate the power line.

7. Power Line with Unknown Voltage

Refer to Option 1 in the Electrical – Power Line Safety – Equipment Operations section

8. Power Line Safety (All Voltages)—Equipment Operations Closer than the "Table A" Zone

Equipment operations in which any part of the equipment, load line or load (including rigging and lifting accessories) is closer than the minimum approach distance under Table A to an energized power line is prohibited, except where the crane user demonstrates that the following requirements are met:

1. Hazards are identified in the CWP
2. Minimum clearance distance is identified
3. The power line owner / operator or registered professional engineer who is a qualified person with respect to electrical power transmission and distribution determines the minimum clearance distance that must be maintained to prevent electrical contact in light of the onsite conditions. The factors that must be considered in making this determination include, but are not limited to, conditions affecting atmospheric conductivity, time necessary to bring the equipment, load line and load (including rigging and lifting accessories) to a complete stop, wind conditions, degree of sway in the power line lighting conditions and other conditions affecting the ability to prevent electrical contact.
4. A planning meeting with the employer and utility owner / operator (or registered professional engineer who is a qualified person with respect to electrical power transmission and distribution) is held to determine the procedures that will be followed to prevent electrical contact and electrocution. At a minimum these procedures must include:
 1. If the power line is equipped with a device that automatically reenergizes the circuit in the event of a power line contact, the automatic reclosing feature of the circuit interrupting device must be made inoperative if the design of the device permits before the work begins
 2. The dedicated spotter must be equipped with a visual aid to assist in identifying the minimum clearance distance. Examples of a visual aid include, but are not limited to, a line painted on the ground; a clearly visible line of stanchions; a set of clearly visible line-of-sight landmarks (such as a fence post behind the dedicated spotter and a building corner ahead of the dedicated spotter) positioned to effectively gauge the clearance distance. Where necessary, use equipment that enables the dedicated spotter to communicate directly with the operator. Give timely information to the operator so that the required clearance distance can be maintained.
 3. An elevated warning line or barricade (not attached to the crane) is in view of the operator (either directly or through video equipment) equipped with flags or similar high-visibility markings to prevent electrical contact
 4. An insulating link / device is installed at a point between the end of the load line (or below) and the load
 5. All employees, excluding equipment operators located on the equipment, who may come in contact with the equipment, the load line, or the load are insulated or guarded from the equipment, the load line, and the load through an additional means other than an insulating link device. Insulating gloves rated for the voltage involved are adequate additional means of protection for the purposes of this

paragraph.

6. Nonconductive rigging is used if the rigging is within the Table A distance during the operation
7. The equipment is equipped with a device that automatically limits range of movement and that is set to prevent any part of the equipment, load line or load (including rigging and lifting accessories) from breaching the minimum approach distance established in Table A
8. Tag lines are of the nonconductive type
9. Barricades forming a perimeter at least 10' away from the equipment are used to prevent unauthorized personnel from entering the work area. In areas where obstacles prevent the barricade from being at least 10' away, the barricade must be as far from the equipment as feasible.
10. Workers other than the operator are prohibited from touching the load line above the insulating link / device and crane. Operators remotely operating the equipment from the ground must use either wireless controls that isolate the operator from the equipment or insulating mats that insulate the operator from the ground.
11. Only personnel essential to the operation are permitted to be in the area of the crane and load
12. The equipment is properly grounded
13. Insulating line hose or cover-up is installed by the utility owner / operator except where such devices are unavailable for the line voltages involved
14. The procedures developed comply with this section and are documented and immediately available onsite
15. The equipment user and utility owner / operator (or RPE) meets with the equipment operator and the other workers who will be in the area of the equipment or load to review the procedures that will be implemented to prevent breaching the minimum approach distance established in Table A of this section and prevent electrocution.
16. The procedures developed to comply with this section are implemented
17. The utility owner / operator (or RPE) and all employers of employees involved in the work identify one person who will direct the implementation of the procedures. The person identified in accordance with this paragraph must direct the implementation of the procedures and must have the authority to stop work at any time to ensure safety.
18. If a problem occurs implementing these procedures or indicating that those procedures are inadequate to prevent electrocution, the employer must safely stop operations and either develop new procedures to comply with this section or have the utility owner / operator de-energize and visibly ground or relocate the power line before resuming work
19. Devices originally designed by the manufacturer for use as a safety device operational aid or a means to prevent power line contact or electrocution, when used to comply with this section, must comply with the manufacturer's procedures for use and conditions of use

9. Safety while Traveling Under or Near Power Lines with No Load

The crane user shall ensure that:

1. The power lines are identified on the crane location plan.
2. The boom / mast and boom / mast support system are lowered sufficiently to meet the requirements of this paragraph.
3. The clearances specified in Table T (see below) of this section are maintained.
4. The effects of speed and terrain on equipment movement (including movement of the boom / mast) are considered so that those effects do not cause the minimum clearance distances specified in Diagram B of this section to be breached.
5. There is a dedicated spotter. If any part of the equipment while traveling will get closer than 15' to the power line, must ensure that a dedicated spotter who is in continuous contact with the driver / operator is used. The dedicated spotter must be positioned to effectively gauge the clearance distance. Where necessary, use equipment that enables the dedicated spotter to communicate directly with the operator. Give timely information to the operator so that the required clearance distance can be maintained.
6. Additional precautions for traveling in poor visibility:
7. When traveling at night or in conditions of poor visibility, in addition to the measures previously specified in this section, the crane user will ensure that the power lines are illuminated or another means of identifying the location of the lines is used and a safe path of travel is identified and used

Table T —Minimum Clearance Distances While Traveling with No Load

Voltage (nominal, kV, alternating current) while traveling	Minimum clearance distance (feet)
---	--------------------------------------

Voltage (nominal, kV, alternating current) while traveling		Minimum clearance distance (feet)
up to 0.75	4
over .75 to 50	6
over 50 to 345	10
over 345 to 750	16
Over 750 to 1,000	20
Over 1,000	as established by the utility owner / operator or registered professional engineer who is a qualified person with respect to electrical power transmission and distribution

Diagram B – Examples of Table T – Required clearances while traveling

10. Unavailable Operation Procedures

Where the manufacturer's procedures are unavailable, the crane user will ensure compliance with all procedures necessary for the safe operation of the equipment and attachments. Procedures for the operational controls must be developed by a qualified person.

11. Accessibility of Procedures

The procedures applicable to the operation of the equipment, including rated capacities (load charts), recommended operating speeds, special hazard warnings, instructions and operator's manual will be readily available in the cab at all times for use by the operator. Where rated capacities are available in the cab only in electronic form and in the event of a failure that makes the rated capacities inaccessible, the operator must immediately cease operations or follow safe shut-down procedures until the rated capacities (in electronic or other form) are available.

3. Electrical: Regional / Project-Specific Requirements

- None

7. Weather

1. The project team shall develop a means to continually monitor weather conditions (e.g. NOAA, web based weather alerts, lightning strike app, local radar, etc.). It will be at the discretion of the project team and crane operator to implement manufactures recommendations for securing the equipment.

Wind

The manufacture's requirements regarding the effects of wind speed shall be identified and adhered to. Cranes that are not equipped with an anemometer shall have a means (e.g. handheld device, etc.) to identify local wind speeds that could potentially have an adverse effect on the crane operations. Objects with large surface areas, such as formwork, may require a lower threshold in order to be safely lifted.

2. Lightning

The use of a crane during a lightning event will be at the discretion of the project team. A means to track lightning strikes and alert workers shall be implemented.

3. Winter Months

Prior to crane operations during the winter months, the boom and head sheaves shall be inspected for the presence of ice. If possible, the boom shall be lowered for the inspection. The CWP shall address the hazard of the potential of falling ice from the crane. Personnel working with the crane shall stand in front of the crane beyond the hook or headache ball. Barge cranes have a higher likelihood of ice buildup.

4. Weather: Regional / Project-Specific Requirements

- None

8. Training Requirements

1. Signal Training—General Requirements

1. Personnel with the responsibility of signaling a crane will possess a certificate from a nationally recognized accredited organization / trainer or have passed Skanska's or subcontractor's hand signal training course.
2. Qualified signal persons shall display visual marking on their hardhat. It is recommended that the signal person dons a unique visual identifier (e.g. green hardhat, vest and gloves).
3. During operations requiring signals, the ability to transmit signals between the operator and designated signal person will be maintained. If that ability is interrupted at any time, the operator will safely stop operations requiring signals until the signal is reestablished and a proper signal is given and understood.
4. If the operator becomes aware of a safety problem and needs to communicate with the signal person, the operator must safely stop operations. Operations will not resume until the operator and signal person agree that the problem has been resolved.
5. Only one person gives signals to a crane / derrick at a time, except in circumstances where the operator cannot see the assigned signal person. In this case, a second signal person can relay signals to the operator from the signal person who is out of view. The CWP must be amended at this time.
6. Anyone who becomes aware of a safety problem must alert the operator or signal person by giving the stop or emergency stop signal. All directions given to the operator by the signal person will be given from the operator's direction perspective.
7. A designated signal person must be provided for any working or traveling crane on site.
8. Signals to operators must be by hand or dedicated two-way communication. When using hand signals, the standard method must be used.

Exception: where use of the standard method for hand signals is infeasible, or where an operation or use of an attachment is not covered in the standard method, non-standard hand signals may be used.

9. Non-Standard Hand Signals

When using non-standard hand signals, the signal person, operator and lift supervisor (where there is one) will contact each other prior to the operation and agree on the non-standard hand signals that will be used.

10. New Signals

1. Signals other than hand, voice or audible signals may be used where the employer on any project, demonstrates that:
 1. The new signals provide communication at least equally effective as voice, audible or standard

method hand signals, and are suitable.

2. The signals used (e.g., hand, voice, audible or new) and means of transmitting the signals to the operator (e.g., direct line of sight, video, radio, etc.) must be appropriate for the site conditions.
2. Prior to crane operations, the operator, designated signal person and when applicable, the lift supervisor shall agree upon the voice signals that will be used. If any personnel are changed, or if there is confusion regarding the voice signals, operations shall cease and a meeting shall be held to clarify the voice signals.
3. Each voice signal must contain the following three elements, given in the following order: function (such as hoist, boom, etc.), direction; distance and/or speed; function, stop command.
4. The operator, signal person and lift supervisor, if there is one, must be able to effectively communicate in the language used.
5. When using any electronic device for voice / audible signals, back-up batteries must be with the signal person prior to operation. A proactive plan for device failure must be discussed and documented.

11. Communication with Multiple Cranes / Derricks

Where a signal person(s) is in communication with more than one crane / derrick, a system for identifying which crane / derrick each signal is for must be established.

12. Radio or Other Electronic Transmission of Signals

The device(s) used to transmit signals will be tested onsite before beginning operations to ensure that the signal transmission is clear and reliable. Signals must be transmitted through a dedicated channel.

Exception: Multiple cranes / derricks and one or more signal persons may share a dedicated channel for the purpose of coordinating operations. The operator's reception of signals must be by a hands-free system

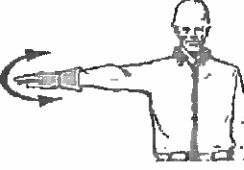

13. Signals

Hand signal charts must be both posted on the equipment and readily available at the site.

Upon completion of the hand signal training course or if the signalman possesses a nationally recognized certificate from an accredited organization, each individual will be issued the appropriate project-specific signalman visual identifier. See images below.

Corresponding Hand Signal	Function	Initiate Voice Function	Terminate Function
	HOIST	"Hoist" "Hoist up" "Hoist load" "Hoist hook"	"Hoist stop"
	LOWER	"Lower" "Lower down" "Lower load" "Lower hook"	"Lower stop"
	BOOM UP	"Boom up"	"Boom stop"
	BOOM DOWN	"Boom down"	"Boom stop"

	TELESCOPE OUT (Mobile Telescopic Boom Cranes ONLY)	"Telescope out"	"Telescope stop"
	TELESCOPE IN (Mobile Telescopic Boom Cranes ONLY)	"Telescope in"	"Telescope stop"
	TROLLEY TRAVEL (Tower Cranes ONLY)	"Trolley in" "Trolley out"	"Trolley stop"
	SWING	"Swing right" "Swing left"	"Swing stop"
	TRAVEL	"Travel forward" "Travel reverse"	"Travel stop"
	DOG EVERYTHING	"Dog everything"	N/A
	USE MAIN HOIST (Mobile Crane ONLY)	"Use main hoist" "Use main drum"	N/A
	USE WHIPLINE (AUXILIARY HOIST) (Mobile Crane ONLY)	"Use whipline" "Use auxiliary hoist" "Use auxiliary drum"	N/A
	BOOM DOWN AND RAISE THE LOAD	NO VOICE COMMAND	N/A

	BOOM UP AND LOWER THE LOAD	NO VOICE COMMAND	N/A
	STOP	Function STOP	N/A
	EMERGENCY STOP	"Emergency Stop"	N/A

2. Electrical Training

General Requirements

Each crew member working with a crane must have completed the electrical training defined in the Electrical – Power Line Safety – Equipment Operations section.

3. Dedicated Spotter

General Requirements

A person working as a dedicated spotter around electrical hazards must be trained to fit the definition of signal person.

4. Rigging Training

1. Personnel with the responsibility of rigging will possess a certificate from a nationally recognized accredited organization / trainer or have passed Skanska's or subcontractor's rigging training course.
2. Qualified riggers shall display visual marking on their hardhat. It is recommended that the signal person dons a unique visual identifier (e.g. green hardhat, vest and gloves).
3. At a minimum, a qualified rigger shall:
 1. Possess a recognized degree, certificate, or professional standing, or has extensive knowledge, training, and experience, and can successfully demonstrate the ability to solve problems related to rigging loads.
 2. Know the weight of the load
 3. Know how to select the appropriate rigging for the load
 4. Know the differences between hitching configurations
 5. Know how to inspect rigging
 6. Understand the concept of center of gravity and balancing of the load {repl:Cranes:AdditionalRigger:

9. Unconventional Cranes

1. Tower Cranes

This section contains supplemental requirements for tower cranes. All sections apply to tower cranes unless specified otherwise.

1. Erecting, Climbing and Dismantling

The following sections apply to tower cranes (except as otherwise noted), except that the term assembly / disassembly (A/D) is replaced by "erecting, climbing and dismantling," and the term "disassembly" is replaced by "dismantling":

Assembly / Disassembly

Selection of manufacturer or employer procedures

Assembly / Disassembly

General requirements (applies to all assembly and disassembly operations)

Disassembly

Additional requirements for dismantling of booms and jibs (applies to both the use of manufacturer procedures and employer procedures)

2. Dangerous Areas (Self-Erecting Tower Cranes)

In addition to the requirements for self-erecting tower cranes, the following applies:

1. Employees will not be in or under the tower, jib or rotating portion of the crane during erecting, climbing and dismantling operations until the crane is secured in a locked position and the competent person in charge indicates it is safe to enter this area, unless the manufacturer's instructions direct otherwise and only the necessary personnel are permitted in this area
2. In some jurisdictions, a master rigger and proper notification to local governing agencies are required. This is the responsibility of the project team.

3. Foundations and Structural Supports

Tower crane foundations and structural supports will be designed by the manufacturer or a RPE.

4. Addressing Specific Hazards

In addition to assembly / disassembly requirements, the A/D supervisor will address the following:

1. Foundations and structural supports: The A/D supervisor will verify that the tower crane foundations and structural supports are installed in accordance with their design.
2. Loss of backward stability: Backward stability must be considered before swinging self-erecting cranes or cranes on traveling or static undercarriages.
3. Wind speed: Wind must not exceed the speed recommended by the manufacturer or where the manufacturer does not specify this information, the speed determined by a qualified person.

5. Plumb Tolerance

Towers will be erected plumb to the manufacturer's tolerance and verified by a qualified person. Where the manufacturer does not specify plumb tolerance, the crane tower will be plumb to a tolerance of at least 1:500 (approximately 1" in 40').

6. Multiple Tower Crane Jobsites

On jobsites where more than one fixed jib (hammerhead) tower crane is installed, the cranes will be located so no crane will come in contact with the structure of another crane. Cranes are permitted to pass over one another.

7. Climbing Procedures

Prior to, and during, all climbing procedures (including inside climbing and top climbing), the employer will:

1. Comply with all manufacturer prohibitions
2. Have an RPE verify that the host structure is strong enough to sustain the forces imposed through the braces
3. Brace anchorages and supporting floors
4. Ensure that no part of the climbing procedure takes place when wind exceeds the speed recommended by the manufacturer or, where the manufacturer does not specify this information, the speed determined by a qualified person. Some local governing agencies require 48-hour notifications.

8. Counterweight / Ballast

Equipment will not be erected, dismantled or operated without the amount and position of counterweight and/or ballast in place as specified by the manufacturer or an RPE familiar with the equipment. The maximum counterweight and/or ballast specified by the manufacturer or an RPE familiar with the equipment will not be exceeded.

9. Signs

The size and location of signs installed on tower cranes must be in accordance with manufacturer specifications. Where these are unavailable, an RPE familiar with the type of equipment involved must approve in writing the size and location of any signs.

10. Safety Devices

The following safety devices are required on all tower cranes unless otherwise specified:

1. Boom stops on luffing boom type tower cranes
2. Jib stops on luffing boom type tower cranes if equipped with a jib attachment
3. Travel rail end stops at both ends of travel rail
4. Travel rail clamps on all travel bogies
5. Integrally mounted check valves on all load-supporting hydraulic cylinders
6. Hydraulic system pressure limiting device
7. The following brakes, which automatically set in the event of pressure loss or power failure:
 1. A hoist brake on all hoists
 2. Swing brake
 3. Trolley brake
 4. Rail travel brake
8. Dead man control or forced neutral return control (hand) levers
9. Emergency stop switch at the operator's station
10. Trolley end stops at both ends of travel of the trolley

Proper operation required

Operations will not begin unless the devices listed in this section are in proper working order. If a device stops working properly during operations, the operator will safely stop operations. Operations will not resume until the device is again working properly. Alternative measures are not permitted to be used.

11. Operational Aids

1. The devices listed in the following sections ("operational aids") are required on all tower cranes, unless otherwise specified.
2. Operations will not begin unless the operational aids are in proper working order, except where Skanska / crane user meets the specified temporary alternative measures. More protective alternative measures specified by the tower crane manufacturer, if any, will be followed.
3. If an operational aid stops working properly during operations, the operator will safely stop operations until the temporary alternative measures are implemented or the device is again working properly. If a replacement part is no longer available, the use of a substitute device that performs the same type of function is permitted and is not considered a modification.

Category I Operational Aids and Alternative Measures

Operational aids listed in this below that are not working properly will be repaired no later than seven days after the deficiency occurs.

Exception: If the employer documents that it has ordered the necessary parts within seven days of the occurrence of the deficiency, the repair will be completed within seven days of receipt of the parts.

4. Trolley Travel Limiting Device

The travel of the trolley will be restricted at both ends of the jib by a trolley-travel limiting device to prevent the trolley from running into the trolley end stops.

Temporary alternative measures:

1. Option A: The trolley rope will be marked (so it can be seen by the operator) at a point that gives the operator sufficient time to stop the trolley prior to the end stops
2. Option B: A spotter will be used when operations are conducted within 10' of the outer or inner trolley end stops

5. Boom Hoist Limiting Device

The range of the boom will be limited at the minimum and maximum radius.

Temporary alternative measures: Clearly mark the cable (so it can be seen by the operator) at a point that

gives the operator sufficient time to stop the boom hoist within the minimum and maximum boom radius or use a spotter.

6. Anti Two–Blocking Device

The tower crane will be equipped with a device that automatically prevents damage from contact between the load block, overhaul ball or similar component and the boom tip (or fixed upper block or similar component). The device(s) must prevent such damage at all points where two–blocking could occur.

Temporary alternative measures: Clearly mark the cable (so it can be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two–blocking or use a spotter.

7. Hoist Drum Lower Limiting Device

Tower cranes manufactured more than one year after January 1st, 2011 must be equipped with a device that prevents the last three wraps of hoist cable from being spooled off the drum.

Temporary alternative measures: Mark the cable (so it can be seen by the operator) at a point that will give the operator sufficient time to stop the hoist prior to the last three wraps of hoist cable being spooled off the drum or use a spotter.

8. Load Moment Limiting Device

The tower crane must have a device that prevents moment overloading

Temporary alternative measures: A radius-indicating device will be used (if the tower crane is not equipped with a radius indicating device, the radius will be measured to ensure the load is within the rated capacity of the crane). In addition, the weight of the load will be determined from a reliable source (e.g., the load's manufacturer), by a reliable calculation method (i.e., calculating a steel beam from measured dimensions and a known per foot weight) or by other equally reliable means. This information will be provided to the operator prior to the lift.

9. Hoist Line Pull Limiting Device

The capacity of the hoist will be limited to prevent overloading including each individual gear ratio if equipped with a multiple-speed hoist transmission.

Temporary alternative measures: The operator will ensure that the weight of the load does not exceed the capacity of the hoist (including for each individual gear ratio if equipped with a multiple speed hoist transmission).

10. Rail Travel Limiting Device

The travel distance in each direction will be limited to prevent the travel bogies from running into the end stops or buffers.

Temporary alternative measures: A spotter will be used when operations are conducted within 10' of either end of the travel rail end stops.

11. Boom Hoist Drum Positive Locking Device

The boom hoist drum will be equipped with a device to positively lock the boom hoist drum.

Temporary alternative measures: The device will be manually set when required if an electric, hydraulic or automatic type is not functioning.

12. Category II Operational Aids and Alternative Measures

Operational aids listed in below that are not working properly will be repaired no later than 30 days after the deficiency occurs.

Exception: If the employer can document that it has ordered the necessary parts within seven days of the occurrence of the deficiency, and the part is not received in time to complete the repair in 30 days, the repair will be completed within seven days of receipt of the parts.

1. Boom Angle or Hook Radius Indicator

1. Luffing boom tower cranes will have a boom angle indicator readable from the operator's station.
2. Hammerhead tower cranes will have a hook radius indicator readable from the operator's

station.

3. If either of the above criteria is not met, the following temporary alternative measures may be implemented:

2. Temporary alternative measures:

1. Hook radii or boom angle will be determined by measuring the hook radii or boom angle
2. Trolley travel deceleration device: the trolley speed will be automatically reduced prior to the trolley reaching the end limit in both directions
3. The operator will reduce the trolley speed when approaching the trolley end limits
4. Boom hoist deceleration device: the boom speed will be automatically reduced prior to the boom reaching the minimum or maximum radius limit
5. The operator will reduce the boom speed when approaching the boom maximum or minimum end limits
6. Load hoist deceleration device: the load speed will be automatically reduced prior to the hoist reaching the upper limit
7. The operator will reduce the hoist speed when approaching the upper limit
8. Wind speed indicator: a device will be provided to display the wind speed and mounted above the upper rotating structure on tower cranes. On self-erecting cranes, it will be mounted at or above the jib level.
9. Use of wind speed information from a properly functioning indicating device on another tower crane on the same site or a qualified person estimates the wind speed
10. Load indicating device: Cranes manufactured after 2012 will have a device that displays the magnitude of the load on the hook. Displays that are part of load-moment limiting devices that display the load on the hook meet this requirement.
11. The weight of the load will be determined from a reliable source (e.g., the load's manufacturer), by a reliable calculation method (i.e., calculating a steel beam from measured dimensions and a known per foot weight) or by other equally reliable means. This information will be provided to the operator prior to the lift.

13. Pre-Erection Inspections

Before each crane component is erected:

1. It must be inspected by a qualified person for damage or excessive wear. The qualified person must pay particular attention to components that will be difficult to inspect thoroughly during shift inspections.
2. If the qualified person determines that a component is damaged or worn to the extent that it would create a safety hazard if used on the crane, that component must not be erected on the crane unless it is repaired and, upon re-inspection by the qualified person, found to no longer create a safety hazard.
3. If the qualified person determines that, though not presently a safety hazard, the component needs to be monitored, the employer must ensure that the component is checked in the monthly inspections. Any such determination must be documented and the documentation must be available to any individual who conducts a monthly inspection.

14. Post-Erection Inspection

The following requirements will be met:

1. A load test using certified weights or scaled weights using a certified scale with a current certificate of calibration will be conducted after each erection. The load test will be conducted in accordance with the manufacturer's instructions. Where these instructions are will develop written load-test procedures.
2. See the Annual Inspections / Nondestructive Testing section for additional requirements

15. Daily / Pre-shift Inspection

See the Daily / Pre-shift Inspections section for additional requirements

16. Monthly Inspection

The following additional items will be included:

1. Tower (mast) bolts and other structural bolts (for loose or dislodged condition) from the base of the tower crane up or, if the crane is tied to or braced by the structure, those above the upper-most brace support
2. The uppermost tie-in, braces, floor supports and floor wedges where the tower crane is supported by the structure, shall be inspected for loose or dislodged components
3. See the Daily / Pre-shift Inspections section for additional requirements

17. Annual Inspection

1. In addition to the items that must be inspected, all turntable and tower bolts must be inspected for proper condition and torque.
2. See the Annual Inspections / Nondestructive Testing section for additional requirements

2. Derricks

This section contains supplemental requirements for derricks. Whether temporarily or permanently mounted, all sections of this subpart apply to derricks unless specified otherwise. A derrick is powered equipment consisting of a mast or equivalent member that is held at or near the end by guys or braces, with or without a boom and its hoisting mechanism. The mast / equivalent member and/or the load is moved by the hoisting mechanism (typically base-mounted) and operating ropes. Derricks include: A-frame, basket, breast, Chicago boom, gin pole (except gin poles used for erection of communication towers), guy, shearleg, stiffleg and variations of such equipment.

1. **Operation – Procedures** Section OSHA 1926.1417 (Operation) applies except for OSHA 1926.1417(c) Accessibility of procedures.

1. Load Chart Contents

Load charts will contain at least:

1. Rated capacity at corresponding ranges of boom angle or operating radii
2. Specific lengths of components to which the rated capacities apply
3. Required parts for hoist reeving
4. Size and construction of rope
5. Load chart location

2. Permanent Installations

For permanently installed derricks with fixed lengths of boom, guy and mast, a load chart will be posted where it is visible to personnel responsible for the operation of the equipment.

3. Non-Permanent Installations

For derricks that are not permanently installed, the load chart will be readily available at the job site to personnel responsible for the operation of the equipment.

2. Construction and Anchoring

General Requirements

1. Derricks will be constructed to meet all stresses imposed on members and components when installed and operated in accordance with the manufacturer's procedures and within its rated capacity
2. Welding of load-sustaining members will conform to recommended practices in ANSI/AWS D14.3 –94 or D1.1–2

3. Guy Derricks

1. The minimum number of guys is six, with equal spacing, except where a qualified person or derrick manufacturer approves variations from these requirements and revises the rated capacity to compensate for such variations. Guy derricks will not be used unless the employer has the following guy information:
 1. The number of guys
 2. The spacing around the mast
 3. The size, grade and construction of rope to be used for each guy
2. The anchorage and guying will be designed to withstand maximum horizontal and vertical forces encountered when operating within rated capacity with the particular guy slope and spacing specified for the application.
3. For guy derricks manufactured after December 18, 1970, in addition to the information required in this section, the employer will have the following guy information:
 1. The amount of initial sag or tension
 2. The amount of tension in guy line rope at anchor
4. The mast base will permit the mast to rotate freely with allowance for slight tilting of the mast caused by guy slack.

The mast cap will:

1. Permit the mast to rotate freely
2. Withstand tilting and cramping caused by the guy loads
3. Be secured to the mast to prevent disengagement during erection
4. Be provided with means for attaching guy ropes

4. Stiffleg Derricks

1. The mast will be supported in the vertical position by at least two stifflegs. One end of each will be connected to the top of the mast and the other end securely anchored. The stifflegs will be capable of withstanding the loads imposed at any point of operation within the load chart range, and the mast base will:
 1. Permit the mast to rotate freely (when necessary)
 2. Permit deflection of the mast without binding
 3. Be prevented from lifting out of its socket when the mast is in tension
 4. Be anchored
 5. Be designed to withstand maximum horizontal and vertical forces encountered when operating within rated capacity with the particular stiffleg spacing and slope specified for the application
2. The stiffleg connecting member at the top of the mast will:
 1. Permit the mast to rotate freely (when necessary)
 2. Withstand the loads imposed by the action of the stifflegs
 3. Be secured so as to oppose separating forces
 4. Be anchored
 5. Be designed to withstand maximum horizontal and vertical forces encountered when operating within rated capacity with the particular stiffleg spacing and slope specified for the application

5. Gin Pole Derrick

Guy lines will be sized and spaced to stabilize the gin pole in both boomed and vertical positions.

Exceptions:

1. Where the size and/or spacing of guy lines do not result in the gin pole being stable in both boomed and vertical positions, the employer will ensure that the derrick is not used in an unstable position
2. The base of the gin pole will permit movement of the pole (when necessary). The gin pole shall be anchored at the base against horizontal forces (when such forces are present)

6. Chicago Boom Derrick

The fittings for stepping the boom and for attaching the topping lift will be arranged to:

1. Permit the derrick to swing at all permitted operating radii and mounting heights between fittings
2. Accommodate attachment to the upright member of the host structure
3. Withstand the forces applied when configured and operated in accordance with the manufacturer's procedures and within its rated capacity
4. Prevent the boom or topping lift from lifting out under tensile forces

7. Swingers and Hoists

The boom, swinger mechanisms and hoists will be suitable for the derrick work intended and will be anchored to prevent displacement from the imposed loads. Base-mounted drum hoists will meet the requirements in the following sections of ASME B30.7-2001:

1. Sections 7-1.1 (Load ratings and markings)
2. Section 7-1.2 (Construction), except: 7-1.2.13 (Operator's cab) 7-1.2.15 (Fire extinguishers)
3. Section 7-1.3 (Installation)
4. Applicable terms in section 7-0.2 (Definitions)

8. Load Tests for New Hoists

The employer will ensure that new hoists are load tested to a minimum of 110 percent of rated capacity, but not more than 125 percent of rated capacity, unless otherwise recommended by the manufacturer. This requirement is met where the manufacturer has conducted this testing.

9. Repaired or Modified Hoists

Hoists that have had repairs, modifications or additions affecting their capacity or safe operation will be evaluated by a qualified person to determine if a load test is necessary. If it is, load testing will be conducted in accordance

with this policy and manufacturer requirements.

10. Load Test Procedure

Load tests required by this policy will be conducted as follows:

1. The test load will be hoisted a vertical distance to assure that the load is supported by the hoist and held by the hoist brake(s)
2. The test load will be lowered, stopped and held with the brake(s)
3. The hoist will not be used unless a competent person determines that the test has been passed

11. Operational Aids

Section OSHA 1926.1416 (Operational aids) applies, except for:

- OSHA 1926.1416 (d)(1) Boom hoist limiting device and
- OSHA 1926.1416(e)(1) Boom angle or radius indicator and
- OSHA 1926.1416(e)(4) Load weighing and similar devices.

1. Boom Angle Aid

The employer will ensure that either:

1. The boom hoist cable is marked with caution and stop marks. The stop marks will correspond to maximum and minimum allowable boom angles. The caution and stop marks will be in view of the operator or a spotter who is in direct communication with the operator.
2. An electronic or other device that signals the operator in time to prevent the boom from moving past its maximum and minimum angles, or automatically prevents such movement, is used

2. Load Weight / Capacity Devices

1. Derricks manufactured after 2012 with a maximum rated capacity over 6,000 pounds will have at least one of the following: load weighing device, load moment indicator, rated capacity indicator or rated capacity limiter.
2. Temporary alternative measures: The weight of the load will be determined by a reliable source (e.g., the load's manufacturer), by a reliable calculation method (i.e., calculating a steel beam from measured dimensions and a known per foot weight) or by other equally reliable means. This information will be provided to the operator prior to the lift.

12. Post-Assembly Approval and Testing – New or Reinstalled Derricks

1. Functional Test

Prior to initial use, new or reinstalled derricks will be tested with no hook load by a competent person to verify proper operation. This test will include:

1. Lifting and lowering the hook(s) through the full range of hook travel
2. Raising and lowering the boom through the full range of boom travel
3. Swinging in each direction through the full range of swing
4. Actuating the anti two-block and boom hoist limit devices (if provided)
5. Actuating the locking, limiting and indicating devices (if provided)

2. Load Test

Prior to initial use, new or reinstalled derricks will be load tested by a qualified person.

1. The test load will meet the following requirements:
 - a. Test loads will be at least 100 percent and no more than 110 percent of the rated capacity unless otherwise recommended by the manufacturer or qualified person but in no event will the test load be less than the maximum anticipated load
2. The test will consist of:
 - a. Hoisting the test load a few inches and holding to verify that the load is supported by the derrick and held by the hoist brake(s)
 - b. Swinging the derrick, if applicable, the full range of its swing, at the maximum allowable working radius for the test load
 - c. Booming the derrick up and down within the allowable working radius for the test load
 - d. Lowering, stopping and holding the load with the brake(s).
3. The derrick will not be used unless the qualified person determines that the test has been passed.

4. Documentation

Tests conducted under this section will be documented. The document will contain the date, test results and the name of the tester. The document will be retained until the derrick is re-tested or dismantled, whichever occurs first.

3. Load Testing Repaired or Modified Derricks

Derricks that have had repairs, modifications or additions affecting the derrick's capacity or safe operation will be evaluated by a qualified person to determine if a load test is necessary. If a load test is necessary, it will be conducted and documented in accordance with this policy.

13. Power Failure Procedures

If power fails during operations, the derrick operator will safely stop operations. This includes setting all brakes or locking devices and moving all clutch and other power controls to the off position.

14. Use of Winch Heads

Ropes will not be handled on a winch head without the knowledge of the operator. While a winch head is being used, the operator will be within reach of the power unit control lever.

15. Securing the Boom

1. When the boom is being held in a fixed position, dogs, pawls or other positive holding mechanisms on the boom hoist will be engaged. When taken out of service for 30 days or more, the boom will be secured by one of the following methods:
 1. Laid down
 2. Secured to a stationary member, as nearly under the head as possible, by attachment of a sling to the load block for guy derricks, lifted to a vertical position and secured to the mast for stiffleg derricks, secured against the stiffleg

The process of jumping the derrick will be supervised by the A/D supervisor.

Derrick operations will be supervised by a competent person.

2. Inspections

In addition to the requirements in OSHA 1926.1412, the following additional items will be included in the inspections:

1. Daily: Guys for proper tension
2. Annual: Gudgeon pin for cracks, wear and distortion
3. Foundation supports for continued ability to sustain the imposed loads. OSHA 1926.1427 Operator qualification and certification does not apply.

3. Floating Cranes, Derricks and Land Cranes, Derricks on Barges

This section contains supplemental requirements for floating cranes / derricks and land cranes / derricks on barges, pontoons, vessels or other means of flotation (vessel / flotation device). All sections of this subpart apply to floating cranes / derricks and land cranes / derricks on barges, pontoons, vessels or other means of flotation, unless specified otherwise. The requirements of this section do not apply when using jacked barges when the jacks are deployed to the river / lake / sea bed and the barge is fully supported by the jacks

1. General Requirements

The following this section apply to both floating cranes / derricks and land cranes / derricks on barges, pontoons, vessels or other means of flotation

2. Work Area Control

The requirements of OSHA 1926.1424 Work area control apply, except for OSHA 1926.1416 (a) (2) (ii).

The employer must either:

1. Erect and maintain control lines, warning lines, railings or similar barriers to mark the boundaries of the

hazard areas.

2. Or: Clearly mark the hazard areas using a combination of warning signs (such as "Danger — Swing / Crush Zone") and high visibility markings on the equipment that identify the hazard areas. In addition, the employer will train the employees to understand what these markings signify.

3. Keeping Clear of the Load

OSHA 1926.1425 does not apply.

4. Additional Safety Devices

In addition to the safety devices listed in OSHA 1926.1415, the following safety devices are required:

1. Barge, pontoon, vessel or other means of flotation list and trim device, located in the cab or, where there is no cab, at the operator's station
2. Horn
3. Positive equipment house lock
4. Wind speed and direction indicator: A competent person will determine if wind is a factor that needs to be considered. If it needs to be considered, a wind speed and direction indicator will be used

5. Operational Aids

An anti two-block device is required only when hoisting personnel or hoisting over an occupied cofferdam or shaft.

OSHA 1926.1416(e)(4) Load weighing and similar devices does not apply to dragline, clamshell (grapple), magnet, drop ball, container handling, concrete bucket and pile driving work.

6. Accessibility of Procedures Applicable to Equipment Operation

If the crane / derrick has a cab, the requirements of OSHA 1926.1417(c) apply. If the crane / derrick does not have a cab, rated capacities (load charts) will be posted at the operator's station. If the operator's station is moveable (such as with pendant-controlled equipment), the load charts will be posted on the equipment

Procedures applicable to the operation of the equipment (other than load charts), recommended operating speeds, special hazard warnings, instructions and operators manual, will be readily available on board.

7. Inspections

In addition to meeting the requirements of OSHA 1926.1412 for inspecting the crane / derrick, the employer will ensure that the barge, pontoons, vessel or other means of flotation used to support a floating crane / derrick or land crane / derrick is inspected as follows:

1. Shift Inspections

The means used to secure / attach the equipment to the vessel / flotation device will be inspected for proper condition, including wear, corrosion, loose or missing fasteners, defective welds and (where applicable) insufficient tension.

See the Daily / Pre-Shift Inspections section for additional requirements

2. Monthly Inspections

The vessel / flotation device used will be inspected for the following:

1. The means used to secure / attach the equipment to the vessel / flotation device will be inspected for proper condition, including wear, corrosion and (where applicable) insufficient tension.
2. The vessel/flotation device is not taking on water.
3. The deck load is properly secured.
4. Chain lockers, storage, fuel compartments and battening of hatches for serviceability as a water-tight appliance.
5. Firefighting and lifesaving equipment in place and functional.

The shift and monthly inspections will be conducted by a competent person. If any deficiency is identified, an immediate determination will be made by a qualified person as to whether the deficiency constitutes a hazard. If the deficiency is determined to constitute a hazard, the vessel / flotation device will be removed from service until it has been corrected.

See the Monthly Inspections section for additional requirements

3. Annual Inspections

External vessel / flotation device inspection

1. The external portion of the barge, pontoons, vessel or other means of flotation used will be inspected annually by a qualified person who has expertise with respect to vessels / flotation devices. The inspection will include the items identified above as Shift and Monthly of this section.
2. In addition, cleats, bitts, chocks, fenders, capstans, ladders and stanchions will be inspected for significant:
 - a. Corrosion, wear, deterioration and deformation
 - b. External evidence of leaks and structural damage
 - c. Four-corner draft readings checked
 - d. Firefighting equipment for serviceability
 - e. Rescue skiffs, lifelines, work vests, life preservers and buoys for condition
3. If any deficiency is identified, an immediate determination will be made by the qualified person as to whether the deficiency constitutes a hazard or, though not yet a hazard, needs to be monitored in the monthly inspections.
4. If the deficiency is determined to constitute a hazard, the vessel / flotation device will be removed from service until it has been corrected.
5. If the qualified person determines that, though not presently a hazard, the deficiency needs to be monitored, the employer will ensure that the deficiency is checked in the monthly inspections.
6. See the Annual / Comprehensive Inspections section for additional requirements

4. Quadrennial Inspections (4-year Inspections)

Internal vessel / flotation device inspection

1. The internal portion of the barge, pontoons, vessel or other means of flotation used will be surveyed once every four years by a marine engineer, marine architect, licensed surveyor or other qualified person who has expertise with respect to vessels / flotation devices.
2. If any deficiency is identified, an immediate determination will be made by the surveyor as to whether the deficiency constitutes a hazard or, though not yet a hazard, needs to be monitored in the monthly or annual inspections, as appropriate.
3. If the deficiency is determined to constitute a hazard, the vessel / flotation device will be removed from service until it has been corrected.
4. If the surveyor determines that, though not presently a hazard, the deficiency needs to be monitored, the employer will ensure that the deficiency is checked in the monthly or annual inspections, as appropriate.

5. Documentation

The monthly and annual inspections required in this section (above) will be documented in accordance with OSHA 1926.1412 (e) (3) and 1926.1412(f)(7), respectively.

The quadrennial inspection required in this section will be documented in accordance with OSHA 1926.1412(f) (7), and the documentation for that inspection will be retained for a minimum of four years.

8. Working with a Diver

The following additional requirements apply when working with a diver in the water:

1. If a crane / derrick is used to get a diver into and out of the water, it will not be used for any other purpose until the diver is back on board. When used for more than one diver, it will not be used for any other purpose until all divers are back on board.
2. The operator will remain at the controls of the crane / derrick at all times. In addition to the requirements in OSHA 1926.1419 through 1422 Signals, either:
 1. A clear line of sight will be maintained between the operator and tender
 2. The signals between the operator and tender will be transmitted electronically
3. The means used to secure the crane / derrick to the vessel / flotation device must not allow any amount of shifting in any direction.
4. The employer must ensure that the manufacturer's specifications and limitations with respect to environmental, operational and in-transit loads for the barge, pontoons, vessel or other means of flotation are

not exceeded or violated.

9. Load Charts

1. The manufacturer load charts applicable to operations on water will not be exceeded. When using these charts, the employer will comply with all parameters and limitations (such as dynamic / environmental parameters) applicable to the use of the charts.
2. The load charts will take into consideration a minimum wind speed of 40 miles per hour.
3. The requirements for maximum allowable list and maximum allowable trim as specified in Table M1 of this section will be met. Reference OSHA 1926.1437(m) (1) – (m) (4)

TABLE M1 – Maximum Allowable List and Trim		
Rated Capacity	Maximum Allowable List	Maximum Allowable Trim
Equipment designed for marine use by permanent attachment (other than derricks):		
25 tons or less	5 degrees	5 degrees
Over 25 tons	7 degrees	7 degrees
Derricks designed for marine use by permanent attachment:	10 degrees	10 degrees

4. The equipment will be stable under the conditions specified in Tables M2 and M3 of this section. Anything less than minimum freeboard list needs to be approved by an RPE.

TABLE M2 – Equipment freeboard stability requirements		
Operated at	Wind speed	Minimum freeboard
Rated capacity	60 mph	2 ft.
Rated capacity plus 25%	60 mph	1 ft.
High boom, no load	60 mph	2 ft.

TABLE M3 – Equipment freeboard stability requirements	
Operated at	Wind speed
For backward stability of the boom: High boom, no load, full back list (least stable condition)	90 mph

5. If the equipment is employer-made, it will not be used unless the employer has documents demonstrating that the load charts and applicable parameters for use meet the requirements of this policy. Such documents will be signed by an RPE who is a qualified person with respect to the design of this type of equipment (including the means of flotation). The barge, pontoons, vessel or other means of flotation used will:
 1. Be structurally sufficient to withstand the static and dynamic loads of the crane / derrick when operating at the crane / derrick's maximum rated capacity with all anticipated deck loads and ballasted compartments
 2. Have a subdivided hull with one or more longitudinal watertight bulkheads for reducing the free surface effect
 3. Have access to void compartments to allow for inspection and pumping
6. The rated capacity of the equipment (load charts) applicable for use on land will be reduced to account for increased loading from list, trim, wave action and wind, be applicable to a specified location(s) on the specific barge, pontoons, vessel or other means of flotation that will be used, under the expected environmental conditions and ensure that the conditions required in this section are met.
7. The equipment manufacturer, or a qualified person who has expertise with respect to both land crane / derrick capacity and the stability of vessels / flotation device, will complete the rated capacity modification required in this section.

10. List and Trim

1. The maximum allowable list and the maximum allowable trim for the barge, pontoon, vessel or other means of flotation will not exceed the amount necessary to ensure that the conditions in Table M2 of this section are met. In addition, the maximum allowable list and the maximum allowable trim will not exceed the least of the following:
 1. Five degrees
 2. The amount specified by the crane / derrick manufacturer

3. The amount specified by the qualified person, when an amount is not specified by the manufacturer
2. The maximum allowable list and the maximum allowable trim for the land crane / derrick will not exceed the amount specified by the crane / derrick manufacturer or, where an amount is not so specified, the amount specified by the qualified person.
3. The following conditions will be met:
 1. All deck surfaces of the barge, pontoons, vessel or other means of flotation used will be above water
 2. The entire bottom area of the barge, pontoons, vessel or other means of flotation used will be submerged

11. Physical Attachment, Corralling, Rails System and Centerline Cable System

The employer will meet the requirements in Option 1, Option 2, Option 3 or Option 4 of this section. Whichever option is used, the requirements of this subsection must also be met.

Option 1 – Physical attachment

The crane / derrick will be physically attached to the barge, pontoons, vessel or other means of flotation. Methods of physical attachment include crossed-cable systems attached to the crane / derrick and vessel / flotation device (this type of system allows the crane / derrick to lift up slightly from the surface of the vessel / means of flotation), bolting or welding the crane / derrick to the vessel / flotation device, strapping the crane / derrick to the vessel / flotation device with chains or other methods of physical attachment.

Option 2 – Corralling

The crane / derrick will be prevented from shifting by installing barricade restraints (a corralling system). Corralling systems will not allow any amount of shifting in any direction by the equipment.

Option 3 – Rails

The crane / derrick will be mounted on a rail system to prevent shifting. Rail clamps and rail stops are required unless the system is designed to prevent movement during operation by other means.

Option 4 – Centerline cable system

The crane / derrick will be mounted to a wire rope system to prevent shifting. The wire rope system will meet the following requirements:

1. The wire rope and attachments will be of sufficient size / strength to support the side load of crane / derrick
 2. The wire rope will be physically attached to the vessel / flotation device
 3. The wire rope will be attached to the crane / derrick by appropriate attachment methods (such as shackles or sheaves) on the undercarriage, which will allow the crew to secure the crane / derrick from movement during operation and to move the crane / derrick longitudinally along the vessel / flotation device for repositioning
 4. Means shall be installed to prevent the crane / derrick from passing the forward or aft end of the wire rope attachments
 5. The crane / derrick will be secured from movement during operation
2. The systems / means used to comply with Option 1, Option 2, Option 3 or Option 4 of this section will be designed by a marine engineer, an Registered Professional Engineer (RPE) familiar with floating crane / derrick design, or a qualified person familiar with floating crane / derrick design.
 3. Exception: For mobile auxiliary cranes used on the deck of a floating crane / derrick, the requirement to use Option 1, Option 2, Option 3 or Option 4 of this section does not apply when the employer demonstrates implementation of a plan and procedures that meet the following requirements:
 1. A marine engineer or RPE familiar with floating crane / derrick design develops and signs a written plan for the use of the mobile auxiliary crane.
 2. The plan will be designed so that the applicable requirements of this section are met despite the position, travel, operation and lack of physical attachment (or corralling, use of rails or cable system) of the mobile auxiliary crane.
 3. The plan will specify the areas of the deck where the mobile auxiliary crane is permitted to be positioned, travel and operate, and the parameters / limitations of such movements and operation.
 4. The deck will be marked to identify the permitted areas for positioning, travel and operation.
 5. The plan will specify the dynamic / environmental conditions that must be present for use of the plan.
 4. If the dynamic / environmental conditions of this subsection are exceeded, the mobile auxiliary crane will be physically attached or corralled in accordance with Option 1, Option 2 or Option 4 of this section.
 5. The barge, pontoons, vessel or other means of flotation used will:
 1. Be structurally sufficient to withstand the static and dynamic loads of the crane / derrick when operating at the crane / derrick's maximum rated capacity with all anticipated deck loads and ballasted compartments.
 2. Have a subdivided hull with one or more longitudinal watertight bulkheads for reducing the free surface effect.

3. Have access to void compartments to allow for inspection and pumping.

4. Overhead & Gantry Cranes

1. Permanently Installed Overhead and Gantry Cranes

This paragraph applies to the following equipment when used in construction and permanently installed in a facility: overhead and gantry cranes, including semi gantry, cantilever gantry, wall cranes, storage bridge cranes, and others having the same fundamental characteristics.

The requirements of OSHA 1910.179, except for OSHA 1910.179(b) (1), apply to the equipment identified in the paragraph above of this section.

2. Overhead and Gantry Cranes that are Not Permanently Installed in a Facility

This section applies to the following equipment when used in construction and not permanently installed in a facility: overhead and gantry cranes, overhead / bridge cranes, semi gantry, cantilever gantry, wall cranes, storage bridge cranes, launching gantry cranes and similar equipment, irrespective of whether it travels on tracks, wheels, or other means.

The following requirements apply to equipment identified in the paragraph directly above in this section:

1. OSHA 1926.1400 through 1414; OSHA 1926.1417 through 1425; OSHA 1926.1426(d), OSHA 1926.1427 through 1434; OSHA 1926.1437, OSHA 1926.1439, and OSHA 1926.1441
2. The following portions of OSHA 1910.179:
3. Paragraphs (b)(5),(6),(7); (e)(1),(3),(5),(6); (f)(1),(4); (g); (h)(1),(3); (k); and (n) of OSHA 1910.179
4. The definitions in OSHA 1910.179 (a) except for "hoist" and "load." For those words, the definitions in OSHA 1926.1401 apply
5. OSHA 1910.179 (b)(2) applies only to equipment identified in paragraph (b)(1) of this section manufactured before September 19, 2001
6. For equipment manufactured on or after September 19, 2001, the following sections of ASME B.30.2–2011 apply: 2-1.3.1; 2-1.3.2; 2-1.4.1; 2-1.6; 2-1.7.2; 2-1.8.2; 2-1.9.1; 2-1.9.2; 2-1.11; 2-1.12.2; 2-1.13.7; 2-1.14.2; 2-1.14.3; 2-1.14.5; 2-1.15.; 2-2.2.2; 2-3.2.1.1. In addition, 2-3.5 applies, except in 2-3.5.1 (b), "29CFR 1910.147" is substituted for "ANSI Z244.1"

5. Unconventional Cranes: Regional / Project-Specific Requirements

- None *

10. Program Management

1. Crane Management System

1. For Skanska owned and rented cranes, the RCC will utilize Intalex for reporting and tracking purposes. The database will include all information related to each Skanska owned or rented crane. It will include size, capacity, make, model, location, status of inspections, certification number, historical maintenance data and all other applicable information related to each crane.
2. Intalex will alert the RCC to upcoming expiring monthly, annual and periodic inspections. The RCC will schedule inspections with the PCC.
3. If at any time a PCC is not available on a jobsite and an action needs to take place, the following hierarchy of authority governs:
 1. Superintendent
 2. Project manager
 3. Project executive
4. If a PCC is removed from the jobsite, there will be a transition period of one month while a new PCC is selected and trained.

2. Program: Regional / Project-Specific Requirement, Approvals and Storage

Each region and project may require amendments to this minimum policy for a specific owner and/or regional variations. Regional and project-specific requirements need to be approved by the EHS and Equipment Departments.

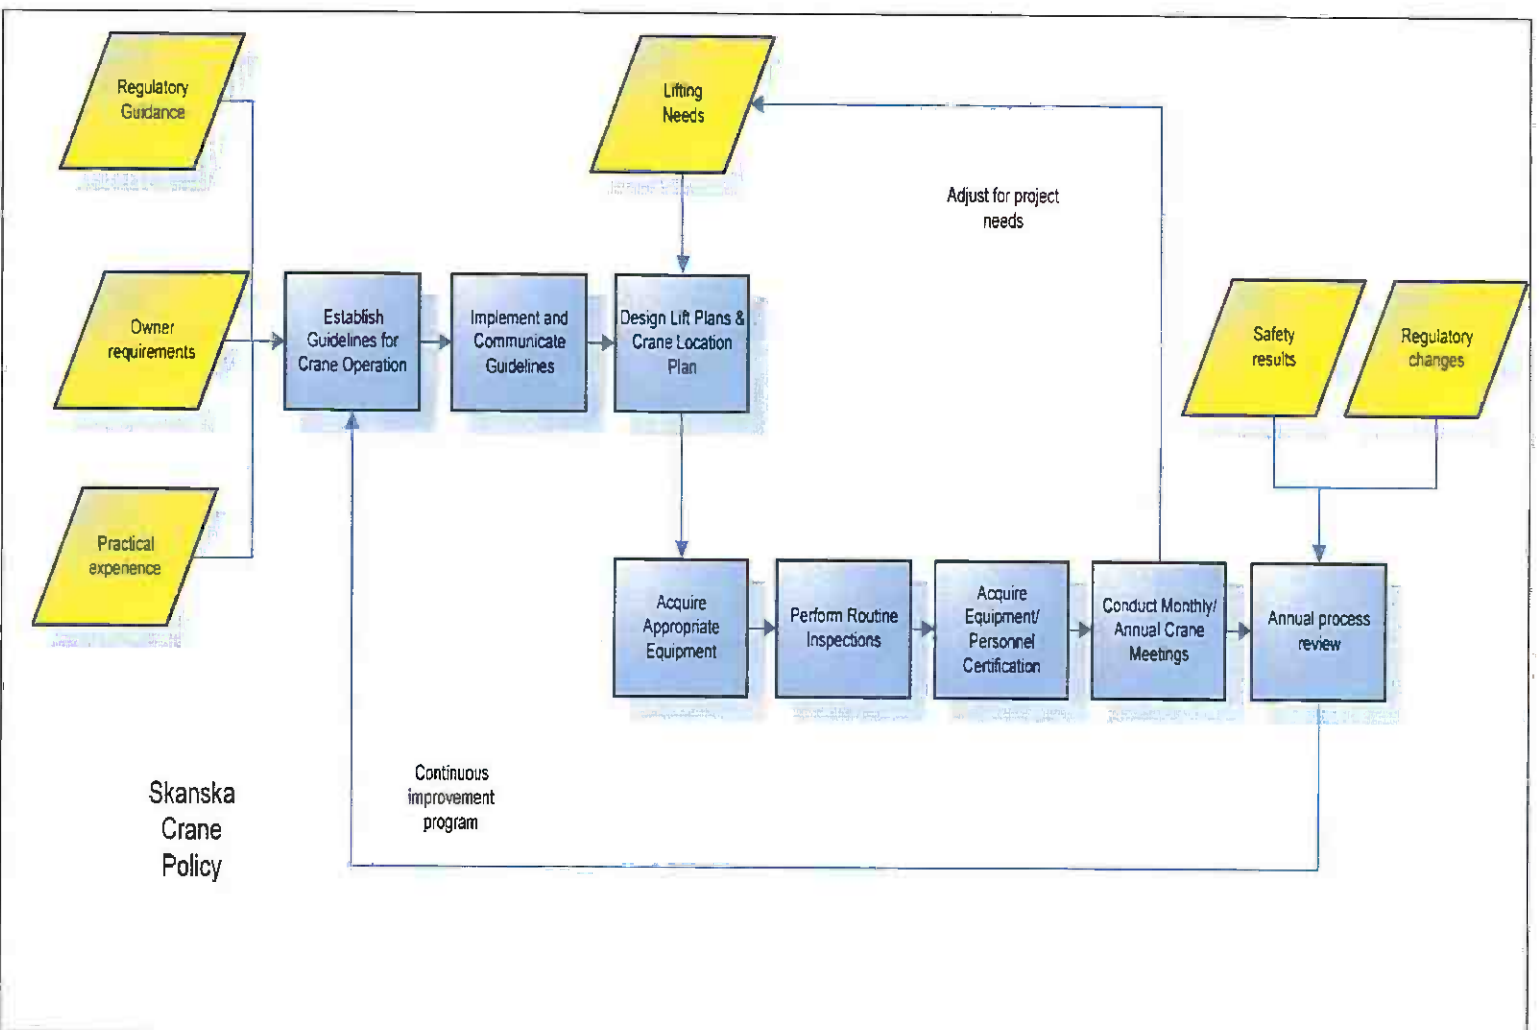

- None

3. Document Storage

Monthly and periodic inspections will be stored in multiple locations. Hard copies of the most recent inspection must be stored in the crane and in the equipment file. These documents will be available upon request at the site of operation.

4. Program Evaluation and Improvement

The Skanska Crane Policy will be evaluated and revised routinely in conjunction with Skanska's EHS manual.

EHS Forms and Documents

- 7460-1 FAA Permit, if applicable.

Applicable Training

- Emergency response
- Confined space entrant, attendant, supervisor, and rescuer training
- Atmospheric testing
- Lockout/tagout

Potential Related Safety, Health and/or Environmental Aspects

- None

Demolition

Objective

The purpose of this program is to establish project-specific guidelines to ensure the highest level of safety during demolition operations.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1926.850 - Preparatory operations](#)
- [NFPA 241](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 4 §1532.3](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 31 §1733-1737](#)

Skanska/Client Requirements

- None

Procedure

1. Demolition plan

1. Prior to demolition activities, a hazardous material survey must be accomplished to identify all hazardous materials (e.g. asbestos, lead, PCBs mercury, etc.).
2. Before starting any demolition activities, each job must develop a project-specific demolition plan.
3. The demolition plan must indicate the phases of work by method. Risk assessment is a critical component when selecting the final method.
4. The plan should include (if they are applicable):
 - Engineering survey report
 - Hazardous materials survey
 - Abatement plans for each hazardous material
 - Demolition method plan
 - Utility protection plan
 - Shoring or bracing plan
 - Fall protection plan
 - Worker access plan
 - Maintenance of Traffic (MOT) plans
 - Dust control plan
 - Waste/debris disposal plan
 - Pest and rodent control (vermin control)
 - Noise and vibration assessment based on demolition means and methods
 - Permits
5. Any project specific requirements for this section are listed here.
 - None

2. Engineering survey

1. Prior to demolition operations, an engineering survey report will be made by a competent person of the structure per OSHA 29 CFR 1926.850, Subpart T.
2. The completed engineering survey report form must be kept onsite during all operations.
3. Any project specific requirements for this section are listed here.
 - None

3. Hazardous materials survey and abatement plan

1. Prior to the disturbance/removal of any identified or suspect hazardous materials, take the necessary precautions to ensure worker and community safety.
2. Any project specific requirements for this section are listed here.

- None

4. Utility protection plan

1. All known or suspected utilities must be clearly identified (using Call Before You Dig or other utility locate service) and marked before demolition work begins.
2. The demolition plan must list each known or suspected utility and indicate the following:
 - Is the utility scheduled to remain or will it be removed before demolition begins?
 - If the utility remains, is protection required including any bracing or shoring?
 - Project management must decide if demolition work can safely proceed if high-risk utilities are suspected in the demolition area.
 - Testing and purging of pipes, tanks or other equipment containing hazardous, flammable or explosive substances must be considered and highlighted in the demolition plan.
3. Any project specific requirements for this section are listed here.
 - None

5. Shoring or bracing plan

1. The demolition plan must identify the structures impacted by demolition, including internal walls, flooring or bracing and external structure (for example party walls that may rely on or be impacted by the demolished structure).
2. Any project specific requirements for this section are listed here.
 - None

6. Dust control plan

1. The demolition plan must state if permitting requires dust control, the type of dust suppressant used (i.e., water, chemical or both), the source (i.e., fire hydrant, ponded water, or tanker) and what equipment is needed to spray the water (i.e., type of pump, length of hose, nozzles, etc.)
2. Any project specific requirements for this section are listed here.
 - None

7. Disposal plan

1. The demolition plan must list the type of debris requiring disposal and must state where each waste is being disposed and how it will be removed from the structure.
2. Any project specific requirements for this section are listed here.
 - None

8. Pest and rodent control plan

1. The demolition plan must state if permitting requires a pest and rodent control plan and the procedures that will be taken.
2. Any project specific requirements for this section are listed here.
 - None

9. Noise and vibration assessment

1. The demolition plan must assess noise and vibration impacts and appropriate controls.
2. Any project specific requirements for this section are listed here.
 - None

Dropped Object Protection

Objective

This plan establishes the guidelines to prevent materials, such as construction materials, tools, equipment, debris, hard hats/helmets, radios, phones, etc., from falling from elevation and causing harm to workers, members of the public, and damage to tools, material and property.

Legal and Other Requirements

Federal, State, Local Regulations

- None

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. Include dropped object prevention controls in Construction Work Plans and Daily Hazard Analyses.
2. The following items shall be included in the plan: construction materials, tools, equipment, debris, hard hats/helmets, radios, phones, etc.
3. Controls may include the following:
 - Sequencing of work to prevent trade stacking
 - Tool tethering
 - Debris netting
 - Barricades
 - Cocoon systems
4. If there is a potential for materials or equipment to fall, all areas below must be secured with barricades and signage.
5. If there is a potential for tools to fall, tool tethers, barricades and signage shall be used.
6. Any project specific requirements for this section are listed here.
 - None

2. Tool and Material Storage

1. Tools, loose materials and equipment with the potential of being displaced shall not be stored within six (6) feet of any hoist way or inside floor openings, nor within 10 feet of an exterior edge unless the opening/edge is protected sufficiently.
2. All tools, loose materials, and equipment that are not in use while working at heights shall be secured against accidental displacement.
3. Any project specific requirements for this section are listed here.

Electrical

Objective

The purpose of this program is to protect against the hazards associated with electricity. Our safeguards against electrical hazards include lockout/tagout (LOTO) procedures and general requirements for work involving any type of electricity or electric tool.

Legal and Other Requirements

Federal, State, Local Regulations

- NEC
- [California Code of Regulations, Title 8, Subchapter 5 §2299-2989](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 33 §1760](#)

- [California Code of Regulations, Title 8, Subchapter 4, Article 3 §1518](#)
- [OSHA 29 CFR 1926 Subpart K](#)
- [OSHA 29 CFR 1926 Subpart V - Electric Power Transmission and Distribution](#)

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. All cords shall be elevated above the work surface when practical.
2. Wire, nails or other conductive material shall not be used to hang or attach cords or welding leads.
3. Cords that cross roadways shall be protected from damage by vehicle and equipment traffic by devices such as hose bridges.
4. Nationally Recognized Testing Laboratories (NRTL) approved (e.g., UL) covers are required on all panels, load centers, pull boxes, etc. prior to energizing. Equipment shall be secured to prevent unauthorized/unqualified workers access to energized electrical parts or equipment.
5. No work will be performed on any energized electrical circuit, busbars, equipment or panels unless a work plan is developed in accordance with Chapter 1 of NFPA 70E and submitted to Skanska management for review prior to performance of work.
6. Electrical equipment and tools shall be inspected by a competent person to prevent any worker from receiving an electrical shock. This rule applies to all cords, portable electrical equipment, tools and appliances not part of any permanent building or structural electrical systems.
7. All temporary cords shall be three-wire, 16 gauge or heavier, with a hard or extra-hard duty rating.
8. Electrical tape cannot be used to repair electrical cords.
9. All cords shall be visually inspected daily.
10. Repairs shall be completed by a designated competent person and be done in accordance with manufacturer's specifications.
11. Once permanent power is energized all exposed live conductors shall be covered (e.g., outlet covers and panels).
12. Prior to drilling through floors and walls where an energized electrical hazard exists, confirmation of the location of existing electrical hazards shall be verified and communicated to the workers. Means of identification may include, but are not limited to x-ray, electronic stud finder with AC detection, review of as-builts, etc.
13. Any project specific requirements for this section are listed here.
 - None

2. Ground Fault Circuit Interrupters (GFCI)

1. All cords, tools and appliances that are 120 volts shall be connected to a GFCI. Office equipment and appliances in site offices do not require GFCI devices.
2. All GFCIs shall be tested prior to use. If a damaged GFCI is identified it shall not be used and it should be reported to a supervisor.
3. Any project specific requirements for this section are listed here.
 - None

3. Double-Insulated Tools

1. All tools must have a grounding conductor/prong or be double-insulated.
2. If the double-insulated label has been removed, painted over or is otherwise not legible, the tool shall be removed from service.
3. Any project specific requirements for this section are listed here.
 - None

4. Electrical Systems

1. Electrical systems shall be inspected and maintained.
2. All equipment shall have positive indication of "ON" (energized) and "OFF" (de-energized) clearly labeled on the device/equipment.
3. Electrical equipment shall not be opened, repaired or otherwise handled until it is de-energized, locked, and tagged according to the Lockout/tagout program.
4. Perform a voltage test on de-energized equipment prior to performing any work.
5. All metal panels, boxes, covers, conduit, etc. that are part of the electrical system shall be grounded.
6. All electrical equipment exposed to flammable gases or vapors, combustible dust, or ignitable fibers shall be explosion-proof.
7. Circuit breakers shall be labeled to show what they control.
8. All circuit breaker panels shall be labeled to show what voltage, phase and feeder source they contain and shall be marked in accordance with ANSI standards and National Electrical Code (NEC).
9. All cables exiting metal panels or boxes shall be secured with stress relieving clamps.
10. Waterproof clamps shall be used as necessary.
11. All splices shall be enclosed inside an approved box. Repairs shall be sealed with epoxy or vulcanizing kits; tape alone is not acceptable.
12. All energized panels shall be equipped with a lockable door so that power can be turned off and locked out for repairs.
13. Adequate space is needed to open the door at least ninety (90) degrees.

Clearance will be according to the table below.

Nominal voltage to ground	Minimum clear distance for conditions ¹			
	(A)	(B)	(C)	
	Feet ²	Feet ²	Feet ²	
0-150	3	3	3	
151-600	3	3 ½	4	
¹ Conditions (A), (B), (C) are as follows: (A) Exposed live parts on one side and no live or grounded parts on the other side of the working space, or exposed live parts on both sides effectively guarded by insulating material. Insulated wire or insulated busbars operating at no more than 300 volts are not considered live parts. (B) Exposed live parts on one side and grounded parts on the other side. (C) Exposed live parts on both sides of the workplace [not guarded as provided in condition (A)] with the operator between.				
² For all international systems of units (SI): one foot = 0.3048 meters				

14. Any project specific requirements for this section will be listed here.

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. A competent person must supervise all trenching and excavations and be onsite at all times during trenching and excavation operations. Employees may not work in any excavation that the competent person deems unsafe. The competent person shall inspect all excavations each shift and when conditions of the excavation have changed, in accordance with Skanska's Excavation Checklist.
2. A Dig Permit is required to be completed prior to any ground intrusive activities (trenching and/or excavation, etc.) to prevent underground utility strikes. A Dig Permit shall be completed and attached to the CWP for the ground intrusive operations.
3. Review utility drawings and contact "one call" or other entities to determine which utilities may be encountered during excavation work.
 - If damage occurs to any line, terminate work and contact the utility owner. Work may only proceed after the utility company and project management give authorization.
 - When approaching the estimated location of the underground installation, use hand digging or alternative safe method.
 - While the excavation is open, protect, support or remove underground installations as necessary to safeguard employees and the utility.
4. Provide adequate barriers around the perimeter of all excavations.
5. Employees must stand away from any vehicle being loaded or unloaded to avoid being struck by spillage or falling materials. Employees will not be under any loads handled by equipment.
6. Keep all spoil piles a minimum of two (2) feet from the edge of the excavation, or detain spoils using a sufficient retaining device.
7. Provide a stairway, ramp, or ladder, in all trench excavations four (4) feet or more in depth. The maximum travel distance to the point of access must be less than 25 feet.
 - When a ramp is used, the employee must be able to exit the excavation upright without having to scale the slope.
 - If structural ramps are used, the competent person must design the ramp. If the ramp is for vehicle use, the competent person must be qualified in structural design. All structural members of ramps and runways shall be of uniform thickness.
8. Scale all excavations to remove loose material that could pose a hazard by falling or rolling into the excavation.
9. Where oxygen deficiency (less than 19.5 percent oxygen) or a hazardous atmosphere exists or could reasonably be expected to exist in an excavation greater than four (4) feet deep, test the atmospheres in the excavation before entry, and do the following:
 - Use a ventilation system to be monitored by the competent person.
 - Make emergency rescue equipment available.
10. Employees will not work in excavations in which there is accumulated water or water is accumulating. Employees may re-enter the excavation after the water has been removed and the competent person has inspected and approved the

excavation.

11. Remove or support surface encumbrances such as signs, poles, and foundations to protect employees from the hazards they pose.
12. Shore, brace, or underpin adjacent structures such as buildings, sidewalks, pavement, etc. as required. Do not excavate below footings or foundations unless an appropriate shoring system designed by a professional engineer is in place.
13. Provide proper guardrails at walkways over excavations.
14. Any project specific requirements for this section are listed here.
 - None

2. Soil

1. Consider all soil Type C until otherwise determined by a competent person.
2. Perform a visual test by observing the soil during excavation specifically looking for cohesiveness, cracks, layered systems, surface water, vibration, other existing underground structures, etc., that can affect the stability of the excavation. In addition to the visual test, perform a plasticity, dry strength, thumb penetration or pocket penetrometer test to determine the soil classification:

Stable Rock	<ul style="list-style-type: none"> ■ Natural solid material ■ Can be excavated with vertical sides remaining intact
Type A	<ul style="list-style-type: none"> ■ Highly cohesive soil ■ Unconfined compressive strength 1.5 tons per square foot (tsf) or greater ■ Contains significant clay content of is a cemented soil
Type B	<ul style="list-style-type: none"> ■ Less cohesive than type A ■ Unconfined compressive strength between 0.5 tsf and 1.5 tsf ■ Can include certain angular gravel and previously disturbed soils that are well compacted
Type C	<ul style="list-style-type: none"> ■ Little or no cohesive properties ■ Unconfined compressive strength less than 0.5 tsf ■ Includes mostly granular soil

3. Any project specific requirements for this section are listed here.
 - None

3. Protective Systems

1. At a minimum, trenches five (5) feet deep or greater must have a protective system, or be properly sloped or benched in accordance with the table below:

Maximum Allowable Slopes		
Stable Rock	Vertical	90 Degrees
Type A	$\frac{3}{4}$ h : 1 v	53 Degrees
Type B	1 h : 1 v	45 Degrees
Type C	1 $\frac{1}{2}$ h : 1 v	34 Degrees

- Trenches less than five (5) feet in depth may require protective systems, sloping, or benching depending on soil conditions and/or activities.

2. If a protective system is used, the below requirements must be met:
 - The protective system must be designed by a registered professional engineer or be a commercially available system.
 - Protective systems designed by a registered professional engineer must include sizes, types and configurations of the materials, and be in written form and properly stamped. Keep at least one copy at the jobsite.
 - Material used for the protective systems must be free from damage that may impair their function, and used per manufacturer's recommendations. Keep manufacturer's data sheet available at the jobsite.
 - Install and remove support systems in a manner that protects employees. Before temporary removal of individual members begins, take additional precautions to ensure the safety of employees, such as installing other structural members to carry the loads imposed on the support system.
 - Begin removal at the bottom of excavation and progress from there. Backfilling will progress together with the removal of support systems from excavations. Do not excavate more than two (2) feet below the bottom member of a support system unless it is so designed.
3. If timber or aluminum shoring is used, use it in accordance with specifications and manufacturer's recommendations. Keep all manufacturer's data at the jobsite. Deviations will only be allowed with the manufacturer's written approval.
4. If shield systems are used, install them in a manner to restrict lateral or other hazardous movement of the shield in the event of the application of sudden lateral loads. Do not excavate more than two (2) feet below the bottom of a shield unless it is so designed.
 1. Protect employees from the hazard of cave-ins when entering or exiting the areas protected by shields, and do not allow them in shields when shields are being installed, removed or moved vertically.
5. Any project specific requirements for this section are listed here.
 - None

Fall Prevention and Protection

Objective

The purpose of this program is to develop, implement, enforce and maintain 100 percent continuous fall protection for employees who are exposed to potential fall hazards, based on risk assessment.

Legal and Other Requirements

Federal, State, Local Regulations

Skanska/Client Requirements

- None

Procedure

1. All employees will be one hundred percent (100%) protected while working six (6) feet or higher off the ground or when hazards below six (6) feet dictate enforcement at a lesser height. This policy will apply to all trades, even when OSHA allows for exceptions. In the event where local statutes require fall protection at less than six (6) feet, the more stringent standard will apply.
2. Guardrail systems

1. Standard rail will consist of:
 - Top rail – must be not less than 42 inches or more than 45 inches in height measured from the upper surface of the top rail to the floor, platform, runway or ramp. When wire rope is selected it will be at least one-quarter inch diameter and will be flagged at six (6) foot intervals with high visibility material such as "Caution" ribbon or equivalent.
 - Mid-rails – must be installed halfway between top edge of guardrail and the walking/working surface.
2. Toe-board – must be a minimum of one by three-and-a-half inches.
3. A maximum allowable deflection in the system will not exceed two (2) inches.
4. When pipe railings are used, posts, top rails and intermediate railings will be at least one and a half inches nominal diameter (schedule 40 pipe) with posts spaced not more than eight (8) feet apart on center.
5. When structural steel railings are used, posts, top rails and intermediate rails will be at least two (2) inches by two (2) inches by three-eighths (3/8) inch angles, with posts spaced not more than eight (8) feet apart on center.
6. Guardrail systems will be capable of withstanding, without failure, a force of at least two hundred (200) pounds for the top rail, and one hundred fifty (150) pounds for the mid-rail, applied within two (2) inches of the top edge, in any outward or downward direction, at any point along the top edge.
7. Guardrail systems will be surfaced to prevent injury to an employee from punctures or lacerations and to prevent snagging of clothing.
8. Duplex nails are not allowed in the construction of guardrails.
9. When guardrail systems are used at access ways and hoisting areas, a chain, gate or removable guardrail section will be installed.
10. When guardrail systems are used around holes that are used as points of access (such as ladder ways), they will be provided with a gate, or be offset so that a person cannot walk directly into the hole.
11. Guardrail systems used on ramps and runways will be erected along each unprotected side or edge.
12. When guardrail systems are used around holes, they will be erected on all unprotected sides or edges of the hole. Holes used for the passage of materials will have no more than two sides provided with removable guardrail sections. When the hole is not in use, provide a guardrail system along unprotected edges or close it over with a cover. If a component of a guardrail system must be removed, additional controls shall be identified in the Construction Work Plan and operation completed under the supervision of the competent person. The competent person is responsible for immediately replacing and restoring the protective system upon completion of the task. The project team may choose to utilize the Skanska Guardrail Removal Permit.
13. Any project specific requirements for this section are listed here.
 - None

3. Safety Nets

1. Safety nets will never be relied upon as a sole form of fall protection.
2. Nets are designed to provide fall arrest under or around an elevated surface, such as a bridge or steel structure.
3. The following criteria must be met when using nets:
 - Place nets as close to the work as possible, and not more than thirty (30) feet below the work surface.
 - Install nets so an object does not contact any lower surface when dropped.
 - Extend the net outward from the outermost projection of the work surface as follows:

Distance Below Work Surface	Projection Distance
Up to 5 feet	8 feet
5 to 10 feet	10 feet
Over 10 feet	13 feet
4. Nets will be drop-tested, using a four hundred (400)-pound bag of sand dropped from forty two (42) inches above the highest working surface that employees would be exposed to a fall, on the following occasions:
 - Immediately after installation
 - Prior to beginning work in the area
 - After relocation
 - Following any repairs
 - At six-month intervals, if left in one place
5. A copy of the test results will be maintained at the jobsite.
6. If it is unreasonable to perform a test drop, a competent person may certify its compliance with the standards.
7. The compliance certificate must include the identification of the net and its installation, date it achieved compliance and the signature of the competent person. This certification must be located at the jobsite.
8. Mesh openings will not exceed six (6) inches by six (6) inches.
9. Remove material that may have fallen into the net as soon as possible.
10. A border rope for webbing capable of withstanding a minimum breaking strength of five thousand (5,000) pounds must

be used.

11. Connections will be as strong as the integral net components and not spaced greater than six inches apart.
12. Visually inspect all nets on a weekly basis for wear, damage or other deterioration, and after any occurrence that could affect the integrity of the net.
13. Remove all defective nets immediately from service.
14. Any project specific requirements for this section are listed here.
 - None

4. Warning Line System

1. When a guardrail system is not feasible, a warning line system can be used for working on elevated slabs or roof with approval via the variance request procedure.
2. Warning lines should be set up around the work and be a minimum of ten (10) feet back from any unprotected or leading edge.
3. Lines should be thirty six (36) inches high and flagged every six (6) feet to ensure visibility. They should withstand a minimal side load to avoid tipping over.
4. Post signage in the area.
5. Establish a delineated path leading to the work area.
6. Any project specific requirements for this section are listed here.
 - None

5. Safety Monitoring System

1. A safety monitor system is not approved at any Skanska project.

6. Covers

1. All holes two inches or greater in a floor, roof or other walking/working surface shall be covered and labeled "Hole" or "Hole Cover".
2. 6.1.1. Covers will be placed on holes in walking/working or road surfaces that present fall hazards. Covers shall be secured in place to prevent accidental removal or displacement, and shall bear a pressure sensitized, painted, or stenciled sign with legible letters not less than one inch high, stating "Opening - Do Not Remove." Markings of chalk or heel shall not be used. Covers will be secured with nails or a chocking device.
3. Covers will be capable of supporting, without failure, at least twice the maximum weight of employees, materials and equipment.
4. Holes in roadways will be capable of supporting, without failure, at least twice the maximum axle load of the largest vehicle expected to cross over the cover based on an engineered design.
5. Any project specific requirements for this section are listed here.
 - None

7. Personal Fall Arrest Systems

General Requirements

1. Inspect all personal fall arrest equipment prior to use.
2. Remove any damaged, defective, or worn equipment from service.
3. In the event of a fall, employees will self-rescue or be rescued in accordance with established rescue procedure.
4. Immediately remove personal fall arrest systems and components subjected to impact loading.
5. Any project specific requirements for this section are listed here.
 - None

8. Full Body Harness/Self-Retracting Lifelines or "Connectors"

1. Use an approved full body harness as part of the personal fall arrest system. It is required to utilize trauma straps with full body harnesses. The only exception is for linemen performing power transmission work (refer to OSHA 1926.959 for specific requirements).
2. Decelerating lanyards will not be permitted. Self-retracting lifelines (SRL) with decelerating lanyards are acceptable.
3. All connectors shall be SRLs. Select the appropriate SRL according to the task/work area (i.e., leading edge work) with a locking snap hook with a gate rated for 3,600 pounds.
4. All SRL's will be equipped with a locking snap hook with a gate rated for 3,600 pounds to prevent disengagement. The gate shall remain locked until engaged for connection or disconnection.
5. Self-retracting lifelines will be inspected prior to use by the user.
6. The anchorage point must be able to withstand a minimum load of 5,000 pounds per person.
7. The anchorage point should ideally be located above the user's head in order to prevent "swing" type falls.
8. The D-ring of the body harness will be located in the center of the wearer's back.

9. Any project specific requirements for this section are listed here.

- None

9. Horizontal/Vertical Lifelines

1. Design, installation and use of lifelines will be under the supervision of a qualified person and maintain a safety factor of at least two.
2. Lifeline systems will be engineered either by the manufacturer or a qualified engineer prior to use and should consider at a minimum:
 - The number of personnel connected to the lifeline
 - The size of wire rope to be used will be a minimum seven (7) strands by nineteen (19) wires per strand and three-eighths (3/8) inch galvanized aircraft cable
 - One shock absorber shall be connected from the anchorage point (stanchion) to the wire rope and must provide adequate protection for two (2) people using self-retracting lifelines (deceleration) devices
 - Distance between anchorage points (slack)
 - Obstructions, permanent material, etc., which may cause injury in an event of a fall
3. Synthetic rope may only be used for vertical applications, unless an engineered system is approved for horizontal use. Store rope to protect against exposures to UV rays, extreme weather and abrasion activities. Certain types of work may also degrade the integrity of synthetic rope systems (e.g., hot work).
4. Ladder climbing safety devices and rope grabs that require hand manipulation are unacceptable.
 - Where a self-retracting lanyard is incorporated in the system, the device shall be located overhead to limit fall distance.
5. The use of knot(s) anywhere in a horizontal/vertical lifeline is prohibited.
6. Any project specific requirements for this section are listed here.
 - None

10. Positioning Devices

1. At no time will a positioning device be used without fall protection via full-body harness, lanyard and anchorage point.
2. Positioning devices will be rigged such that an employee cannot free fall more than two (2) feet and secured to an anchorage capable of supporting at least twice the potential impact load of an employee's fall or three thousand (3,000) pounds (13.3 kN), whichever is greater.
3. Connectors will be drop forged, pressed or formed steel or made of equivalent materials.
4. Any project specific requirements for this section are listed here.
 - None

11. Fall Protection Plan

The fall protection identified in the Construction Work Plan shall:

1. Identify all fall hazards in the work area.
2. Describe the method of fall arrest or fall restraint to be provided.
3. Describe the proper procedures for the assembly, maintenance, inspection and disassembly of the fall protection system to be used.
4. Describe the proper procedures for the handling, storage and securing of tools and materials.
5. Describe the method of providing overhead protection for workers exposed below overhead work.
6. Describe the method(s) for prompt, safe removal of injured workers.
7. Be available on the job site for inspection
8. Any project specific requirements for this section are listed here.
 - None

Fire Prevention and Protection

Objective

The purpose of this program is to establish procedures for jobsite fire protection and prevention measures. The company will take all necessary measures to protect employees from fire hazards and the hazards associated with flammable liquid storage, temporary heating devices, liquid propane (LP) gas and propane.

Legal and Other Requirements

Federal, State, Local Regulations

- [California Code of Regulations, Title 8, Subchapter 7, Group 16 §5139-5223](#)
- [OSHA 29 CFR 1926.150 Subpart F - Fire Protection and Prevention - Fire Protection](#)

Skanska/Client Requirements

- None

Procedure

1. Fire Extinguishers

1. All fire extinguishers will be ABC type, except for the two and one half (2 ½) point extinguishers kept in project vehicles such as pick-up trucks which will be type BC.
2. Inspect extinguishers monthly for damage, leakage, discharge and block accessibility, and document inspections on metal tags or equivalent.
3. Mount, label and display fire extinguishers in planned locations of building projects (e.g., stair cases, ingress and egress points, etc.) every three thousand (3,000) square feet and within one hundred (100) feet.
4. Keep additional fire extinguishers readily available during any hot work operation.
5. Install a twenty (20) pound ABC type extinguisher on all heavy equipment, trucks (other than pick-ups), connex boxes, welders, compressors and asphalt/batch plants.
6. Mount two extinguishers to all fuel and lube trucks such that:
 - They will not both be made inaccessible by a localized fire.
 - They will not be knocked off or clogged with mud or ice.
 - They will not become blocked by loose equipment if they are mounted inside a cabinet. Put a sign on the cabinet to indicate that a fire extinguisher is located inside.
7. Employees shall be trained on the proper use of fire extinguishers.
8. Any project specific requirements for this section are listed here.
 - None

2. Flammable Liquid Storage

General Requirements

1. Smoking is not permitted in any flammable liquid storage areas.
2. Keep an inventory for all flammable or combustible storage areas.
3. Use only approved containers and portable tanks for storage and handling of flammable and combustible liquids.
4. Do not store flammable or combustible liquids in areas used for exits, stairways or those normally used for the safe passage of people.
5. Store waste containers on a firm working base that is impervious and at least four (4) inches thick. Maintain a berm, or

similar, of at least six (6) inches around the base.

6. The storage structure must have a secondary containment system that is capable of holding at least twenty percent (20%) of the total capacity of all containers or one hundred percent (100%) of the capacity of the largest container or tank, whichever is greater.
7. Any project specific requirements for this section are listed here.
 - None

3. Indoor Storage

1. Flammable liquids or other hazardous materials should be stored outdoors or in small detached structures. If flammable liquids or other hazardous material are stored indoors, in buildings, shops and ventilated connex boxes, the requirements of this section must be met.
2. Design inside storage rooms per Fire Tests of Building Construction and Materials, NFPA 251-1995. In addition, the room must:
 - Be liquid tight, so that liquid cannot leak through the walls and floors
 - Provide adequate fire resistance to adjoining building areas
 - Have non-combustible openings to other rooms
 - Have liquid tight raised sill or ramps that are at least six (6) inches in height, make the floor in the storage area six (6) inches lower than the floors in the adjoining rooms
3. Locate at least one portable twenty (20) pound ABC extinguisher no more than ten (10) feet outside of the door opening into any room used for flammable or combustible liquid storage.
4. Use lighting fixtures that are explosion proof and ventilate general storage.
5. No more than twenty five (25) gallons of flammable and combustible chemicals shall be stored in a room outside of the flammable chemical storage cabinet. No more than sixty (60) gallons of Category 1, 2 and/or 3 flammable liquids, or one hundred and twenty (120) gallons of Category 4 flammable liquids can be stored inside in a storage cabinet. Liquid petroleum gas shall not be stored within a building.

Classifying Flammable Liquids	
Category 1	A flashpoint below 73.4ℱ (23ℳ) and boiling point at or below 95ℳ (35ℳ)
Category 2	A flashpoint below 73.4ℱ (23ℳ) and boiling point above 95ℳ (35ℳ)
Category 3	A flashpoint at or above 73.4ℱ (23ℳ) and at or below 140ℳ (60ℳ)
Category 4	A flashpoint at or above 140ℳ (60ℳ) and at or below 199.4ℳ (93ℳ)

6. Label cabinets "Flammable – Keep Away from Open Flames."
7. Transfers of flammable chemicals inside a building must be done in the flammable chemical storage area, or in another room in the building that is separated from other operations, protected by walls with adequate fire resistance and provided with adequate ventilation.
8. Any project specific requirements for this section are listed here.
 - None

4. Outdoor Storage

1. Locate at least one portable fire extinguisher not less than twenty five (25) feet, nor more than seventy five (75) feet, from any flammable liquid storage area located outside.
2. Storage of containers (not more than sixty (60) gallons each) shall not exceed eleven hundred (1,100) gallons in any one pile or area. Piles or groups of containers shall be separated by a five (5) foot clearance and shall not be nearer than twenty (20) feet to a building.
3. Maintain at least ten (10) feet of distance between the storage area and any street, alley or public way.
4. Maintain a twelve (12) foot wide access way within two hundred (200) feet of each storage area to permit approach of fire control apparatus.
5. Grade the storage area to divert possible spills away from buildings or other exposures, or surround them by a curb at least six (6) inches high. When curbs or dikes are used, make provisions for draining off accumulations of ground or rainwater or spills of flammable or combustible liquids. Terminate drains at a safe location and keep them accessible to operation under fire conditions.
6. An outside storage building that is located fifty (50) feet or less from another building or adjoining property line must have a two-hour rated fire wall.
7. Secure storage areas against tampering by trespassers.
8. Keep storage areas and a twenty five (25) foot perimeter around the storage area, free of weeds, debris or other combustible materials.
9. When feasible, provide a covering over all containers.
10. Keep lighting fixtures used in outdoor flammable chemical storage areas at least eight (8) feet above the containers. If not feasible, use an explosion proof lighting and electrical system.
11. Any project specific requirements for this section are listed here.
 - None

5. Outdoor Portable Tank Storage

1. Do not store portable tanks within twenty (20) feet of any building.
2. Maintain a minimum five (5) foot clearance between portable tanks with a combined capacity of two thousand two hundred (2,200) gallons, and around a single portable tank exceeding one thousand one hundred (1,100) gallons.
3. Maintain a twelve (12) foot wide access way within two hundred (200) feet of each storage area to permit approach of fire control apparatus.
4. Keep storage areas and a twenty five (25) foot perimeter around the storage area, free of weeds, debris, or other combustible materials.
5. Locate at least one portable fire extinguisher not less than twenty five (25) feet, nor more than seventy five (75) feet, from any flammable liquid storage area located outside.
6. Label each tank "(Contents of Tank) – Flammable, No Smoking."
7. Any project specific requirements for this section are listed here.
 - None

6. Temporary Heating Devices

General Requirements

1. Keep combustible materials at least ten (10) feet away from heating devices.
2. Fire barrels are not allowed on any project.
3. Clothes, gloves, shoes, etc., cannot be placed on, overhead or immediately next to a heater.
4. Never store compressed gas (acetylene, propane, etc.), gasoline, diesel fuel, paint thinner or any flammable liquid in a trailer or room where a temporary heating device is in use.
5. Do not use paint or thinner in areas where a heater may ignite the explosive.
6. Maintain escape routes in case a heater malfunctions.
7. Keep fire extinguishers readily available and fully charged.
8. Inspect the entire heating unit frequently for any defects, leaks or worn parts. Make repairs immediately.
9. Any project specific requirements for this section are listed here.
 - None

7. Combustion Heaters

1. Read manufacturer's instructions before lighting a heater.
2. Provide adequate ventilation and monitor the area for oxygen and carbon monoxide levels.
3. Each unit shall be equipped with an automatic shut-off valve to stop the flow of gas or oil any time the flame goes out.
4. Refuel only after turning off the heater and allowing it to become cool to the touch.
5. Safety cans with funnels or spouts are required for all flammable liquids, including diesel fuel.
6. Any project specific requirements for this section are listed here.
 - None

8. Electric Heaters

1. Properly ground all electric heaters and use them in a dry area to prevent electric shock.
2. An automatic shut-off device must be built into the unit to prevent fire in the event the unit is tipped over.
3. Keep electric cords out of mud, snow, ice and water.
4. Any project specific requirements for this section are listed here.
 - None

9. Liquefied Petroleum Gas and Propane Requirements

1. Each system will have containers, valves, manifolds, assemblies and regulators of an approved type and in good repair.
2. Connect valves and fittings with a rated working pressure of at least two hundred fifty (250) P.S.I.G. directly to the container.
3. Every container and vaporizer will be provided with one or more approved safety relief valves or devices. These valves will be arranged to afford free venting to the outer air.
4. Cylinder connectors will be provided with an excess flow valve to minimize the flow of gas in the event the fuel lines become ruptured.
5. Any project specific requirements for this section are listed here.
 - None

10. Storage

1. Store containers in cages upright on firm foundations or otherwise firmly secured.
2. Do not store propane cylinders within buildings or connex boxes.
3. Where propane is stored, provide at least an approved portable twenty (20) pound ABC fire extinguisher.
4. Do not store propane within twenty five (25) feet of the nearest building.

5. Clearly label storage areas/cages "Flammable Gas—No Open Flames."
6. Any project specific requirements for this section are listed here.
 - None

11. Use

1. Locate containers, regulating equipment, manifolds, pipe, tubing and hose to minimize exposure to high temperatures or physical damage.
2. For temporary heating, locate heaters six (6) feet from any LP gas container. Do not direct blower and radiant type heaters toward any LP gas container within twenty (20) feet.
3. Arrange valves in the assembly of multiple container systems so that containers can be replaced without shutting off the flow of gas in the system.
4. Separate propane and ignition sources, such as compressors, light plants, etc., at least twenty five (25) feet.
5. Remove combustible material such as weeds and long dry grass within ten (10) feet of the container.
6. Use a soap and water solution to detect leaks and correct leaks immediately.
7. Do not weld on containers or tanks.
8. Any project specific requirements for this section are listed here.
 - None

Housekeeping

Objective

The purpose of this program is to establish guidelines to protect employees from the hazards associated with poor housekeeping. This program details general housekeeping and the handling of waste and debris.

Legal and Other Requirements

Federal, State, Local Regulations

- [California Code of Regulations, Title 8, Subchapter 4, Article 18 §1629-1631](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 7 §1548-1549](#)
- [OSHA 29 CFR 1926.25 Subpart C - General Safety and Health Provisions - Housekeeping](#)
- [OSHA 29 CFR 1926.252 Subpart H - Materials Handling, Storage, Use, and Disposal - Disposal of waste materials](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 3 §1513](#)

Skanska/Client Requirements

- None

Procedure

1. General Housekeeping

1. Work areas will be kept in an orderly manner at all times and all waste will be removed by the end of the shift.
2. Trash receptacles will be provided throughout each jobsite with safe means to facilitate removal and will be emptied regularly to prevent overflow.
3. Any extra materials from activities will be returned to storage facilities at the end of each shift.
4. Oily rags will be kept and disposed of separately in metal containers with tops.
5. All scrap lumber, forms and crates will be kept cleared from work areas, passageways, stairs, in and around buildings or other structures.
6. All nails will be bent or removed from lumber or other material.
7. Receptacles will have self-closing or securable lids to prevent pest and rodent infestation.
8. A trash receptacle will be placed in all designated break areas.
9. All trailers and office space will be kept clean at all times.
10. Any project specific requirements for this section are listed here.
 - None

2. Trash Chute

1. When materials must be dropped more than twenty (20) feet to any point lying outside the exterior walls of a structure, an enclosed chute of wood or equivalent material will be used as a ramp. For the purpose of this subsection, an enclosed chute is a slide, closed in on all sides, through which material is moved from a high place to a lower one.
2. When debris is dropped through holes or openings in the floor without the use of a chute, the area onto which the material is dropped will be completely enclosed with barricades.
3. Enclosure requirements:
 - Barricades must be at least forty two (42) inches high and at least six (6) feet back from the projected edge of the opening above.
 - Wind velocity and its potential for carrying materials should be calculated into the disposal plan.
 - Signs warning of the hazard of falling materials should be posted at each level.
 - A spotter may be posted at the area of retrieval to keep area clear of unnecessary traffic.
 - Debris will not be removed from the disposal site until all handling ceases from above.
4. A dumpster or truck will be maintained at the bottom of the chute at all times.
5. A physical barrier will be maintained around the trash receptacle at the bottom of the chute.
6. "Caution" signs will be posted on the barrier to warn employees of potential hazards.
7. Any project specific requirements for this section are listed here.

Illumination - Project Lighting

Objective

Ensure that adequate lighting is provided during all work operations. In addition to providing necessary illumination for our workers, ensure that adequate lighting is provided for vehicular and pedestrian traffic.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1926.56 Subpart D - Occupational Health and Environmental Controls - Illumination](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 3 §1523](#)

Skanska/Client Requirements

- None

Procedure

1. Fixtures:

1. Fixtures are to be rated for the project environment and/or classification.
2. Fixtures are recommended to be made out of metal or high-strength plastics with suitable diffusers.
3. Fixture guards are required to reduce breakage.
4. Fixtures are to be fastened to a solid surface or suspended with proper cable or hangers to support the weight of the fixture, wire and environmental conditions (e.g., ice load).
5. All fixtures are to be UL listed for the application.
6. Stringers are discouraged and may only be used when allowed by local jurisdiction.
7. Any stringers (e.g., streamer) shall have guards/cages of either plastic or metal.
8. Team shall consider using energy efficient lighting.
9. Any project specific requirements for this section are listed here.
 - None

2. Power Source

1. Power to all light fixtures shall have a dedicated circuit(s) designated for temporary lighting.
2. Egress signs will be on a separate circuit from general lighting.
3. A minimum of two (2) circuits will be required in a work area/floor.
4. All circuits will be clearly labeled to indicate that they are served at the source panel. Fixtures connected to 277/480VAC circuits will have a separate label indicating voltage.
5. Temporary power system shall be located in areas that do not interfere with construction activities (e.g., low hanging wires, wires on the floors, etc.).
6. Any project specific requirements for this section are listed here.
 - None

3. Task Lighting

1. Task lighting may be achieved for work activities utilizing commercially available fixtures/tripods.
2. All task lighting fixtures are to be UL listed for the application.
3. The use of halogen lamps for task lighting is acceptable, providing the fixture has tempered glass and a wire shield. Highly recommended to use high efficient fixtures.
4. Any project specific requirements for this section are listed here.
 - None

4. Lighting Levels

1. The minimum lighting levels will be in accordance with OSHA 1926.56 – Illumination.
2. Measurements will be made from a calibrated light meter either new out of box or calibrated per the manufacturer's requirements.
3. Any project specific requirements for this section are listed here.
 - None

5. General Requirements

1. Construction areas, ramps, runways, corridors, offices, shops and storage areas will be illuminated to the intensities at a minimum listed in the table below while any work is in progress.
2. Lighting plans will include additional fixtures to be installed when interior walls and elements constructed reduced the lighting levels.
3. At a minimum, lighting in stairways, hallways, egress paths and elevator lobbies shall be maintained at all times.
4. Any project specific requirements for this section are listed here.
 - None

6. Illumination Requirements

1. See the chart below:

Foot-Candles	Area of Operation	
5	General construction area lighting.	--
3	Concrete placement, excavation and waste areas, access ways, active storage areas, loading platforms, refueling and field maintenance areas.	--
5	Indoors: warehouses, corridors, hallways and exits.	--
5	Tunnels, shafts and general underground work areas, (Exception: minimum of 10-foot candles is required at tunnel and shaft heading during drilling, mucking and scaling. Bureau of Mines approved cap lights will be acceptable for use in the tunnel heading).	--
10	General Construction Work Plant and shops (e.g., batch plants, screening plants, mechanical and electrical equipment rooms, carpenter shops, rigging lofts and active store rooms, barracks or living quarters, locker or dressing rooms, mess halls, and indoor toilets and work rooms).	--
30	First aid stations, infirmaries and offices.	--

2. For areas or operations not covered above, refer to the American National Standard A11.1-1965, R1970, Practice for Industrial Lighting, for recommended values of illumination or local governing codes.
3. Any project specific requirements for this section are listed here.

Inclement Weather and Lightning

Objective

To ensure that all employees are safe guarded from the occupational health and safety risks associated with inclement weather, including but not limited to: thunderstorms, lightning, hurricanes, and tornados. This program establishes safe work practices while preparing for and during severe weather events.

Legal and Other Requirements

Federal, State, Local Regulations

- None

Skanska/Client Requirements

- None

Procedure

General

- The project team shall conduct a thorough review of the project site and surrounding structures to determine locations acceptable for use as shelter and to review site egress procedures and routes.
- Severe weather responses shall be included in the project's Emergency Action Plan.
- In the event of inclement weather, the project team will monitor local weather reports and inform employees of the potential for impacts.
 - The following can be used to monitor for inclement weather and lightning: www.noaa.gov, portable lightning detectors, local radio or television stations, phone application, etc.
- Cranes and equipment and local legal restrictions shall follow the manufacture's requirements. When a crane is used, Skanska's crane policy shall be followed.
- Project leadership will make the decision to stop work as a result of inclement weather and determine the appropriate communication method. Examples: horn blast, mobile warning system, etc.
- Work shall not resume until project supervision communicates the all clear to resume suspended activities.
- At designated shelter locations, all personnel shall be accounted for before anyone may leave.
- Any project specific requirements for this section are listed here.
 - None

Potential Airborne Materials

- Materials that could possibly become airborne, ie plywood metal paneling etc. must be secured as to not become flying projectiles
- Any project specific requirements for this section are listed here.
 - None

Thunderstorms and Lightning

- When the nearest lightning strike is within 6 miles, all employees must secure equipment and seek shelter and not resume activities for 30 minutes.
 - Count the time between the lightning and the thunder—for each 5 seconds between, the lightning is 1 mile away. See table below.
 - Activate lightning safety plan at count of 30 or 6 miles away and don't resume activities for 30 minutes.

If thunder is heard...	The lightning is...
5 seconds after a flash	1 mile away
10 seconds after a flash	2 miles away
15 seconds after a flash	3 miles away

20 seconds after a flash	4 miles away
25 seconds after a flash	5 miles away
30 seconds after a flash	6 miles away
40 seconds after a flash	8 miles away
50 seconds after a flash	10 miles away

- If working inside of a structure is possible and the safety of the workers is not jeopardized, work may continue.
- Adequate shelter can be any large structure/building. Doors and windows should be closed, and individuals inside must avoid touching objects that penetrate from outside to inside (i.e., door handles, radio antennas, electrical circuits, etc.).
- Mobile equipment and vehicles can also be used as shelter as long as the cab is enclosed. Windows need to be shut and the person should avoid contact with objects that penetrate from inside to outside.
- Any project specific requirements for this section are listed here.
 - None

Hurricanes

- During severe weather, the project team will ensure that the site is secure for the protection of employees, the public, and nearby property.
- Protective action shall be taken with respect to each building/structure and equipment to prevent damage from water, wind, and debris.
- All loose construction materials, trailers, temporary building and equipment will be secured and/or moved to a protected location.
- Any project specific requirements for this section are listed here.
 - None

Tornadoes

- Secure all loose material or materials that can become displaced or airborne and prepare to lower crane booms.
- In the event of a tornado, personnel shall be signaled of the potential danger and moved to structurally protected areas. Personnel should be kept away from windows and glass during a tornado. Personnel should avoid waste piles or stacks of building materials as points of safe refuge.
- Office personnel should evacuate office trailers. If nothing else, seek shelters in ditches, storm drains, or heavy equipment.
- Any project specific requirements for this section are listed here.
 - None

Applicable Training

- None

Potential Related Safety, Health and/or Environmental Aspects

- None

Lockout Tagout

Objective

This section establishes a lockout/tagout procedure to ensure that workers are not exposed to the hazards from moving machinery or equipment and those hazards posed by an energized source (pneumatic, steam, hydraulic, electrical, chemical).

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1910.147 Subpart J - General Environmental Controls - The control of hazardous energy \(lockout/tagout\)](#)
- [California Code of Regulations, Title 8, Subchapter 7, Group 2, Article 7, §3314](#)
- [California Code of Regulations, Title 8, Subchapter 5 §2299-2989](#)
- [OSHA 29 CFR 1926.417 Subpart K - Electrical - Lockout and tagging of circuits](#)

Skanska/Client Requirements

- None

Procedure

1. Lockout/Tagout (LOTO) Procedure

Step 1 – Preparation/Planning

The project superintendent or designated qualified person (authorized employee) shall authorize the shutdown of the equipment after an evaluation of energy sources has been conducted.

1. This evaluation will include the type and magnitude of the energy, the hazards of the energy to be controlled and the method to control the energy. The LOTO evaluation form will be used to document this.
2. Using the LOTO Shutdown Equipment form to locate and identify all isolating devices to be sure which breaker, valve, switch or other energy isolating devices are required to lockout the equipment or system. All items to be isolated will be listed on the LOTO Shutdown Equipment form under "devices to be isolated."
3. Any project specific requirements for this section are listed here.
 - None

Step 2 – Shutdown

4. After preparation for shutdown requirements have been satisfied, the qualified person will review the LOTO Shutdown Equipment form for completeness and accuracy.
5. Any project specific requirements for this section are listed here.
 - None

2. Isolation

To isolate the equipment or system from its energy source, the following actions will be taken in sequence:

1. The qualified person lists all devices that must be locked out on the LOTO Shutdown Equipment form.
2. The qualified person will self-perform or assign another qualified person to physically operate all necessary devices to isolate the equipment or system (e.g., de-energizes, drain, vent, close valves, etc.)
3. Any project specific requirements for this section are listed here.
 - None

3. Lockout

To lockout the equipment, the following actions will be taken in sequence:

1. The qualified person will attach a locking device with a lock and "Do Not Operate" tag. All affected craft supervisors will verify the locks and tags have been hung.
2. The responsible manager and supervisor will initial the LOTO Shutdown Equipment form to verify the isolation is complete and that the key(s) will be maintained in or near the lockout office.
3. The key lock boxes or rods for the isolation lock(s) will be maintained in a predetermined, secure location. The qualified person will drop their key into the lock box. The clearance holder (craft supervisor) will add their lock to the lock box.
4. Each trained employee will be provided one lock for each piece of equipment being locked out and will have only one key for each. Each employee must lockout at the disconnect switch and/or valve themselves.
5. If more than one person is working on the same piece of equipment at the same time, each person is to have a personal lock on the lockout device. If the primary device will not accommodate each person's lock, multiple locking devices are

to be used.

6. When multiple locking devices are required, the shank of the devices must immobilize the equipment and must not merely be attached to the shank of another lock.
7. It may be necessary to lockout/tagout energy caused by gravity.
8. Where a keyed switch controls the ignition, the key will be placed in the "off" position, removed and the switch tagged with a "Do Not Start" tag.
9. If standard lockout switches are not available to immobilize the machinery, fuses should be pulled, terminals disconnected or other standard safety procedures applicable to the individual piece of equipment should be followed. "Do not start" tags will be placed at the starter button or switch.
10. In the event that tagging and removing the ignition key are not considered adequate protection, the battery cable that is connected to the starter will be removed at the battery end and tagged with a "Do Not Start" tag.
11. All other necessary precautions, such as opening or closing valves, changing valves, tagging and locking valves, installing blind flanges, etc., will be performed prior to starting the job.
12. No employee will remove another person's lock, lockout device or "Do Not Start" tag. Before leaving the job for another assignment, at shift end or upon completion of that job, each employee will personally remove their own lock.
13. If an employee fails to remove a lock, that employee will be required to return to remove it in person. If the individual is not available, the lock will not be removed until the foreman in charge has made a thorough check of the equipment. The foreman will verify and make certain the equipment is safe to operate.
14. Any project specific requirements for this section are listed here.
 - None

4. Verification of Isolation

Before starting work on the equipment or system, the following actions will be taken in the following sequence:

1. After ensuring that no personnel are exposed and having checked on all disconnected energy sources, start the equipment or system.
2. Return all controls to the "off" position after the test.
3. The qualified person will notify the clearance holder that the lockout procedure is complete. The clearance holder and affected employee(s) will then discuss the specific equipment or system to be worked on and understand all the system boundaries (i.e., location of all locks and tags).
4. The qualified person and clearance holder return to the control room to sign a Shutdown Equipment Form, signifying that the system is safe to work and isolation is complete.
5. The supervisor informs the affected employee(s) the system has been locked out and verified. The clearance holder drops their key in a separate lock box, all affected employee(s) lock back onto the box.
6. Work can now begin.
7. Any project specific requirements for this section are listed here.
 - None

5. Release from Lockout (Return to Service)

Before lockout devices are removed and energy is restored to the equipment or system, the following procedures will be followed and actions taken by the qualified person using a Shutdown Equipment Form:

1. After work on the equipment or system is complete, the area will be inspected to ensure nonessential items have been removed and equipment or system components are intact.
2. The work area will be checked to be sure that all employees have been safely positioned or removed.
3. All affected employee(s) will be notified that the lockout devices are to be removed.
4. The qualified person will use the Shutdown Equipment form as a guide to ensure that all isolation devices listed in the Shutdown Equipment form are properly accounted for. The following sequence is to occur:
 - The clearance holder verifies that all affected persons on the Shutdown Equipment form have signed the lockout form and show evidence of notification.
 - All craft supervisors who are listed on the Shutdown Equipment form will return to the lockout station and sign and date the LOTO Log.
 - The qualified person will remove all locks.
5. Should it become necessary to have a clearance released when the clearance holder (craft supervisor) is off duty, the procedure will be as follows:
 - The qualified person will contact the clearance holder and request a release of the clearance. If unable to do so, the clearance holder's supervisor will be notified.
 - The supervisor will check the work prior to authorizing the release. They will then sign the clearance holder's name and their own name on the appropriate line of the Shutdown Equipment form.
 - The same procedure applies and the Emergency Lock Removal Form must be used.
6. Any project specific requirements for this section are listed here.
 - None

6. Testing

The following steps will be taken to test equipment or systems under the clearance procedures:

1. Notify all craft supervisors on the Evaluation form that the system and/or isolated components are to be tested.
2. The qualified person along with the craft supervision will "walk down" the system to verify that component isolation/activation will not compromise the safety of personnel working in this area.
3. Each supervisor and the qualified person will sign the test release on the Evaluation form.
4. Affected employee(s) (listed on the Evaluation form) in the immediate area of the isolated test will be notified by verbal warning, barricades, warning tape, etc., or by other appropriate means.
5. Locks will be removed on the isolated component by the qualified person and the test will be completed.
6. If no further work is required, the craft supervisor will initial the Shutdown Equipment form, returning the device into service.
7. If further work needs to be done on the component, the isolation devices (locks, blind, etc.) will be reattached and this policy will resume from the beginning.
8. Any project specific requirements for this section are listed here.
 - None

7. Medium and High Voltage Lockout Procedures (600 + volts)

1. Work on high voltage lines or equipment requires safety precautions in addition to the standard lockout program and procedures.
2. Whenever any high voltage rooms or areas, such as collector ring compartments, are unlocked and de-energized, the following must happen:
 - All personnel working in or near these areas will place their lock and tag on the junction box that is disconnected or at the gate on the appropriate substation or disconnect box.
 - Multiple lockouts will be used so that each employee has a lock and tag in position.
3. Any project specific requirements for this section are listed here.
 - None

8. High Voltage Lines and Equipment

1. When a high voltage line is to be worked on, it must not be considered de-energized until a qualified person determines that the high voltage line has been de-energized and grounded.
2. Qualified persons will visually observe to:
 - Determine that the disconnecting devices on the high voltage circuit are in the open position.
 - Ensure that each ungrounded conductor of the high voltage circuit, upon which work is to be done, is properly connected to the system ground medium.
 - Ground the ungrounded conductor, which will be on the source side of the circuit on which work is to be performed. Grounding jumpers connected to the ground bus will be provided for this purpose. Grounding will be accomplished by the following procedure:
 - Verifying that the feeder disconnect is open and locked out
 - Using a ground stick, ground each ungrounded phase to bleed off any residual electrical charge on the circuit.
 - Attaching grounding jumpers to each ungrounded phase of the circuit on which work is to be performed
 - None
3. High voltage circuits will not be energized until:
 - All work on the high voltage circuit is completed and inspected.
 - All personnel have been cleared from the high voltage area and notified that the circuit will be energized.
 - All protective grounding installed has been removed from ungrounded conductors.
 - The high voltage area has been secured and locked.
4. Any project specific requirements for this section are listed here.
 - None

9. Lockout – General Requirements

1. All energy sources of power-driven equipment will be locked and/or tagged in the off-position when maintenance is being performed.
2. Energy sources that must be locked out include but are not limited to electrical, mechanical, chemical, steam, hydraulic and pneumatic.
3. It is the responsibility of the qualified person to ensure that the proper lockout/tagout procedures are followed.
4. It is the responsibility of the qualified person and the clearance holder performing the maintenance to ensure that all equipment is properly locked and tagged out before starting any maintenance work.
5. Both the qualified person and the clearance holder must check the equipment before restarting it to make sure it is safe to operate.

6. Skanska requires that both lockout and tagout devices be used during equipment maintenance
7. All lockout devices must be:
 - Durable to withstand wear.
 - Substantial so they will not detach.
 - Capable of identifying the person who applied it.
 - Designed for a single use application
8. Available lockout devices include:
 - A disconnect switch, circuit breaker, valve or other energy isolating mechanism that is placed in the safe on or off position
 - A device placed over the energy isolating mechanism to hold it in the safe position
 - A lock attached to the "on" switch to ensure equipment cannot be energized without removal of the lock
9. Any project specific requirements for this section are listed here.
 - None
10. Tagout-General Requirements
 1. Tagout refers to a sign or tag posted on a switch that physically cannot be locked out.
 2. Once the switch has been placed in the off-position, the tag is placed over the switch and warns other employees that the equipment is under maintenance and should not be started.
 3. This tag must also identify the person who applied it. In a tagout, the energy-isolating device is placed in the safe position and a written warning is attached to it.
 4. All tagout materials must be:
 - Durable to withstand wear.
 - Substantial so they will not detach.
 - Capable of identifying the person who applied it.
 - Designed for a single use application.
 5. A lockout or tagout is applied whenever maintenance is performed around any machine where injury could occur from:
 - Unexpected startup of the equipment.
 - Release of stored energy.
 6. Any project specific requirements for this section are listed here.
 - None

EHS Forms and Documents

- [LOTO Emergency Lock Removal Form - LOTO Emergency Lock Removal Form](#)
- [LOTO Shutdown Equipment Form - Shutdown Equipment Form](#)
- [LOTO Evaluation Form - LOTO Evaluation Form](#)

Applicable Training

Management training and communications

Employee will be properly trained to ensure that all affected employee(s) understand the purpose and function of the lockout/tagout policy. The training will include the following:

- Communications
 - Each qualified person will receive training in the recognition of applicable hazardous energy sources, the type and magnitude of the energy available in the workplace and the methods and means necessary for energy isolation and control
 - Each supervisor of the affected employee(s) will be instructed in the purpose and use of clearance procedure
 - All other employees who work in construction or startup operations and may be in an area where energy control procedures may be utilized will be instructed about the procedure and about preventing any attempt to restart or re-energize equipment or systems that are locked out.
 - Any project specific requirements for this section are listed here:
 - None
- Employee Retraining:
 - Retraining will be provided for all clearance holders, qualified persons and affected employee(s) whenever there is a change in their job assignments, equipment, or processes that present a new hazard or when there is a change in the safety clearance procedure

- Additional retraining will also be conducted wherever a periodic inspection of the section reveals or whenever management has reason to believe that there are deviations from or inadequacies in the employee's knowledge or use of the energy control procedures
- Management will verify that employee training has been accomplished and is being kept up to date. The verification will contain each employee's name, dates of training and who conducted the training
- Any project specific requirements for this section are listed here:
 - None

Lockout/Tagout

- Employees performing any service or maintenance work must be made aware of the lockout and tagout program. This also applies to any vendors or subcontractors doing work on company jobsites.
- Employees will be taught the purpose and function of performing the lockout/tagout.
- Employees will receive periodic training to ensure they are up to date and knowledgeable on the lockout/tagout program and procedure.
- Any project specific requirements for this section are listed here:
 - None

Maintenance and Protection of Traffic

Objective

The purpose of the Maintenance and Protection of Traffic (MPT) program is to protect our employees and the public when our projects directly impact traffic. This program will be project-specific according to the environment and needs of the site.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1926.200 Subpart G - Signs, Signals, and Barricades - Accident prevention signs and tags](#)
- [Manual on Uniform Traffic Control Devices \(MUTCD\)](#)
- [OSHA 29 CFR 1926.201 Subpart G - Signs, Signals, and Barricades - Signaling](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 11, §1597-1599](#)
- [American Traffic Safety Services Association \(ATSSA\)](#)

Skanska/Client Requirements

- None

Procedure

When it becomes necessary to temporarily close a public street or alley, a written traffic control plan is required to show how the closure will occur. The plan must be submitted to Skanska for review.

1. Maintenance of Traffic (MT) plan shall include:

1. Copy of current specifications
2. Barricade log
3. Duration of plan
4. Traffic survey identifying conditions (volume, speed, etc.)
5. Existing traffic control measures
6. Photos and/or video of existing conditions along with periodic photos as the plan changes
7. Applicable permits

2. Specialized Vehicles

Projects that require extensive traffic control may set up specific traffic control vehicles with flashing/rotating lights or beacons, sign racks, cone racks, worker platforms, protective railing and impact absorption capabilities, (attenuator trucks). Use the following at a minimum:

1. The cone truck should be a one-ton flatbed outfitted with two warning beacons visible from all directions and a Type II flashing arrow sign controlled from within the cab.
2. There should be two (2) platforms on the truck for employees to stand on while setting out the cone pattern, one (1) on each side built into the bed frame. These can be a stand-in type cages so that the employee can stand upright while placing or removing the cones. This design will help to ensure the safety of the worker while reducing the possibility of an injury due to excessive bending.
3. Fall protection equipment shall be provided to the employees if required.
4. The crash truck should be a five-ton flatbed, outfitted with the same warning devices as the cone truck. Check with local authorities for your area as some require Type I arrow signs on crash trucks.
5. There will be an approved truck-mounted attenuator attached to the rear of the truck for added protection against vehicle impacts.
6. There will be two-way communication between all vehicles and the superintendent in charge of traffic control.
7. Any project specific requirements for this section are listed here.
 - None

3. Flagger Control

1. Flaggers are required when:
 - Workers or equipment intermittently block a traffic lane.
 - Plans call for one (1) lane to be used for two (2) directions of traffic with a flagger at each end.
 - EHS and/or project staff determines there is a need.

- Required by the owner.
 - 2. Flaggers will be trained in the techniques of flagging traffic (i.e., ATSSA and/or state equivalent) before performing this duty.
 - 3. Flaggers will be far enough away from the work to slow or stop traffic before it enters the work zone.
 - 4. During daylight hours, all flaggers must wear a reflectorized garment (ANSI/ISEA 107-240 Class II).
 - 5. At night, all flaggers must wear a reflectorized garment (ANSI/ISEA 107-240 Class III). It is recommended that they also wear reflectorized gloves.
 - 6. From sunset to sunrise, flagger stations must be illuminated so the flagger is clearly visible to approaching traffic.
 - 7. When communicating through radios, a spare battery pack should be readily available.
 - 8. If communication breaks down between the flaggers, the operation is to be shut down immediately until the situation is remedied.
 - 9. Any project specific requirements for this section are listed here.
 - None
4. Documentation
1. One (1) person should be responsible for documenting traffic control.
 2. The same individual should carry out routine inspections of the traffic control installation.
 3. A traffic control inspection report should be completed and signed every day by the designated traffic control person and included in the documentation.
 4. Further documentation will include a camera for recording any accidents or incidents. These pictures will be in a successive series from advance warning, all the way up to and including termination of the traffic pattern.
 5. Documentation records should include:
 - Starting and ending times of work
 - Location of work
 - Names of crew members
 - Types of equipment used
 - Changes in temporary or permanent regulatory devices
 - Installation, change and removal of traffic control devices
 - Drawing of working closure to include all devices
 6. When an inspection requires correction to include maintenance, the documentation should include:
 - A description of the corrections needed, when it was noted and by whom
 - Corrections made or deferred and why
 - Replacements made or deferred and why
 - Any other needed actions
 7. Any project specific requirements for this section are listed here.
 - None
5. Control Warning and Guidance Devices
1. Effective warning and guidance devices are planned out in advance and should be uniformly placed and well maintained. There are six (6) categories of devices:
 - Signs
 - Barricades
 - Delineators
 - High-level warning devices
 - Warning lights/illumination
 - Flashing arrow/message boards
 2. Utilization of Halo has been determined to be a best practice and is recommended for Skanska projects. All signage and traffic control shall comply with the Federal Manual on Uniform Traffic Control Devices (MUTCD) and can be viewed and downloaded at: <http://mutcd.fhwa.dot.gov/>
6. Traffic Signs for Functional Groups
1. Construction signs are used only for construction or maintenance work on or adjacent to the roadway.
 2. Warning signs generally apply to a permanent situation but may have some applications on temporary construction sites.
 3. Regulatory signs are used for posting speed limits, enforced by local law enforcement agencies and maintained by the contractor when placed within or adjacent to the work area.
 4. Sign location depends on alignment, grade, location of street intersections and posted speed limits. The signs must face and be visible to oncoming traffic and be mounted to resist displacement.

5. Advance warning signs are located on the right-hand side of traffic lanes.
6. On divided highways, supplemental advance warning signs will be placed on the divider.
7. Messages conveyed during hours of darkness must be on reflectorized or illuminated signs.
8. Signs will be installed before work begins and will be removed or covered immediately after work has been completed.
9. If at any time a sign is not required, it will remain covered or be removed.
10. Any project specific requirements for this section are listed here.
 - None

7. Barricades

1. Barricades will be used to mark or block off specific hazard or to channel traffic. They may not be placed in a moving lane of traffic without advance warning, such as high level warning devices (e.g., flashing arrow signs) and appropriate delineators.
2. When closing off a street, barricades should be placed to prevent vehicles from passing through, except where access is necessary for local traffic or emergency vehicles.
3. Barricades will be aligned with MUTCD.
4. Marking barricade rails is done by alternating orange and white stripes on a downward slant at 45 degrees. The entire area of white and orange must be reflectorized for night time use. The width of the stripes depends on the size of the rails. Rails less than three feet require four (4) inch wide stripes; all other rails require six (6) inch stripes.
5. Barricades will have a minimum of two hundred seventy (270) square inches of retro-reflective area facing traffic when used on freeways, expressways and other high-speed highways.
6. Barricades with stripes that begin in the upper right side and slope downward to the lower left are designated right barricades. Barricades with stripes that begin in the upper left side and slope downward to the lower right are designated left barricades. Barricades should slope with the direction of traffic.
7. On highways or in situations where barricades are susceptible to overturning in the wind, sandbags should provide ballasting. Sandbags may be placed on lower parts of the frame or stays to provide the required ballast but will not be placed on top of any striped rail.
8. Any project specific requirements for this section are listed here.
 - None

8. Delineators

1. Delineators will be used to aid a driver in determining the location and alignment of the traffic lane.
2. During daylight hours, maximize delineator effectiveness by evaluating position, spacing, form, texture, size and color.
3. During night time, maximize effectiveness by evaluating position and visibility.
4. All delineators used at night must be adequately reflectorized.
5. Delineators are used for the following instances:
 - To channel and divert traffic in advance of work zones.
 - To define traffic lanes through work zones.
 - To define a change in the position of the existing lane around work zones.
 - To define curves and edges of the roadway on detours.
 - Delineators will be constructed to withstand impact without appreciable damage to the device, the striking vehicle or passing traffic, including damage from knockdown by wind or turbulence from passing vehicles.

Minimum Recommended Delineator and Sign Placement				
Traffic Speed	Taper Length (Each Lane)	Delineator (Taper)	Spacing (Tangent)	Sign Spacing (Advance of Taper & Between Signs)
25 MPH	150 Feet	25 Feet	50 Feet	150 Feet
30 MPH	200 Feet	30 Feet	60 Feet	200 Feet
35 MPH	250 Feet	35 Feet	70 Feet	250 Feet
40 MPH	350 Feet	40 Feet	80 Feet	350 Feet
45 MPH	550 Feet	45 Feet	90 Feet	550 Feet
50 MPH	600 Feet	50 Feet	100 Feet	600 Feet
55+MPH	1000 Feet	50 Feet	100 Feet	1000 Feet

9. Warning Lights/Illumination

1. Lights should be used on top of channelizing devices for intermediate and long-term closures especially at tapers, shifts and turnarounds.
2. Illumination should be provided in lane closures at night.
3. Any project specific requirements for this section are listed here.
 - None

10. Flashing Arrow/Message Signs

1. Panels with a matrix of electric lights, capable of sequential arrows displays or messages are intended to supplement, not replace, other work area traffic control devices by providing additional, high level, advance warning of lane closures. They are effective for all lane closures and should be considered for all high-speed situations.
2. Flashing arrow/message signs will be repaired immediately or taken out of service if:
 - Any of the lamps are out.
 - The panel is not dimming properly.
 - Lamps are out of alignment.
3. Any project specific requirements for this section are listed here.
 - None

11. Day Closures

1. Devices should be installed in the direction of traffic in the following order:
 - First advance warning sign
 - Advance warning zone
 - Transition zone
 - Buffer zone
 - Work zone
 - Termination zone
2. When signs and channelizing devices are installed and removed several times during an operation, a spot should be painted or marked where each sign or device is located to minimize time required to reset the signs or devices.
3. Flashing vehicle lights should be used to warn the drivers of the presence of workers.
4. All aspects of the closure should provide clear, concise direction to all drivers. Be sure of positioning and visibility of all signs, flashing arrow/message signs, barricades and delineators.
5. Any part of the pattern that has been disturbed should be reset as soon and as quickly as possible.
6. Any project specific requirements for this section are listed here.
 - None

12. Night Closures

1. During night operations, a back-up, shadow or protection vehicle should be used and should be positioned one hundred (100) feet or more behind the cone truck as the first signs are placed. This process is to be followed for set-up and teardown.
2. All crews working in or around the closure need to be outfitted with personal protective equipment, including bright clothes conforming to ANSI standards, hard hats, safety glasses, gloves and Class III reflectorized vests.
3. All employees should be visible at a distance of one thousand (1,000) feet.
4. If working together, crews/workers should wear the same clothing to prevent confusing approaching motorists.
5. Other applicable accessories may include retro reflective striping on hard-hats.
6. Before making night-time closures, all materials and equipment must be inspected and in good working order.
 - All message boards and flashing arrow signs will be tested to ensure all lights and switches are functioning properly and that the equipment is fueled and fully charged.
 - All inspections and maintenance procedures will be documented daily and/or nightly.
7. Devices maintained in project inventory will be kept clean, stored properly to avoid marring and organized to verify that all items are in stock and readily retrievable.
8. Devices will be inspected when they are returned to inventory.
9. Any devices that are non-standard or in poor condition will be retired, modified or repaired.
10. Any project specific requirements for this section are listed here.

Material Handling and Storage

Objective

The purpose of this program is to establish safe procedures for material loading/unloading, storage, use and disposal. By properly handling materials with mechanical means, safe work practices and correct storage methods, the risk of injury and illness is reduced.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1926.251 Subpart H - Materials Handling, Storage, Use, and Disposal - Rigging equipment for material handling.](#)
- [Federal Motor Carrier Safety Administration 40 CFR 112.7\(h\)\(2\) & \(3\)](#)
- [Federal Highway Administration](#)
- [OSHA 29 CFR 1926.1501](#)
- [California Code of Regulations, Title 8, Subchapter 7, Group 15, Article 106 §5110-5120](#)
- DOT 49 CFR Parts 393.100-136
- [OSHA 29 CFR 1926.250 Subpart H - Materials Handling, Storage, Use, and Disposal - General requirements for storage](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 7, §1548-1549](#)

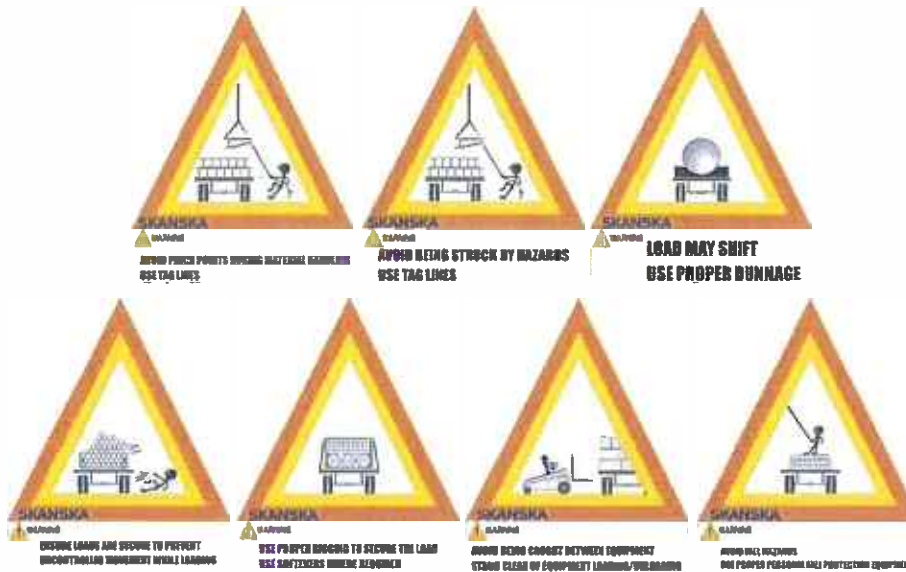

Skanska/Client Requirements

- None

Procedure

1. Loading and Unloading

1. All employees involved with the loading or unloading of materials will be trained in accordance with the requirements of this program. Exceptions to this program must be approved by the Skanska regional EHS Director.
2. Designate roles in loading/unloading operations, such as escort, spotter, flagmen, operator and competent person who will be involved in any activity involving loading/unloading.
3. Implement measures necessary to prevent unauthorized or unsupervised material handling for loading/unloading operations by competent person.
4. Ensure procedures are reviewed regularly to verify adequacy and adherence.
5. Ensure deficiencies in procedures are corrected before subsequent loading/unloading operations are authorized to continue.
6. Ensure safe access to truck bed during loading and unloading operations.
7. Examples of circumstances requiring the review of the loading/unloading program are:
 - Any observed unsafe acts that are against this policy or any other company policy.
 - Any observance of an unescorted delivery.
 - Any observance of an unsupervised loading/unloading activity.
 - The occurrence of an injury or near-miss during loading/unloading.
 - Employee complaints about the effectiveness of the program.
8. The decals below shall be applied to all Skanska-owned vehicles involved in loading or unloading on jobsites.

2. Escorting

1. Preloading/Unloading Procedure

1. All deliveries must be scheduled in advance of the anticipated delivery date and time.
2. A crewmember shall meet the delivery driver at project entrance.
3. Inspect load for movement/shifting during transit prior to accepting delivery.
4. Any loads that exhibit signs of shifting or movement during transit will not be accepted.
5. Use a flagger to spot vehicles in designated unloading area.
6. Loads must remain strapped/chained until in the designated unloading area.
7. Ensure that the truck or trailer does not move during loading or unloading with any piece of equipment by engaging the parking brake and chocking the wheels.
8. Designated loading and unloading areas shall be:
 - Clear of other traffic, pedestrians and people not involved in loading or unloading of materials
 - Clear of overhead electrical hazards/obstructions
 - Firm level ground

2. Loading the Truck and Trailer: Before the Tie-Downs Are Applied

1. The gross vehicle weight rating (GVWR) of a truck and trailer stipulates the maximum cargo weight that the unit may carry. Exceeding the GVWR is dangerous: brakes work less efficiently, tires loose air pressure and springs may be stressed to the limit.
2. Proper placement of materials must always be pre-planned. Placing a load too far back on a long trailer may cause fishtailing and placing it too far forward on a trailer can overload the tongue, making steering difficult.
3. Considerations:
 - Vehicles must never be overloaded.
 - Loading should allow for safe unloading.
 - The load must be distributed so that the maximum permitted gross vehicle weight and axle weights are not exceeded.
4. The load center of gravity is kept as low as possible to achieve maximum stability when the vehicle is braked, or accelerated or changes direction.
5. Unauthorized individuals will not be permitted into the loading area.
6. The designated competent person shall be in place to observe all loading activities.
7. Ensure the designated loading area is clear of all obstructions.
8. Ensure vehicle and trailer brakes applied and all stabilizers, wheel chocks and interlocks are engaged prior to the commencement of loading activities.
9. Drivers shall not remain in their cabs during loading activities unless required and authorized by Skanska management.
10. Ensure all vehicle floors and/or decking areas are inspected for debris, broken boarding, etc. prior to the placement of any loads.
11. Spotter should be in place when opposite side of load is not visible and maintain visual/audible communication with the operator and where needed.
12. Proper personal fall protection equipment shall be in place for all employees who are required to work from

13. Proper dunnage/cribbing must be in place prior to landing/placing the materials on the trailer.
14. Ensure lift plan, as required, is developed in the construction work plan.
15. Taglines are required if load is being moved overhead.
16. Rope hooks shall not be used to anchor loads. Rope hooks are not subject to construction standards and vary in strength, size and material content and are rarely designed to withstand forces.
17. All materials being loaded shall be secured to ensure no loose items.
18. Secure load in place with two straps at a minimum.
19. Fixed jacks may be necessary to support a semitrailer and prevent upending during loading or when the trailer is not coupled to a tractor.
20. Material handling form used for logging in materials being loaded and unloaded are as follows:

#	ITEM	CHECKS	CHECKS	COMMENT
1	Cargo:	Make sure all equipment is not damaged or missing		
2	Cargo/Load Distribution	Cargo is evenly distributed and lighter cargo is stacked on top of heavier freight; the cargo level and placement		
3	Cargo Material	Cargo is identified, tagged, banded or strapped and is in place right to prevent movement		
4	Cargo/Load	Check direction of cargo to vehicle orientation Does the cargo need to be tagged in the front? Is the load older than the best? Is a DOT Permit		
5	Surfaces	Check the top of the unit to ensure against the cargo		
6	Wheels	Check the cargo need to be distributed evenly		
7	Chassis and Fuel Tanks	Make sure there are cracks, leaks, water, leaks, fuel, electrolyte, and air pressure		
8	Interior Vehicle	Check interior for equipment all goods: Check for leaks, fuel, water, and air pressure		
9	Sealing points for doors	Check sealing points for air and water leaks Pressure sealing points are not tight and/or of equal or greater than strength ratings		
10	Equipment for doors	Check the unit, wheels are checked, hoses, air, fuel, and fueling backed down. Ensure that there is enough air, fuel, water, and air pressure		
11	Inspected during inspection	Check the unit, wheels are checked, hoses, air, fuel, and fueling backed down. Ensure that there is enough air, fuel, water, and air pressure		
	CITY	DATE	ITEM	TOTAL

RECEIVER
Do Not begin any offloading until you
have reviewed the checklist on rear of
card

1. Unauthorized individuals will not be permitted into the unloading area.
2. The designated competent person shall be in place to inspect the load for stability and any shifting that may have taken place during transit and to observe all unloading activities.
3. Ensure the designated unloading area is clear of all obstructions.
4. Ensure vehicle and trailer brakes are applied and all stabilizers, wheel chocks and interlocks are engaged prior to the commencement of unloading operations.
5. Drivers shall not remain in their cabs during unloading operations unless required and authorized by project management.
6. Spotter should be in place where needed and maintain visual/audible communication with the operator.
7. Proper personal fall protection equipment shall be in place for all employees who are required to work from heights (six (6) feet or greater fall hazard) while unloading materials.
8. Proper dunnage/cribbing must be in place prior to landing/placing the materials in the designated storage area.
9. Ensure lift plan, as required, is developed in the construction work plan.
10. Taglines are required if load is being moved overhead.
11. Rope hooks should not be used to anchor loads. Rope hooks are not subject to construction standards and vary in strength, size and material content and are rarely designed to withstand forces.
12. The delivered material shall be in a condition to ensure safe unloading.
13. Fixed jacks may be necessary to support a semitrailer and prevent upending during the unloading when the trailer is not coupled to a tractor.

Hazardous material loading/unloading

1. Identify and communicate special handling and storage requirements for all hazardous materials prior to loading and unloading.

Dunnage Do's and Don'ts

Load Weights - Calculating

Materials and Liquids - Pounds / cu. ft.			Pounds / sq. ft.		Pounds / gal.
Aluminum	165	Iron Casting	450	Steel plate	Gas 6.0
Asbestos	153	Lead	708	• 1/8" 5	Diesel 7.0
Asphalt	81	Lumber - Fir	32	• 1/4" 10	Water 8.3
Brass	524	Lumber - Oak	62	• 1/2" 20	
Brick	120	Lumber - RR Ties	50	• 1" 40	
Bronze	534	Oil, Motor	58	Aluminum plate	
Coal	56	Paper	58	• 1/8" 1.75	• 7.5 gallons of liquid to a cubic foot
Concrete, Reinf.	150	Portland Cement	94	• 1/4" 3.50	• 27 cubic feet to a cubic yard
Crushed Rock	95	River Sand	120	Lumber	• 2,000 lbs = 1 U.S. ton
Diesel	52	Rubber	94	• 3/4" Fir 2	
Dry Earth, Loose	75	Steel	480	• 3/4" Oak 4	
Gasoline	45	Water	63		
Glass	162	Zinc	437		

Formulas and Information					
• H = Height	• W = Width	• L = Length	• d = diameter	• r = 1/2 diameter	• $\pi = 3.2$ (approx.)
• Area of square or rectangle = LW • Vol. of cube = HWL • Area of circle = πr^2 • Circumference = πd					
• The area of a circle is approx. 80% of its diameter squared (diameter x diameter)					
• Load Weight (to estimate) _____ Volume in cu. ft. x 500 lbs. x density factor .02, .10, .20, .30 etc.					

Formulas and Information

• H = Height • W = Width • L = Length • d = diameter • r = 1/2 diameter • $\pi = 3.2$ (approx.)
 • Area of square or rectangle = LW • Vol. of cube = HWL • Area of circle = πr^2 • Circumference = πd
 • The area of a circle is approx. 80% of its diameter squared (diameter x diameter)
 • Load Weight (to estimate) = Volume in cu. ft. x 500 lbs. x density factor .02, .05, .10, .20, .30 etc.

6. Load Distribution on Trailers

Distance Requirements for Overhead Power Lines

7. Material Storage

1. Plan for accessibility and safe clearances of designated storage space.
2. Passageways, traffic routes and rail beds will be identified and not be obstructed.
3. All storage space will be kept organized and free of debris.
4. Materials stacked above six (6) feet in height shall be banded or otherwise secured and warning signs posted.
5. Permanent passageways should be marked to ensure safe access.
6. Proper drainage must be established before the storage of materials is initiated.
7. All parts of cranes and material handling equipment, including loads hoisted, should be kept at least ten (10) feet from energized overhead electrical lines or equipment. Minimum clearance will change according to line voltage in cases where voltage exceeds 50 kV.
8. Underground utilities must be given sufficient protection from loads imposed by equipment and materials.
9. Material must be stored in accordance with its compatibility as indicated on the Safety Data Sheet.
10. Materials shall be secured to prevent sliding, falling or collapsing.
11. Load limits for the floor or shelf being used for storage must be determined by a qualified person and not exceeded.
12. Equipment or materials stored inside a building under construction will not be placed within six (6) feet of any hoist way or inside floor openings, nor within ten (10) feet of an unenclosed exterior perimeter.
13. Materials will not be stacked above or against the guardrails.
14. Stacking of materials should be based on the frequency of need. Special bins shall be used for odd shapes or fragile material and height limitations shall be determined when planning storage space.
15. Lumber shall not be stacked more than sixteen (16) feet high if moved by hand or more than twenty (20) feet high if moved by forklift.
16. All nails must be removed from used lumber before stacking. Lumber must be stacked and leveled on solid supports and the stacks must be stable and self-supporting.
17. Stacks of loose bricks shall not be greater than seven (7) feet high. At four (4) feet, the stack will be tapered back two (2) inches for every foot above four (4) feet. At six (6) feet, the stack will be tapered back one-half block for each tier above six (6) feet.
18. Bags and bundles must be stacked in interlocking rows to remain secure.
19. Bagged material must be stacked by stepping back the layers and cross-keying the bags at least every ten (10) layers.

20. Boxed materials must be banded or held in place with cross-ties or shrink wrap plastic fiber when stacked.
21. Drums, barrels and kegs must be stacked symmetrical. When stored on their sides, bottom tiers must be blocked to prevent rolling.
22. If stacking material two (2) or more tiers high, the bottom tier must be choked to prevent shifting in either direction.
23. When stacked on end, planks or sheets of plywood or pallets must be placed between each tier to provide a flat, firm surface.
24. Cylindrical materials, bar stock and structural steel must be blocked or stored in racks.
25. Racks will not face main aisles or traffic lanes nor create hazards to passersby when supplies are being removed. When racks are not available, material will be stacked and blocked to prevent spreading or tilting.
26. Large structural steel beams will be placed on solid level ground. They should be braced, especially when the height exceeds the width, to prevent accidental tipping over.
27. Any project specific requirements for this section are listed here.
 - None

8. Banding

1. Hazards associated with steel strapping include shifting or moving loads, loose ends, whipping, improper use of banding as handholds, tripping over banding and cuts from sharp edges.
2. Banding shall be removed with caution because loads may have shifted during transport and can tumble when tension is released.
3. When tension is released from removal of banding or breaks caused by incorrect strapping, loose ends will whip away from the package with enough force to cause serious injury. Always use caution when working around bundles strapped under pressure.
4. Banding is not to be used as a handhold to access the load.
5. Steel straps shall be disposed of as soon as possible to avoid tripping or cutting hazards.
6. Banding machines must be kept in good condition and employees using the machine will be properly trained.
7. When applying or removing banding, ensure proper hand protection is utilized.
8. Loose fitting clothes are not permitted when working around strapping machines.
9. Safe removal of banding from bound material will be with tools designed to cut steel banding. Claw hammer, crowbar, chisel or anything that applies leverage is prohibited when removing banding.
10. Employees and/or machinery must be clear of the work area when removing banding.
11. Two-hand operated strap cutters are recommended because they are designed to cut the strap and absorb the energy released when the strap is cut.
12. Straps should be cut square and not at an angle.
13. Any project specific requirements for this section are listed here.
 - None

9. Manually Moving Materials

1. Inspect materials for any laceration hazards or splintering.
2. Determine the weight of the load before applying force to move it.
3. Identify and walk the intended pathway and ensure it is clear of any hazards.
4. Use gloves and forearm protection when handling sharp-edge materials.
5. Get assistance for large and/or heavy loads.
6. Get assistance when visibility is imposed due to load size.
7. Use dunnage blocks under raised loads that require manual placement.
8. Attach handles and holders to loads when possible to reduce pinching or smashing fingers.
9. Any project specific requirements for this section are listed here.
 - None

10. Manually Operated Mechanisms

1. Wheel wells with safety hooks, jibs or other lifting mechanisms should be used when manually lifting material overhead.
2. Equipment is to be installed as per manufacturer's recommendations.
3. Lifts are to be reviewed by competent person.
4. Hoist all loads with tag lines.
5. When lifting all loose materials shall be secured to prevent materials from slipping out of rigging.
6. Any project specific requirements for this section are listed here.
 - None

11. Moving Long and/or Bulky Materials

1. Any material that may carry a wind load requires two (2) or more employees to handle.
2. Any project specific requirements for this section are listed here.
 - None

12. Mechanically Moving Materials

1. Barrels must always be picked with a proper lifting device. Cutting lifting eyes into barrels to move is not acceptable.
2. Weight, size and shape of the material must be determined when selecting equipment to move it.
3. Consult the equipment's rated load chart to determine maximum weight and condition capacity. Rating charts shall be available to the operator and not exceeded.
4. Ensure that loads are centered and stable against shifting.
5. Keep the load in the lowest position possible on the equipment for traveling.
6. Stacked loads on pallets shall be correctly piled and cross-tiered and secured with banding if necessary.
7. The water line and weight capacity of scale boxes and skip buckets must be clearly identified.
8. Scale boxes or skip buckets used for moving material or debris must be permanently rigged with a bolt and pin shackle and may not be loaded above their water line or exceed weight capacity.
9. Lifting boxes must be proof tested by a qualified person to one hundred twenty five percent (125%) capacity.
10. Daily visual inspections must be performed on all lifting boxes.
11. Any project specific requirements for this section are listed here.
 - None

3. Conveyors

1. General Requirements

1. Employees must never ride on material handling conveyors.
2. Where the conveyor passes over work areas or aisles, guards must be provided to keep employees from being struck by falling objects.
3. Crossovers must be guarded to protect employees and either marked with a warning sign or painted a highly visible color.
4. Screw conveyors must be completely covered except at loading and discharge points.
5. Any project specific requirements for this section are listed here.
 - None

2. Guards and Emergency Stops

1. Guards must be provided at loading and discharge points to protect employees from contacting the moving screw.
2. Guards are moveable and must be interlocked to prevent conveyor movement when not in place.
3. Emergency buttons or pull cords designed to stop the conveyor must be installed at the employee workstation or the station must be adequately guarded to positively prevent all injury exposure.
4. Access points on the conveyor should have an emergency stop cable that extends the entire length of exposed belt or be guarded.
5. The emergency stop switch must be designed to be reset before the conveyor can be restarted.
6. Any project specific requirements for this section are listed here.
 - None

4. Disposal of Waste Material

1. General Requirements

1. When materials must be dropped more than twenty (20) feet to any point lying outside the exterior walls of a structure, an enclosed chute of wood or equivalent material will be used as a ramp.
2. When debris is dropped through holes or openings in the floor without the use of a chute, the area onto which the material is dropped will be completely enclosed with barricades.
3. Enclosure requirements:
 - Physical barricades must be at least forty-two (42) inches high and at least six (6) feet back from the projected edge of the opening above.
 - Wind velocity and its potential for carrying materials should be calculated into the disposal plan.
 - Signs warning of the hazard of falling materials should be posted at each level.
 - A spotter shall be posted at the area of retrieval to keep area clear of unnecessary traffic.
 - Debris will not be removed from the disposal site until all handling ceases from above.
4. All scrap lumber, waste material and rubbish shall be removed from the immediate work area as the work progresses.
5. All solvent waste, oily rags and flammable liquids shall be kept in fire resistant covered containers until removed from the jobsite.

6. Any project specific requirements for this section are listed here.

Procedure

Mobile Elevating Work Platforms (MEWPs), including telescoping boom platforms, articulating boom platforms, scissor lifts and vertical towers/lifts are covered by this program.

1. All Group B MEWPs (e.g., boom lifts) shall be fitted with appropriate primary or secondary guarding devices in an effort to eliminate operator crushing incidents. A primary guarding device is a physical structure that prevents the operator from being crushed. A secondary guarding device is an alarm and/or sensor bar that alerts ground personnel when the operator is in a potential crush hazard. In the event that primary guarding or secondary guarding is not available, a spotter who has no other responsibilities shall be at the MEWP's emergency controls at all time.
2. MEWPs designated as "indoor" only models shall not be used outdoors (i.e., anywhere the MEWP would be subjected to wind). For MEWPs with "indoor/outdoor" settings, only the "outdoor" setting shall be used when the MEWP is subjected to wind.
3. The working surface shall be assessed prior to MEWP operation to ensure it is adequate to support the weight of the MEWP.
4. A written rescue plan shall be in place prior to MEWP operation. The rescue plan shall:
 1. Be incorporated into operator, supervisor and occupant training
 2. Limit the time that a worker is suspended in the air
 3. Define type(s) of rescue to be employed:
 - Self-rescue = by the person involved
 - Assisted rescue = by others in the work area
 - Technical rescue = by emergency services
 4. All MEWPs used must be equipped with a one-step emergency lowering procedure. Those with a 2-3 step emergency lowering procedure will not be allowed to be used
5. During operation of the MEWP, an individual trained on emergency ground control processes shall be in reasonable proximity to ground controls to respond to an emergency.
6. In the event that an MEWP is stuck, the operator must immediately shut off the MEWP and summon help.
7. MEWPs shall be maintained and inspected in accordance with the manufacturer's recommendations and ANSI standards. Required documented inspections include:
 - Frequent inspections=every three months or 150 operating hours, whichever comes first
 - Annual inspections at least every twelve (12) months shall be documented on the MEWP to identify the date of the last annual inspection
8. MEWP operators shall be trained on the safe operation of the equipment, selection of the proper MEWP, risk assessment, rescue planning and occupant training.
9. MEWP occupants (anyone in the MEWP who is not an operator) shall receive training on fall protection systems and what to do if the operator is unable to operate the lift.

10. Employees who directly supervise one or more MEWP operators shall receive MEWP supervisor training.
11. Prior to use, employees shall perform a documented inspection on the MEWP. Inspections shall be in accordance with the manufacturer's requirements.
12. Employees shall ensure that copies of the manufacturer's operating manual are with each MEWP.
13. Employees shall wear a full body harness and be tied off with a self-retracting lifeline (SRL) to the manufacturer's designated anchorage point at all times while operating the MEWP.
 1. Decelerating lanyards are not permitted. SRLs manufactured with decelerating lanyards are acceptable.
 2. Static fall restraint lanyards are permitted in 3A MEWPs (e.g., scissor lifts).
14. While working from a MEWP, tying off to an adjacent structure or equipment shall not be permitted unless designed for that purpose or appropriate engineering design checks have been conducted.
15. Operators and their supervisors shall be held accountable for the safe operation of the MEWP to which they are assigned. If the MEWP is operated in an unsafe manner, the operator shall be subject to disciplinary action up to, and including, termination.
16. Employees shall always stand firmly on the platform of the lift. An employee shall never stand, sit or climb on the edge of the platform, or use any type of ladder, plank or other device as a work positioning system unless approved by the MEWP manufacturer.
17. The gates of MEWPs shall be properly engaged whenever the MEWP is in use.
18. Boom or basket load limits shall not be exceeded for any reason.
19. MEWPs shall not be used as material hoists unless the load is contained within the basket and meets the MEWP's rated capacity. The MEWP shall not be modified for hoisting, lifting or positioning of material unless approved by the manufacturer.
20. An MEWP shall not be moved when the boom is extended in a working position and employees are in the platform, unless the equipment has been specifically designed for this purpose.
21. The insulating components of an MEWP shall not be altered or integrity compromised in any way to reduce its insulating value.
22. Operational MEWPs must maintain a minimum of 10 feet clearance from power lines in accordance with OSHA 1926 subpart K.
23. Any project specific requirements for this section are listed here.

Motor Vehicles and Mechanized Equipment

Objective

The purpose of this program is to establish rules and regulations for safe operation of motor vehicles and mechanized equipment.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1926.601 Subpart O - Motor Vehicles, Mechanized Equipment, and Marine Operations - Motor vehicles](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 11, §1597-1599](#)
- [OSHA 29 CFR 1926.600 Subpart O - Motor Vehicles, Mechanized Equipment, and Marine Operations - Equipment](#)
- [California Code of Regulations, Title 8, Subchapter 7, Group 16, Article 107 §5146](#)
- [OSHA 29 CFR 1910.178 Subpart N - Materials Handling and Storage - Powered industrial trucks](#)
- [OSHA 29 CFR 1926.20 Subpart C - General Safety and Health Provisions - General safety and health provisions](#)

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. Employees shall have appropriate license and/or training to operate vehicles and equipment.
2. Parked equipment, one (1) ton or greater in capacity, shall have a wheel chocked and parking brake set.
3. Modifications affecting the equipment's safe operation shall not be made.
4. Complete visual equipment inspections and applicable checklists prior to each use and submit to supervisor daily.
5. Correct identified safety defects before equipment use. Seat belts shall be worn while operating vehicles and equipment with roll over protective structures (ROPS).
6. Equip construction vehicles greater than a pickup truck with an audible reverse signal alarm. A "white noise" alarm may be required in urban areas. Remove construction equipment without alarms from service or provide a spotter.
7. Parked -equipment unattended overnight any must have lights or reflectors. All hauling vehicles, loaders, cranes, shovels, etc., shall have a cab shield and/or canopy.
8. Equip all rubber-tired equipment with manufacturer provided fenders.
9. Secure tools and equipment in employee compartment when transported.
10. Never short across the starter terminals batteries as this could bypass the engine neutral-start system as well as damage the electrical system.
11. Mount and dismount the equipment at the manufacturers recommended access points.
12. Passengers are not permitted in equipment cabs unless additional seat, seat belt, and ROPS or falling object protective structure (FOPS) are provided.
13. Riding in the bed of pick-up trucks is prohibited.
14. Do not operate equipment above posted speed limits.
15. Pushing equipment with vehicles or other equipment is strictly prohibited.
16. Any project specific requirements for this section are listed here.
 - None

2. Backing and Spotters

1. All equipment reversing operations shall be controlled.
2. Use a spotter when workers on foot are exposed to reversing operations.
3. Designated Spotters shall be used where the vehicle or equipment has an obstructed view to the rear, except when approved controls are identified in the Construction Work Plan.
4. Spotters shall be trained, designated and identified.
5. Designated spotters will be personnel assigned to reverse signaling activities and shall have the following:
 - A minimum ANSI approved Class 2 safety vest and spotter gloves during daytime operations
 - A minimum ANSI Class 3 safety vest and two lighted red traffic wands during nighttime operations
 - During all operations the designated spotter shall be visible at a minimum distance of one thousand (1,000) feet.

6. Spotters shall not engage in any activities other than those related to the signaled vehicle or equipment.
7. Spotters shall always maintain a safe working distance from the vehicle or equipment and visual contact with the operator, and shall not cross behind vehicles or equipment.
8. If the operator loses visual contact with the spotter, the vehicle shall immediately stop until visual contact with the spotter is reestablished.
9. Light duty vehicles, which DO NOT have a reverse signal alarm and an obstructed view to the rear, are required to do the following:
 - Before reversing, perform a three hundred sixty (360) degree visual inspection, sound the horn with two (2) short blasts and wait two (2) seconds before proceeding.
 - Reverse the vehicle into a parking space upon arrival or pull through to eliminate the need to back out of a parking space or work area.
10. Vehicles and equipment with video or proximity sensor technology are NOT exempt from the use of a spotter if the operator has an obstructed view.

3. Maintenance

1. Implement an equipment maintenance program.
2. All equipment is required to be locked and tagged out prior to maintenance operations.
3. Block or crib heavy equipment suspended by slings, hoists or jacks to prevent falling and shifting. Provide safety tire rack cage or equivalent protection when changing tires with split rims or rims equipped with locking rings.
4. Equip trucks with dump bodies with permanent positive protection capable of locking to prevent accidental lowering of the body during maintenance or inspection work.
5. Replace all damaged or worn parts prior to use.
6. Any project specific requirements for this section are listed here.
 - None

4. Safe walkways

1. Delineate safe walkways, haul routes and work zones.
2. The following are best practices used when installing walkways:
 - Avoid personnel versus machine interface. All personnel shall stay at least 25 feet away from active heavy equipment until visual contact has been made with the operator and the operator has acknowledged the close proximity.
 - Maintain eye contact with operators when walking near any equipment or vehicles.
 - Use barricades and delineators to establish pedestrian and safe access walkways within work zones. Established walkways are NOT PPE free zones, unless otherwise posted.
 - Use construction barrels to delineate haul routes and equipment paths.
 - Maintain barricades, delineators and barrels on a daily basis.
 - Consider installing swing gates at the entrance/exit of each walkway.

Delineators used for walkway

Entrance/Exit swing gate

Pile Driving

Objective

The purpose of this program is to establish a safe operating procedure for the use of pile drivers and pile driving equipment.

Legal and Other Requirements

Federal, State, Local Regulations

- American Society of Mechanical Engineers, Pressure Vessels Codes Section VIII
- [California Code of Regulations, Title 8, Subchapter 4, Article 12, §1600-1601](#)
- [OSHA 29 CFR 1926.603 Subpart O - Motor Vehicles, Mechanized Equipment, and Marine Operations - Pile driving equipment](#)

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. Identify potential risks (overhead power lines, underground utility vaults, unstable ground, existing utilities, etc.) pertaining to driving and cutting piles.
2. Provide adequate manpower for safe execution of all pile driving and cutting activities.
3. Pile paths will be clear. Pile driving work will not occur until verification of underground utilities is completed and existing underground utility locations are verified by hand or vacuum excavation.
4. Identify geologic bearing strata profiles prior to executing pile driving operations.
5. Procure the appropriate pile lengths and place in relation to the geologic bearing profiles to limit excessive pile lengths cut above grade.
6. Loading and offloading of piles or sheets from trucks with beds over six (6) feet high requires fall protection.
7. All employees conducting pile operations above six (6) feet will use one hundred percent (100%) fall protection, including while in a mobile elevating work platform (MEWP).
8. Keep all personnel clear when piling is hoisted into the leads.
9. Outriggers and rubber-tired equipment must be in position to provide maximum stability when in use.
10. Use mats and cribbing for support in cuts, fills or other areas where soil may be unstable
11. Ground operated mechanical pile-headers and remote release shackles shall be the first choice when planning operations.
12. Steam or air supply lines shall have shut off valves within easy reach of operators.
13. Use appropriate support of excavation (SOE) for piles driven in an excavated pit.
14. Keep employees beyond the range of falling materials as steel pipe piles are "blown out."
15. Attach a tag line to steady the blow pipe during operations.
16. Take precautions to prevent exposure to falling objects (cushion blocks, auger spoils, pile chips, and steel debris).
17. Personnel involved with the pile driving operation will not stand in front of the leads while driving piles.
18. Workers guiding piles into the leads, shall not place arms or hands between the pile and the inside guide or on top of the pile.
19. Provide blocking on top of booms to prevent damage to lacing from hoist line whipping.
20. A secured ladder shall extend the height of the rig and be maintained in good condition.
21. Provide stop-blocks for the leads to prevent the hammer from raising against the head-block.
22. Protect employees working below the hammer, by providing a blocking device capable of safely supporting the weight of the hammer. Provide guards across the top of the head-block to prevent the cable from jumping out of the sheaves.
23. When the leads must be inclined in the driving of batter piles, stabilize the leads.
24. Fixed leads will be provided with a ladder, adequate rings and a safety climbing device.
25. Use guardrails to protect leads provided with platforms.
26. Use a closed shackle or a positive means of attachment when hoisting piling to prevent accidental disengagement.
27. Riding the ball, hook or loads is prohibited.

28. A boatswain's chair is not allowed during any pile driving activity.
29. Use a pile extractor if piling cannot be pulled without exceeding the load rating of equipment.
30. Dogs on pile driver hoist drums that automatically disengage either by relieving the load or rotating the drum will be prohibited.
31. Lower pile hammers to the bottom of leads while pile driver is moved.
32. Provide safe access to the top of the crane and any attached power units.
33. A certified and/or qualified signal person shall perform all signaling.
34. Coordinate access into a pile driving area with the pile driving foreman.
35. Secure hose connections with at least one and a quarter (1 ¼) inch diameter chain or equivalent wire rope to prevent whipping.
36. Stirrups will be provided on sheet piling to aid in guiding the pile into place.
37. A driving head or bonnet is required to bell the head for piles other than sheet piles.
38. Provide pit access ladders and edge protection methods to prevent material from falling into the pit.
39. Follow engineered design solutions specific to the pile type/dimensions, including support tab patterns, allowing for safe removal.
40. Review plumb of pile prior to cutting to determine potential for eccentric loading risk.
41. Pile sections more than five (5) feet above grade must be secured, removed and lowered by mechanical means (e.g., loader, excavator, pile driving rig, crane, etc.).
42. Pile sections less than five (5) feet may be manually displaced, using tab utilization process, in conjunction with safe working practices detailed in Construction Work Plan.
43. Establish, when possible, a controlled access zone two and a half (2 ½) times the length of the longest pile that is to be cut during pile top cutting operations.
44. No pile driving activity is to take place within the controlled access zone (CAZ).
45. Any project specific requirements for this section are listed here.
 - None

2. Personal Protective Equipment (PPE)

1. Provide adequate hearing protection based on occupational noise monitoring.
2. When driving creosoted wood piles, hammer impact may spray creosote, injuring the eyes, skin and lungs. Double eye protection, protective suits and respiratory protection may be required.
3. Any project specific requirements for this section are listed here.
 - None

3. Inspection and Maintenance of Pile Driving Equipment

1. The use of metal-armored hoses is recommended when possible.
2. Secure all hose connections with at least one and a quarter (1 ¼) inch diameter chain or equivalent wire rope to prevent whipping or spraying of steam or air.
3. Repair or replace defective air or steam hoses in accordance with the manufacturer's recommendations before reuse.
4. Lubricate all moving parts in the lead in accordance with manufacturer's recommendations.
5. Provide whip checks, or equivalent means, to prevent hoses from thrashing around if couplings disconnect.
6. Check hooks, slings, leads and all other connections for damage and cracking prior to mobilization and periodically during use.
7. Relieve pressure from lines when shutting down rigs.
8. Lower hammer to the base of the leads and block when not in use.
9. Lock and tag out all equipment prior to maintenance operations. Consider steam and/or air pressure.
10. Any project specific requirements for this section are listed here.

Pressurization of Piping Systems

Objective

This chapter is for the pressure testing of piping. Prior to initial operation of piping systems, testing must be conducted to check for leaks. Typically, the types of testing are pneumatic or hydrostatic. Regardless of the testing method used, the testing process is considered dangerous and must be performed with caution. To ensure the safety of personnel and the public, safety precautions must be enacted prior to conducting a test.

Legal and Other Requirements

Federal, State, Local Regulations

- ASME B31.9 – Building Services Piping - ASME B31.9 – Building Services Piping
- NFPA 24.2.2.1 - NFPA 24.2.2.1

Skanska/Client Requirements

- None

Procedure

There must be a detailed plan, completed checklists, and completed test permit prior to any pressurization of piping systems and/or the use of pneumatic plugs. Refer to MCAA Guide to Pressure Testing Safety for sample checklists. The plan (written by the project team or subcontractor, depending on who is performing the pressurization) must, at a minimum, address the following:

1. Reason for pressure test (reference applicable contract requirements and specifications).
2. Planned test pressure
3. Planned duration of test
4. Lock Out-Tag Out program
5. Written procedure for test that includes:
 1. Test site preparations and related precautions including removal of unauthorized personnel, isolation of test site and a determination of the restricted distance for the pressure test. The restricted distance is the distance from the items under test at which barriers and warning signs are placed to prohibit access.
 2. Automatic pressure relieving device (pressure relief safety valve), which must be sized to handle the maximum output of the pressure source and set at not more than 110% of planned test pressure to prevent excessive pressure during testing as well as pipe sized to match the volume of the test piping per ASME standards.
 3. Restraint methods of piping system
 4. Names of test supervisor, participants, and their qualifications/training
 5. Ratings of connections and fittings, including those used solely for testing purposes. They must be rated for pressure equal to or greater than the system piping
 6. An approved/reviewed Construction Work Plan (CWP) and Daily Hazard Analysis (DHA) written for the activity. These plans will be reviewed by the test crew immediately prior to testing.
6. A preconstruction meeting will be held with the contractor and their personnel to review the scope of work and safety documentation. Completed checklists and permits must be reviewed and signed by the project team.
7. Only upon receipt of adequate safety documentation, permits, and checklists shall pressurizing piping systems be authorized to begin.
8. A group of Skanska MEP experts are available to answer questions and provide peer review of subcontractor pressure testing plans and CWPs.

Project Design

- Meetings for testing design: The priority of safe and effective pressure testing will be added to the system design process to include isolation to lower the volume being tested and enable hydrostatic pre-testing, as well as low point drains required for freeze protection and pressurization drain down.
- Contract documents include parameters for pressure testing: Refer to language in contract documents for all testing/pretesting requirements and build pressure testing plans accordingly. Any changes to the pressure testing plan from what is stated in the contract documents need to be reviewed by the project team.

General Pressure Testing Requirements

1. **Test Medium Type:** Prior to initial startup, piping systems shall be tested for leakage in accordance with contract drawings and specifications. Typical leak testing methods consist of hydrostatic, pneumatic, or service. Hydrostatic testing generates considerably less stored energy and thus involves less risk to workers. Pneumatic testing is more dangerous for workers and should be performed only when hydrostatic testing isn't possible.
2. These guidelines must be followed prior to all testing:
 1. Notify personnel of the area to be avoided due to risks during pressure testing.
 2. Create an exclusion/controlled access zone for the work area.
 3. Ensure that personnel conducting the test stand behind a barrier or away from the area of effect during pressurization.
 4. Ensure that pedestrians are re-routed out of the area. Spotters may be needed to re-route pedestrians, if applicable.
 5. Identify the maximum test pressure to be used (typically provided by an engineer or specifications).
 6. Identify the pipe to be tested, per contract specifications and as directed by the engineer of record. Ensure that the system has been completed according to the drawings/specifications and that no ends of the piping system are left open.
 7. Identify any adjacent equipment that could be affected by a failure and isolate or otherwise protect the equipment.
 8. Examine all connections within the testing section prior to the test, per compliance with contract documents and industry standards.
 9. Determine the pressure rating for all connected fittings and devices to ensure they are rated for the maximum test pressure.
 10. Use a calibrated gauge that has the proper pressure range for the test.
 11. Ensure the pipe and fittings used on the test header are rated for the test pressures and that the valves used on the test header are rated appropriately.
 12. Test trees shall be capped with a cap, plug, double block and bleed, or similar device to ensure valve is not solely holding back the test.
 13. Expansion joints and other elements that cannot sustain the reactions due to test pressure shall be provided with temporary restraint or isolated from testing per manufacturer's specifications and contract documents.
 14. Equipment that is not to be subjected to the test pressure shall be isolated from the piping. Flanged joints at which blinds are inserted to isolate equipment need not be tested.
 15. If the test pressure is to be maintained for a period of time during which the test fluid is subject to thermal expansion or any other source of over pressurizing during the test, precautions such as the installation of a relief device shall be taken to avoid excessive pressure.
 16. Ensure that all necessary lock out tag out procedures have been completed.
 17. Verify that all non-essential personnel are clear from the area.
 18. Inform all affected personnel that the test is about to start.

Post Test Requirements

1. Release pressure before attempting to repair any leaks. Never attempt to repair leaks while any part of the system is under pressure.
2. Drain the system. Carefully follow the procedures to safely and gradually release the pressure from the system and collect the waste liquid test medium when required. Caution must be taken to avoid escaping air stream, debris, and high noise levels.
3. Repair any leaks that were found. Lock Out-Tag Out procedures must be followed during leak repair.
4. Retest the system if necessary.
5. Complete any appropriate forms/logs to document test completion/pass.
6. Drain down test pressures at the end of each shift. At no time shall any testing pressure be left on beyond a single shift.

EHS Forms and Documents

- [Hydrostatic Test Checklist](#)
- [Pneumatic Test Checklist](#)
- [Pressure Test Permit](#)

Applicable Training

- **General Awareness:** Any worker that can be affected by the stored energy of a pressure test will need general awareness training about the potential hazards of stored energy in pressure testing.
- **Competency:** Workers who supervise and conduct pressure testing or work on systems that could be under pressure must be able to identify existing and predictable hazards of pressure testing and have the ability and authority to take prompt corrective measures to eliminate them. Competency training will be conducted by contractors before they mobilize to the

site.

- Test Specific Training: All affected workers will get trainings (briefings) about the potential hazards of a specific test, its specifications/location, and how they are to protect themselves from those hazards.

Potential Related Safety, Health and/or Environmental Aspects

- Lockout Tagout

Rigging

Objective

The following policy and procedures support the safe use, maintenance, and inspection of rigging equipment and associated gear on all projects.

Legal and Other Requirements

Federal, State, Local Regulations

- [California Code of Regulations, Title 8, Subchapter 4, Article 9 §1581-1589](#)
- [OSHA 29 CFR 1926.32 Subpart C - General Safety and Health Provisions - Definitions](#)
- [OSHA 29 CFR 1926.251 Subpart H - Materials Handling, Storage, Use, and Disposal - Rigging equipment for material handling](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 15, §1610-1619.5](#)
- [OSHA 29 CFR 1910.184 Subpart N - Materials Handling and Storage - Slings](#)

Skanska/Client Requirements

- None

Procedure

1. Rigging Plan

1. A detailed rigging plan must be attached to the CWP for all categories of lifts. The rigging plan must be completed by a qualified person and documented on the rigging plan form triggered in lift plan.

2. General Requirements

1. A designated person shall inspect all new rigging equipment before it is placed into service.
2. Visual inspection for damage shall be performed by the user or other designated person prior to each use on each shift and as necessary to ensure there is no damage and is safe to be used. Written records are not required for these inspections.
3. A documented monthly inspection of all rigging shall be completed by a designated person. RFID technology may be used to document monthly inspections.
4. Chains shall not be used for rigging purposes. Chains will not be used for rigging purposes unless the chain is designed and part of a proprietary engineered system. Documentation on the equipment must be attached to the CWP and submitted to Skanska Corporate EHS Department and project team for review.
5. Manufacture requirements must be followed for proprietary system using chains.
6. Any project specific requirements for this section are listed here.
 - None

3. Lifting Devices

1. Any lifting device must be stamped with the (1) maximum working load limit, (2) weight of the device, (3) serial number and (4) manufacturer's name. Skanska fabricated lifting devices must also include date of the load test.
2. Custom below-the-hook lifting devices, as defined by ASME BTH-1, must be designed by a Professional Engineer. Drawings must be made available upon request.
3. Before use, the custom lifting device shall be load tested per the requirements of OSHA, ASME BTH-1, ASME B30.20, or as directed by the Engineer.
4. The load test shall be performed by either a professional testing service or under the supervision of a qualified person at a Skanska facility or project site.
5. All testing documentation must be kept on file at the jobsite.
6. Any project specific requirements for this section are listed here.
 - None

4. Storage

1. All rigging must be properly stored at the end of each shift or when not in use.
2. All rigging will be stored in an area where it will not be subjected to mechanical damage, corrosive action, moisture, direct sunlight, extreme temperatures, or kinking.
3. A storage box will be supplied and designated for rigging storage.

4. Proper storage needs for wire rope rigging shall be determined by the team.
5. Any project specific requirements for this section are listed here.
 - None

5. Synthetic, Round, and Wire Rope Slings

1. Proper use:
 1. Synthetic slings shall not be shortened with knots, bolts, or other makeshift devices.
 2. Sling legs shall not be kinked, crushed or broken.
 3. Slings shall not be loaded in excess of their rated capacities.
 4. Slings used in a basket hitch shall have the loads balanced to prevent slippage.
 5. Slings shall be securely attached to their loads.
 6. Slings shall be padded or protected from the sharp edges of their loads.
 7. Shock loading is prohibited.
 8. All loads shall be placed on dunnage so the load is not resting on the sling.
 9. A competent person shall inspect slings and attachments before and after each lift.
 10. All damaged equipment shall be taken out of service and destroyed to prevent future use.
 11. Any project specific requirements for this section are listed here.
 - None
2. Removal criteria for synthetic web/round slings:
 1. Acid or caustic burns
 2. Melting or charring of any part of the sling surface
 3. Snags, punctures, tears or cuts
 4. Broken or worn stitches or distortion of fittings
 5. Missing or illegible identification tags
 6. Holes, tears, cuts, abrasive wear, or snags that expose the core yarns
 7. Discoloration, brittle, or stiff areas on any part of the sling that may indicate damage
 8. Any project specific requirements for this section are listed here.
 - None
3. Removal criteria for wire rope sling:
 1. Ten randomly distributed broken wires in one rope lay, or five broken wires in one strand in one rope lay
 2. Wear or scraping of one-third the original diameter of outside individual wires
 3. Kinking, crushing, bird caging or any other damage resulting in distortion of the wire rope structure
 4. Evidence of heat damage
 5. Missing or illegible identification tags
 6. Any project specific requirements for this section are listed here.
 - None

6. Hardware

1. Proper Use:
 1. Only hardware that is in compliance with ANSI requirements will be permitted.
 2. Crosby brand shackles recommended.
 3. For long-term installations (i.e. shackles on skips, pans, welding machines, air compressors, concrete buckets, bolt type shackles shall be used.
 4. If screw pin type shackles are used, the pin shall be secured from rotation or loosening.
 5. The screw pin will be fully engaged and in contact with the shackle body.
 6. The load applied to the shackle will be centered in the bow of the shackle to prevent side loading.
 7. Multiple sling legs will not be applied to the shackle pin.
 8. Multiple slings in the body of a shackle will not exceed 120 degrees in angle.
 9. If the shackle is to be side loaded, the rated load will be reduced at a minimum of the manufacturer's specifications (50%) or higher as designated by a qualified person.
 10. The screw pin shackle will not be rigged in a manner that would cause the pin to unscrew.
 11. When a shackle is used in a choker hitch, the pin will be connected to the choking eye of the sling.
 12. Any project specific requirements for this section are listed here.
 - None
2. Steel Sorting/Shake Out
 1. All sorting hooks must have a handle at the top of the hook.

2. Sorting hooks can only be used for shaking out and separating steel.
 3. At no time will sorting hooks be used to fly steel during erecting operations (no higher than chest level).
 4. The competent person shall directly oversee the use of sorting hooks and ensure proper use at all times.
 5. The improper use of sorting hooks will be subject to reprimand.
3. Hardware Removal Criteria
1. Missing or illegible manufacturer's name or trademark and/or rated load identification.
 2. A ten percent (10%) or more reduction of the original dimension.
 3. Indications of bends, twists, distortions, stretching, elongation, cracking or broken load bearing components, excessive nicks, gouges, pitting and corrosion.
 4. Indications of heat damage including weld spatter or arc strikes.
 5. Loose or missing nuts, bolts, cotter pins, snap rings or other fasteners and retaining devices.
 6. Unauthorized replacement components.
 7. Other visible conditions that cause doubt as to the continued use of the hardware.
 8. Any project specific requirements for this section are listed here.
 - None

Scaffolds

Objective

The purpose of this program is to establish guidelines for working on or around scaffolding. This program will inform employees about the hazards of working with scaffolding, the proper terminology, different types of scaffolds and tagging systems.

Legal and Other Requirements

Federal, State, Local Regulations

- [California Code of Regulations, Title 8, Subchapter 4, Article 21, §1635.1-1637](#)
- [OSHA 29 CFR 1926.452 Subpart L - Scaffolds - Additional requirements applicable to specific types of scaffolds](#)

- [OSHA 29 CFR 1926.451 Subpart L - Scaffolds - General requirements](#)

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. Workers who construct scaffolding will be trained in the following:
 - Types of scaffolding hazards: electrical, fall and falling objects
 - Correct procedures for erecting and maintaining scaffolding
 - Maximum intended load and intended use of the scaffold
2. Scaffolds will be securely anchored, set plumb and capable of carrying the maximum intended load without settling or displacement.
3. Identify and label the maximum working load for each scaffold.
 - The maximum intended load is the total load of all persons, equipment, tools, materials, transmitted loads and other anticipated loads to be applied to a scaffold or scaffold component at any one time.
4. All scaffolds must be capable of supporting at least four times the maximum intended load.
5. Unstable objects, such as barrels, boxes, loose brick or concrete blocks, may not be used to support scaffolds or planks.
6. The use of shore or lean-to scaffolding is prohibited.
7. No scaffold may be erected, dismantled or altered except under the supervision of competent persons.
8. Any scaffold component, including braces, brackets, trusses, screw legs, ladders, etc., that has been damaged or weakened in any way must be immediately repaired or replaced.
9. A stair tower, access ladder or equivalent safe access to the scaffold must be provided.
10. Diagonal bracing and scaffold rungs are not to be used to access the scaffold unless their design incorporates an approved ladder.
11. An eighteen (18) gauge screen, a half inch (1/2) wire mesh or equivalent protection must be placed between the toe board and the guardrail when employees must work underneath a scaffold.
12. All wooden load-carrying components of scaffold framing must be a minimum of 1,500 fiber construction grade lumber.
13. All dimensions are nominal sizes as provided in the American Lumber Standards.
14. Scaffold tagging procedures must be followed at all times:
 - Scaffolding will be tagged appropriately during erection, use and dismantle.
 - All scaffolds will have a daily documented inspection by job superintendent or designated competent person

before use.

- Tags will be located at each access point and kept current.

15. Scaffolding Tag Identification Code:

- Red Tag = DO NOT USE. Prohibits use of scaffolding.
- Yellow Tag = NOT ERECTED TO CODE. Indicates restriction or special use conditions of scaffold, i.e., a requirement for fall protection.
- Green Tag = APPROVED FOR USE. Indicates scaffold is erected to all safety standards and company policies and is ready for use.

16. Any project specific requirements for this section are listed here.

17. Scaffold users must comply with all local regulations and training.

- None

2. Planking

1. All wood planking shall be scaffold-grade or equivalent, as recognized by approved grading rules for species of wood used. Laminated planking that provides the equivalent strength of scaffold grade planking is also permitted.
2. The maximum permissible span for two (2) inches by ten (10) inches or wider planks of full thickness undressed lumber is:
 - Ten (10) feet with a working load of twenty-five (25) per square foot (psf)
 - Eight (8) feet with a working load of fifty (50) psf
 - Six (6) feet with a working load of seventy-five (75) psf
3. The maximum permissible spans for two (2) inches by ten (10) inches or wider planks of nominal thickness lumber (not recommended for heavy use) are:
 - Eight (8) feet with a working load of twenty-five (25) psf
 - Six (6) feet with a working load of fifty (50) psf
4. All planking must overlap by a minimum of twelve (12) inches or be secured from movement.
5. Wood scaffold planks must extend over their end supports at least six (6) inches but no more than twelve (12) inches (unless cleated to prevent slipping).
6. All working levels on scaffolds will be fully planked.
7. Any project specific requirements for this section are listed here.
 - None

3. Guardrails and Toe boards

1. Guardrails and toe boards must be installed on all open sides and ends of platforms more than six (6) feet above the ground or floor, except needle beam scaffolds and float scaffolds.
2. Guardrails must be forty-two (42) inches high with a three (3) inch tolerance and a mid-rail. Supports must be at intervals not to exceed eight (8) feet.
3. Toe boards must be at least one (1) inch by four (4) inches lumber or equivalent.
4. Light duty scaffolds shall have guardrails and outriggers installed when possible regardless of height.
5. Any project specific requirements for this section are listed here.
 - None

4. Tubular Welded Frame Scaffolds

1. Cross bracing and/or diagonal bracing is required to secure vertical members laterally.
2. Cross bracing must square and align vertical member to keep scaffolding plumb at all times.
3. All bracing connections must be secure.
4. Legs must be set on adjustable bases, mud sills or other foundations adequate to support the maximum load.
5. Frames will be placed on top of one another using coupling or stacking pins for vertical alignment.
6. Panels will be locked together vertically by pins or other equivalent suitable means to prevent uplifting.
7. Scaffolding will be secured to a structure as required by the design engineer to meet required design criteria.
8. Scaffolds shall be designed by a Professional Engineer licensed in the area of work as required by governing authorities.
9. Upon receipt of shipment of tubular scaffolds, always inspect all components.
10. Any project specific requirements for this section are listed here.
 - None

5. Manually Propelled Ladder Stands and Scaffolds

The design and construction of mobile work platforms (ladder stands) and rolling (mobile) scaffolds (towers) will conform to the following:

1. The designed working load of ladder stands must be calculated on the basis of one or more individuals weighing two-hundred (200) pounds with fifty (50) pounds of equipment per person.

2. Light duty scaffolds must be designed and constructed to carry a working load of twenty-five (25) pounds per square foot.
3. Medium duty scaffolds must be designed and constructed to carry a working load of fifty (50) pounds per square foot.
4. Heavy duty scaffolds must be designed and constructed to carry a working load of seventy-five (75) pounds per square foot.
5. All ladder stands and scaffolds must be capable of supporting at least four (4) times the designed working load.
6. The height of rolling scaffolds will not exceed four (4) times the minimum base dimension.
7. The material selected must be strong enough to meet test requirements and must be protected against corrosion and deterioration.
8. The materials used must meet manufacturer's standards, including strength, dimension and weight specifications, and they must safely support the working load.
9. Nails, bolts and other fasteners used in the construction of ladders, scaffolds and towers must be of adequate size and in sufficient number to develop the designed strength of the unit.
10. Nails must be driven full length.
11. Steps must be fabricated from slip-resistant treads.
12. Leveling of elevated work platforms, screw jacks or other suitable means for adjusting the height must be provided in the base section of each unit.
13. No one will ride rolling scaffolds when they are being moved.
14. Rolling scaffolds will only be used on level surfaces.
15. Caster brakes must be locked when the scaffold is in use or not in motion.
16. Loose material and equipment will be secured or removed before moving scaffold.
17. Any exposed surface must be free of sharp edges, burrs or other hazards.
18. Any project specific requirements for this section are listed here.
 - None

6. Suspended Scaffolds (Swing Stage Scaffold)

1. Suspended scaffolds will not be less than twenty (20) inches nor more than thirty-six (36) inches wide.
2. Wire, synthetic or fiber rope used for scaffold suspension must support at least six (6) times the maximum intended load.
3. Non-conducting, insulated material will be placed over scaffold suspension cables if there is any chance of contact with an electrical arc.
4. Employees working from a two-point suspended scaffold must wear a full body harness and be tied off to an independent lifeline.
5. Multi-stage scaffolds require additional safety suspension lines and fall protection devices.
6. Ropes will be protected from burning or welding operations.
7. Any project specific requirements for this section are listed here.
 - None

7. Stilts

Stilts shall only be used in areas where:

1. Floor surfaces are solid, level and can support stilt work activity.
2. Floor surfaces have been cleared, swept and dry.
3. Stilt workers need to be able move freely and without stepping over or moving around trip hazards.
4. Floor penetrations, stairwells and voids are covered or guarded in such a way that they can be clearly seen by stilt workers.
5. Stilt users shall not walk on stairs or walk backwards.
6. Employer shall provide a safe means of attaching and removing stilts. A rigid platform should be used for mounting /dismounting stilts with the platform at a height equal to or greater than the height of the stilts. Stepladders are not to be used for mounting/dismounting stilts. Stepping up and balancing on one stilt then bending to fit the second is also not acceptable.
7. All equipment and materials required by a stilt worker should be supported by a purpose-built stand (mobile or stationary) that enables the stilt worker to access them without over-reaching or bending down below knee level. The height of the stand should be appropriate for the task being performed.
8. The handling of long, heavy or cumbersome objects or items should be avoided.
9. Any waste produced and material dropped by stilt workers must be promptly cleared from the floor surface they are working on.

Signs, Signals and Barricades

Objective

The purpose of this program is to establish safe working guidelines for using signs, signals and barricades as part of a hazard warning system.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29CFR 1926.200 Subpart G - Signs, Signals, and Barricades - Accident prevention signs and tags](#)
- ANSI D6.1-1971
- [California Code of Regulations, Title 8, Subchapter 4, Article 3 §1523](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 11, §1597-1599](#)
- ANSI Z53.1-1967

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. The project shall have a consistent means of identifying local or general hazards with appropriate signs, signals or barricades.
2. The signs, signals and barricades must be understandable by all employees, subcontractors and visitors.
3. Any project specific requirements for this section are listed here.
 - None

2. Signs/Signals

1. Signs shall be visible at all times when applicable work is being performed and shall be removed promptly when the purpose for them no longer exists.
2. Danger signs shall be used where an immediate hazard exists and have red as the predominating color for the upper panel, black outline on the borders and a white lower panel for additional sign wording.
3. Caution signs shall be used to warn against potential hazards and have yellow as the dominant color, black upper panel and borders, yellow lettering of "caution" on the black panel and a lower yellow panel for additional sign wording. Black lettering shall be used for additional wording.
4. Exit signs shall be lettered in legible red letters, not less than six (6) inches high, on a white field and the principal stroke of the letters shall be at least three-fourths (3/4) inch in width.
5. Safety instruction signs shall be white with a green upper panel with white letters to convey the principal message. Any additional wording on the sign shall be black letters on the white background.
6. Directional signs, other than automotive traffic signs, shall be white with a black panel and a white directional symbol. Any additional wording on the sign shall be black letters on the white background.
7. Construction areas shall be posted with legible traffic signs at points of hazards.
8. All traffic control signs or signals shall comply with the Manual on Uniform Traffic Control Devices (MUTCD).
9. Accident prevention tags shall be used as a temporary means of warning employees of an existing hazard, such as defective tools, equipment, etc. They shall not be used in place of, or as a substitute for, accident prevention signs.
10. Any project specific requirements for this section are listed here.
 - None

3. Barricades

1. Barricades shall be visible at all times when work is being performed and shall be removed promptly when the hazard no longer exists.
2. Yellow and red chain/rope shall be the preferred method.
3. If barricade tape is to be used, it shall only be reinforced barricade tape.
4. All red danger barricades shall have a sign identifying the hazard that the barricade is protecting.

5. Red and black barricade tape, minimum of two (2) inches wide, shall be used to designate an area of danger.
6. Employees are not allowed to enter a red barricaded area without permission from the supervisor/crew responsible for the hazard in that area.
7. Yellow and black barricade tape, minimum of two (2) inches wide, shall be used to designate an area of caution.
8. Employees shall be allowed to move through an area marked with caution tape once the hazard is identified.
9. Any project specific requirements for this section are listed here

Skanska/Client Requirements

- [ANSI A14 1992 Job Made Wooden Ladders](#)

Procedure

Ladders Last

1. Prior to beginning work, the crew will evaluate all tasks that require individuals to work from elevated heights. It is the expectation that these tasks shall be performed using methods other than using a ladder. Portable scaffold devices, scissor lifts, scaffold towers, podium ladders (acceptable only with the top rail at least thirty (30) inches above the platform), lift pods, etc. are the preferred method to performing work at heights.
2. A-Frame Ladder use will be allowed only when it has been determined by the crew in conjunction with Skanska USA Civil, Inc. project management that it is not feasible to use any other options to complete the task. If it is determined that a ladder must be used, the need shall be documented in the Construction Work Plan.
3. General Requirements
 1. Where there is a break in access elevation of nineteen (19) inches or more a stair/step must be installed.
 2. Workers must maintain three (3) points of contact at all times when climbing or descending from a ladder.
 3. Fall protection is required when an employee's feet are at or above the sixth rung from the bottom.
 4. Manufactured ladders are not to be modified without manufacturer's consent.
 5. Ladder rungs, cleats and steps must be parallel, level and uniformly spaced.
 6. Ladders must not be tied or fastened together to create longer sections.
 7. During pit excavations, a job-built ladder will be used to accommodate the adding of additional rungs as the depth of the excavation increases.
 8. Two or more separate ladders used to reach an elevated work area must be offset with a platform or landing between the ladders.
 9. Wooden ladders will not be painted, except for identification or warning labels placed only on one face of a side rail.
 10. Metal ladders are prohibited on all job sites.
 11. Ladders will not be used in a horizontal position for use as platforms, runways or scaffolds.
 12. The minimum clear distance between side rails for all portable ladders is eleven and a half (11 ½) inches.
 13. All stepladders must have a metal spreader or locking device.
 14. Stepladders may not be used in any configuration other than completely open, locked in place and sitting on firm, level ground.

15. Where access is required for elevation difference of thirty (30) feet or greater, ladders are not permitted.
16. All ladders must be used per the manufacturer's requirements.
17. Portable ladders must be capable of supporting at least four (4) times the maximum intended load, except Type 1A (Extra Heavy Duty), which must sustain 3.3 times the maximum intended load.
18. Any project specific requirements for this section are listed here.
 - None

4. Ladder Safety Practices

Setup and Use

1. When ladders are used to access an upper landing, the side rails must extend at least three (3) feet above the upper landing. An employee can walk through the ladder by gripping the side rails while stepping onto the landing.
2. When an extension is not possible, the ladder must be secured at the top to a rigid support that will not deflect and a grasping device, such as a grab rail, will be provided to assist employees in accessing the ladder.
3. The grasping device must be close enough for an employee to reach without stooping or stretching.
4. Under no circumstance may the extension cause the ladder to deflect under a load or slip off its support.
5. Non-self-supporting ladders must be angled so that the horizontal distance from the top support to the toe of the ladder is approximately one-quarter (1/4) the working length of the ladder.
6. Ladders must be maintained free of oil, grease and other slipping hazards.
7. Ladders must not be loaded beyond the maximum intended load or beyond the manufacturer's rated capacity.
8. Ladders must be used only for the purpose for which they were designed.
9. Ladders must be used only on stable and level surfaces unless secured to prevent accidental displacement.
10. Ladders must not be used on slippery surfaces unless secured or provided with slip-resistant feet to prevent accidental displacement. Slip-resistant feet must not be used as a substitute for care in placing, lashing or holding a ladder that is used upon slippery surfaces.
11. A physical barrier must be placed around ladders that are located in passageways, doorways or driveways to keep the activities or traffic away from the ladder.
12. The area around the top and bottom of ladders must be kept clear of debris.
13. The top of a non-self-supporting ladder must be placed with the two (2) rails supported equally unless it is equipped with a single support attachment.
14. Ladders must not be moved, shifted or extended while occupied.
15. The top or top step of a stepladder must not be used as a work platform.
16. Cross-bracing on the rear section of stepladders must not be used for climbing unless the ladders are designed for and provided with steps for climbing on both front and rear sections.
17. Single-rail ladders must not be used.
18. Ladders will be tied, blocked or otherwise secured to prevent displacement.
19. Any project specific requirements for this section are listed here.
 - None

5. Housekeeping

1. Electrical cords, air hoses, welding leads and other obstructions will not impede access at the top or bottom of ladder.
2. Should the ladder be located in an area susceptible to mud, water or snow, it will be inspected prior to use and relocated as needed.
3. In areas where muddy conditions are present, crushed stone and/or grating will be located at the bottom to prevent slipping while climbing.
4. Any project specific requirements for this section are listed here.
 - None

6. Ladder Inspection and Repair

1. At least every shift a competent person will inspect ladders each shift for visible defects and address any situation that may have affected their safe use. Job-built ladders will be inspected each shift and documented each week with a tag.
2. Portable and fixed ladders with structural defects must be withdrawn from service by immediately removal from the project site or marking the ladder in a manner that readily identifies it as defective and tagging it with "Do Not Use" or similar notices.
3. A ladder can also be removed from service by blocking it with plywood or other attachment that spans several rungs.
4. Any project specific requirements for this section are listed here.
 - None

Steel Erection

Objective

The purpose of this program is to establish safe working practices for all employees associated with steel erection activities.

Legal and Other Requirements

Federal, State, Local Regulations

- [California Code of Regulations, Title 8, Subchapter 4, Article 20 §1635](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 29 §1709-1722.1](#)
- [OSHA 29 CFR 1926 Subpart R - Steel Erection](#)
- ANSI Z359-1-2007
- [OSHA 29 CFR 1926 Subpart M Fall Protection](#)

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. All workers engaged in steel erection activities shall follow Skanska's one hundred percent (100%) fall protection requirements when working from heights. Regulatory height requirements may vary by jurisdiction and be more restrictive, but in no circumstance shall any worker be exposed to an unprotected fall greater than (six) feet.

2. Preconstruction Requirements

1. A written steel erection plan must be developed and approved.
2. Verification and sign off on concrete foundations and/or piers reaching design strength must be provided to steel erector prior to commencement of steel erection.
3. Skanska's Notice to Commence Steel Erection form shall be completed prior to any steel erection.
4. Complete a Construction Work Plan and Lift Plan prior to all steel erection activities.

3. Steel Erection Crane Activities

1. Preplan all overhead crane lifting operations to prevent lifting over personnel.
2. Coordinate all steel deliveries with Skanska to ensure pedestrian/vehicular traffic around the project is controlled.
3. No deliveries shall be unbound/unloaded until inspected and deemed secure by a qualified person.
4. Inspect loads to ensure there are no sharp edges that will cut into lifting slings. Use softeners where needed.
5. Use a tag line on all loads.
6. During the placement of solid web structural members, the load will not be released from the crane hoisting line until the members are secured with no less than two (2) bolts or the equivalent at each connection and drawn up wrench tight.
7. Multiple lifts (Christmas treeing) shall only be performed if the following criteria are met:
 - A multiple lift rigging assembly is used.
 - A maximum of five (5) members are hoisted per lift.
 - Only beams and similar structural members are lifted.
 - They are rigged at least seven (7) feet apart.

4. Decking Operations

1. Metal decking bundles shall be landed on adequately supported framing members.
2. Metal decking shall be secured against displacement at the end of the shift or when environmental/jobsite conditions require.
3. All openings shall be decked over. Where large size, configuration or other structural design does not allow openings to be decked over (such as elevator shafts, stair wells, etc.) employees shall be provided with appropriate fall protection equipment.

5. Dropped Object Prevention

1. Covers for roof/floor openings shall be capable of supporting, without failure, twice the weight of the employees, equipment and materials that may be imposed on the cover at any one time.
2. All covers shall be secured to prevent accidental displacement by the wind, equipment or employees.
3. All covers shall be painted with high-visibility paint or shall be marked with the word "HOLE."
4. Wire mesh, exterior plywood or equivalent, shall be installed around columns where planks or metal decking do not fit tightly. The materials used must be of sufficient strength to provide fall protection for personnel and prevent objects from falling through.
5. All materials, equipment and tools shall be secured against accidental displacement.
6. The controlling contractor shall prohibit other construction activities below steel erection.
7. Containers shall be provided for storing or carrying bolts, nuts and drift pins and secured against accidental displacement.
8. Impact wrenches shall be provided with a locking device for retaining the socket.
9. All workers engaged in steel erection activities shall follow Skanska's one hundred percent (100%) fall protection requirements when working from heights of six (6) feet or greater (including where local thresholds are more stringent). Regulatory height requirements may vary by jurisdiction and be more restrictive, but in no circumstance shall any worker be exposed to an unprotected fall greater than six (6) feet, including but not limited to connecting, decking and bolt up crews.
10. Establish controlled access zones when necessary utilizing physical barriers.
11. Safety signs will be posted where necessary to keep people out of danger areas (i.e., Workers Overhead). Projecting or protruding reinforcing rods that create tripping or falling hazards will be bent or covered. Commercially available rebar caps or job-built protection devices significant enough to provide impalement protection will be used.
12. Before cutting any large or heavy structural steel member, the member will be secured or supported by ropes, cables or other means to prevent dropping or uncontrolled swinging.
13. A tag line will be attached to all loads.
14. All openings in floors, temporary or permanent, will be securely planked over or guarded and properly marked as a "FLOOR OPENING."
15. Keep working area in orderly condition with necessary equipment and materials safely arranged. Unused material should be properly stored at all times.
16. Lateral lines for perimeter guarding and anchorage for personal fall arrest systems should be installed on the ground before the lift.
17. A safety railing of five-sixteenths (5/16) of an inch wire rope or equal will be installed, approximately forty-two (42) inches high (not less than 42 inches nor more than 45 inches), around the perimeter of all temporary-planked or temporary metal-decked floors during structural steel assembly.
18. Bright colored flagging should be tied to the railing at not more than six (6) foot intervals to increase visibility.
19. Any project specific requirements for this section are listed here.
 - None

6. Steel Assembly

1. A safety guardrail system shall be installed around the perimeter of all temporary-planked or temporary metal-decked floors during structural steel assembly. It shall be five-sixteenths (5/16) of an inch wire rope or equal, approximately forty-two (42) inches high (not less than 42 inches nor more than 45 inches), and a midrail equidistant between the top rail and the steel. Toe boards will be installed. Bright colored flagging shall be tied to the top cable railing at six (6) foot intervals to increase visibility.
2. Horizontal lifelines for personal fall arrest systems shall be installed on the ground before the lift.
3. Keep working areas in orderly condition with necessary equipment and materials safely arranged. Unused material shall be properly stored at all times.
4. The permanent floors (i.e., concrete) shall be installed as the erection of structural members progresses. There shall be not more than eight stories between the erection floor and the upper-most permanent floor.
5. At no time shall there be more than four (4) floors or forty-eight (48) feet, whichever is less, of unfinished bolting or welding above the foundation or uppermost permanently secured floor.
6. A fully planked/decked floor or nets shall be maintained within two (2) stories or thirty (30) feet, whichever is less, directly under any erection work being performed.
7. All columns shall be anchored by a minimum of four (4) anchor bolts/rods.
8. All columns shall be evaluated by a competent person to determine whether guying or bracing is needed.
9. Anchor bolts/rods shall not be repaired, replaced or field-modified without the approval of the structural engineer of record.
10. Solid web structural members used as diagonal bracing shall be secured by at least one (1) bolt per connection drawn up wrench-tight or the equivalent as specified by the project structural engineer of record.

11. Utilize physical barriers and signage to establish controlled access zones.
12. Power sources shall be secured and hose lines shall be bled off before disconnecting tools or hose sections.
13. Whip checks and positive protection shall be installed on all airline hose connections/fittings.
14. When plumbing-up a building, related equipment shall be placed so that connection points are accessible.
15. Equipment used in plumbing-up shall be properly secured at all times.
16. Plumbing-up equipment shall be removed only with the approval of a competent person.
17. Turn buckles shall be secured to prevent unwinding under stress.
18. During the placement of any solid web structural members, the load will not be released from the hoisting line until the members are secured with no less than two (2) bolts or the equivalent at each connection and drawn up wrench tight.
19. Containers will be provided for storing or carrying bolts, nuts and drift pins, and secured against accidental displacement when aloft.
20. When bolts or drift pins are being knocked out, means shall be provided to keep them from falling.
21. Impact wrenches will be provided with a locking device for retaining the socket.
22. Any project specific requirements for this section are listed here.

Temporary Works

Objective

The purpose of this program is to ensure that all "temporary works" or "false works," such as temporary shoring, platforms, walkways or scaffolds, required for the construction of the "permanent works" are identified and the appropriate criteria are executed.

Legal and Other Requirements

Federal, State, Local Regulations

- [California Code of Regulations, Title 8, Subchapter 4, Article 17, §1623-1626](#)
- [OSHA 1926 Subpart P- Excavations - Falsework](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 20 §1635](#)
- [OSHA 1926 Subpart Q - Concrete and Masonry Construction - Falsework](#)
- [OSHA 29 CFR 1926.450 Subpart L - Scaffolds - General requirements](#)

Skanska/Client Requirements

- [ANSI A14 1992 Job Made Wooden Ladders](#)

Procedure

1. Operations shall take steps to ensure that all temporary works are adequately deployed and maintained for their intended use.
2. Fit for purpose review must take place prior to installing temporary works systems.
3. Review must include the application requirements with design engineers for task-specific design and review of manufacturer's specifications for proprietary systems.
4. The documented design of the temporary works by a competent engineer or manufacturer, including working drawings and specifications, must be maintained on site and available for review.
5. Temporary works shall be identified on project schedules as part of the project look-ahead and risk assessment process.
6. Temporary works shall be assembled by qualified persons per the engineer's or manufacturer's designed criteria.
7. Temporary works shall be inspected daily by a competent person prior to use and tagged at all access points.
8. Any project specific requirements for this section are listed here.

- <https://www.osha.gov/laws-regs/regulations/standardnumber/1926/1926.403>

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. Maintain all hand and power tools in a safe condition and visually inspect prior to each use
2. Power tools equipped with belts, gears, shafts, pulleys, sprockets, spindles, drums, fly wheels, chains or other reciprocating, rotating or moving parts of equipment will be properly guarded.
3. Impact tools, such as drift pins, wedges, and chisels will be kept free of mushroomed heads.
4. The wooden handles of tools will be kept free of splinters or cracks and will be kept tight in the tool.
5. Any project specific requirements for this section are listed here.
 - None

2. Power Operated Hand Tools

1. Refer to the manufacturer's instruction manual prior to using all power operated tools.
2. Electric power operated tools will either be the approved double-insulated type or grounded.
3. Comply with electrical section regarding requirements for the use of ground fault circuit interrupters (GFCI).
4. Electric power operated tools will have free-spinning clutches designed to protect against wrist injuries.
5. Do not use a power tool with broken or defective insulation on the cord, defective plugs, or loose or broken switches.
6. The use of electric cords for hoisting or lowering tools is not permitted.
7. Power tools with secondary handles must be used according to the manufacturer's requirements.
8. All components on the tool must be compatible per the manufacturer's requirements.
9. Before changing out wheels/blades or bits, disconnect the power cords or remove the battery power pack.

10. If using a gas-powered tool, considerations should be made for exhaust in enclosed working spaces.
11. Any project specific requirements for this section are listed here.
 - None

3. Powder Actuated Tools

1. Loading:

1. Tools will not be loaded until just prior to the intended firing time.
2. The tool will be tested each day before loading to see that the safety devices are in proper working condition. The method of testing will be in accordance with the manufacturer's recommended procedure.
3. Any project specific requirements for this section are listed here.
 - None

2. Use:

1. Only trained individuals are permitted to use powder actuated tools and proof of training must be carried on the individual at all times.
2. The lowest velocity to suit the specific task/working material shall be used at all times.
3. Neither loaded nor empty tools are to be pointed at any employees.
4. Keep hands clear of the open barrel end.
5. Loaded powder actuated tools shall never be left unattended.
6. Fasteners will not be driven into very hard or brittle materials, including, but not limited to, cast iron, glazed tile, surface-hardened steel, glass block, face brick or hollow tile.
7. Sufficient backing must be in place to prevent the pin or fastener from passing completely through the surface.
8. No fastener will be driven into a spalled area.
9. The operator will never fasten closer than three (3) inches from the edge of masonry work.
10. Ensure that the masonry work be at least three (3) times as thick as the fastener penetration.
11. Tools will not be used in an explosive or flammable atmosphere.
12. All tools will be used with the correct shield, guard or attachment recommended by the manufacturer.
13. Ensure that all tools are required with constant pressure switch that will shut off the power when the pressure is released.
14. Safety glasses and face shields are required when using powder actuated tools.
15. Any tool found not in proper working order or that develops a defect during use, will be immediately removed from service, tagged out and not used until properly repaired or replaced.
16. Any project specific requirements for this section are listed here.
 - None

3. Charge Storage:

1. Live loads/cartridges must be stored in an approved, locked storage cabinet.
2. Unfired loads shall be disposed of per manufacturer's recommendations.
3. Explosive charges shall not be disposed of in trash containers or left unattended.
4. Any project specific requirements for this section are listed here.
 - None

4. Pneumatic/Hydraulic Tools

1. Ensure that all couplings are installed properly.
2. All hose-connections shall be inspected before each use and periodically throughout the operation.
3. All hoses shall be inspected prior to each use by looking for bends, kinks or swelled areas.
4. Worn out hoses shall be removed from service. Duct tape is not to be used for repairs.
5. Hoses under pressure must be a reinforced wire braided type.
6. Couplings under pressure shall not be disconnected unless specifically designed.
7. Hoses that are not in service shall be stored properly.
8. Hoses will not be placed in access ways or across ladder passage. Where this is unavoidable, lines should be rerouted, blocked over or otherwise protected.
9. Hoses placed across vehicle roadways will be protected by means of modular hose protectors, manmade jobsite ramps, protection boards, such as wood blocking (two (2) inches by four (4) inches, four (4) inches by four (4) inches) engineered to withstand a minimum of ten (10) tons per wheel.
10. Whip checks will be used on all hoses and tools to prevent against the hazards when uncoupling occurs.
11. Whip checks will be properly positioned on the hose based on the maximum working pressure not exceeding two hundred (200) pounds per square inch (PSI).

1. Hoses up to one and a half (1 ½) inches in diameter require a three-sixteenths (3/16) whip check.
2. Hoses up to three (3) inches in diameter require a one-quarter (1/4) inch whip check.
3. Hoses four (4) inches in diameter require a three-eighths (3/8) inch whip check.
12. If the hose diameter is larger than four (4) inches or the pressure is greater than two hundred (200) PSI, consult the manufacturer and/or jobsite engineering department for proper protection.
13. All hose clamps must be crimped into place. Double band clamps can be used per the manufacturer's recommendations.
14. Hoses with worn gear clamps shall be tagged and taken out of service.
15. Ensure safety clips or other wire-type retainers are used at the fittings and the flanges are lined up properly.
16. Any project specific requirements for this section are listed here.

Welding and Cutting

Objective

The purpose of this program is to establish guidelines to protect employees from the hazards of welding and cutting and the compressed gases used in these operations.

Legal and Other Requirements

Federal, State, Local Regulations

Skanska/Client Requirements

- None

Procedure

1. Compressed Gas Handling, Storage and Use

1. All cylinder valve assemblies shall be protected when not in use.
2. Cylinders will be moved by tilting and rolling them on their bottom edges. They will not be intentionally dropped, struck or permitted to strike each other violently.
3. Valve protection caps will not be used for lifting cylinders from one vertical position to another. Bars will not be used under valves or valve protection caps to pry cylinders loose when frozen.
4. Secure cylinders in an upright position. Use carriers/carts and isolate them from welding and cutting operations.
5. Cylinders, when transported by vehicle, will be transported in an upright position.
6. When hoisting cylinders, they will be secured on manufacturer engineered and approved carts or designed for hoisting to ensure they are fully secure. They will not be hoisted or transported by means of magnets or choker slings.
7. Do not hoist individual cylinders with a chain or a choker sling.
8. Compressed gas cylinders must be stored in accordance with applicable regulatory requirements.
9. Cylinders should be stored in designated areas away from elevators, stairs or gangways.
10. Storage areas will be located where cylinders will not be knocked over or damaged.
11. Cylinders will not be kept in unventilated enclosures.
12. Storage of propane inside a building is prohibited.
13. Gas fuel hoses with potential for accumulation and release of fuel gas shall be stored in a secured, ventilated storage box.
14. Carts will have half-hour fire-resistant wall between cylinders.
15. Fuel gas and oxygen manifolds must be located in well-ventilated areas.
16. Do not take oxygen, acetylene or other gas cylinders into a confined space.
17. Reverse flow check valves will be installed at the torch end.
18. Flashback arrestors will be installed at both the torch end and the regulator.
19. Inspect hoses and fittings daily and replace damaged hoses to prevent leaking gases. Leaking equipment shall be repaired or replaced.

20. Keep hoses, cables and other equipment clear of passageways, ladders and stairs.
21. Place cylinders away from the work, so that sparks, hot slag or flame cannot reach them.
22. Use only approved regulators, gauges and torches.
23. Use only friction lighters, "strickers," to ignite torches. Butane lighters are not allowed as an ignition source.
24. "Crack" (open and close quickly) all cylinder valves to remove any dirt or dust, prior to connecting a regulator.
25. Keep all hose, regulators, cylinders, valve protection caps, couplings, apparatus and torch connections free of grease and oil.
26. Do not weld or cut on any containers that have contained toxic or flammable materials.
27. Do not place anything on or near a manifold or cylinder top that may interfere with prompt shutoff in case of an emergency.
28. When shutting down a system make sure to shut off regulators and bleed lines.
29. Do not use oxygen for cleaning off surfaces, ventilation or blowing dust from clothing.
30. Any project specific requirements for this section are listed here.
 - None

2. Arc Welding and Cutting Safe Practices and Procedures

1. A welding hood must be properly attached to a hard hat and in place before striking an arc and during welding.
2. Wear safety glasses under the hood or shield.
3. When leaving electrode holders unattended, remove the electrode and place the holder in a place so that electrical contact will not occur.
4. The welding machine should be shut off when not in use or if it is being moved.
5. Use noncombustible or flameproof screens to protect employees and others from arc flash whenever practical.
6. Rod stubs shall be placed in a metal container.
7. Do not use cables with repairs or splices within ten (10) feet of the holder unless the insulation is valued equivalent to the original.
8. Do not weld on any drum or container that has contained gasoline, oils or other flammable liquids.
9. Use appropriate hearing protection when performing plasma arc welding or cutting.
10. Any project specific requirements for this section are listed here.
 - None

3. Ventilation

1. Ventilation must be sufficient to supply respirable air to the welder and to passersby.
2. Natural ventilation is considered sufficient when the above restrictions are not present.
3. Any project specific requirements for this section are listed here.
 - None

4. Respiratory Protection

1. Welding and gas cutting generate carbon monoxide, carbon dioxide and nitrous gases. When these potentially hazardous materials are present in amounts that exceed OSHA's permissible exposure limits, and engineering controls are not sufficient to eliminate the hazard, appropriate respiratory protection will be provided. An air-purifying respirator will not protect you from carbon monoxide, carbon dioxide and toxic gases.
2. Refer to the Respiratory Protection section of this EHS Manual.
3. Refer to the Safety Data Sheet (SDS) for all products being used to determine what toxic materials the process may emit.
4. Any project specific requirements for this section are listed here.
 - None

5. Eye Protection

1. Welders shall wear filter lenses to protect their eyes against infrared and ultraviolet light.
2. When feasible, screens or barriers shall be utilized around welding operations. If not feasible employees within thirty (30) feet will need appropriate eye protection.
3. The guide below shows shade numbers of filter lenses and their application:

Welding Operation	Shade Number
Shielded metal-arc welding 1/16, 3/32, 1/8, 5/32-inch diameter electrodes	10
Gas-shielded arc welding (non-ferrous) 1/16, 3/32, 1/8, 5/32-inch diameter electrodes	11
Gas-shielded arc welding (ferrous) 1/16, 3/32, 1/8, 5/32-inch diameter electrodes	12
Shielded metal-arc welding 3/16, 7/32, 1/4 inch diameter electrodes	12
5/16, 3/8-inch diameter electrodes	14
Atomic hydrogen welding	10-14
Carbon arc welding	14
Soldering	14
Torch brazing	3 or 4
Light cutting, up to one inch	3 or 4
Medium cutting, 1 inch to 6 inches	4 or 5
Heavy cutting, over 6 inches	5 or 6
Gas welding (light), up to 1/8 inch	4 or 5
Gas welding (medium), 1/8 inch to 1/2 inch	5 or 6
Gas welding (heavy), over 1/2 inch	6 or 8

4. Any project specific requirements for this section are listed here.

- None

6. Fire Protection

1. Prior to commencing any hot work operation, workers must thoroughly inspect area to make sure that there are no combustible materials nearby. Clear and maintain a minimum twenty-five (25) foot radius.
2. Institute a hot work permit.
3. Workers will keep a fire extinguisher within thirty (30) feet of their work area.
4. A thorough visual inspection of the work area should be made after each shift (a minimum 1/2 hour) to make sure that combustible material is not smoldering and that all equipment has been shut down and properly secured. Consideration should be given to areas above and below hot work operations.
5. A fire watch will be assigned and stationed with a fire extinguisher. More than one fire watch/extinguisher may be required if the hot work operation could impact more than one floor.
6. Any project specific requirements for this section are listed here.

Procedure

1. Each project team shall develop, implement and maintain project-specific protection and preservation programs inclusive of controls to mitigate potential negative impacts to archaeological, cultural and historically sensitive areas in the work zone. Teams will monitor and document plan compliance and periodically review for effectiveness.
 1. Review project specifications and drawings to determine if there are any archaeological, cultural and historically sensitive areas.
 2. Perform or review preconstruction surveys of sensitive areas in order to identify potential impacts. The surveys may include areas outside the project boundaries.
 3. Collect preconstruction photographic documentation of sensitive areas.
 4. Secure required regulatory permits, and comply with permit stipulations.
 5. Communicate archaeological, cultural and historical protection and preservation plan to internal and external stakeholders, and update them on changes and impacts regularly.

Materials and Waste Management

Objective

To reduce the upfront demand on materials placed into our projects and minimize the amount of solid waste generated on site.

Target

Impact Significant Reasons

- None

Legal and Other Requirements

Federal, State, Local Regulations

- None

Skanska/Client Requirements

- For projects pursuing LEED/EnVision certification, follow USGBC or ISI requirements
- Environmental Compliance Program
- Green Strategic indicator – landfill diversion rate

Procedure

1. Each project team shall develop, implement and maintain a project-specific Construction Waste Management Plan to ensure effective materials management and promote the diversion of recyclable materials from landfills. Monitor and document plan compliance, and periodically review for effectiveness.
 1. Review project specifications and drawings to determine if any operations may present opportunities to reduce, reuse or recycle materials.
 2. Communicate the plan to internal and external stakeholders, and update them of changes and impacts periodically.
 3. Educate the employees via project orientation, monthly toolbox talks or DHAs regarding materials and waste management.
 4. Any project specific requirements for this section are listed here.

Noise and/or Vibration

Objective

To properly plan for and control noise or vibration generating activities to mitigate any negative impacts to surrounding communities.

Target

Impact Significant Reasons

- None

Legal and Other Requirements

Federal, State, Local Regulations

- Work hour restrictions
- Local noise ordinances

Skanska/Client Requirements

- Work hour restrictions (e.g., project specifications, permit stipulations other contract conditions)
- Truck route restrictions

Procedure

1. Each project team shall develop, implement and maintain project-specific noise and vibration programs to mitigate negative impacts. Monitor and document plan compliance, and periodically review for effectiveness.
 1. Review project specifications and drawings to determine if any operations may create any noise or vibration risk.
 2. Conduct or review preconstruction ambient noise and vibration monitoring.
 3. Any project specific requirements for this section are listed here.

- For projects pursuing LEED/Envision certification, refer to USGBC or ISI requirements

Procedure

1. Each project team shall develop, implement and maintain project-specific programs to mitigate potential negative impacts on water resources. Monitor and document compliance with the program, and periodically review for effectiveness.
 1. Review project specifications and drawings to determine if any operations require the use of potable water or the management of storm water (e.g., dewatering, dust suppression, tire wash, temporary irrigation, street sweeping, erosion sediment control), and assess the opportunities to use this effluent.
 2. Properly identify all potential impacts to water bodies.
 3. Secure required regulatory permits, and comply with permit stipulations (e.g., effluent sampling, erosion and sedimentation controls).

Health

Asbestos Inclusive of Naturally Occurring Asbestos

Objective

The purpose of this program is to ensure that all employees are safeguarded from the occupational health and safety risks associated with asbestos.

Legal and Other Requirements

Federal, State, Local Regulations

- [NESHAPS 40 CFR Part 61](#)
- [OSHA 29 CFR 1926.1101](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 4 §1532.3](#)
- [OSHA 29 CFR 1910.134](#)
- [OSHA 29 CFR 1910.1001](#)
- EPA 600/4-80-005
- EPA 40 CFR 260-265

Skanska/Client Requirements

- None

Procedure

1. General Requirements:

1. Prior to commencing work, survey the existing conditions to identify naturally occurring asbestos (NOA) and asbestos-containing building materials (ACBM) that may be disturbed by project activities.
2. Communicate the location of asbestos to all employees whose work activities may contact asbestos containing material (ACM), presumed asbestos containing material (PACM) or NOA.
3. Only certified employees and licensed contractors may disturb ACM or PACM.
4. Review area monitoring and/or personal exposure monitoring and communicate results to employees in adjacent areas.
5. Communicate the locations of and authorized entrant requirements pertaining to regulated areas.
6. Use signs and labels to identify all ACM and/or PACM work areas that may be disturbed during construction in accordance with OSHA 29 CFR 1926/1910.
7. Any project specific requirements for this section are listed here.
 - None

2. Identification and Disturbance of Naturally Occurring Asbestos:

1. Prior to engaging in any geo-technical or sub-surface investigative work (e.g., drilling, pile driving, test pitting, mechanical breaking of rock, etc.) refer to the project's geo-technical survey. If the project has not conducted a survey and it is possible to collect a sample of the rock, the rock is to be analyzed by a certified laboratory to determine the presence of NOA.
2. If NOA exists on the project and will be disturbed, the project team must create, implement and maintain an Asbestos Control Plan detailing the approach to mitigate inhalation exposures and reduce the amount of fibers from the rock being released into the atmosphere. The topics of the plan may include the following:
 - Introduction and scope of work
 - Construction work plan
 - Dust control plan
 - Employee exposure control plan
 - Worksite specific respiratory protection plan
 - Engineering controls
 - Personal protective equipment
 - Administrative controls

- Material handling
 - Personal hygiene
 - Waste management
 - Analytical results
 - Logistics map
 - Contract documents and drawings
3. Any project specific requirements for this section are listed here.
- None

3. Asbestos-Containing Building Materials:

1. Prior to any renovation or demolition activities, an AHERA (or equal) certified building inspector shall conduct a survey for all potentially impacted materials.
2. Share the asbestos survey report with all personnel on site and keep a copy on site for reference.
3. Assume materials not sampled are asbestos-containing until proven otherwise.
4. If additional suspect materials are identified during the project, all work must stop immediately and the materials must be sampled for asbestos by a certified inspector.
5. Only a licensed contractor will remove, repair or clean up asbestos-containing building materials.
6. Prepare an emergency response plan in the event that ACM is disturbed by anyone other than a licensed contractor.

First Aid, Emergency Services, Bloodborne Pathogens

Objective

The purpose of this program is to ensure that all employees are provided proper medical treatment and are safeguarded from the occupational health and safety risks associated with bloodborne pathogens.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1926.50 Subpart D Occupational Health and Environmental Controls - Medical services and first aid](#)
- [OSHA 29 CFR 1910.1030 Subpart Z Toxic and Hazardous Substances - Bloodborne pathogens](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 3 §1512](#)

Skanska/Client Requirements

- Emergency Action Plan (EAP)
- Bloodborne Pathogen Control Plan

Procedure

1. First Aid Requirements:

1. Skanska and each subcontractor shall have, at all times, a minimum of one (1) employee per shift trained in first aid/CPR/AED and bloodborne pathogens in accordance with 29 CFR 1926.50 Subpart D.
2. The EAP shall include, at a minimum:
 - Contact details and maps to the nearest clinic or hospital
 - Communication systems in the event of a medical emergency

2. First Aid Station:

1. Employees shall not eat, drink, smoke, apply cosmetics or lip balm, or handle contact lenses at the First Aid Station.
2. A fully stocked first aid kit in accordance with ANSI-Z308.1-1978 must include:
 - An eye-wash station capable of at least a fifteen (15) minute flush
 - Running water, hot (if feasible) and cold
 - CPR resuscitation masks and non-latex gloves as PPE for first aid providers

3. First Aid and AED Supplies:

1. Each site shall have at least one (1) first aid kit. Evaluate the workplace to determine the need for additional kits, different types of supplies or any additional quantities according to location, size, number of employees, etc.
2. Check contents of the first aid kit prior to initial use and thereafter on a weekly basis, and replace any expended and expired items.
3. Place the contents of the first aid kit in a weatherproof container with individually sealed packages.
4. Provide access to an AED on each site
5. Any project specific requirements for this section are listed here.
 - None

4. Bloodborne Pathogens:

1. Employees who work at job sites that have the following conditions have the potential for exposure to bloodborne pathogens:
 - Effluent waste in Waste Water Pollution Control Plants
 - Effluent drained on ground when plumbers hook up to sewer systems
 - Contaminants in restrooms when plumbers complete hook ups
 - Exposure to contaminants in portable toilets
 - Exposures to the following as a result of an injury:
 - Human blood components
 - Body fluid visibly contaminated with blood
 - Any unfixed tissue or organ (other than intact skin)
2. Any project specific requirements for this section are listed here.

- None

5. Bloodborne Pathogen Control Plan:

1. Maintain an exposure control plan on the project site consisting of:
 - Identification of all job classifications with occupational exposure, without regard to the use of personal protective equipment
 - The procedure for evaluating circumstances surrounding an exposure incident
 - The process for disinfecting manageable contaminated surface areas (no more than four (4) square feet)
 - The contact information for the firm contracted to manage larger contaminated areas

6. Site Preparation and Engineering Controls

1. Train employees involved in the decontamination procedures according to 29 CFR 1910.1030.
2. Post highly visible warning signs at the entrance of the contaminated area.
3. Don the following personal protective equipment at all times within the contaminated work area.
 - Eye protection, such as splash goggles, safety glasses with solid side shields or full-face shields
 - Rubber utility gloves (preferred) or disposable gloves (single use)
 - Rubber boots or boot covers
 - Protective outer clothing, such as impervious coveralls, bibs or aprons
 - Respiratory protection
4. Employees shall not eat, drink, smoke, handle contact lenses or apply cosmetics inside contaminated areas.
5. After clean up, remove PPE and wash hands with soap and running. Use antiseptic hand wipes or gels in conjunction with clean cloth/paper towels in the absence of hand washing facilities or water.
6. Seal all infectious waste materials in double-bagged, heavy-duty trash bags and tag or mark them as hazardous materials prior to removal from the contaminated area.

7. Hard Surface Cleaning and Disinfection

1. Remove liquid blood or fluids by blotting with absorbent pads, paper towels or absorbent materials, such as kitty litter or diatomaceous earth powder.
2. Thoroughly clean affected areas with a disinfectant solution.
3. Apply disinfectant to the cleaned surface and allow it to remain wet for at least ten (10) minutes, then wipe dry or air dry.
4. Decontaminate all infectious materials, including cleaning supplies or materials contaminated with blood or body fluids by wetting thoroughly with disinfectant prior to being placed in biohazard bags for disposal.

8. Regulated Waste Disposal

1. Place materials soiled with blood or bodily fluids, such as paper towels, cloths, sponges and mop heads, in double-bagged trash bags, sealed with tape, labeled and disposed of as hazardous materials in accordance with local and state regulations.
2. Any project specific requirements for this section are listed here.

Hazard Communication

Objective

The purpose of this program is to communicate the hazards associated with chemicals on the jobsite to all affected employees.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1926.59 Subpart D Occupational Health and Environmental Controls - Hazard Communication](#)
- [OSHA 29 CFR 1910.1200 Subpart Z Toxic and Hazardous Substances - Hazard Communication](#)
- [California Code of Regulations, Title 8, Subchapter 7, Group 16, Article 109 §5139-5223](#)
- [Global Harmonization Standard Revision 9 – 2021](#)
- [ANSI/ASSP A10.49-2015 Control of Chemical Health Hazards in Construction and Demolition Operations](#)

Skanska/Client Requirements

- None

Procedure

1. Train all employees on the proper use, storage, labeling and disposal of chemicals in the work place.
2. Properly label all chemicals, including laboratory bottles, solvent cans and dispensers. All information contained on labels must comply with federal, state and local laws and/or regulations and include the identity of the chemical products or substances in the container, hazard warnings and names and addresses of the manufacturer or the responsible parties. Replace all illegible labels. Chemicals that can be classified "For Immediate Use" meaning under the control of and used during that shift only by the person who transfers it from the labeled container are exempted from the stated labeling procedures.
3. In storage areas where similar chemical products are stored, signs or placards to identify the material may be posted in lieu of container labels.
4. If any hazardous materials are transferred from a storage tank or container through a pipeline, affix labels with the required information to the line at the discharge point (valve).
5. If a chemical product other than that specified on the container label is placed in a container, relabel the container to accurately reflect the hazards of the current contents.
6. Provide all employees access to safety data sheets (SDS) for chemicals in the work place.
7. All contractors must maintain a master chemical inventory list for chemicals brought on site.
8. Any project specific requirements for this section are listed here.
 - None

- [OSHA 29 CFR 1904.7 Subpart C Recording and Reporting Occupational Injuries and Illness - General recording criteria](#)
- [California Code of Regulations, Title 8, Subchapter 7, Group 2, Article 10 §3395](#)

Skanska/Client Requirements

- None

Procedure

1. General Requirements

1. Evaluate work environment to identify potential exposures to hot or cold conditions.
2. Acclimate all employees to the ambient temperatures prior to working a full work schedule.
3. Train employees in the recognition of a heat or cold related illness and have a means to initiate emergency response.
4. Remind employees to drink plenty of water throughout the work shift.
5. Any project specific requirements for this section are listed here.
 - None

2. Hot Environment

1. Provide one or more accessible shaded areas in accordance with local requirements.

The amount of shade present shall be at least enough to accommodate the number of employees on recovery or rest periods, so that they can sit in a normal posture fully in the shade without having to be in physical contact with each other. The shade shall be located as close as practicable to the areas where employees are working.
2. Structures such as bridges, false work, etc. can be utilized as shaded areas.
3. During a heat wave, supervisors shall closely observe all employees. For purposes of this section only, "heat wave" means any day in which the predicted high temperature for the day will be at least eighty-five (80 degrees Fahrenheit and at least ten (10) degrees Fahrenheit higher than the average high daily temperature in the preceding five (5) days.
4. Supervisors shall closely observe all employees in accordance with local requirements, who have been newly assigned or returning to work after prolonged absence to a high heat area for the first fourteen (14) days.
5. Any project specific requirements for this section are listed here.
 - None

3. Cold Environment

1. Employees shall wear layered clothing.
2. Establish areas where employees can warm up.
3. Closely observe employees to identify signs of frost bite or hypothermia.
4. Provide winter hard hat liners during times of cold weather.
5. Employees shall wear insulated gloves (water resistant if necessary) to protect the hands.
6. Project teams shall monitor the weather conditions during a winter storm and have a reliable means of communicating

with workers in order to stop work or evacuate when necessary.

7. Any project specific requirements for this section are listed here.

Infectious Disease Prevention and Response

Objective

This section of the EHS Manual establishes guidelines concerning prevention and response concerning infectious disease to limit the exposure of the project and subcontractor employees at work in order to reduce illness of employees as well as safeguard against the spread of diseases such as influenza, norovirus and COVID-19.

Legal and Other Requirements

Federal, State, Local Regulations

- None

Skanska/Client Requirements

- Project Response Investigations

Procedure

According to the World Health Organization, infectious diseases are caused by pathogenic microorganisms, such as bacteria, viruses, parasites or fungi; the diseases can be spread, directly or indirectly, from one person to another.

I. Prevention

1. Zero-Tolerance Policy and Work Force Communication

- a. The project observes a zero-tolerance policy for coming to work while feeling unwell and exhibiting any of the following symptoms: onset of fever, cough (usually dry), headache, muscle and joint pain, sore throat and a runny nose, shortness of breath or any other flu-like symptom. The individual is not permitted to return to the project or office until they are no longer ill or are able to secure a release from their healthcare provider, certifying that they can return to work without risk to others.
- b. Distribute notice of zero-tolerance policy to all employees, subcontractors and partners explaining the expectation on their commitment to the program. Include a summary of the policy during site orientations, morning meetings and part of the DHA process.
- c. Review all related Toolbox talks with Skanska and subcontractor employees on site such as *Understanding the Novel Coronavirus and Preventative Guidelines*. In the case of a potential outbreak (see below item Response to an Outbreak of an Infectious Disease) Toolbox talks are to be reviewed by crews with as few as possible employees gathering in one area.

2. Identification Of High Risk Areas

- a. A team consisting of the project superintendent, project manager, and onsite EHS will meet to identify potential exposure areas for the spread of infectious disease. Areas for consideration are lunch rooms, break areas, kitchens, bathrooms (temporary and permanent), shared computers/work stations, meeting rooms, water stations, shared equipment/vehicles, high capacity transportation (buses/vans), and highly trafficked storage areas / Conex boxes.
- b. The team will implement strategies for preventing exposure within the identified areas.

3. Implement Strategy For Preventing Exposure

- a. Clean and disinfect high-touch surfaces frequently as determined by project leadership depending on current occupancy of the space. Examples of high-touch surfaces include but are not limited to tables, hard backed chairs, doorknobs, handles, light switches, toilets, and sinks.
 - Use cleaning products effective against infectious disease. If these products are not available, a diluted household bleach solution can be used of 5 tablespoons (1/3rd cup) bleach per gallon of water or 4 teaspoons bleach per quart of water.
 - Personnel involved with cleaning/disinfecting activities will wear disposable nitrile gloves over the standard cut level 3 gloves and other PPE as required by the manufacturer of the disinfecting agent. The nitrile gloves are disposed of after each cleaning. The personnel involved in cleaning will be familiarized with the cleaning agent's required contact time to ensure the agent is used effectively.
- b. Assess all available hand wash stations and consider providing additional locations for easier and more frequent hand washing with soap and water. Promote hand washing with soap and water for at least 20 seconds and thoroughly drying after hands have been cleaned.
- c. Clean bathroom facilities and hand wash stations at a frequency commensurate with the current occupancy of the space. Inspect these facilities regularly to ensure availability of soap, hand towels or air dryer and hand sanitizer.

- d. Add stations with commercially available hand sanitizer containing 60% alcohol and or sanitizing wipes to jobsite entrances, break areas, common use computers/workstations, and high traffic or storage areas.
- e. Sanitizing wipes should be available in shared-use vehicles and equipment used by multiple operators, ex: a shared job truck, golf cart, or forklift.
- f. Disinfect vehicles transporting multiple employees such as vans or shuttles frequently and as a minimum at the end of each shift. Clean surfaces of service/fleet vehicles, steering wheel, gear shift, instrument panels, etc.; use aerosol sanitizers inside closed cabs.
- g. Provide sanitizing wipes at break areas and promote daily cleansing of eye wear, cell phones, radios and hard hats.
- h. All single use products for cleaning or personal hygiene such as paper towels, sanitizing wipes or tissues must be disposed of after use in trash receptacles and not carried on the person or left behind on surfaces.

4. Response to an Outbreak of an Infectious Disease:

According to the Center for Disease Control an outbreak refers to an increase, often sudden, in the number of cases of a disease above what is normally expected in that population in that area. Therefore project leadership, in coordination with onsite EHS and project superintendent, must determine the point at which there has been an onsite outbreak unless otherwise directed by Regional leadership or Regulatory Authority.

- a. **Reduction of Personnel On-Site:** The project superintendent, project manager, and onsite EHS will meet to discuss Skanska project staffing requirements and create a staffing plan.
 - Personnel who can conduct their job responsibilities remotely will work from a remote location unless otherwise directed by project leadership.
 - Skanska personnel directly involved in the day to day management of field operations report to the jobsite as usual unless otherwise directed by project leadership.
- b. **Implement Social Distancing:** The following guidelines should be evaluated to potentially reduce the size of groups.
 - Suspend or stagger start times of stretch and flex- and/or implement multiple starting locations to reduce the number of personnel gathering in one area.
 - Stagger times for coffee and lunch breaks throughout the day.
 - Stagger times for transporting employees to or from the job site (vans/ shuttles) and reduce the number of employees in transit at one time within a vehicle.
 - Remove common potable water sources such as drinking fountains and water coolers as appropriate. If common water sources are removed ensure water is available for employees by other means such as providing single use water bottles.
- c. **In-person, Non-Essential Meetings:** Suspend entirely or reduce attendance for meetings/gatherings that are non-essential. Consider conducting virtual meetings/teleconferences. All essential meetings will be determined by project leadership.
- d. **In-person, Non-Essential Site tours or visits:** Suspend entirely or reduce attendance for job tours / site visits that are non-essential. All essential visits and tours will be determined by project leadership.
 - Examples of non-essential site tours may include: job tours by external stakeholders, subcontractor or vendor promotional meetings, public groups, student visits, political visits, etc.

II. Response Action Levels:

1. Risk Profile:

In response to an outbreak of an infectious disease, projects shall use the following risk profiles to prepare workplaces to limit or eliminate the transfer of infectious diseases.

OSHA (in OSHA publication 3990-03 2020-Guidance on Preparing Workplaces for COVID-19) identifies the following four worker exposure risk levels: Lower Risk (Caution), Medium, High and Very High. Infectious diseases like COVID-19 are spread primarily from person to person through respiratory droplets produced when an infected person coughs or sneezes. These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs.

Lower Exposure Risk (Caution) includes work that does not require contact with people known to be, or suspected of being, infected nor does the work require frequent close contact with (i.e., within six feet of) the general public. Workers in this category have minimal occupational contact with the public and other coworkers.

Medium Exposure Risk includes work that requires frequent and/or close contact with (i.e., within six feet of) people who may be infected, but who are not known or suspected patients. In areas without ongoing community transmission, workers in this risk group may have frequent contact with travelers who may return from international locations with widespread disease transmission. In areas where there is ongoing community transmission, workers in this category may have contact be with the general public (e.g., in schools, high-population-density work environments, and some high-volume retail settings).

The **High and Very High Risk** levels generally apply to workers involved in healthcare (e.g., doctors, nurses etc.).

morgue/ mortuary, medical transport and medical laboratory testing activities.

Additional resources can be found in the following protocols developed for the Safety Stand Down - Implementing project site guidelines to minimize COVID-19 exposure risk:

- Project Activity Risk Assessment (PAA)
- Mitigation Strategies/Considerations
- General Jobsite Guidance/Recommendations

2. Criteria for initiating a Project Response Investigation

- a. In the event an individual or individual(s) on a project site has come into close contact (as defined by CDC – see below) with someone who has tested positive for an infectious disease, the project team must notify the account manager, regional HR, and general manager. Note the CDC defines close contact as one of the following:

Being within approximately 6 feet (2 meters) of an infected person for a prolonged period of time; close contact can occur while caring for, living with, visiting, or sharing a healthcare waiting area or room with a confirmed case – or –

Having direct contact with infectious secretions of an infected person (e.g., being coughed on).

- b. Additionally, a Project Response Investigation must be completed by the project team. The project superintendent, project manager, and EHS manager will be responsible for the completion of the investigation (see form entitled **Skanska USA Civil, Inc. Project Response Investigation Requirements**)

Noise Exposure

Objective

The purpose of this program is to ensure that all employees are safeguarded from the occupational health and safety risks associated with noise.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1910.95 Subpart G Occupational Health and Environmental Control - Occupational noise exposure](#)
- [OSHA 29 CFR 1926.101 Subpart E Personal Protective and Life Saving Equipment - Hearing protection](#)
- ANSI S3.19
- [OSHA 29 CFR 1926.52 Subpart D Occupational Health and Environmental Controls - Occupational noise exposure](#)
- [California Code of Regulations, Title 8, Subchapter 7, Article 105 §5095-5.100](#)

Skanska/Client Requirements

- None

Procedure

1. General

1. Identify and monitor workplace noise levels using a calibrated sound level meter during daily work activities and whenever there is a change in production processes, equipment or controls.
2. Determine if employees are exposed to noise exceeding OSHA regulations (table below).
3. Employees exposed to sound levels greater than 85dBA/8-Hour Time Weighted Average (TWA) shall use hearing protection complying with ANSI S3.19.
4. Control noise at the source utilizing engineering controls before any other measures are implemented.
5. Post warning signs in conspicuous locations near the high noise level areas to notify employees that hearing protection is required.
6. When the following tasks are performed, hearing protection is mandatory. Exposure to impulsive or impact noise should not exceed 140 dB peak sound pressure level:
 - Pile driving
 - Jack hammering
 - Chipping concrete or steel with power tools
 - Operating gasoline chain or cut-off saws
 - Arc gouging
 - Hoe ram operating

7. OSHA Permitted Noise Exposure

(A-scale readings on sound level meter at slow response)

Duration per Day (Hours)	Sound Level dBA Slow Response
8	90
6	92
4	95
3	97
2	100
1.5	102
1	105
.5	110
.25 or less	115

- None

2. Hearing Protection

1. Provide a variety of appropriate hearing protection devices for employees working in high noise areas.
2. Employees shall wear company-provided hearing protection. Employees shall not tamper with or modify any hearing protection equipment.
3. Discard and replace any damaged or defective equipment.
4. Failure to follow the hearing conservation program and rules set forth by the company may result in disciplinary action.
5. Any project specific requirements for this section are listed here.

Respiratory Protection

Objective

The purpose of this program is to establish, implement and maintain an appropriate respiratory protection program to protect employees from respiratory hazards on our jobsites.

Legal and Other Requirements

Federal, State, Local Regulations

- [California Code of Regulations, Title 8, Subchapter 7, Group 16, Article 107 §5144](#)
- [OSHA 29 CFR 1910.134 Subpart I Personal Protective Equipment - Respiratory Protection](#)
- [OSHA 29 CFR 1926.103 Subpart E Personal Protective and Life Saving Equipment - Respiratory protection](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 4 §1532.3](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 28 §1696](#)

Skanska/Client Requirements

- None

Procedure

1. Medical Evaluation

1. Prior to respirator use, each employee shall complete a Medical Evaluation Questionnaire (MEQ) in accordance with CFR 1910.134 to be sent to a licensed healthcare provider for approval.
2. The licensed healthcare provider will evaluate the MEQ and certify clearance for respirator use. Forward this clearance to the employer for processing and recordkeeping.
3. Provide additional medical evaluations when:
 - An employee has a change in medical status.
 - An employee reports medical signs or symptoms related to ability to use a respirator.
 - The licensed healthcare provider states that employee needs to be re-evaluated.

2. Fit Test

1. Full-face respirators require quantitative fit tests to achieve OSHA protection factors.
2. A qualitative fit test may be used for half face air purifying respirators.
3. Fit tests will be done:
 - Before using the respirator in the field
 - At least annually
 - When a different type or brand of respirator is worn
 - When there is a significant physical difference in the employee such as body weight changes, facial scarring or dentures
4. Do not conduct fit testing if there is any hair growth between the skin and the face piece seal surface.
5. If an employee exhibits difficulty in breathing during the tests, refer them to a licensed healthcare provider.
6. If the employee does not pass a fit test, provide them with another make, model or size of the required respirator and perform a fit test.
7. Maintain a summary of all fit test results for three years. The summary shall, at a minimum, include:
 - The name of the individual tested
 - The date of the test
 - The name of the individual who administered the test
 - The fit factors obtained from quantitative tests, if performed
 - The manufacturer, model and size of respirator

3. Selection of Respirators

1. Filtering face pieces/dust masks are only permitted for voluntary use when respiratory protection is not required per the applicable OSHA standard or this EHS Manual. Voluntary use must be in accordance with OSHA 1910.134 Appendix D.
2. The respirator furnished shall provide adequate respiratory protection against the particular hazard for which it is

designed.

3. Choose respirators according to an assigned protection factor (APF).
4. Respirators are required at fifty percent (50%) of the permissible exposure limit, except for silica where respirators are only required above the permissible exposure limit.
5. To determine which respirator is adequate to protect against the contaminant, the following calculation shall be used:

$$\text{Applicable PEL} \times \text{APF} = \text{Maximum Use Concentration}/2^{**}$$
 - * PEL = Permissible Exposure Limit
 - ** Skanska's safety factor of two
6. Select respirators based on the specific hazard and in accordance with the manufacturer's instructions or other related requirements (OSHA, ANSI, NIOSH, etc.).

4. Use of Respirators

1. Specify the respirator in the Construction Work Plan.
2. Assign each employee their own respirator.
3. The wearer shall perform a fit check prior to the use of a negative pressure air-purifying respirators.
4. Standby personnel with suitable rescue equipment shall be present when a self-contained breathing apparatus (SCBA) is used in immediately dangerous to life or health (IDLH) atmospheres.
5. Employees shall be permitted to leave the work area to maintain, clean, change filters, replace parts or to inspect their respirator if it is impeding their ability to work or if the respirator stops functioning.
6. Employees shall notify supervisor when leaving the work area.
7. The competent person shall monitor work area conditions to assure respirator effectiveness.
8. Provide employees requiring corrective vision for full-face respirators with manufacturer approved optical inserts.

5. Filter/Cartridge Selection

1. Each cartridge is color coded as indicated in the table below.

ATMOSPHERIC CONTAMINANT(S)	ASSIGNED COLOR(S)
Acid gases	WHITE
Hydrocyanic acid gas	WHITE with a ½ inch GREEN stripe completely around the canister near the bottom
Chlorine gas	WHITE with a ½ inch YELLOW stripe completely around the canister near the bottom
Organic vapors	BLACK
Ammonia gas	GREEN
Acid gases and ammonia gas	GREEN with ½ inch WHITE stripe completely around the canister near the bottom
Carbon monoxide	BLUE
Acid gases and organic vapors	YELLOW
Hydrocyanic acid gas and chloropicrin vapor	YELLOW with ½ inch BLUE strip completely around the canister near the bottom
Acid gases, organic vapors, and ammonia gases	BROWN
Particulates (dusts, fumes, mists, fogs, or smokes) Radioactive materials, (except tritium and noble gases)	PURPLE (Magenta) – High Efficiency Particulate Filter (HEPA)*
Particulates (dusts, fumes, mists, fogs, or smokes) in combination with any of the gases or vapors	Canister color for contaminant as designated above, with ½ inch GRAY stripe completely around the canister near the top
All of the above atmospheric contaminants	RED with ½ inch GRAY stripe completely around the canister near the top

* Only P-100 Series HEPA filters are permitted

6. Air Quality/Requirements for In-Line Respiratory Systems

1. Cylinders of purchased breathing air shall meet at least the requirements of the specification for Type 1 – Grade D breathing air as described in Compressed Gas Association Commodity Specifications G-7.1-1989.
2. Breathing air may be supplied to respirators from cylinders or air compressors.
3. Supplied air compressors shall be equipped with the necessary safety and standby devices.
4. Position compressors to prevent contaminated air from entering the system and install inline air purifying absorbent beds and filters to assure breathing air quality.
5. An authorized person shall sign a tag indicating the last absorbent bed and filter change.
6. Each employee shall have an emergency escape bottle of sufficient capacity to evacuate the contaminated atmosphere in the event of compressor failure.
7. Equipment must have alarms to indicate compressor failure and overheating.
8. If an oil lubricated compressor is used, it shall have a high-temperature and carbon monoxide alarm.
9. Maintain carbon monoxide levels below ten (10) ppm.
10. Respirator hose length shall not exceed three hundred (300) linear feet.

7. Cleaning and Disinfecting

1. Clean and disinfect respirators daily.
2. Respirator wipes are intended for the cleaning/sanitizing prior to each use throughout the shift and shall not be used in lieu of the daily cleaning requirements.

8. Storage

1. Store respirators to protect against dust, sunlight, heat, extreme cold, excessive moisture or damaging chemicals.
2. Store respirators in a plastic bag or other container in a sanitary location.
3. Do not store respirators in lockers or toolboxes unless they are in carrying cases or cartons.
4. Place emergency use respirators at stations and work areas as required.
5. Emergency use respirators shall be immediately accessible at all times.
6. Store emergency use respirators in clearly marked compartments built for the purpose and in accordance with the manufacturer's recommendations.
7. Place instructions for the use and storage of emergency use respirators inside the carrying case lid.

9. Inspections

1. Employees must document the daily inspection of their respirator.
2. Inspect emergency use respirators after each use, monthly and per the manufacturer's recommendations.
3. Keep a record of inspection dates and findings for emergency use respirators.
4. Inspect rubber or elastomeric parts for pliability and signs of deterioration.
5. Only use NIOSH approved parts for respirator repairs.
 - Do not replace components, adjust or repair beyond the manufacturer's recommendations.
6. Return reducing/admission valves or regulators to the manufacturer for adjustment or repair.
7. Respirators that have failed inspection shall be taken out of service.
8. Inspect self-contained breathing apparatuses (SCBAs) monthly.
 - Charge cylinders according to the manufacturer's instructions.
 - Ensure regulator and warning devices function properly.
 - Check the tightness of connections and the condition of the face piece, headband, valves, connecting tube and canisters.
9. Inspect SCBA tanks annually.

Sanitation

Objective

The purpose of this program is to ensure all workers are provided with a sanitary work environment inclusive of drinking water, adequate facilities and an area free of vermin.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1926.51 Subpart D Occupational Health and Environmental Controls - Sanitation](#)
- [California Code of Regulations, Title 8, Subchapter 7, Group 2 §3300-3416](#)
- [California Code of Regulations, Title 8, Subchapter 7, Group 16, Article 107 §5155](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 3 §1524-1527](#)
- [California Code of Regulations, Title 8, Subchapter 4, Article 4 §1530-1530.1](#)

Skanska/Client Requirements

- None

Procedure

1. Drinking Water

1. Provide clean drinking water to all employees.
2. Containers used to dispense drinking water shall be constructed of materials that maintain water quality, sanitized daily, clearly marked and equipped with a tap and tight fitting lid.
3. Do not dip or scoop water from containers.
4. Use of a drinking cup by more than one person is not acceptable.
5. Provide drinking cups in a sanitary container and trash cans at water stations.
6. Clearly mark water sources that are not suitable for drinking.

2. Toilets

1. Make toilets available at the worksite. This does not apply to mobile crews that have transportation available to nearby toilet facilities.
2. Toilet facilities shall be adequately ventilated, appropriately screened, have self-closing doors that can be closed and latched from inside and shall be constructed to insure privacy.
3. Provide females with keys and combinations for designated locked toilets.
4. Service and clean toilets as often as necessary to maintain sanitary conditions.
5. Remove or repair toilets in poor condition.
6. Provide the following minimum amount of toilets at each jobsite:

A toilet is required for each 20 employees or fraction thereof of each sex; urinals may be substituted for half of the units. Sites with fewer than five employees are not required to provide separate toilets for each sex; however, toilets must be lockable from the inside.

3. Washing Facilities

1. Provide washing facilities with cleaning agents and towels near the worksite.
2. Provide one handwashing facility for each twenty (20) employees or fraction thereof. Washing stations must be clean and have an adequate supply of soap, water, and single use towels (or warm air blower). Washing stations must have a sign indicating water is for washing. Wash stations are to be located outside and not attached to the toilet facility. If there are less than five employees and only one toilet facility is required, the wash station may be located inside the toilet facility.
3. Refill hand washing facilities with an adequate supply of potable water, soap and single use towels.

4. Change Rooms

1. Provide change rooms to employees handling hazardous materials.

5. Eating and Drinking

1. Do not allow eating or drinking in hazardous materials areas.

6. Vermin Control

1. Construct, maintain, clean and organize enclosed workplaces, buildings, storage trailers, etc. to prevent the entrance and harborage of rats, mice, insects and other vermin. Utilize extermination measures when their presence is detected.

7. Insect Control

1. Reduce areas of standing water to prevent mosquitoes breeding. Where standing water cannot be removed treat with larvicides per the manufacturer's instructions. If these controls are ineffective, an industrial-style pesticide will be used per EPA guidelines. Provide insect repellant containing DEET® (N,N-Diethyl-meta-toluamide) to employees.
2. Minimize mosquito breeding grounds to prevent nuisance and reduce the risk of communicable diseases.
3. Store wheelbarrows, buckets and other containers upside down when not in use so they do not collect standing water.

Silica

Objective

The purpose of this program is to ensure that all employees are safeguarded from the occupational health and safety risks associated with exposures to silica.

Legal and Other Requirements

Federal, State, Local Regulations

- [OSHA 29 CFR 1926.21 Subpart C General Safety and Health Provisions - Safety training and education](#)
- [OSHA 29 CFR 1926.103 Subpart E Personal Protective and Life Saving Equipment - Respiratory protection](#)

- [OSHA 1926.1153 - Respirable Crystalline Silica](#)
- [OSHA 29 CFR 1910.134 Subpart I Personal Protective Equipment - Respiratory Protection](#)
- [OSHA 29 CFR 1910.1020 Subpart Z Toxic and Hazardous Substances - Access to employee exposure and medical records](#)
- [OSHA Silica General - "Crystalline Silica Exposure" Health Hazard Information for General Industry Employees](#)

Skanska/Client Requirements

- None

Procedure

1. Activities that may disturb crystalline silica-containing materials include, but are not limited to:
 - Jack hammering and chipping
 - Grinding concrete
 - Tunneling
 - Sandblasting
 - Dry sweeping or blowing concrete debris, sand or rock dust
 - Demolition of concrete/masonry structures
 - Drilling rock or concrete
 - Crushing, loading, dumping rock or concrete
 - Saw cutting concrete or rock
2. Controls
 1. Use either Table 1 from OSHA 1926.1153 or occupational monitoring to establish PPE and engineering controls. If tasks are not included in Table 1, occupational monitoring must be done.
 2. Engineering controls may include, but are not limited to:
 - Dust collection systems
 - Wetting down surfaces with a fine mist sprayer
 - Equipment that provides water to the blade during saw cutting
 - Water through the drill stem during rock drilling
 - Abrasives with a low silica or no silica content
 - Local exhaust ventilation
 3. Where engineering controls cannot be utilized, or are not effective to reduce silica exposure, use administrative controls to reduce the time of exposure for employees. These may include, but are not limited to:
 - Job rotation
 - Activity rescheduling to off hours
 - Shift change
 - Reassignment to a work area away from silica generating activities

4. Give appropriate respirators and protective clothing to employees that are potentially exposed above the permissible exposure limit.
5. Provide trash bins at the exit to each area to allow employees to discard used protective clothing is provided. Post signs and barricades around areas where create potential silica exposure exist.

3. Respiratory Protection

1. Create a Worksite Specific Respiratory Plan for all activities that may potentially disturb crystalline silica.
2. Use respiratory protection as the last line of defense in the protection against exposure to silica.
3. Select respirators based on the criteria identified in OSHA Table 1 or occupational monitoring.

4. Medical Examinations

1. Occupational medical surveillance shall be made available for each employee required to use a respirator for thirty (30) or more days per year.
 2. Initial examination:
 1. Initial (baseline) medical examination shall be made available within thirty (30) days after initial assignment, unless the employee has received a medical examination that meets the requirements of this section within the last three (3) years. The examination shall consist of:
 - A medical and work history, with emphasis on: past, present, and anticipated exposure to respirable crystalline silica, dust and other agents affecting the respiratory system
 - A physical examination with special emphasis on the respiratory system
 - A chest x-ray
 - A pulmonary function test
 - Testing for latent tuberculosis infection
 - Any other tests deemed appropriate by the physician or other licensed health care professional (PLHCP)
 3. Periodic examination:
 1. Provide medical examinations at least every three (3) years or more frequently if recommended by the PLHCP.
 4. Obtain a written medical opinion from the PLHCP within thirty (30) days of the medical examination.
- ### 5. Personal Hygiene
1. Do not permit food, drink, or tobacco products to be present or consumed in the work area.
 2. Provide a wash station for employees to use following work in designated silica work areas.

Security Plan (PR-03)

SKANSKA | FLATIRON

Contents

Security Plan..... 3

1 Construction Security..... 3

Security Plan

1 Construction Security

In accordance with the requirements of PR-02 4.A.6 SFJV will install, protect, and maintain security fencing around the construction staging yards and areas of operations where feasible. Some active construction work zones will be located in public roadways or other areas that will need to remain accessible to the public. These areas will not be conducive to perimeter security fencing but will have temporary warning signs, barricades, and/or flaggers as required by the ASR/LIR. Openings in the security fence to major yards will be supervised by a security guard, flagger, or craft watch-person when open for access during construction hours. SFJV will work with LAWA to optimize the security requirements to balance security needs with the project budget to ensure a safe and efficient project.

SFJV will work with LAWA's CALM team to determine any other security measures that are needed and will implement as needed throughout the project.

November 7, 2024

INTRODUCTION

As required by the *Project Requirements (PR-01)* Section 4.D.3, Skanska-Flatiron, a Joint Venture ('SFJV'), hereby submits Schedule Update 16 with Data Date 01NOV24. The Baseline Schedule Schematic Design R0 Schedule was updated to reflect progress through October 31, 2024.

SFJV incorporated modifications to the schedule in the period. Notably, SFJV:

- Addressed comments received from LAWA upon its review of Update 15;
- Updated the "Owner Activities" to comport with the updated P6 file provided by LAWA; and
- Modified activities and logic within the construction work to comport with the now-current and developing plan to construct the work.

Detail of schedule modifications in the period are included below.

WORK COMPLETED IN THE PERIOD

Within the period, SFJV and its team:

- Submitted the Task Order 5, Design Unit 4 documents to LAWA meeting the obligated submission date;
- Progressed the pricing for the task order for the construction documents for the balance of the work;
- Submitted TO-PH1-TO03R1, MOT Analysis & Traffic Evaluation 60% design;
- Continued the taking of geotechnical borings;
- Advanced the preparation of the geotechnical reports for Main Work Packages #2 and #3; and
- Advanced the preparation of the Design Development for all packages on the Project.

LONGEST PATH

The longest path to project completion is attached herewith.

The longest path remains driven by the process to put a GMP in place between the parties to allow Main Work Package #2 to commence upon issuance of NTP in advance of installation of drilled shaft foundations, the sequence of which was optimized in the period.

Bridge A Frame 7 construction then continues to control the longest path upon completion of drilled shafts at Bent 22 with an anticipated completion in May 2027. With the traffic switch to Segment A, the existing hook ramp is removed allowing the commencement of the Stage 4 work. Work to commence Retaining Wall A-3 then controls the longest path through excavation and shoring which then allows for the west tie in to the relocated box culvert to take place. With the box culvert relocation complete, the longest path is then controlled by the construction of Retaining Wall K-2 followed by the roadway section in Segment I between Sta 17+50 and Sta 21+44. With Segment I complete, existing Westbound Century over Sepulveda is removed allowing for Stage 5 work to commence in January 2028. Within Stage 5, construction of Bridge P controls the longest path through 15SEP28 whereupon the existing EB Century over Sepulveda may be removed and the remainder of Bridge P, with its requisite traffic tie-ins, may complete. Segment NE is then constructed with a forecast Project Final Completion date of 24JAN30.

The minor longest path betterment in the period is the direct result of the re-optimization of the drilled shaft installation.

SCHEDULE MODIFICATIONS

The schedule modifications discussed are between schedule file LAWA-ATMP-BLR0UP15 with Data Date 01OCT24 and LAWA-ATMP-BLR0UP16 with Data Date 01NOV24.

The following activities and their relationships were added to the schedule to model the preparation and review of the final IFC packages for MWP #2 and #3:

ID	Description	LAWA-ATMP-BLR0UP15	LAWA-ATMP-BLR0UP16
DS-31030	CD - Incorporate LAWA/AHJ Comments from IFC Ready Design Main Work Package #2 Review	*	✓
DS-31040	CD - Perform DQC on IFC Main Work Package #2	*	✓
DS-31050	CD - Conduct IFC Main Work Package #2 Review & Submit	*	✓
DS-31060	CD - LAWA/AHJ Review of IFC Main Work Package #2	*	✓
DS-31070	CD - LAWA/AHJ Readiness Review IFC Main Work Package #2	*	✓
MS-21250	CD - Issue IFC Ready Main Work Package #2	*	✓
DS-31080	CD - Incorporate LAWA/AHJ Comments from IFC Ready Design Main Work Package #3 Review	*	✓
DS-31090	CD - Perform DQC on IFC Main Work Package #3	*	✓
DS-31100	CD - Conduct IFC Main Work Package #3 Review & Submit	*	✓
DS-31110	CD - LAWA/AHJ Review of IFC Main Work Package #3	*	✓
DS-31120	CD - LAWA/AHJ Readiness Review IFC Main Work Package #3	*	✓

The following activities and their relationships were added to the schedule to model the noted utility relocations identified in the period:

ID	Description	LAWA-ATMP-BLR00P15	LAWA-ATMP-BLR00P16
UTIL-13040	Util Relo - AT&T Ant on 96th - Disconnect & Remove Antenna (By Others)	x	✓
UTIL-13070	Util Relo - AT&T Ant on 96th - Install Conduit & Pull Boxes	x	✓
UTIL-13080	Util Relo - AT&T Ant on 96th - Reinstall Light Pole / Antenna (By Others)	x	✓

ANTICIPATED SCHEDULE MODIFICATIONS – NEXT PERIOD

SFJV anticipates the following schedule modifications, at a minimum, will be included within the next Schedule Update:

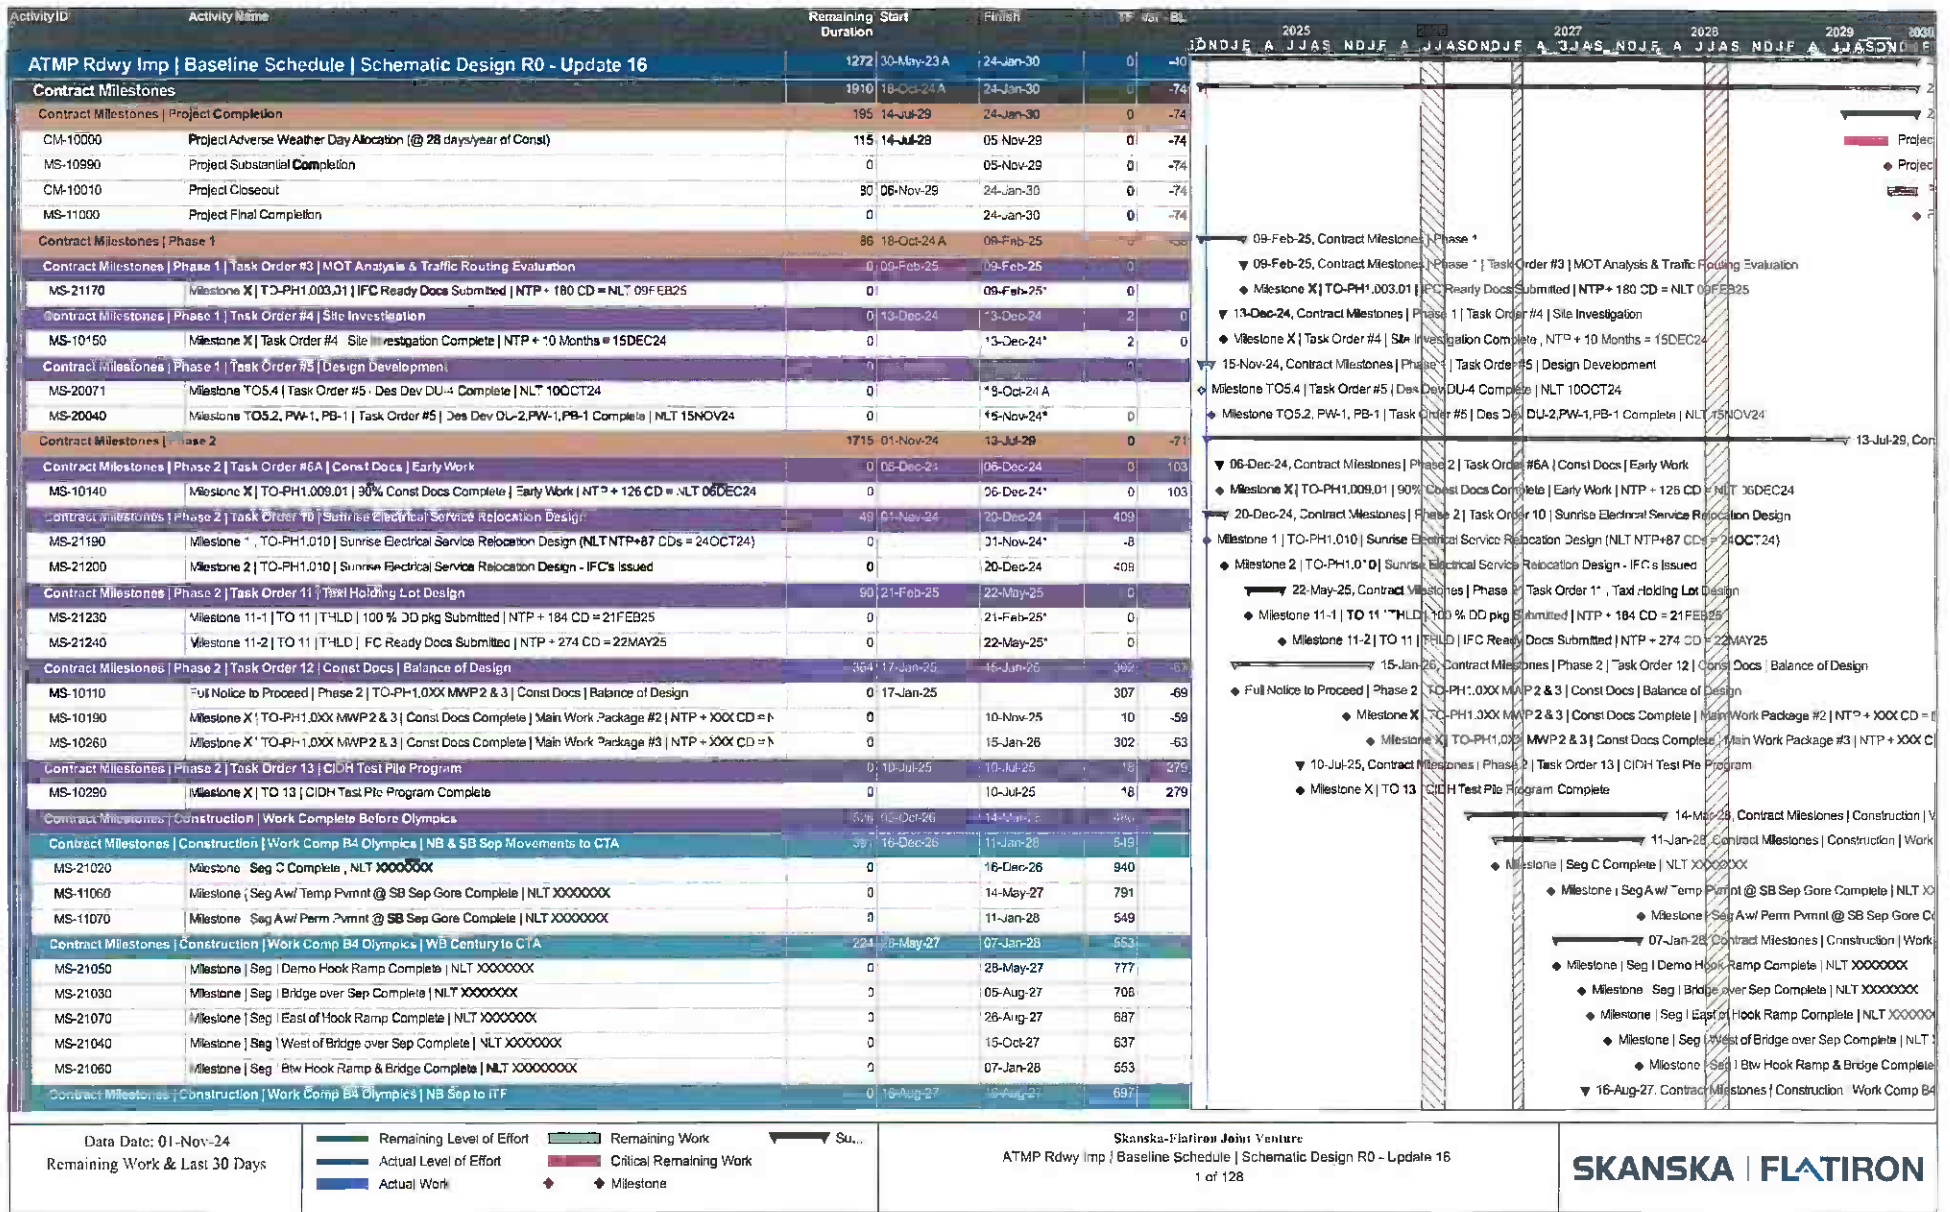

- Continued review of Bridge Structures for bridge type, sequence, and scope; and
- Continued resolution of redundant logic.

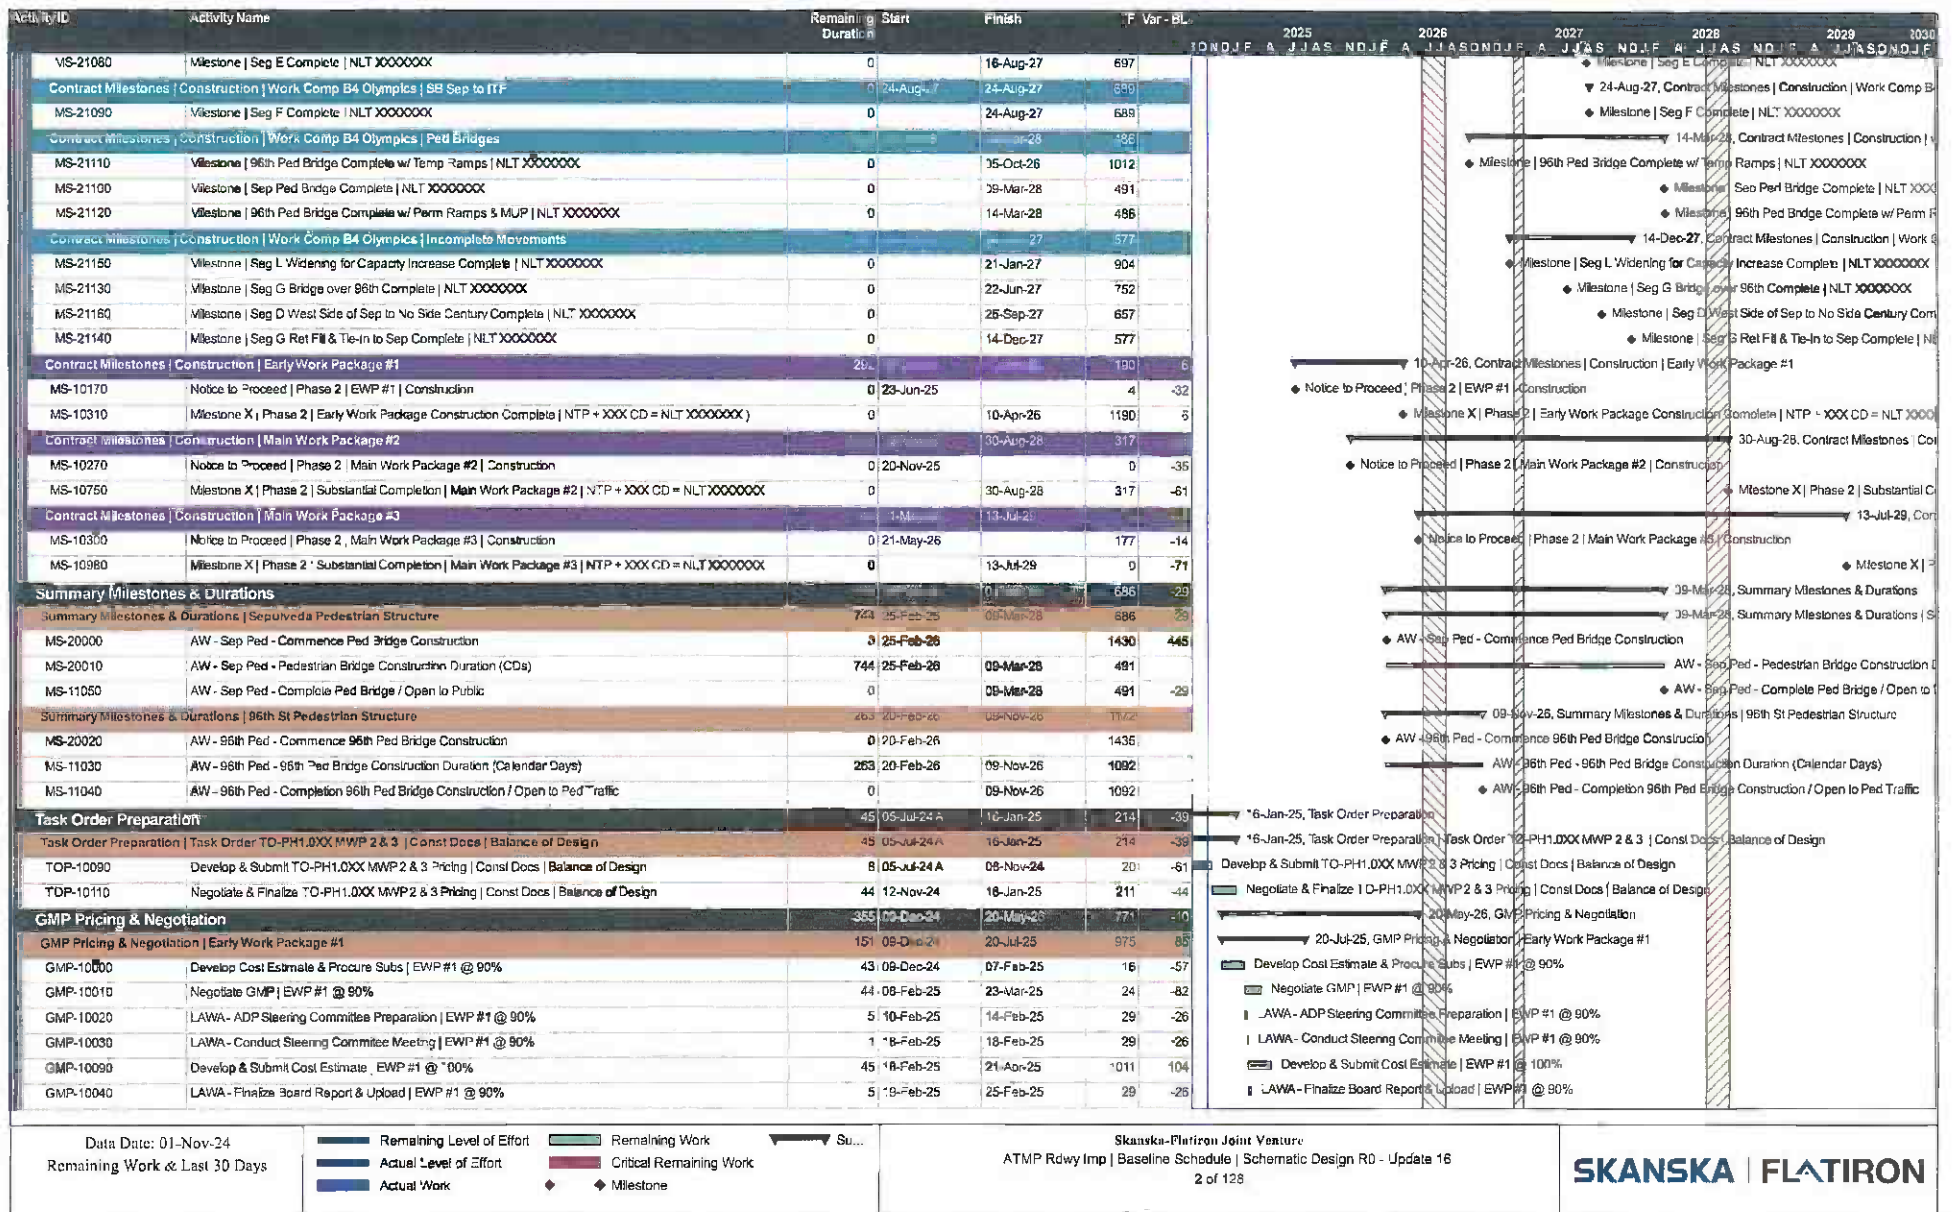

SFJV has reviewed the requirements contained within Project Requirement PR-04 with regard to the content of the Monthly Schedule Update Narrative Report. SFJV shall include the additional narrative sections as they become applicable to the Work authorized to proceed.

Acumen Fuse® Diagnostic Executive Briefing

Report Generated On Wednesday, November 6, 2024
 Created by amysheine

SFJV Summary

An Acumen Fuse analysis was conducted on Wednesday, November 6, 2024 on the SFJV workbook. It contains 16 projects: LAWA-ATMP-PREUP04, LAWA-ATMP-PREUP04R1, LAWA-ATMP-PREUP05, LAWA-ATMP-PREUP06, LAWA-ATMP-PREUP07, LAWA-ATMP-PREUP08, LAWA-ATMP-BLSDR0, LAWA-ATMP-BLSDR0UP09, LAWA-ATMP-BLSDR0UP10, LAWA-ATMP-BLSDR0UP11, LAWA-ATMP-BLR0UP11R1, LAWA-ATMP-BLR0UP12, LAWA-ATMP-BLR0UP13, LAWA-ATMP-BLR0UP14, LAWA-ATMP-BLR0UP15 and LAWA-ATMP-BLR0UP16, modeled in Oracle Primavera P6.

The 16 projects in the workbook represent a total cost of \$465.66MM of which \$402.43MM are remaining with \$63.23MM spent as actual cost. The earliest start date is Tuesday, May 30, 2023 with the latest completion date being Monday, February 25, 2030.

Trend Analysis

The following section details how the characteristics of the workbook vary over time. This provides useful insight by showing improving/worsening trends. The analysis was conducted using months as time intervals:

- **Missing Logic:** decreases over time with the best period being 6/2023 (0) and the worst period being 5/2023 (5).
- **Logic Density:** increases over time with the highest period being 5/2023 (6.50) and the lowest period being 11/2023 (3.52).
- **Critical:** remains constant over time.
- **Hard Constraints:** remains constant over time.
- **Negative Float:** remains constant over time.
- **Insufficient Detail:** remains constant over time.
- **Number of Lags:** increases over time with the best period being 5/2023 (0) and the worst period being 7/2023 (25).
- **Number of Leads:** remains constant over time.
- **Merge Hotspot:** decreases over time with the best period being 11/2023 (0) and the worst period being 7/2023 (15).

Projects Summary

LAWA-ATMP-BLR0UP12 Project

The LAWA-ATMP-BLR0UP12 project has a start date of Tuesday, May 30, 2023 and has Monday, January 7, 2030 as the completion date. The project is currently in progress with a status date of Monday, July 1, 2024. It has 4334 normal activities of which 247 (5.7%) are complete, 52 (1.2%) are in progress and 4035 (93.1%) are still planned. It contains 81 milestones, no summaries and 35 LOEs.

The project baseline start date was Thursday, December 1, 2022 with the baseline finish date being Monday, January 7, 2030. The project is currently on schedule.

The total cost of the project is \$37.88MM (compared to baseline cost of \$37.88MM) of which \$0 has been actualized with \$37.88MM remaining. The project is currently on budget.

LAWA-ATMP-BLR0UP13 Project

The LAWA-ATMP-BLR0UP13 project has a start date of Tuesday, May 30, 2023 and has Monday, February 25, 2030 as the completion date. The project is currently in progress with a status date of Thursday, August 1, 2024. It has 4277 normal activities of which 263 (6.1%) are complete, 52 (1.2%) are in progress and 3962 (92.6%) are still planned. It contains 82 milestones, no summaries and 35 LOEs.

The project baseline start date was Thursday, December 1, 2022 with the baseline finish date being Monday, February 25, 2030. The project is currently on schedule.

The total cost of the project is \$37.88MM (compared to baseline cost of \$37.88MM) of which \$0 has been actualized with \$37.88MM remaining. The project is currently on budget.

LAWA-ATMP-BLR0UP14 Project

The LAWA-ATMP-BLR0UP14 project has a start date of Tuesday, May 30, 2023 and has Wednesday, January 30, 2030 as the completion date. The project is currently in progress with a status date of Sunday, September 1, 2024. It has 4467 normal activities of which 287 (6.4%) are complete, 45 (1%) are in progress and 4135 (92.6%) are still planned. It contains 78 milestones, no summaries and 35 LOEs.

The project baseline start date was Thursday, December 1, 2022 with the baseline finish date being Wednesday, January 30, 2030. The project is currently on schedule.

The total cost of the project is \$37.88MM (compared to baseline cost of \$37.88MM) of which \$0 has been actualized with \$37.88MM remaining. The project is currently on budget.

LAWA-ATMP-BLR0UP15 Project

The LAWA-ATMP-BLR0UP15 project has a start date of Tuesday, May 30, 2023 and has Tuesday, February 5, 2030 as the completion date. The project is currently in progress with a status date of Tuesday, October 1, 2024. It has 4603 normal activities of which 312 (6.8%) are complete, 38 (0.8%) are in progress and 4253 (92.4%) are still planned. It contains 87 milestones, no summaries and 35 LOEs.

The project baseline start date was Thursday, December 1, 2022 with the baseline finish date being Tuesday, February 5, 2030. The project is currently on schedule.

The total cost of the project is \$37.88MM (compared to baseline cost of \$37.88MM) of which \$0 has been actualized with \$37.88MM remaining. The project is currently on budget.

LAWA-ATMP-BLR0UP16 Project

The LAWA-ATMP-BLR0UP16 project has a start date of Tuesday, May 30, 2023 and has Tuesday, February 5, 2030 as the completion date. The project is currently in progress with a status date of Friday, November 1, 2024. It has 4682 normal activities of which 329 (7%) are complete, 47 (1%) are in progress and 4306 (92%) are still planned. It contains 87 milestones, no summaries and 35 LOEs.

The project baseline start date was Thursday, December 1, 2022 with the baseline finish date being Tuesday, February 5, 2030. The project is currently on schedule.

The total cost of the project is \$37.88MM (compared to baseline cost of \$37.88MM) of which \$0 has been actualized with \$37.88MM remaining. The project is currently on budget.

Ribbon Analysis

A ribbon analysis shows how the results from the selected metrics vary across the selected groupings of activities. This is a useful means of comparing between such groupings. In addition, the scorecard value for each ribbon provides an overarching summary of each ribbon.

The workbook has been grouped by projects. The analysis contains 5 ribbons: "LAWA-ATMP-BLR0UP12", "LAWA-ATMP-BLR0UP13", "LAWA-ATMP-BLR0UP14", "LAWA-ATMP-BLR0UP15" and "LAWA-ATMP-BLR0UP16".

Ribbon Analyzer

Ribbons \ Phases	Missing Logic	Logic Density™	Critical	Hard Constraints	Negative Float	Insufficient Detail™	Number of Lags	Number of Leads	Merge Hotspot	Scorecard Value
LAWA-ATMP-BLR0UP12	1	3.80	0	0	0	0	12	0	12	85.8%
LAWA-ATMP-BLR0UP13	1	3.77	0	0	0	0	13	0	12	86.1%
LAWA-ATMP-BLR0UP14	1	3.78	0	0	0	0	13	0	12	86.1%
LAWA-ATMP-BLR0UP15	1	3.79	0	0	0	0	13	0	12	86.1%
LAWA-ATMP-BLR0UP16	1	3.79	0	0	0	0	13	0	12	86.1%

- LAWA-ATMP-BLR0UP12 has the worst scorecard value with a score of 85.8%.
- LAWA-ATMP-BLR0UP13, LAWA-ATMP-BLR0UP14, LAWA-ATMP-BLR0UP15 and LAWA-ATMP-BLR0UP16 have the best scorecard value with a score of 86.1%.

LAWA-ATMP-BLR0UP12 Ribbon Analysis

The LAWA-ATMP-BLR0UP12 ribbon contains 124 normal activities, 8 milestones, 0 summaries and 30 LOEs spanning from Tuesday, May 30, 2023 to Friday, October 19, 2029.

93.8% of the activities in this ribbon are complete; 0% are planned and 6.2% are in progress.

The ribbon is 184 days long and has a remaining cost of \$7.79MM.

The ribbon was analyzed using 9 metrics, as detailed below:

- 1 activity (0%) has Missing Logic. Less than 10% exceptions. Some improvements may be required.
- This ribbon has a Logic Density of 3.80. There are between two and four links per activity.
- 0 activities are Critical. No data meets the metric Inclusion or Filter criteria for Secondary Formula
- 0 activities (0%) have Hard Constraints. No exceptions.
- 0 activities have Negative Float. No data meets the metric Inclusion or Filter criteria for Secondary Formula
- 0 activities (0%) have Insufficient Detail.
- This ribbon has a Number of Lags of 13 (10%). Less than 25% of activities have lags. Some improvements may be required.
- 0 activities (0%) have Number of Leads. Less than 5% of activities have negative lags.
- 12 activities (9%) are Merge Hotspot. Less than 10% of activities have more than two predecessors.

LAWA-ATMP-BLR0UP13 Ribbon Analysis

The LAWA-ATMP-BLR0UP13 ribbon contains 124 normal activities, 11 milestones, 0 summaries and 30 LOEs spanning from Tuesday, May 30, 2023 to Friday, December 7, 2029.

93.9% of the activities in this ribbon are complete; 0% are planned and 6.1% are in progress.

The ribbon is 184 days long and has a remaining cost of \$7.79MM.

The ribbon was analyzed using 9 metrics, as detailed below:

- 1 activity (0%) has Missing Logic. Less than 10% exceptions. Some improvements may be required.
- This ribbon has a Logic Density of 3.77. There are between two and four links per activity.
- 0 activities are Critical. No data meets the metric Inclusion or Filter criteria for Secondary Formula
- 0 activities (0%) have Hard Constraints. No exceptions.
- 0 activities have Negative Float. No data meets the metric Inclusion or Filter criteria for Secondary Formula
- 0 activities (0%) have Insufficient Detail.
- This ribbon has a Number of Lags of 13 (10%). Less than 25% of activities have lags. Some improvements may be required.
- 0 activities (0%) have Number of Leads. Less than 5% of activities have negative lags.
- 12 activities (9%) are Merge Hotspot. Less than 10% of activities have more than two predecessors.

LAWA-ATMP-BLR0UP14 Ribbon Analysis

The LAWA-ATMP-BLR0UP14 ribbon contains 124 normal activities, 11 milestones, 0 summaries and 30 LOEs spanning from Tuesday, May 30, 2023 to Friday, November 9, 2029.

93.9% of the activities in this ribbon are complete; 0% are planned and 6.1% are in progress.

The ribbon is 184 days long and has a remaining cost of \$7.79MM.

The ribbon was analyzed using 9 metrics, as detailed below:

- 1 activity (0%) has Missing Logic. Less than 10% exceptions. Some improvements may be required.
- This ribbon has a Logic Density of 3.78. There are between two and four links per activity.
- 0 activities are Critical. No data meets the metric Inclusion or Filter criteria for Secondary Formula
- 0 activities (0%) have Hard Constraints. No exceptions.
- 0 activities have Negative Float. No data meets the metric Inclusion or Filter criteria for Secondary Formula
- 0 activities (0%) have Insufficient Detail.
- This ribbon has a Number of Lags of 13 (10%). Less than 25% of activities have lags. Some improvements may be required.
- 0 activities (0%) have Number of Leads. Less than 5% of activities have negative lags.
- 12 activities (9%) are Merge Hotspot. Less than 10% of activities have more than two predecessors.

LAWA-ATMP-BLR0UP15 Ribbon Analysis

The LAWA-ATMP-BLR0UP15 ribbon contains 124 normal activities, 11 milestones, 0 summaries and 30 LOEs spanning from Tuesday, May 30, 2023 to Friday, November 16, 2029.

93.9% of the activities in this ribbon are complete; 0% are planned and 6.1% are in progress.

The ribbon is 184 days long and has a remaining cost of \$7.79MM.

The ribbon was analyzed using 9 metrics, as detailed below:

- 1 activity (0%) has Missing Logic. Less than 10% exceptions. Some improvements may be required.
- This ribbon has a Logic Density of 3.79. There are between two and four links per activity.
- 0 activities are Critical. No data meets the metric Inclusion or Filter criteria for Secondary Formula
- 0 activities (0%) have Hard Constraints. No exceptions.
- 0 activities have Negative Float. No data meets the metric Inclusion or Filter criteria for Secondary Formula
- 0 activities (0%) have Insufficient Detail.
- This ribbon has a Number of Lags of 13 (10%). Less than 25% of activities have lags. Some improvements may be required.
- 0 activities (0%) have Number of Leads. Less than 5% of activities have negative lags.
- 12 activities (9%) are Merge Hotspot. Less than 10% of activities have more than two predecessors.

LAWA-ATMP-BLR0UP16 Ribbon Analysis

The LAWA-ATMP-BLR0UP16 ribbon contains 124 normal activities, 11 milestones, 0 summaries and 30 LOEs spanning from Tuesday, May 30, 2023 to Friday, November 16, 2029.

93.9% of the activities in this ribbon are complete; 0% are planned and 6.1% are in progress.

The ribbon is 184 days long and has a remaining cost of \$7.79MM.

The ribbon was analyzed using 9 metrics, as detailed below:

- 1 activity (0%) has Missing Logic. Less than 10% exceptions. Some improvements may be required.
- This ribbon has a Logic Density of 3.79. There are between two and four links per activity.
- 0 activities are Critical. No data meets the metric Inclusion or Filter criteria for Secondary Formula
- 0 activities (0%) have Hard Constraints. No exceptions.
- 0 activities have Negative Float. No data meets the metric Inclusion or Filter criteria for Secondary Formula
- 0 activities (0%) have Insufficient Detail.
- This ribbon has a Number of Lags of 13 (10%). Less than 25% of activities have lags. Some improvements may be required.
- 0 activities (0%) have Number of Leads. Less than 5% of activities have negative lags.
- 12 activities (9%) are Merge Hotspot. Less than 10% of activities have more than two predecessors.

Preliminary Site Investigation Plan

1 Overview and Goals

During the task order negotiations for Task Order PH1-TO01 a scope was developed that was agreeable to both LAWA and SFJV to perform some preliminary site investigations for the BOD phase that would provide initial levels of information to inform the alternatives analysis and selection of preferred alternative. This plan addresses the investigation for the BOD phase. Additional investigations will be required for future phases, and this plan will be updated accordingly in future phases. During the BOD phase there are six primary areas of investigation, engineering field investigations, utility pothole investigation, geotechnical investigation, field surveying, traffic counts, and tree survey.

2. BOD Phase Preliminary Site Investigation

2.1 Engineering Field Investigation

SFJV and HNTB will conduct periodic site investigations to confirm certain locations and impacts of various items as may be identified during the Basis of Design. This activity is typical for most any engineering design project and expected part of the design process.

As the majority of this project exists within the public right of way, specific requests for access will not be necessary during the BOD Phase of the project. As the design develops and right of way takes are identified as may be necessary for permanent and or temporary conditions, SFJV will advise LAWA accordingly as to the needs for such private property site visits.

General engineering site visits as are typically conducted will always involve two individuals when going into the field. Appropriate PPE as required by the SFJV's safety plan will be used for such visits.

2.2 Utility Pothole Investigation

During the Basis of Design, it will be necessary to identify potential utility conflicts where underground work is proposed. This work generally entails foundation construction, storm drain construction, and the installation of other underground utility facilities as may need to be installed and or relocated as part of the project.

SFJV and HNTB will identify these potential conflicts via the design process attempting to avoid and minimize these conflicts to the greatest extent possible. Where it is critical to identify the locations of those facilities in potential conflict, potholing to verify the facility's coordinates and elevation will be undertaken. This work will be performed under the conditions of *PR – 07 UTILITIES*. This information will be collected via the project team surveyor and tie into the LAX Survey Control Network.

The specific work will also entail the required traffic control to be permitted through the appropriate agency prior to the work being performed.

The pothole information as collected will be references onto and be part of the project plans eventually to be Issued For Construction (IFC).

2.3. Geotechnical Investigation

SFJV and HNTB are required to provide geotechnical designs for the foundations of the various structures on the project, including pavement, slope stability and trench requirements where applicable. To develop this design, it will be necessary to perform a geotechnical site investigation of the proposed foundation locations for all the structures on the project.

Upon LAWA confirmation of a Preferred Alternative and the corresponding project geometry, SFJV, HNTB and its geotechnical engineer will prepare a proposed field investigation for the borings required. This plan will identify the foundation locations and the proposed boring locations.

The specific work will also entail the required traffic control to be permitted through the appropriate agency prior to the work being performed.

2.4 Field Surveying

Survey work will be performed over the entire project site and will be an ongoing task depending on the needs of the design at any given time. The surveyor will be setting project control targets and monument recovery activity in the first two to three months of the BOD Phase. This will be in support of the aerial and Lidar mapping activities that will be part of the BOD Phase.

During the BOPD Phase, it is anticipated that some additional field work from the surveyor will be required. As the project lies within the public right of way, their activities will not require any specific access to private property.

2.5 Traffic Counts

SFJV and HNTB have identified a budget for this activity should it prove necessary to validate any of the traffic volumes on the project site. This work will be provided by a local provider and will be performed in accordance with the appropriate local requirements.

2.6 Tree Survey

SFJV and HNTB have identified the need to inventory all trees that exist within the project footprint. This will be important when the project is required to identify the tree removal count and provide

appropriate mitigation. This work will be performed by visual inspection. It is recommended this work be performed after the completion of the site survey and will be scheduled accordingly.

No traffic control is anticipated to perform this activity.

3. Phase 2 Final Design

3.1 Engineering Field Investigation

SFJV and HNTB will continue to conduct periodic site investigations throughout Final Design. SFJV will advise LAWA for access outside the public right of way on private property.

General engineering site visits as are typically conducted will always involve two individuals when going into the field. Appropriate PPE as required by the SFJV's safety plan will be used for such visits.

3.2 Utility Pothole Investigation

It is anticipated that Phase 1 potholing identifies the potential utility conflicts. As the design progresses towards final design, it may be necessary to perform additional potholes. Increased footing sizes for example or shifts in alignment may bring utilities that were not a concern to utilities that need to be located through potholing. This work will be performed and documented as was done in Phase 1.

3.3. Geotechnical Investigation

It is not anticipated that additional geotechnical investigation will be required for Final Design.

3.4 Field Surveying

SFJV and HNTB have identified a budget for this activity should it prove necessary to acquire additional design tie in survey. This work will be performed as was done in Phase 1.

3.5 Traffic Counts

It is not anticipated that additional traffic counts will be required for Final Design.

3.6 Tree Survey

SFJV and HNTB will perform the tree survey as part of an Arborist Report. This work will be performed by a local provider in accordance with the appropriate local requirements.

No traffic control is anticipated to perform this activity.

1. GENERAL

This Design Management Plan is prepared in accordance with *Project Requirement PR-11 Design Management*. The outline below represents the contents of the section noted as well as specific items referenced in *Project Requirement PR-02 Project Management* and *Coordination* and other sections as noted here.

2. DESIGN DELIVERABLES

The Skanska/Flatiron Joint Venture (SFJV) team and the HNTB design team HNTB will manage the prescribed deliverables in accordance with the applicable Project Requirements. Design deliverables for the project shall consist of the required deliverables described in each Task Order. Each deliverable shall contain the applicable documentation as required in *Project Requirement PR-09 Submittal Procedures*.

The elements of the project are noted below in the graphic included in the *Project Requirement PR-01 Scope of Work*:

The specific design elements included in the *Project Requirement PR-01 Scope of Work* graphic lead by HNTB include:

- Basis of Design (BOD)
- Schematic Design
- Design Development
- Construction Documents

The balance of the items shown in the graphic are items HNTB is performing in conjunction the SFJV.

3. PRECONSTRUCTION DELIVERABLES IN SUPPORT OF DESIGN

HNTB will work with the SFJV team to identify the preconstruction elements that represent the deliverables required for the work. In general those items are:

- Preliminary Project Management Plan
- Work Plan and Schedule
- Design Management Plan
- Project Controls Plan
- Quality Control Plan
- Communication Plan
- Stakeholder Engagement Plan
- Safety Plan

Of the deliverables noted above, HNTB is specifically responsible for the Design Management Plan. HNTB has prepared and submitted to SFJV the Design Quality Management Plan that resides in SFJV's Quality Control Plan for the project. HNTB has coordinated the balance of the deliverables noted above for input from SFJV for pertinent information. SFJV will be making the balance of the deliverables noted above as part of the preconstruction services under the work described.

4. DESIGN SERVICES

For the design services, HNTB is responsible for all professional engineering design services and management as defined in *Project Requirement PR-01 Scope of Work*. This includes all disciplines related to the nature of the work including roadway, structural, traffic, drainage, utility, surveying, geotechnical, landscape architecture, architecture, and all other support services required to deliver the elements that make up this multi-discipline project.

As the project develops certain specific requirements may be identified via the stakeholder interviews as defined in the BOD Phase. These requirements will be evaluated with the SFJV and LAWA to determine the applicability of potential "new" requirement. As these elements are defined, HNTB will incorporate the new design requirements into the project as appropriate.

With the development of the design, HNTB will manage all project plans as they are delivered, keeping a record of the submittal. Drawings will be submitted via electronic submittal using PDF formatted plan sheets following the software requirement specified in the Project Requirements.

The specifications for the project shall be prepared to represent the appropriate requirements for implementing the construction activity and/or materials required for the project.

HNTB will maintain all design files including calculations as may be required for any of the design analysis. Calculations prepared by hand will be documented on HNTB letterhead grid paper. Software that may be used for the design analysis will be software that has been previously adopted by HNTB as acceptable to perform the various engineering calculations as may be performed. This will generally be as it relates to roadway, structural, hydrologic and hydraulic and traffic design.

During construction, if changes to the Issued for Construction Plan set becomes necessary the HNTB design team will utilize the Notice of Design Change processes as is appropriate and required by the contract documents.

5. DESIGN QUALITY

The Design Quality Management Plan (DQMP) is documented and part of the overall project Quality Assurance/Quality Control (QA/QC) program in accordance with *Project Requirement PR-13/14 Quality Assurance/Quality Control*. As part of the Program Wide QA/QC plan, HNTB has prepared the required DQMP that is incorporated into that document.

As part of the BOD, HNTB, SFJV and LAWA will identify the appropriate project requirements and performance indicators. The team will collectively identify these parameters and then move the design forward accordingly.

The Design Quality process will include an identification of project deliverables and scope with each Task Order as issued by LAWA. HNTB and the SFJV will develop scopes and deliverable requirements for the upcoming design elements (SD, DD, CD) by interpreting the Project Requirements and the needs of the project at that point in time during the design.

HNTB will utilize its own design process for adhering to its own standardized design procedure. This quality process generally involves application of the process to all disciplines as the overall compilation of the project plans. The process identifies the need for a Discipline Quality Check (DQC), Interdisciplinary Review (IDR), Constructability Review (CR), and when there are highly technical and complex design elements, a Senior Technical Review (STR) may be identified. For this project, it is anticipated for the two large viaduct bridges (Segment A and Segment D) to have an STR quality review.

Each Discipline Task Lead will be the responsible party for the overall DQC of the discipline deliverables. Completion of quality forms including the redline plans and documents will be retained as part of the overall QC process. This will be documented in accordance with the DQMP. This process for checking has successfully delivered design documents with the appropriate level of accuracy and completeness.

HNTB will proactively identify the sequence of reviews to occur prior to the design milestone submittals. These reviews will start with the DQC review, followed by the IDR, and CR with the SFJV team participation will be conducted. The latter review will occur with key staff from SFJV team who are familiar with the project. This will focus their input to the level of completeness of the plans at that point in time (30% plans will necessitate a differing level of construction detail than offered at 100%). The overall checking and interface management will lead to a reconciliation meeting between the SFJV and the design team.

As part of the quality design process, comments and disposition verification are important. While this statement may seem most applicable to the reviews provided by LAWA, HNTB applies the same approach to comment resolution and disposition for its own internal DQC, IDR, STR and CR reviews. HNTB will address all the comments and meet with LAWA and its team to resolve any outstanding comments.

6. DESIGN REVIEWS

The design reviews will involve a number of agencies. The primary reviewer for the project will be LAWA. Included in the review of the project will be other authorities having jurisdiction (AHJ) as identified during the BOD phase. The submittals to the AHJ's will be coordinated in accordance with *Project Requirement PR-09 Submittal Procedure* and *PR-12 Third Party Coordination*.

HNTB will coordinate all submittals and comment resolution process with the applicable AHJ.

7. DRAWINGS, DATA, AND CONFIGURATION MANAGEMENT

HNTB shall maintain all design drawings, design data and calculations utilizing the applicable software and design standards identified in the *Project Requirement PR-01 Scope of Work* and approved during the BOD phase.

As part of the project HNTB's organization, the responsibility of the Discipline Task Leads entails:

- Overseeing the staff preparing plans, calculations under their direct supervision
- Reviewing all documents issued through their respective group, and initiate an independent DQC
- Coordinating all IDR with the other Task Leads,
- Implementing the appropriate control over the documents including the plans, specifications and comments resolution documents.
- Assuring plan information is incorporated into the baseline to allow for the development of the applicable modeling in accordance with the Project Requirement PR-21 Building Information Model (BIM) and Virtual Design and Construction (VDC) Coordination.

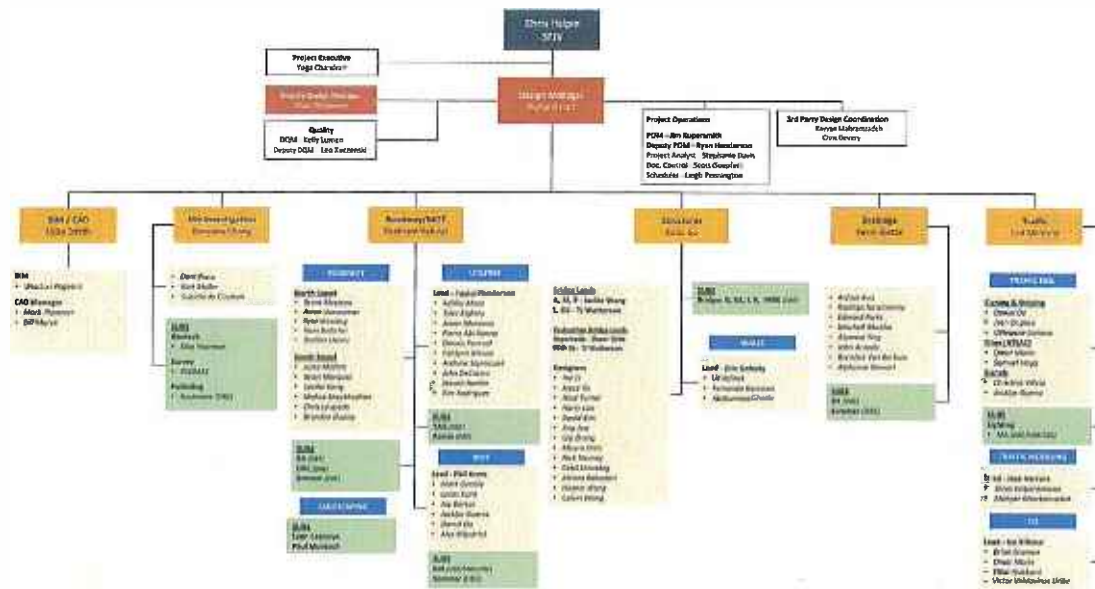

8. STANDARDS AND CODES

As part of the Proof of Concept report submitted during the BOD, HNTB will define the applicable standards and design criteria to be used for the project. These items will require validation with the AHJs to assure the correct standards are being applied to the project. This will be an ongoing process within the BOD and throughout the design to assure the agreed upon standards are being used.

9. CHECKLISTS

The HNTB design team will use the appropriate checklists as offered by the AHJs to prepare its plans for the project. This will be addressed as part of the BOD's Proof of Concept report noted above. Agreement on the checklists will need to be documented at the time the agencies agree to the form of the check list to be used.

APPENDIX A – SEGMENT PACKAGING

1. GENERAL

This Design Submittal Packaging Plan is a subset of the Project Management Plan (PMP). It has been prepared to divide the design work based on geographic area and primary Authority Having Jurisdiction (AHJ).

2. DESIGN DRAWINGS

Design drawings have been broken up into design units, project wide Maintenance of Traffic (MOT), ITS and Site Improvement packages, and an Early Works packages as shown in Table 1 and graphically shown in Appendix A. Each design discipline will be included in the package, however utilities will be as described in Section 3. The Early Works package will be limited to demolition work and temporary pavement. The Skanska Flatiron Joint Venture (SFJV) will transmit a design drawing package to LAWA for distribution. Separate packages for secondary AHJs or departments within an organization will not be created.

Table 1: Design Drawing Packaging Plan

Design Units	Roadway Segments	# of Bridges	# of Walls
1	E, G, H, Mixed Use Trail	1	5
2A	A, C, D, F	2	11
2B	D	1	2
3	J Century Blvd. Vicksburg Ave.	N/A	N/A

PW 3	Site Improvements	N/A	N/A
PB 1	Sepulveda Blvd. & 96 th St	2 Ped	N/A
AC 1	Early Works	N/A	1

3. PROJECT WIDE UTILITIES

Composite utility plans depicting existing conditions and relocations will be included with each of the design drawing packages described in Section 2. Relocation plans will be developed for each utility owner. The relocation plans will be divided into communications (UR 1) and non communications (UR 2). An Early Works package (AC2) is proposed to advance those utilities that are identified to impact initial construction activities. These could be relocated, demolished or protected in place. These will be developed to a level as outlined in the current Task Order.

It is assumed that the utility owner will design the relocation plans noted in Table 2.

COST MANAGEMENT PLAN

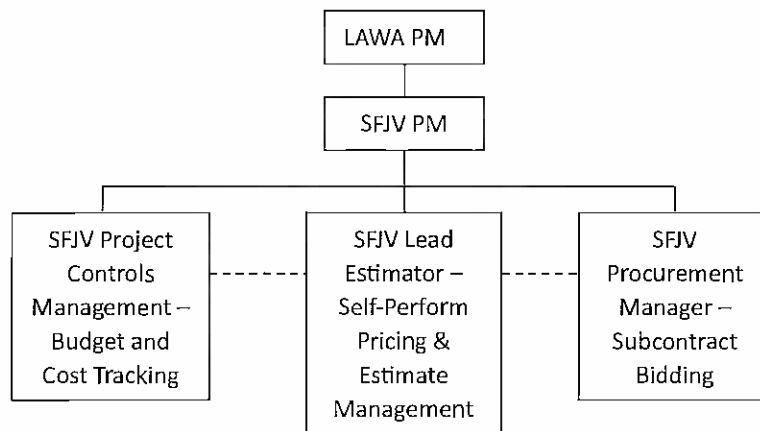

OBJECTIVES

This Cost Management Plan provides the framework to create and monitor the project's budget. Four (4) simple keys to a successful plan for cost management:

- Break the work into tasks.
- Estimate the costs including potential risks and opportunities.
- Create the budget.
- Monitor performance.

RESPONSIBILITIES

Managing project costs is a joint effort by both LAWA and SFJV. To manage costs during the procurement phase, SFJV will implement experienced staff with strong communication skills to lead self-perform pricing and negotiations, subcontract bidding processes, and risk identification. During the construction phase, project controls staff will transition to perform budget and cost tracking functions as well as tracking status of contingency levels.

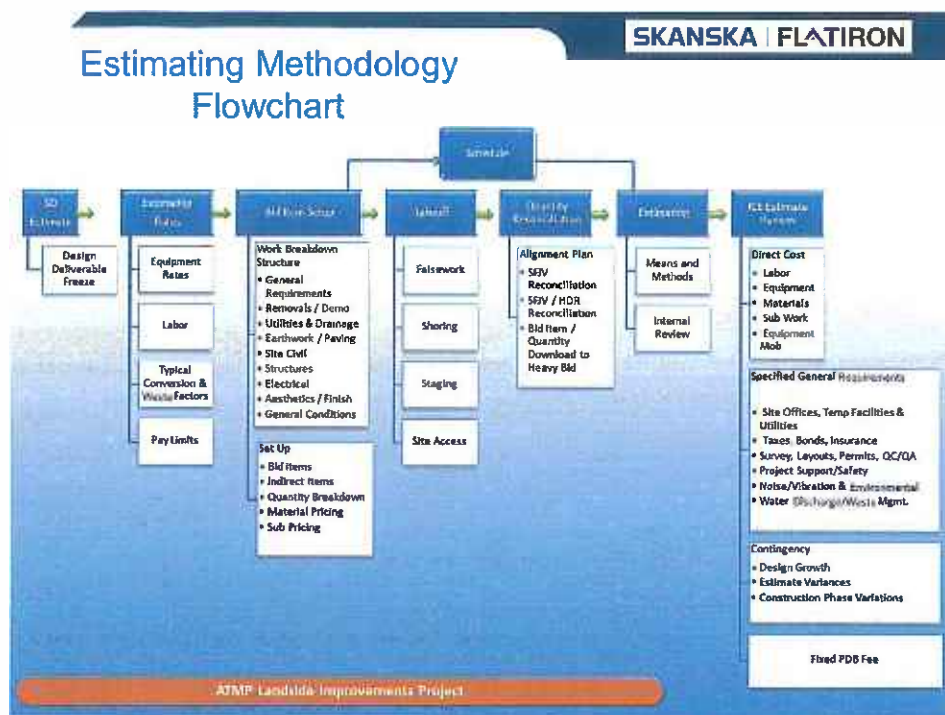

WORK BREAKDOWN STRUCTURE AND COST ESTIMATING

SFJV's lead estimator is responsible to prepare Estimating Methodology Report for each design milestone cost estimate. This initial report will be distributed at a draft level for comment. Prior to the start of the first bottoms-up cost estimate, the final version will be distributed to address comments and update the draft WBS to align with the design submittal scope. The report serves as a guide to facilitate understanding of the estimating process between the different entities involved and to facilitate the comparison of cost estimates between the different entities involved in the Progressive Design-Build process. The general objective of the estimating methodology report is to provide a transparent, bottoms-up estimate format for the design submissions.

The report will contain, at a minimum:

- References to the design documents, specifications, and reports that serve as the basis of the cost estimate.
- Work Breakdown Structure (WBS)
- Bases of escalation costs
- Budgetary pricing for subcontractor and material costs until the subcontractor bidding process has been completed.
- Labor rates and burdens/multipliers
- Equipment rates
- Assumptions commensurate with the design maturity
- Basis for work schedule, i.e. project schedule and shift frequency and duration

Refer to the Cost Methodology Report distributed under separate cover for the Schematic Design cost estimate. A summary of the process is shown below and will be implemented for subsequent cost estimates.

Design Milestone Estimating & Work Breakdown Structure

Design Milestone Estimating

Cost estimates will be performed after the submittal of the following design milestone submittals:

- Schematic Design (30%)
- Design Development (60%)
- Component GMPs
- Final/permitted design submittals as negotiated with LAWA.

Work Breakdown Structure (WBS)

In order to facilitate cost estimate reviews and comparisons, a WBS will be submitted with the Cost Methodology Report for each design milestone cost estimate. The WBS will be organized by major work discipline. The following categories will be used to structure the estimate. The WBS will provide more detail to facilitate quantity reconciliation and estimate reviews and comparisons. The general WBS categories are shown below:

CATEGORY ID	CATEGORY DESCRIPTION
1000	General Requirements: Includes project requirements as listed in the contract.
2000	Removals / Demolition: Includes clear and grub, removal of bridges, retaining walls, striping and sign structures, minor concrete demolition, and removal of miscellaneous site furnishings.
3000	Underground / Utilities: Includes abandonment, removal and relocation of all utilities, including storm drain improvements.
4000	Earthwork / Paving: Includes roadway removals, embankment, and new structural section.
5000	Site Civil: Scope includes minor concrete improvements, CAS and wayfinding signage, new sign structures, striping, fencing and railing.
6000	Structures: Scope is limited to bridge and retaining wall construction.
7000	Electrical, Lighting, ITS / Comms
8000	Aesthetics and Finishes: Includes major project architectural features including 9/11 memorial, pylons, and landscape / irrigation.
9000	General Conditions: See Section V Construction Indirect Costs

Construction Indirect Groups (IG)

The indirect costs shall be presented as shown below.

A. IG-1 Job Supervision / Staff Related (This includes all Job Supervision, Engineering, Office Personnel, and Purchasing. Estimate duration of all supervision in man-months. Supervision shall be broken down as follows):

- a. Management Salaries
 - i. Management
- b. Administration & Business Salaries

- i. Office Manager
 - ii. Timekeeper
- iii. Procurement/Payables
 - iv. Project Controls
 - v. IT
 - vi. Clerical
- c. Project Controls Staff
- d. Supervision Staff
- e. Quality Staff
- f. Design Management Staff

B. IG-2 Craft Related

- a. Drug Testing
- b. Craft Cell Phones / iPads.
- c. Show Up Time
- d. PPE
- e. Training
- f. On-Boarding
- g. Portable Toilets
- h. Water / ICE
- i. Incidental OT
- j. Craft Time Spent in Transit

C. IG-3 Office & Yard

- a. Site Cameras
- b. Security Guard
- c. Temp Power Drops
- d. Temp Fencing
- e. Yard Support Crew
- f. Restore Yards
- g. Road & Yard Maintenance

D. IG-4 Other Indirect Costs

- a. Survey
 - i. Survey Support
 - ii. GPS Equipment
- b. Quality
- c. Design
- d. Escalations
 - i. Materials
 - ii. Subs
 - iii. Fuel
- e. Other
 - i. Graffiti Removal / Trash Pick-Up
 - ii. Risk Register
 - iii. Legal Expenses

E. IG -5 Taxes, Bonds & Insurance

- a. Gross Receipts

F. IG -6 Equipment

- a. Master Mechanic
- b. Mobilization/Demobilization of Equipment
- c. Mobilization/Demobilization of Structures Equipment

- d. Onsite Moves
- e. Light Plants
- f. Equipment Idle Time

Cost Drivers

Upon the completion of each cost estimate, the lead estimator will summarize the major scope components by percentage of direct cost so that the team is aware of what the major cost drivers are. This awareness will allow the team to strive to reduce quantities and scope of those major components, control scope growth, and to continue to optimize the design and project value.

Variance Tracking

Major variances of cost items from prior estimates will be defined in a variance tracking sheet supplied with each cost estimate documentation, with descriptions of the cause for the variances.

Design Decisions

As the design progresses and major innovations or scope changes are developed, the concepts will be priced to inform the team of the cost implications and value assessment of each change. The decisions will be captured by the Design Manager and Design-Build Manager in a Design Decision Log and reviewed monthly at the Owner's Meeting.

Risk & Contingency

At each design milestone cost estimate, contingencies will be developed and included that are commensurate with the level of design. SFJV expects that as the design matures, the contingency for design scope growth will decrease. Subcontract Buyout contingency levels will vary depending on when the buyout process occurs, i.e. before cGMP or after.

Risk

For self-perform work, SFJV will include a risk component commensurate with the self-perform scope, similar to how bidders will incorporate when they provide bids for the subcontracted scopes. This risk component for self-perform work will be reviewed with LAWA in a transparent and open-book format. Once the risk component is incorporated into a respective cGMP, SFJV will solely manage the risk component.

Contingency

Design-Build, shared, and other forms of contingency will be discussed and agreed to with LAWA, including any savings or losses. Potential contingency items include:

- Those items that were included in the proposal drawings and specifications that SFJV missed in proposing the (C)GMP.
- Those items that were included in the proposal drawings and specifications that SFJV underpriced in proposing the (C)GMP.
- Schedule acceleration or schedule mitigation as required to meet contract milestones, or as deemed necessary by the Design/Builder to improve the project schedule when required.
- Increased general conditions or general requirements costs. This may include items such as additional temporary fence moves, increased costs for temporary protection of installed work, increased costs for weather protection, increased staffing for general conditions, etc.

- To cover higher costs for replacing a subcontractor which are not covered by subcontractor default insurance or surety.
- Costs related to subcontractor claims or charges that result from mistakes or omissions in the subcontract buyout.
- Coordination errors and omissions related to SFJV's shop drawing coordination obligations.
- Interference between any subcontractor and SFJV
- Interference between any subcontractor and any other subcontractor
- SFJV failure to coordinate the Work it self-performs with work of other subcontractors.
- Other items not outlined above, if approved in advance in writing by LAWA

LAWA's PM/CM will lead the project's risk analysis process. Project risks will be identified and tracked throughout the design phase of the project by the team, with mitigation strategies assigned to team members. During cGMP negotiations, the risk register will be used to allocate risks accordingly, to the entity that is best suited to mitigate the risk. SFJV's project management team will participate in the risk process to ensure that new threats and opportunities are updated as the design and stakeholder participation evolves.

BUDGET DEVELOPMENT

Design Budget Development

During the contract development phase, SFJV provided LAWA with a design and Phase 1 preconstruction ROM budget that was incorporated into the contract as shown below.

Scope Component	Budget Value
Basis of Design + Schematic Design (30%) + Preconstruction	\$37.9M
Design Development + (60%) Preconstruction	\$42.9M
Construction Documents	\$50.5M
Site Investigations	\$8M
Integrated Project Office	\$3.1M
Insurance/Bonds	\$ 7.6M
Total	\$150M

Design Task Order Development and Tracking

SFJV, in concurrence with LAWA, intends to utilize the task order process for the entirety of the project's design scope. By using the task order process and not including 90% and 100% design scopes in cGMPs, the design can keep progressing and not be delayed by negotiation timeframes for Phase 2 cGMP processes.

For the base design scope thru Design Development (60%), SFJV intends to negotiate individual task orders for each of the below:

- Basis of Design Phase
- Schematic Design (30%) Phase

- Design Development (60%) Phase

SFJV and LAWA will continue discussions for the optimum task order approach after Design Development (60%) phase that integrates the agreed approach to procurement and cGMPs. This could consist of a single task order for each of the following phases/and packages:

- 90%/100%/Final Construction Documents – Early Work Package 1
- 90%/100%/Final Construction Documents – Main Work Package 2
- 90%/100%/Final Construction Documents – Main Work Package 3

Additional task orders are anticipated for enabling scopes for the ATMP program that are not yet defined. The table below provides the current approximate task order budget tracking.

Scope Component	Budget Value	Approximate Task Order Utilization	Budget Remaining
Basis of Design + Schematic Design (30%) + Preconstruction	\$37.9M	\$35.7M	\$2.2M
Design Development + (60%) + Preconstruction (In negotiation)	\$42.9M	\$42.5M	\$.4M
Construction Documents	\$50.5M		\$50.5M
Site Investigations	\$8M	\$7.6M	\$.4M
Integrated Project Office	\$3.1M	\$.3M	\$2.8M
Insurance/Bonds	\$7.6M	\$2.4M	\$5.2M
Total	\$150M	\$88.5M	\$61.5M

Target Budget Development

It is anticipated that the Design Development (60%) cost estimate will serve as the basis for LAWA to determine the Target Budget. The Design Development (60%) phase will be the design milestone that supplements approved geometry at 30% design with the necessary structure detailing at 60% design. At the 60% design level, the major scope components should be identified and incorporated, as well as results from site investigations comments from Authorities Having Jurisdiction (AHJs).

SFJV and LAWA will continue to utilize the project's risk register to assess the threats and opportunities to the Target Budget.

COMPONENT GMP APPROACH & DEVELOPMENT

SFJV's approach to the project is to self-perform work that is essential to project success or on the critical path and subcontract work that doesn't fall within our core competency, in accordance with the contract requirements. This allows SFJV to meet the schedule demands of the project and ensure key project elements are constructed on time and according to expectations and standards.

Our strategy in determining self-performed scopes of work is based on:

- Capitalizing on our core self-performed capabilities and experience
- Self-perform high-risk and/or schedule-sensitive scopes within our core capabilities.
- Self-perform work where we may have a significant cost/budget advantage over the

subcontracting community.

- Reviewing select self-performed scope against the potential for carving out work for DBE firms to assist in meeting the project goals.

Self-Perform Estimating and Negotiations

The detailed WBS will provide sufficient level of work and cost detail for a transparent and collaborative analysis of our self-performed costs with LAWA for negotiation purposes. Our recent and active local projects allow our team to provide LAWA with relevant information to validate our cost approach and assumptions.

SFJV will generate bottoms-up estimates for all scopes we are qualified to perform, in accordance with the Estimating Methodology Report. In parallel, we will also solicit subcontractor pricing for work we do not intend to self-perform at each cGMP estimate. Reference the Cost Estimating Methodology section for the integration of the Independent Cost Estimating team into the validation process for self-perform cost estimates and negotiations.

Subcontract Packaging

SFJV will prepare a Subcontracting Plan with each cost estimate as the framework for our project management team to clearly identify work packages, communicate scopes we intend to self-perform, and manage the bidding and subcontracting plan throughout the procurement and construction phases. The plan will be a living document and, as such, will be maintained and updated throughout the duration of the procurement phase. The plan will define the scopes to be self-performed and procured thru a negotiation process, and scopes that will be procured thru a subcontract bidding process. A sample plan for an unrelated project is provided below.

SAMPLE Subcontract Packages

BP#	DESCRIPTION	TOTAL COST
NEGOTIATED SELF-PERFORMED WORK (NSP) 50% MAX		
01	01 - Aerial Guideway	
02	02 - Earthwork & Grading	
03	03 - Removals	
04	04 - Stations Structural	
05	05 - Parking Garage Structural	
06	06 - Drainage	
08	08 - Site Structures	
36	36 - CIP Walls	
	Subtotal	
NON-NEGOTIATED SELF-PERFORMED WORK (CBY) 20% MAX		
19	19 - Elevators & Escalators	
29	29 - Trestles	
34	34 - Architectural	
37	37 - Wet Utilities	
38	38 - Soldier Pile Walls	

39	39 - Noise & Screen Walls	
	Subtotal	

COMPETITIVELY BID WORK (CBN) 30% MIN		
07	07 - Potholing	
09	09 - Streetwork	
10	10 - OCS Foundations	
11	11 - Drilled Shafts	
13	13 - Stray Current Protection	
14	14 - Painting	
15	15 - Post-Tensioning	
16	16 - Soil Nail Walls	
17	17 - Trackwork	
18	18 - Fire Suppression	
21	21 - Plumbing

33	33 - Signs, Fence, Guardrail	
35	35 - Concrete Barrier	
41	41 - Train Control	
42	42 - Pavement Markings	
43	43 - Concrete Pavement	
	Subtotal	

Table 1 Key:

NSP – Negotiated Self-Perform (Skanska can perform 50% Max)

CBY – Competitive Bid Yes (Skanska can perform 20% Max)

CBN – Competitive Bid No (30% Min)

Subcontract Bidding & Buyout

SFJV recognizes and accepts that the subcontractor and supplier selection and contracting procedures specified in GC-9 of the General Conditions of the prime contract are intended to promote pricing or buyout of the Work in a fair and reasonable manner and to maintain fair and open competition. As such, all subcontracted scopes shall be procured based upon either competitive bids awarded to the lowest responsive and responsible bidder or through the use of a Competitive Sealed Proposal Selection Process (CSPSP), awarded to proposers providing the best value to LAWA.

All scopes that SFJV intends to self-perform will be negotiated in conformance with SC-3 of the Special Conditions of the prime contract.

All packages will reinforce and define expectations for DBE participation that will be part of a responsiveness review. And achieving the project's DBE goal.

Subcontract Bidding

Prior to the design milestone that is mutually agreeable to SFJV and LAWA, SFJV will prepare Subcontract Bid Packages for the scopes that are to be procured competitively, in accordance with the Subcontract Packaging Plan. LAWA will review the bid packages and advise SFJV of their acceptability. At the issuance of the Issued for Pricing documents, SFJV will manage the subcontracting process for those packages it does not bid on, including:

- a. Preparation of bid packages
- b. Advertisement of bid packages
- c. Pre-bid meetings
- d. RFI and Addendum processes
- e. Receipt of bids
- f. Review of bids for responsiveness and responsibility or qualifications
- g. Bid levelling as required.
- h. Conformance to DBE participation requirements
- i. Recommendations for selection/award to LAWA

For those packages that SFJV may choose to competitively bid on, LAWA will manage items b. thru i. for the subcontract bid process described above.

Subcontract Buyout

SFJV and LAWA continue to discuss the appropriate design stage to activate the cGMP and subcontract bidding processes to manage buyout risks for the project. Procuring the subcontracted scopes and cGMPs at a 90% design level will increase the level of price surety and reduce risks and contingencies.

If the subcontract bidding process occurs after respective cGMPs are already in place, SFJV shall document the actual buyout costs of the subcontract packages as compared to the cGMP anticipated costs and will include with the recommendations for selection/award to LAWA.

Savings and losses resulting from the purchase or buyout of subcontracted scopes that are procured after cGMPs are in place will be tracked using a Subcontracts Buyout Fund (SBF). Risk allocations defined in the respective cGMPs will further define how the savings and/or losses are allocated.

MONITORING PERFORMANCE

During the construction phases of the project, the Project Controls Management team will track performance of the self-perform and subcontracted scopes using a combination of schedule and cost tools including earned value management.

For purposes of tracking progress payments, a Schedule of Values will be developed that itemizes the Cost of the Work elements as agreed by SFJV and LAWA. The self-perform and subcontracted scopes will be detailed by respective packages, as shown in an example in Figure 1 below.

(Within each package, the Work will be further broken down into discrete activities that can be quantified and verified to serve as the basis of payment for progressing activities. This would include using quantities and unit costs with descriptions to calculate earned values for payment purposes. Examples of payment items at the activity level are provided in Figure 2.

Figure 1

A.2 Schedule of Values - Activities with Earned Value						
Budgeted Labor Cost						
Current Earned Value						
L300 - Schedule of Values Summary						
Schedule of Values Item Details						
Pay Item 1 GCCM FIXED FEE	Item Value	Previous Billing	Period Billing	JTD Billing	% Complete	
GCCM Fixed Fee (EW)	\$ 3,699,625	\$ 3,699,625	\$ -	\$3,699,625		
Pay Item 2 SPECIFIED GENERAL CONDITIONS	\$ 22,343,670	\$ 21,606,119	\$ 85,031	\$21,691,150		
Pay Item 3 SUBCONTRACT BID PACKAGE COST	\$ 597,244,327	\$ 591,976,714	\$ 2,590,262	\$594,566,975

Project Controls Plan

1 Overview

This section describes the project's planning, scheduling, budgeting, executing, and reporting project control processes.

The major project controls tools will include:

- **Procore** - Comprises a multipurpose set of web technologies powered by a common technical infrastructure. Procore can provide, document & file management, collaboration, enterprise search, and business intelligence. It also has system integration, process integration, and workflow automation capabilities. SFJV will use Procore primarily for document and file management.
- **Prolog** – LAWA's document control system. SFJV will utilize prolog for all official correspondence, transmittals, submittals, and RFI's to LAWA.
- **Primavera P6R19** – SFJV's preferred software for scheduling and cost/schedule integration; as well as alignment and compatibility with LAWA.
- **Construction Financial Management** - Job cost control system, which contains a database to manage all cost and revenue for the Project. SFJV uses JDEdwards for internal reporting.
- **HeavyBid** – Utilized primarily for estimating large joint venture and design-build projects. HeavyBid contains a cost history database for accurate estimates, has the ability to monitor and meet DBE goals, and can manage sub and supplier quotes.
- **Bluebeam Revu** – Used for constructability reviews, interdisciplinary reviews, and other internal reviews as needed

2 Bonding and Insurance

SFJV will provide and maintain at all times during the term of the Contract, financial security for performance of the Work which include for Phase 1 the following, additional insurance and bonding will be procured to cover Phase 2 construction work.

- 100% Payment and Performance Bond
- Insurance as defined in the table below

Insurance Coverage	Limit	Term	Deductible
Commercial General Liability	\$5M/\$10M/\$10M	24 Months	\$1,000,000
Auto Liability (Hired and Non-Owned)	\$2,000,000	Annual	N/A
Excess Liability	\$25M	24 Months	N/A
Professional Liability	\$5M/\$5M	24 Months	\$1,000,000
Pollution Liability	\$5M/\$5M	24 Months	\$100,000
Workers Compensation	Statutory/\$2M	Annual	N/A

Performance and Payment Bonds, each in the amount of 100% of the total contract, and certificates of insurance were submitted prior to execution of the contract.

3 Cost and Schedule Management

3.1 Milestones and Liquidated Damages

Time is of the essence on this project and managing the work in accordance with a well-thought out, comprehensive schedule is critical to our success. We will carry out the Work to ensure completion prior to the milestone dates

Airfield and Terminal Modernization Project (ATMP) Roadway Improvements		
Milestone	Description	Liquidated Damages Amount
Schedule Deliverable 1 60 Calendar Days After Phase 1 NTP	Failure to submit Contract Compliant Phase 1 Baseline Schedule to LAWA	\$5,000/day
Schedule Deliverable 1a	Failure to Resubmit Contract Compliant Phase 1 Baseline Schedule to LAWA within 15 Calendar days after LAWA review and comment.	\$5,000/day
Schedule Deliverable 2 1st of each month	Failure to submit Contract Compliant Monthly Schedule Updates to LAWA	\$5,000/day
Milestone 1 180 Calendar Days After Phase 1 NTP	Preliminary Assessment, Alternatives Analysis, and Proof of Concept Reports	\$X,XXX/day
Milestone 2 xxx Calendar Days After Phase 1 NTP	Guaranteed Maximum Price (GMP)/Component Guaranteed Maximum Price (CGMP) • 60% Completion of the Construction Documents and Construction Models for the Project • Completion of the GMP checklist	TBD/day
Milestone 3 xxx Calendar Days After Phase 1 NTP	90% and 100% Completion of the Construction Documents and Construction Models for the Project	TBD/day
Milestone 4 Calendar Days After Phase 2 NTP	Substantial Completion of Guaranteed Maximum Price (GMP)/Component Guaranteed Maximum Price (CGMP) Work Packages in accordance with the Contract Documents	TBD/day
Milestone 5 June 30, 2028 Calendar Days After Phase 2 NTP	Final Completion in accordance with the Contract Documents	TBD/day

3.2 Schedule of Values (SOV)

A schedule of values will be prepared and submitted within 30 days of NTP and revised and updated as changes to the contract occur, additional task orders or GMP's are executed, or change orders are executed. Please see the individual submittals for the most current submittal schedules for each task order.

3.3 Baseline CPM Schedule

SFJV has submitted a baseline schedule, and continues to provide updates to the baseline schedule with each major design milestone as described in PR-01, as well as monthly updates to the as-builts.

4 Document Control

SFJV will designate a Document Control Manager to be responsible for and oversee all document control processes on this project, including integrating our sub-consultants and sub-contractors. SFJV will be utilizing ProCore as the internal Document Control System (DCS) to store and record all correspondence, design specifications, drawings, progress reports, technical reports, specifications, Contract Documents, submittals, calculations, test results, inspection reports, nonconformance reports, administrative documents, and other documents generated under the Contract. Customized project workflows and reports will be programmed into the DCS, which will incorporate the review and approval, routing, filing, control, and retrieval methods for all documents. All official document control with LAWA will use Prolog.

5 Changes and Modifications

SFJV will implement a Change Management process, which will include processing of Change Orders and Modifications pursuant to the Contract and as issued by LAWA.

6 Disputes and Claims

6.1 Insurance-related Claims Management

SFJV will establish and implement a proactive Claims Management program for the handling and disposition of all claims arising out of the Contractor's performance of the Work, including claims that the Contractor pays or settles directly under the deductible limits of its required insurance policies and claims submitted to its insurance carriers. SFJV will maintain a Claims Status Report which shall set forth in matrix format (1) the nature of the claim; (2) the claiming party; (3) the dollar amount of the claim; (4) whether the claims has been submitted to an insurance carrier; and (5) the resolution or status of the claim to date.

6.2 Contract Disputes and Claims Management

[Any dispute or claim under or in connection with the Contract will be managed per the requirements of the Contract, as defined in GC-62 and GC-63.

2. SCOPE

This Program Wide QAQC Plan (QAQCP) provides the administrative and organizational structure for the Quality Program Skanska-Flatiron JV will employ throughout the Design-Build Contract ATMP Roadway Improvement Project. The QA/QC Program provides the controls and tools necessary to ensure conformance with the contract requirements established by the Los Angeles World Airports (LAWA). The highest level of management commitment is dedicated to providing the necessary resources, communications, training, and organizational freedom for putting in place a successful quality management system throughout the duration of the Project.

For the program to be fully effective, all employees, sub-consultants, subcontractors, and suppliers must understand, accept, and fully implement the program. SFJV will ensure design requirements and performance objectives are clear and that the information and processes needed to control and complete design and construction are accurate. Managers are devoted to coordinating their operations and instilling a focus on providing LAWA with a project that meets or exceeds quality requirements.

This QAQCP describes the Design-Builder's overall QA and QC elements to be implemented by SFJV and is supplemented by the Quality Procedures (QP) in Appendix 1 of this QAQCP. This Quality Program is a combination of the Project's Quality Assurance measures and Construction Quality Control processes. Additionally, this QAQCP is supplemented with the Design Subcontractor, HNTB Project Design Quality Management Plan (DQMP, Appendix 2) which addresses both QA and QC elements in the plan and attached procedures to be implemented by HNTB on their design activities. All of these documents, the QAQCP, QP, and DQMP combine into a complete Quality Management System.

2.1 APPLICATION

The QAQCP, and the references contained herein, apply to all applicable activities performed by SFJV and its subconsultants, subcontractors, and suppliers within the scope of the Contract for the ATMP Roadway Improvement Project.

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 7 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

3. QUALITY ORGANIZATION, ROLES, AND RESPONSIBILITIES

SFJV developed, implemented, and maintains this QAQCP as a means of ensuring the ATMP Roadway Improvements Project is constructed in conformance with the Contract requirements. The sequence and interaction of work processes to conform to the requirements are controlled and maintained by the responsible SFJV personnel, as shown in the Quality Management Organizational Chart, with general oversight from the Project Manager.

The Project Manager plans, administers, and authorizes the use of resources of all departments within SFJV to satisfy functional and technical requirements and perform the services contracted with subconsultants, subcontractors, and suppliers. The Project Manager is directly responsible for the general administration and overview of the Project staff, and for assurance all Project requirements are met. The responsibility to implement this QAQCP rests with the Quality Control Manager (QCM).

To monitor the work being produced, and establish impartiality in review, personnel conducting oversight activities including quality audits, surveillances, and inspection activities will be independent to those having direct responsibility for the subject work being built or installed. When necessary, corrective actions will be implemented when deficiencies from these audits, surveillances or inspection activities are discovered.

The QAQCP will function as a continually improving quality system to ensure suitable measures throughout the Project's lifecycle. This will be done primarily through management audit and surveillance reports, consistently analyzing inspection and test results, and reviews of the quality program by SFJV Senior Management. Revisions to the Program Wide QAQC Plan will be documented and logged. See Attachment 1.

Key individuals responsible for implementing the QAQCP and their respective responsibilities are identified below. Refer to the Quality Organization Chart, as shown in Figure 2.2 (Quality Organizational Chart) for the oversight reporting requirements within the quality system.

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 8 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

3.1 MANAGEMENT REPRESENTATIVES

Project Manager

SFJV Project Manager has the ultimate responsibility for implementing and authorizing the use of resources to meet the project requirements, including the Quality Program. This responsibility is accomplished through:

- Delegating the day-to-day operation of the QAQCP to subsequent management
- Reporting administratively to SFJV Executive Management
- Establishing an organizational structure providing quality program activity independent from personnel involved in the activity.
- Attending management reviews of the QAQCP to ensure its continuing adequacy and effectiveness.
- Providing staff support and appropriate resources to achieve the objectives of the QAQCP.
- Directing all Project activities and acting as the single point of contact with LAWA

Construction Manager

SFJV Construction Manager is responsible for aspects related to the Project construction, including completing work in compliance with the QAQCP. This responsibility is accomplished through:

- Coordinating with the QCM and field personnel to address all quality issues.
- Scheduling, monitoring progress, and the compliant completion of work.
- Providing advance notice of work requiring inspection and testing to SFJV QC, LAWA, and authorities having jurisdiction as required
- Providing adequate construction supervision to ensure quality workmanship.
- Monitoring subcontractor and supplier performance
- Attending pre-construction meetings, developing, and reviewing Project Specific Construction QC Plan

Quality Control Manager

The Quality Control Manager (QCM) is responsible for the implementation of the Quality Management System and adherence to the QAQC Plan. This responsibility is accomplished through:

- Reporting administratively to SFJV Executive Management
- Ensuring the promotion of awareness of the contract quality requirements throughout SFJV organization
- Administering a continually improving quality process

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 9 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

- Assuring this QAQCP is maintained.
- Assuring affected persons performing inspection and testing are qualified for the task.
- Managing construction inspection and testing including subcontractor activities associated with inspection and laboratory testing.
- Controlling the progression of work not meeting contract requirements through issuance of a Stop Work Order
- Managing nonconformance, corrective action processes, including identifying and reporting nonconformance and corrective action and verifying actions prior to closure

As indicated in Figure 2.1 (Quality Organizational Chart), two key personnel will report to and aid the QCM in conforming to the Contract quality requirements:

- Design Quality Manager
- Lead Inspector

Design Quality Manager (DQM)

Design quality functions are the responsibility of the DQM, who monitors compliance with the Quality Program, Design Quality Management Plan (Appendix 2) and hence the Contract documents. All Approved for Construction design plan packages require certification of the DQM prior to issuance to SFJV. Quality control during design is provided by the design staff independently checking each other's work and qualified design staff performing formal and documented interdisciplinary coordination reviews at pre-determined times on each submittal. The DQM monitors implementation of the procedures of the design staff and certifies compliance with the Quality Program of each submittal package.

Lead Inspector

The Lead Inspector is responsible for the implementation of the Construction Quality Program at the job site and reports directly to the Quality Control Manager. He or she will supervise the work of the QC Inspectors and Field Technicians as well as conduct or monitor the day-to-day inspection and testing of construction activities within their respective work elements. The Lead Inspector's responsibilities include:

- Coordinating and assigning QC Inspectors and ITL Technicians to work activities performed by on and off-site construction personnel, subcontractors, and others.
- Review Daily Inspection Reports and QC testing results to ensure contract requirements have been met.
- Monitor QC Inspection and testing frequency for compliance with the ITPs and Contract documents.
- Verify QC Inspectors and ITL Technicians have the certifications, licenses, quality training, and qualifications that meet the Project Requirements

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 10 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

- Perform daily inspections and interface with the foreman, superintendents, and LAWA representatives.
- Address field quality issues with appropriate personnel and report on all issues

QC Inspector

The QC Inspectors provide sufficient in-process QC inspection of all construction activities in their assigned area. QC Inspectors are responsible for the following:

- Recording observations and inspections in Daily Inspection Reports
- Inspecting materials delivered to the project and completing Material Receiving Reports
- Collecting and submitting all quality-related documentation prepared by subcontractors and construction staff.
- Verify work is performed with approved documentation, As-Builts are being updated as required and all nonconforming conditions are reported.
- Communicating and coordinating with the construction foreman, superintendents, ITL Technicians, LAWA and AHJ representatives

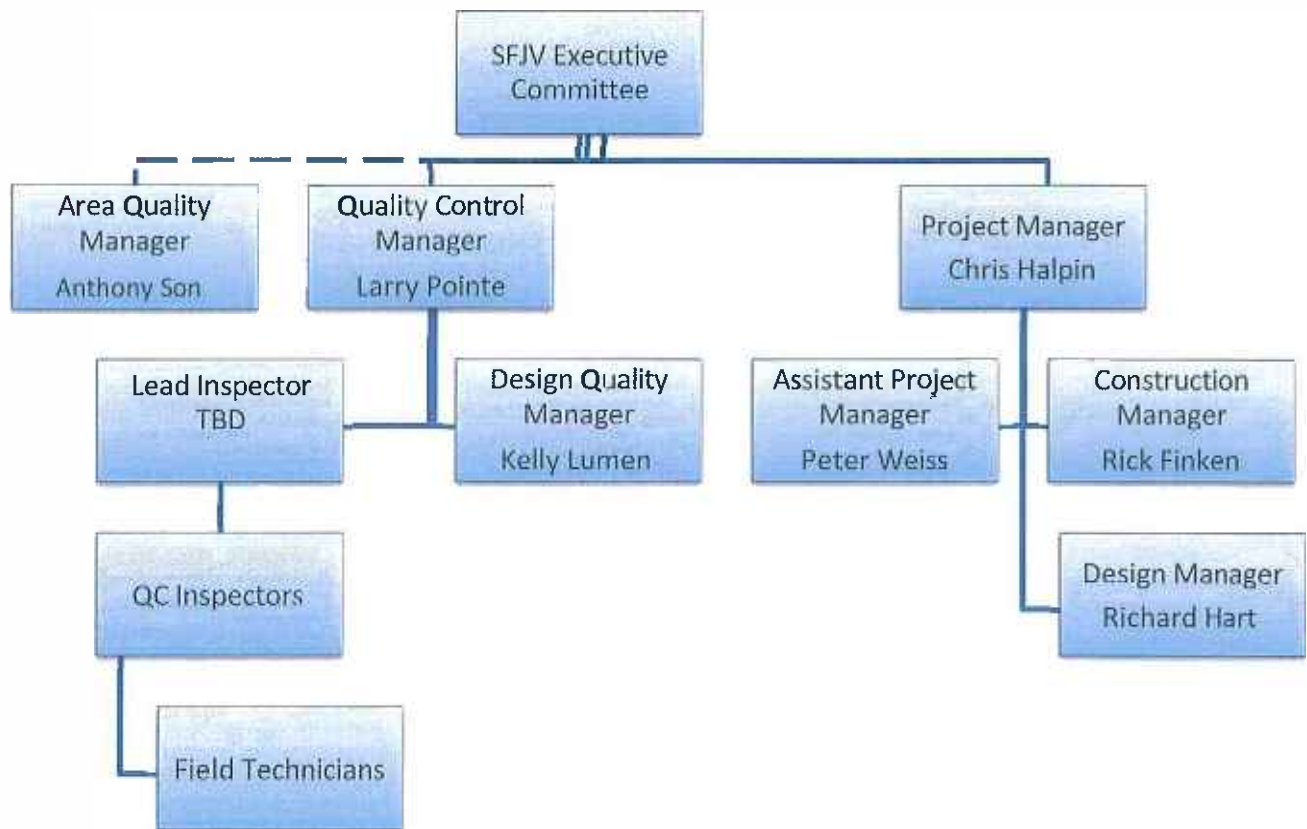

Independent Testing Laboratory (ITL) Technician

The ITL Technician will be on-site as required to perform all quality control tests and measurements as required by the Inspection and Test Plans and Project Requirements. His or Her duties include:

- Verify current calibration and proper maintenance of testing and measuring equipment.
- Perform material sampling and testing in compliance with the Inspection and Test Plans, codes, standards, and jurisdictional requirements.
- Document and communicate test results promptly.

4. PRE-WORK COORDINATION

4.1 PROJECT SPECIFIC CONSTRUCTION QC PLAN, ITP, AND PRE-CONSTRUCTION MEETING

Prior to beginning construction on any definable feature of permanent work, a Project Specific Construction QC Plan (PSCQCP) will be developed to ensure that SFJV and its subcontractors meet the requirements of the contract. A definable feature of work is a task that is separate and distinct from other tasks and has separate control requirements. A preliminary list of these tasks will include each contract Work Package. The Project Specific Construction QC Plan requires qualified, trained individuals to ensure all construction materials, methods, workmanship, coordination, and end products meet the Contract's technical and quality requirements.

Prior to construction, a Pre-Construction meeting will be held, and the Project Specific Construction QC Plan will be reviewed. Included in the meeting will be LAWA, QC Manager, Construction Manager, Safety Representative, necessary inspectors, SFJV management involved in the work, and applicable subcontractors, AHJ's, and vendors. Prior to the meeting, the QC Manager will provide LAWA with the Project Specific Construction QC Plan and agenda for review.

The purpose of the Pre-Construction meeting is to review the Project Specific Construction QC Plan and to ensure all pre-construction requirements are complete and that there are no misunderstandings with regards to the quality and technical requirements of the feature of work, as well as the safety, coordination, and environmental precautions to be taken. A review of the appropriate Project specifications and plans, materials, and equipment to be used, testing requirements, acceptance criteria, including workmanship, and the documentation to be submitted attesting to the achievement of the quality and technical requirements. Interfaces with LAWA and their representatives are identified, including other third-party inspection or regulatory personnel.

The Pre-Construction meeting will be documented by the Quality staff and field engineer in charge of the work. When required the Project Specific Construction QC Plan will be revised with applicable changes from the meeting. The revised PSCQCP will be distributed to all attendees along with the attendance sign-in sheet.

In planning for upcoming activities, an Inspection and Test Plan (ITP) will be prepared identifying all activities comprising the quality control elements of the work. The ITP includes

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 13 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

hold points for what is to be tested/inspected, the agency performing the inspection/test, the frequency the inspection/test will be conducted, the procedure/reference standard, specified references, and record documents to be maintained. The ITPs will be integrated into the respective work's Project Specific Construction QC Plan.

A PSCQCP for major work elements will be submitted to LAWA for review, and include the following:

- Description of the Work with step-by-step sequence, inspection, and testing requirements
- List of Prerequisite Activities required.
- List of applicable Contract Specification Sections
- List of applicable Design Drawings
- List of applicable Shop or Working Drawings
- List of required Submittals and their Status
- List of Permanent Materials to be used and material receiving requirements.
- List of individuals and positions responsible for Supervision, inspection, and testing of the Work, including subcontractor supervision; providing phone numbers
- Scheduled start date
- Completed Inspection and Test Plan that includes Hold Points

5. QUALITY MEASUREMENT, ANALYSIS, AND IMPROVEMENT

SFJV will implement the monitoring, measuring, analysis, and improvement processes needed to:

- Demonstrate conformity to the Contract requirements.
- Ensure conformity of the QAQCP (e.g., via audit and surveillance), and
- Continually improve the effectiveness of the QAQCP (e.g., searching for opportunities for improvement via quality management reviews, and customer feedback).

The Quality Control Manager will ensure all work and products are inspected and tested in accordance with the Contract requirements. Specific methods will be employed to indicate the inspection and test status of work-in-progress and finished products. The status of completed, tested, and inspected construction will be preserved as ongoing records in accordance with documentation requirements.

An approved independent testing laboratory and personnel will be utilized to perform material

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 14 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

qualification and job control testing under the direction of SFJV QCM. Testing procedures will be those standardized methods and procedures of the testing laboratories. Where job-specific testing procedures are required, they will be prepared by the appropriate individuals and approved by the SFJV Quality Control Manager.

All testing laboratories used for the Project will be certified in accordance with the applicable Codes, Federal Standards, Utility Standards, Industry Standards, etc., and will be approved by LAWA prior to initiating work. Credentials of personnel conducting

or overseeing testing or inspection activities will be reviewed by SFJV, maintained on the jobsite, and available to LAWA upon request.

5.1 Monitoring and Measurement of Product

Inspections and testing to ensure compliance with the Contract requirements will be done by SFJV or its independent parties. Where LAWA standards exist, the inspection and/or tests will be conducted in accordance with LAWA-prescribed standards.

Inspecting or testing personnel are to follow the ITPs approved by SFJV and LAWA. All requirements for frequency of tests, acceptance/rejection criteria, inspection hold points, etc., as stated in the ITPs and plans and specifications are to be followed. All inspection and test records will be maintained as part of the Quality Records.

Initial inspections will be performed as soon as work begins on a representative section of the work. The initial inspection's purpose is to verify SFJV, and its subcontractor's personnel are familiar with all construction documents including their personal responsibilities on the Project. An examination of workmanship quality is conducted to confirm all work is performed in accordance with the established Contract requirements.

Follow-up inspections continue as work progresses to ensure compliance with the construction documents. Appropriate inspections and acceptance testing of work are subsequently conducted to ensure satisfactory performance of the completed work.

5.1.1 Receiving Inspection

The field inspection of materials or equipment delivered as the end product is guided by the Contract documents which, in most cases, provide for any required inspection.

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 15 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

and testing prior to shipment. SFJV Construction Manager overseeing the subject work is responsible for the purchase of materials and equipment, while the QCM is responsible for verifying appropriate inspection and testing is conducted. Receiving inspections will be performed in accordance with the Quality Procedure – QP 106, Quality Verification.

SFJV QC staff and the responsible construction personnel will coordinate their activities in such a manner to inspect deliveries of material or equipment to ensure conformance with the requirements. Items of material or equipment received are accompanied by appropriate documentation to render the item traceable.

The receipt of minor routine items may be made without the physical presence of the QC staff, but documentation will be reviewed at regular intervals to ensure conformance with requirements. At random times and locations, the QC staff will conduct an acceptance inspection and may have verification testing performed.

Structural elements may require off-site inspection during the manufacturing process. The subcontractor agreements or purchase orders stipulate suppliers and subcontractors notify the QCM when materials or other items requiring source inspection are ready for inspection. Hold points may be established when deemed necessary by the Quality Control Manager or the Project Manager, or as specified by LAWA. Inspection and testing of purchased materials, equipment, and services at off-site sources is conducted by SFJV QC staff in coordination with LAWA.

Many products, e.g., concrete, asphalt, fill, and coatings, arrive at the construction site and are used each day with partial but not fully accepted testing having been performed. To minimize the risk of having to remove materials failing subsequent tests,

daily use of materials is closely monitored, documented, and retained in a Daily Inspection Report (DIR) and subsequent test results. The DIRs will be maintained at the jobsite and available to LAWA.

5.1.2 Quality Control Inspection

SFJV Quality Control will utilize the required six-point inspection plan as detailed in PR 13/14-3.

- Pre-work coordination prior to the start of construction will be addressed through the Construction Quality Work Plan and the Pre-Construction Meeting.
- Initial inspection will include, but not be limited to checking the workmanship quality, conformance with approved documentation, adequacy of materials, inspection and

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 16 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

testing results and as-built drawings maintained daily. Within 2 weeks of the start of a new or changed operation, LAWA, SFJV QCM, supervisors and QC representatives will meet to evaluate the work performed to represent a physical baseline for quality and acceptability.

- Follow-up inspections will be performed regularly to monitor the workmanship quality established in the initial inspection. The QC Manager will review the inspections for conformance. Initial and Follow-up Inspections are outlined in Quality Procedure QP 115.
- Prior to the completion of an item or segment of work a LAWA Completion Inspection will be performed to verify the completed work is of acceptable quality and sufficiently complete to progress to the next stage of work.
- Final acceptance will be performed in two stages, Pre-Final Acceptance and Final Acceptance. The QC Manager, QC inspectors, and lead construction staff will verify all corrections, punch list items, non-conformance reports, Corrective Action Request, and items on the LAWA deficiency list have been corrected, accepted, and closed out prior to turnover to LAWA.

5.1.3 Completed Work

LAWA has the sole responsibility for final acceptance of all project work. LAWA's acceptance is based on their oversight of SFJV acceptance testing, final inspection and the audit and surveillance of the work. All deviations from specified test methods, frequencies, and specifications will require LAWA approval. Final acceptance follows the construction completion and final inspection. In some instances, SFJV may demobilize the job site after substantial completion, while punch list work is on-going, prior to final acceptance of the Work.

5.1.4 Quality Records

All inspections are recorded in the Inspector's DIR, including any applicable checklists and forms. For equipment, after installation it's often under a manufacturer's warranty or maintenance service; the equipment may even have a training component, which is to be delivered in conformance with the Project requirements. SFJV Project Manager has the responsibility for follow-up on and coordination of these activities until the final handing over of the facility to LAWA.

SFJV Document Control Manager maintains records of inspections and tests. These records are maintained in conformance with LAWA requirements and contain factual evidence that the

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 17 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

required inspections and tests have been performed. These records cover both conforming and defective or deficient features and include the compliance reports and necessary back-up data from SFJV subcontractors and material suppliers. These records include:

- Work performed by the contractor, subcontractor, and/or material supplier,
- Type and number of inspections or tests,
- Factual evidence the required inspections and tests have been performed,
- Results of inspections or tests,
- Nature of defects,
- Cause of rejection,
- Nonconforming activities,
- Basis for acceptance,
- Corrective action taken,
- Other data pertinent to the acceptance/rejection of the work.

Records and reports of inspection and test activity serve as quality acceptance documents.

Inspection and test activity records identify, at a minimum, the following:

- Name of item(s) inspected and tested,
- Quantity of items,
- Inspection and test procedure reference,
- Location inspection/test is being performed,
- Date,
- Name of inspector or tester,
- Observations and comments,
- Specified requirements,
- Acceptability,
- Deviations and non-conformances,
- Corrective action,
- Evaluation of results,
- Signature of authorized evaluator.

6. DOCUMENTATION REQUIREMENTS

The QAQCP is a part of the Quality Program, which encompasses all quality activities including detailed Quality Procedures (QP), Inspection and Test Plans (ITP), etc., implemented by SFJV to meet the Contract requirements. This overall system includes:

- Quality Policy statement (Incorporated into QAQCP)

SKANSKA FLATIRON		Page 18 of 38	
ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD			
PROJECT-WIDE QAQC PLAN		Rev. #	Date Approved
		1	

- This Program Wide QAQC Plan (QAQCP)
- Documented Plans, Procedures, and Instructions
- Documents needed by SFJV to ensure effective planning, operation, and control of its processes.
- Records providing objective evidence of activity completion.

The QAQCP, as a part of the Quality Program, is prepared by the SFJV Los Angeles Area Quality Manager to provide the uniting document between all Quality Program documents. The QAQCP is approved by the SFJV Project Manager and then subsequently approved by LAWA prior to distribution by SFJV. Revisions to the QAQCP are approved, controlled, and distributed by SFJV under the same provisions as its original distribution.

6.1 Quality Program

The Quality Program defines the scope of quality management, procedures, responsibilities, and activities. The program includes the following Contract required documented processes:

- Control of Documents
- Control of Records
- Control of Design
- Design Verification
- Construction Quality Control Plans
- Pre-Construction Meeting
- Initial & Follow-up Inspection
- Daily Inspection Reporting
- Training
- Material Receiving
- Control of Measure Devices Monitoring/Measuring of Product
- Control of Nonconforming Product
- Corrective & Preventative Action
- Stop Work Order
- Redline and As-Builts
- Punchlist Process
- Substantial Completion & Final Acceptance

6.2 Control of Documents

SFJV Document Control Manager has primary responsibility for controlling pertinent documents

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 19 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

and records for the ATMP Roadway Improvement Project. Such documents include, but are not limited to Plans, Procedures, Instructions, correspondence, specifications, drawings, calculations, material requisitions, data sheets, design change documents, inspection and test reports, audit reports, corrective action requests, nonconformance reports, management reviews, and Inspection and Test Plans.

Further descriptions of the configuration management system; including routing, filing, control, and retrieval methods for all documents can be seen in the Document Control Procedures.

6.3 Control of Records

SFJV has implemented and maintains procedures for controlling records related to quality activities. The submitted Document Control Plan defines the controls for recording identification, storage, protection, retrieval, retention, and disposition, as well as the applicable quality records required to be maintained.

Records maintained by Document Control demonstrate the achievement of quality objectives and provide objective evidence of the implementation of the Program Wide QAQC Plan. Types of records include but are not limited to:

- Design Reviews
- Drawings and Specifications
- Calculations
- Design Changes
- Request For Information
- Management Reviews
- Procurement and Subcontract Documents
- Procedures and Instructions
- Quality Plans
- Calibration Records
- Audit and Surveillance Reports
- Nonconformance Reports
- Corrective Action Requests
- Inspection and Test Reports
- Batch Plant Tickets
- Concrete Placement Records
- Receipt Inspection Records
- Product Data

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 20 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

- Checklists

7. PRODUCT AND SUBCONTRACT PROCESSES

7.1 Determination of Requirements Related to the Product

SFJV will review the Project Contract to determine all specific LAWA requirements. SFJV management will evaluate these requirements and determine any additional requirements, including statutory and regulatory requirements, that need to be addressed during the Project.

7.2 Review of Requirements Related to the Product

SFJV will ensure all sub-consultant, subcontractor, and supplier contracts or purchase orders are clearly defined and communicate the requirements of the Project Contract with LAWA. Verification of the sub-consultant, subcontractor, or supplier's capabilities will be assessed prior to execution of an agreement and any subsequent changes to agreements will be communicated to those affected parties.

7.3 External Communication

SFJV Project Manager is responsible for ensuring relevant communication from LAWA is processed in a timely manner. LAWA feedback, including complaints, will be addressed by SFJV management in an expeditious manner.

7.4 Purchasing and Subcontracting

SFJV has established procedures for the evaluation and selection of sub-consultants, subcontractors, and suppliers for the Project. These processes stipulate the requirements for contracts for services, supplier requirements, and the preparation of purchase orders. Selection includes an overall ability to supply products and services in accordance with LAWA's Contract requirements.

7.4.1 Purchasing and Subcontracting Process

The qualifications and products of sub-consultants, subcontractors, and suppliers will be examined prior to contracting for services or materials. The review process considers:

- Evaluation and selection of sub-consultants, subcontractors, and suppliers on the basis

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 21 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

of their ability to meet Contract requirements, including quality, safety, and reliability on performance standards.

- Definition of the type and extent of control exercised by SFJV over the sub-consultants, subcontractors, and suppliers will be determined based on a pre-award assessment audit, and the scope of impact the supplied materials or services have on the quality of final product. Where applicable, quality records of prior in-service demonstrated capabilities will be required; of which such records will be maintained.

7.4.2 Purchasing and Subcontracting Information

Purchasing documents will contain information clearly describing the service or material being contracted for, to include:

- The materials to be furnished and scope of services.
- The applicable issue of specifications, drawings process requirements, instructions, and other relevant technical information, including requirements for acceptance of materials, services, procedures, processes, and personnel.
- The quality assurance and control requirements to be used in the inspection and testing of materials and/or performance of services.

The contracts for services or purchase orders will acknowledge the right of LAWA, or their designated representatives, must carry out reviews, examinations, oversight, or inspection and testing of the work at the location where the work is being performed and prior to shipment, or upon receipt, to verify the service or product meets the Contract requirements. Such provisions by LAWA will not absolve the supplier of the responsibility to provide an acceptable service or product.

Construction subcontractors will implement SFJV-approved QAQCP and Quality Program for their respective work. Subconsultants and subcontractors providing significant elements of work may be required to submit their own quality assurance and control program to be approved by SFJV. Requirements for submittal of a separate program will be at the discretion of SFJV.

7.4.3 Verification of Purchased Product

Where storage or off-site production is required, SFJV has the right of access to the facility to review the work in-process, files, and documents of third tier subs' products or services from which the materials/products are made. Access for LAWA personnel to review the same off-site work is also included in the terms and conditions of the subcontractor's contract. Such

SKANSKA FLATIRON		ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD		Page 22 of 38	
PROJECT-WIDE QAQC PLAN		Rev. #		Date Approved	
		1			

verification by LAWA will not be used by SFJV as evidence of effective quality control.

Whereas SFJV proposes to verify purchased materials or equipment at a subcontractor's or supplier's premises, SFJV will specify acceptable verification arrangements.

8. PRODUCTION AND SERVICE PROVISION

8.1 Control of Production and Service Provision

The construction processes will be performed in a controlled manner and logical sequence by qualified personnel using established procedures to meet the Contract requirements.

SFJV has established the following controls for the design and construction of the ATMP Roadway Improvement Project:

- Activities are planned and scheduled.
- Acceptance criteria are defined.
- Adequate resources (tools, equipment, trained personnel) are available to perform the work.
- The work environment is safe and conforms to recognized health and safety requirements.
- Plans, procedures, and instructions important to achieving the quality objectives are available to the workforce.
- Codes and standards and other reference information needed to plan and execute work properly are available to the workforce.
- When required, licensed and/or certified personnel are assigned to the Project to perform selected activities.
- Management oversight including quality audits and surveillance are performed to monitor the effectiveness of the QAQCP.
- A system of review focuses on evaluating the implementation effectiveness of these control processes.

As discussed in Section 3, a major component aiding in the quality and verification of the work is the ITP, submitted by SFJV and accepted by LAWA prior to initiating work. The ITP will incorporate inspection and testing instructions, procedures, validation requirements, and personnel requirements to meet the Contract requirements. For

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 23 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

inspections and tests on major work activities a checklist will be included in the ITP to facilitate the recording of data or results.

Utilizing the ITP and a PSCQCP, a Pre-Construction Meeting for each new major work activity is conducted and attended by the QCM and/or Lead Inspector directly responsible for the inspection and testing of the work. The Lead Inspectors and LAWA will be notified at least 24 hours in advance of the Pre-Construction Meeting.

Additionally, SFJV will conduct a weekly construction schedule meeting for the upcoming week; using the four-week schedule which is updated weekly. This will provide the QCM and/or Lead Inspectors and LAWA the ability to plan their inspection, testing, and verification activities, helping ensure no LAWA or third-party inspections are missed.

Where inspection or testing is being performed by parties other than SFJV, SFJV will not be relieved of Contract requirements regarding the subject work.

Where performed work is not visible and needs inspection, it may be necessary for SFJV to expose the work. If LAWA directs SFJV to uncover a portion of work for examination, it will be at LAWA's cost if the subject work meets the conformance requirements and adequate notice and opportunity for proper prior examination was given. If the exposed work does not meet the conformance requirements, repairing and recovering the work will be SFJV cost.

8.2 Validation of Processes for Production and Service Provision

The adequacies of the construction processes to be utilized in the ATMP Roadway Improvements Project are time-tested, and the resulting outputs can be verified by subsequent monitoring or measurement. Such processes include, but are not limited to:

Special Processes

- Metal Welding
- Non-destructive
- Examination Coatings
- Heat Treating

Job Control Testing

- Concrete & Asphalt Placement

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD		Page 24 of 38	
PROJECT-WIDE QAQC PLAN		Rev. #	Date Approved
		1	

- Corrosion Control
- Soils
- Bolted Structural Assemblies

The above processes are governed by requirements contained in the Project specifications, Government Laws and Standards, Utility Standards, Industry Standards, and LAWA Contract requirements. Records resulting from the implementation of the construction processes are maintained in accordance with Document Control Procedures.

Test laboratories performing special processes will have the necessary certifications to conduct the work and are subject to review and approval of LAWA prior to initiating work. Credentials of the laboratory's personnel will be maintained at the jobsite, available to LAWA upon request, and maintained in accordance with the submitted Document Control Plan.

8.3 Identification and Traceability

Certain products and materials will be necessary to be identified from receipt through installation and throughout stages of construction. Identification methods are also established to designate the inspection status of work products.

When required, identification and traceability methods include:

- Tagging,
- Markings on Item (care required to ensure marking method is non-destructive),
- Color coding,
- Location (secured area for rejected items),
- Documentation traceable to the item (travelers, inspection reports, notations on drawings, or other documents),
- Entries in computer databases.

Items received without proper documentation will be marked "HOLD" and not progress further in the system until the appropriate traceable records are in hand. Records are maintained, as required, throughout the erection, installation, and use of an item to ensure no nonconforming or defective materials become part of the permanent work.

8.4 LAWA Property

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 25 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

Material and equipment furnished by LAWA may be provided in new or used condition and may lack specified documentation. SFJV anticipates LAWA will furnish documentation in sufficient detail to positively identify and certify all material and equipment furnished by LAWA, or a variance will be issued to cover this deficiency.

Whenever possible, LAWA-furnished material will be inspected and received in the presence of a LAWA representative so any damage, deficiency, or shortage can be verified and documented. Any problems in this area will be immediately brought to the attention of LAWA by written communication through normal channels.

Materials, products, or design outputs provided by LAWA for the project will be stored, maintained, and protected by SFJV according to LAWA specified requirements.

8.5 Preservation of Product

To preserve the integrity, and prevent damage or deterioration to products, SFJV will provide designated secure storage areas (i.e., job site warehouse, lay down areas). During such storage, appropriate methods for preservation, segregation, and identification of products are provided.

SFJV implements product handling, preservation, and storage requirements based on recommendations provided by suppliers. Storage considerations may include:

- Covered or uncovered,
- Environmental controls,
- Preventative maintenance,
- Local heating requirements.

Packaging, handling, identification, and storage are controlled to the extent necessary to ensure conformance to specified requirements. When the product remains in SFJV jurisdictional control (e.g., after testing, prior to turnover) adequate protection will be provided by SFJV.

8.6 Control of Monitoring and Measuring Devices

To conform to Contract requirements, proper quality procedures to ensure tools, gauges, instruments, and other measuring devices are properly maintained, controlled, calibrated, and adjusted will be employed. The laboratory manager, QCM, or a subcontractor's designated QC personnel is responsible for the calibration and maintenance of the measuring and testing equipment. A qualified testing firm calibrates testing equipment and labels the equipment with

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 26 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

the necessary seals or tags recording the date it was calibrated. Documented verification of calibration of test and measuring equipment is retained in the laboratory's files and will be available to SFJV and LAWA. Field and laboratory testing equipment is calibrated prior to first use and recalibrated/reconditioned in accordance with industry standards and Contract requirements.

Where necessary, measuring equipment will be:

- Calibrated or verified at specified intervals, or prior to use, against measurement standards traceable to the National Institute of Standards and Technology (NIST). Where no such standards exist, the basis used for calibration or verification will be recorded,
- Identified with a unique equipment identification number, location, etc.,
- Clearly labeled with the calibration date,
- Safeguarded from adjustments that would invalidate the measurement result,
- Protected from damage and deterioration during handling, maintenance, and storage.

Testing and measuring equipment that has been found to be out-of-tolerance will be documented, removed from the project, or recalibrated. Work built, inspected, or tested with out-of-tolerance equipment will be considered not acceptable to SFJV until the subject work can be verified using other equipment, or the nonconforming equipment can be repaired; both of which actions require the subsequent results being in conformance with the Contract requirements.

8.7 Control of Nonconforming Product

Inspections and testing will be performed during all phases of the work to ensure the work meets and is performed in accordance with the Contract requirements, including specific requirements of LAWA and local jurisdictions. During inspection and testing, it may be determined the work is not in accordance with the approved design and/or contract specifications, or the quality of workmanship has not been produced in the required end product. While anyone participating in the Project may identify a nonconforming item, the Report must be validated by the Quality Control Manager. A Nonconformance Report (NCR) will be used to track in-process deficiencies to ensure the deficient item is completed correctly. Significant aspects of the NCR process include the documentation of the nonconforming work; the designer's review of the recommended disposition; segregation of the nonconforming work; and disposition of the nonconforming work. Proposed resolutions include:

- a reworking to meet specified requirements (rework)
- repair of the work to meet revised specified requirements through a joint agreement (repair).

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 27 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

- acceptance of nonconformance through joint agreement (accept-as-is).
- and removal and replacement of nonconforming work (reject).

Work resolved as “repair” or “accept-as-is” will be approved by the appropriate Design personnel and by LAWA.

Three potential categories of nonconformance on a project typically include:

- Lack of compliance with construction plans or specifications identified during the QC field inspection and test activities,
- Errors found in designs and reports handled through established QC checking and review processes,
- Functional conditions where an item is constructed in accordance with approved plans and procedures, however, the end product does not function as required.

The nonconformance process, as detailed in QP 107; Control of Nonconforming Items, establishes the standard practices for identifying, reporting, evaluating, controlling, and resolving nonconforming work. Each NCR will be assigned an NCR number and logged. The NCR is issued to the Construction Manager and distributed to the Project Manager and LAWA as appropriate by the QCM, for evaluation and development of a proposed resolution.

SFJV will cease work pertaining to the item in question until a proposed resolution has been developed and agreed upon by all parties except where a conditional release is agreed to as described in the QP 107. The Construction Manager will develop a proposed resolution and corrective action to prevent reoccurrence for review and approval.

8.8 Analysis of Data

SFJV collects and analyzes appropriate data to determine the suitability and effectiveness of this QAQCP. During the management review process, as a minimum, the following data is gathered and analyzed:

- LAWA satisfaction/dissatisfaction input,
- LAWA issues raised,
- Conformity of product to requirements,
- Trends of both positive and negative compliance,
- Results of audits, surveillances, and CARs,
- Major supplier and subcontractor quality performance,
- NCR status and trends.

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 28 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

8.9 Improvement

8.9.1 Continual Improvement

SFJV continually improves the effectiveness of this QAQCP using the following processes:

- Lessons learned,
- Management reviews,
- Audits and Surveillances,
- Corrective and preventive actions.

8.9.2 Corrective Action

In the event a nonconforming condition persists without correction, or the severity of the condition meets at least one of the criteria below, the Quality Control Manager issues a Corrective Action Request (CAR) to the appropriate and responsible Manager and the Project Manager. If the Quality Control Manager deems it necessary, he or she will issue a Stop Work Order.

A CAR is issued for varied situations, including serious or repetitive conditions which:

- Threaten the public safety and well-being,
- Could severely damage a major utility,
- Would reduce the soundness, strength, or integrity of a structure,
- Would reduce the life span of the structure or any equipment and systems,
- Have caused the work to deviate from Contract requirements,

Corrective action may require previous work be repaired or if serious enough removed and replaced. This decision rests with the Project Manager and LAWA.

8.9.3 Preventive Action

Preventive actions are established to identify and eliminate the reoccurrence of nonconformances and their potential causes. For preventive action before a nonconforming item occurs, which is ideally the best method to implement preventive action, SFJV will utilize PSCQCPs, ITPs, Pre-Construction meetings, and the Requests for Information (RFI) process to ensure a good understanding of the work to be performed. The process for the development of preventative actions can be seen in QP 105, Corrective and Preventative Action.

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 29 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

8.9.4 Audit and Surveillance

This QAQCP provides for internal quality audits of the SFJV quality system. Qualified personnel independent from staff having direct responsibility for the Project activity being evaluated will perform the audits. All records resulting from implementing the audit and surveillance program are maintained in accordance with the Document Control Procedures.

Audits are:

- Planned, taking into consideration the status and importance of the processes and areas to be audited as well as the results of previous audits,
- Scheduled, with audit notifications defining audit criteria, scope, duration, and team members. Joint audits (LAWA and SFJV) are coordinated with interested stakeholders by the Quality Control Manager.

Audit reports are prepared and distributed to the audited organization. The audited organization shall ensure actions are taken to eliminate nonconformities and their causes. Follow-up activities by SFJV QC staff include verification of corrective action, implementation, and reporting of verification results.

When compared to an audit, surveillance is a less formalized approach for verifying the quality program implementation. Quality Surveillance will be conducted to assess the adequacy of the QAQCP and focus on real-time monitoring of activities. Surveillance reports are prepared and distributed to the audited organization.

Surveillances are:

- Planned, taking into consideration the status and importance of the specific activity to be evaluated as the result of previous surveillances, and areas of concern.
- Unscheduled with the organization being evaluated to monitor the current in-place work activities.

9. MANAGEMENT RESPONSIBILITY

9.1 Management Commitment

SFJV management has developed, implemented, and communicates its quality policy and program, and ensures the availability of qualified staff and resources to continually improve the quality system.

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 30 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

9.2 Customer Focus

Management ensures LAWA requirements are met through:

- Communicating requirements throughout the Project team,
- Focusing on process improvement,
- Soliciting feedback from LAWA through project quality status meetings.

9.3 Quality Policy

SFJV is dedicated to furnishing quality construction services resulting in reliable transit roadways and facilities. All work performed meets or exceeds LAWA requirements, applicable codes, legal requirements, and industry standards as defined in the Contract.

9.4 Quality Management System Objectives

To further ensure Contract requirements are met and SFJV is continually improving its processes, the following measurable objectives have been established, which may be adjusted throughout the Project's life cycle to maintain effectiveness and suitability:

- To develop, implement, and maintain a quality management system conforming to the contract requirements. The measurement criterion includes LAWA approval of the quality management system and compliance with audits and surveillances.
- Review and approval of subcontractor-submitted quality programs, or their acceptance of complying with the SFJV QAQC Program, prior to their starting work. The measurement criteria are zero cases where subcontractors and suppliers start work prior to SFJV approval of their submitted quality program, or their acceptance of SFJV QAQC Program.
- Review and approval of suppliers providing specialty material and/or equipment to project-specific quality and design requirements.
- Cycle time for dispositions on Corrective Action Requests (CARs), Nonconformance Reports (NCRs), and Audit Findings.
- Ensure the timely submittal of Inspection and Test Plans to facilitate the identification of "Hold" points, with an objective of zero missed hold points as the result of untimely customer notification.

The achievement of the QAQCP objectives will be reported on and assessed during SFJV Senior Management reviews.

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 31 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

9.5 Responsibility, LAWA and Communication

SFJV focus on project activities and the ability of the organization to meet Contract requirements, are the responsibility of SFJV management. It is the objective of SFJV management to instill close cooperation between all parties of the Design-Build team in order to achieve uniformity and economy throughout the Project.

9.5.1 Internal Communication

SFJV ensures the processes of the QAQCP and the requirements for its effectiveness are communicated throughout the organization. Typical methods of communicating include:

- Management-led communication in work areas
- Noticeboards
- Electronic media, such as email
- Employee surveys and suggestions
- Plan of the day meetings, toolbox meetings, staff meetings
- Required reading.
- On-the-Job training (OJT), and
- Formal training

Specific plans, procedures, and instructions also convey information about the necessary activities, including internal audits, surveillances, and management reviews. Feedback from LAWA and other Project stakeholders is also disseminated to relevant groups and individuals within LAWA.

9.6 Management Review

SFJV Senior Management reviews the performance of the QAQCP to ensure its suitability, adequacy, and effectiveness. The purpose of the review is to assess opportunities for improvement and the need for changes within the quality system, including the policy and objectives.

Action items resulting from reviews are tracked and followed up to ensure satisfactory closure. Reviews are conducted in accordance with the corresponding procedure within the QAQC Program and records produced because of these reviews provide objective evidence of the QAQCP process. Records produced from the Management Review process are maintained in accordance with Section 3.4. Control of Records.

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 32 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

9.6.1 Review Input

Inputs to management reviews include:

- Status of action items identified at previous quality system review meetings.
- Results of Quality System Audits and Surveillance
- Corrective Action Requests
- Results of Agency and/or third party audits, surveillances, or reviews
- Nonconformance Reports
- Implementation of the quality program by Subcontractors
- Training activities
- Identification of any adverse quality trends
- QAQC Program procedures development
- Summary of overall assessment regarding the general adequacy and effectiveness of the quality management system
- LAWA feedback

9.6.2 Review Output

Outputs from the management review may include decisions and actions related to:

- Improvement of the effectiveness of the QAQCP and its processes.
- Improvement of the product related to LAWA requirements.
- Resource needs.
- Performance improvement objectives for the Project organization
- Loss prevention and mitigation plans for identified risks.
- Information for strategic quality planning for the future needs of the Project organization.

10. RESOURCE MANAGEMENT

10.1 Provision of Resources

SFJV Project Manager and Executive Committee are responsible for assessing SFJV needs and allocating resources in a timely manner to implement and improve the QA/QC Program.

The resources needed to implement the QAQC Program include all human, physical, and

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 33 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

financial resources needed by SFJV to function effectively. Careful planning and consideration are given to:

- Effective, efficient, and timely provision of resources in relation to opportunities and constraints
- Resources and mechanisms to encourage innovative continual improvement.
- Organizational structures, including Project off-site support.
- Information management and technology
- Enhancement of leadership skills and profiles for future staffing
- Planning for future resource needs

Managers and supervisors of the work are also responsible for determining needs and obtaining competent staff to accomplish their objectives. If it is determined additional resources are needed, the request is made through the Project's chain of command as shown in the Project Organizational Chart.

SFJV is committed to providing adequate resources for:

- Training, if necessary, and qualification of personnel
- Subcontractor and Supplier oversight and verifications
- Performing and managing work or activities
- Verifying the acceptability of work or activities such as reviews, inspections, tests, audits, and surveillances.

10.2 Human Resources

SFJV management is responsible for authorizing only personnel competent on the basis of education, training, skills and experience for assignment to the Project.

To aid in achieving the Project objectives, SFJV will encourage the involvement and development of its people by:

- Providing a safe and secure work environment
- Clearly defining responsibilities and authorities
- Facilitating open, two-way communication
- Ensuring effective teamwork

10.2.1 Competence, Training, and Awareness

Based on the prior review of the qualifications of personnel selected to fill roles, individuals on

SKANSKA FLATIRON ATMP Roadway Improvement Project – PROGRESSIVE-DESIGN-BUILD	Page 34 of 38	
PROJECT-WIDE QAQC PLAN	Rev. #	Date Approved
	1	

SFJV's team are not expected to require significant additional training to function effectively. As stated in Section 2.1, the Quality Control Manager (QCM), Lead Inspector, and the Design Quality Manager are those individuals whose resumes have been submitted and approved by LAWA. Subsequent records documenting certification of additional quality personnel will be maintained and/or submitted to LAWA as required.

SFJV Quality Staff and the Independent Test Laboratory will staff inspectors and technicians on an as-needed basis. The proposed SFJV Quality and Independent Test Laboratory staffing plan includes Lead Inspectors and sufficient full-time inspectors to adequately inspect and accept the work.

Initially, the inspection staff will consist of individuals with civil, soil, concrete, asphalt, and utility relocation backgrounds and certifications (e.g., ACI, ICC, AWS, etc.). As the work progresses into other disciplines, inspectors with appropriate qualifications will be provided. In some instances, for specialty type work (e.g., water, communication, power, etc.) SFJV inspectors will work closely with a subcontractor or supplier and oversee a required subcontractor's or supplier's inspectors to verify compliance with the Contract requirements and the Authority Having Jurisdiction.

10.3 Infrastructure

SFJV provides a work environment suitable to satisfy Project requirements. SFJV management determines, provides, and maintains the infrastructure needed to facilitate the work and achieve its quality objectives. Infrastructure includes:

- Buildings, workspace, acceptable work environment, and associated utilities
- Process equipment (both hardware and software)
- Supporting services (such as administrative, transportation, electric power, communication, security)

10.4 Work Environment

Appropriate work environments will be established and maintained to conform to applicable Codes, Standards, and Contract requirements. Creation of a suitable work environment includes consideration of:

- Ergonomics
- Workplace locations

PROJECT-WIDE QAQC PLAN

Rev. #

Date Approved

1

- Safe and secure facilities for personnel
- Heat, humidity, light, airflow
- Hygiene, cleanliness, and mitigation of noise, vibration, and pollution

LAWA and Agencies having jurisdiction will be given access to wherever work is performed under the Contract to conduct audits, inspections, and tests to verify compliance with Contract requirements. Audits, inspections, and tests conducted by LAWA, and other Agencies will not relieve SFJV of responsibility to ensure Contract requirements are met.

QP 113	PROJECT CLOSEOUT

SKANSKA FLATIRON		ATMP Roadway Improvements Project – DESIGN-BUILD	Quality Procedure QP 101	
DEVELOPING QUALITY PROCEDURES			Rev. #	Date Approved
			0	

1.0 PURPOSE/SCOPE

This procedure describes the requirements and responsibilities for initiating, preparing, approving, issuing, and revising the SFJV Quality Procedures (QPs) for the ATMP Roadway Improvement Project – DESIGN-BUILD.

2.0 DEFINITIONS

Process	A set of interrelated or interacting activities which transform inputs into outputs
Quality Procedures	Quality related procedures that implement the quality process requirements of the Contractor Quality Assurance Quality Control Plan

3.0 REFERENCES

3.1 The SFJV Project Wide QAQC Plan

4.0 PROCEDURE

4.1 General

A set of procedures developed for SFJV to use in the administration of related Quality Processes.

4.2 Format

All QPs will be prepared using the format shown below. Any sections not used will be noted with the word "None."

- 1.0 Purpose and Scope** – Briefly states the intent and explains the boundaries of the procedure by answering why the procedure exists and stating to whom or what the procedure applies.

- 2.0 Definitions** – Defines any special terms pertaining to the subject matter of a procedure.
- 3.0 References** – Identifies by title and document number (if applicable) only the references required to permit implementation of the procedure (does not use revision dates or numbers).
- 4.0 Procedures** – Delineates the actions required to accomplish the purpose of a procedure within the scope and uses the references as a background by stating, “who” does “what” “when”.
- 5.0 Project Records** – Provides general information regarding forms or documents generated because of the procedure. These forms or documents provide evidence that requirements of the procedure have been accomplished and verified and provides information regarding retention of those documents.
- 6.0 Attachments** – Lists any forms or exhibits used to request a service or to record an action cited in the procedure.

4.3 Numbering

The Quality Manager (QM) assigns a number to identify each procedure. The numbering sequence will be Quality Procedures (QP) followed by a three digit sequential number.

4.4 Initiation

The Project Manager assigns the QM responsibility for determining the need for and development of project Quality Procedures.

The QM, working with representative management and staff, assists in preparing required procedures.

4.5 Approval

Prepared quality procedures are approved by the QM and the Project Manager as indicated on the Quality Procedure Manual Table of Contents.

4.6 Issuance

The QM provides the approved QPs to Document Control for distribution. All QPs together shall become the Quality Procedure Manual, with a Table of Contents indicating current QP revision numbers.

4.7 Employee Initiated Revisions

Any employee of the SFJV may mark up a copy of any QP with suggested revisions and send it to the QM.

The QM evaluates the suggestion(s) and decides if the procedure should be revised; the QM then informs the employee of the disposition of the suggested revision. Any QP revised because of the suggestion is properly approved and issued per the Approval and Issuance Sections of this procedure.

4.8 Revisions by Quality Manager

The QM revises quality procedures to reflect current management policies or the Client's Contract requirements and review comments to the QPs, and ensures revised procedures are properly approved and issued per the Approval and Issuance Sections of this procedure. Also, the QP Manual Table of Contents will be updated to reflect current revision numbers of each QP.

5.0 PROJECT RECORDS

Copies of Project Quality Procedures are maintained in the project files. After project completion they are processed in accordance with Document Control procedures.

6.0 ATTACHMENTS

None

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN-BUILD	Quality Procedure QP 102	
QUALITY MANAGEMENT SYSTEM REVIEW	Rev. #	Date Approved
	0	

1.0 PURPOSE/SCOPE

This procedure describes the requirements and responsibilities for periodic management reviews to the SFJV Quality Management System (QMS), to ensure its continued suitability, adequacy, and effectiveness.

2.0 DEFINITIONS

Management Review Team	Members of the SFJV Senior Management Staff
Quality Management System	The organizational structure, roles and responsibilities, procedures, processes, and resources for implementing the Project Wide QAQC Plan.
Quality Management System Review	A formal review by the Skanska Management of the suitability, adequacy, and continued effectiveness of the SFJV Quality Management System (e.g., policies, objectives, procedures, instructions).

3.0 REFERENCES

- 3.1 SFJV Project Wide QAQC Plan
- 3.2 QP 103; Quality System Audit
- 3.3 QP 104; Surveillances
- 3.4 QP 105; Corrective and Preventive Action

4.0 PROCEDURE

4.1 General

This procedure describes the processes and responsibilities for collecting, categorizing, summarizing, evaluating, and reporting quality trends based on results of Quality Control Inspections, Quality Audits and Surveillances, and any other documented nonconforming or indeterminate conditions. Relevant data will be communicated to the Management Review Team. Appropriate corrective actions will be taken when negative trends are noted.

4.2 Responsibilities

4.2.1 The Project Manager shall be responsible for:

- Scheduling management reviews,
- Providing necessary resources,
- Selecting senior management staff and others to serve on the Management Review Team,
- Responding to all Management Review Team reported recommendations.

4.2.2 The Quality Manager shall be responsible for:

- Preparing a checklist of items for review,
- Ensuring all Management Review Team members are familiar with and understand the review process,
- Preparing meeting minutes of the management review, and providing these minutes to the Project Manager, the SFJV Management Review Team, the SFJV Executive Committee members and Document Control,
- Verifying the Project Manager responses to the recommendations made by the Management Review Team, and any recommended changes are implemented,
- Resolving with the Project Manager any responses conflicting with the quality policy or the Contract requirements,
- Documenting resolutions of each recommendation.

4.2.3 The Management Review Team shall be responsible:

- To attend management review meetings and participate in making recommendations for changes and/or required corrective actions.

QUALITY MANAGEMENT SYSTEM REVIEW	QP 102; Rev. 0
---	-----------------------

Quality Management System elements to be discussed may include agenda items from the following list as appropriate:

- Status of action items identified at previous quality system review meetings,
- Results of Internal Audits and Surveillances,
- Corrective Actions Requests,
- Results of third party Audits, Surveillances or reviews,
- Construction Nonconformance Reports,
- Implementation of QMS by Subcontractors,
- Training activities,
- Identification of any adverse quality trends,
- Quality procedure development activities,
- Summary of an overall assessment regarding the general adequacy and effectiveness of the quality management system.

5.0 ATTACHMENTS

5.1 Form QP 102.01; Quality Management System Review Checklist – Sample

Item #	Assessed Item	Assessment Results & Recommendations	Corrective Action Completed
1	Previous QMS review results.		
2	Review implementation of QP 103; Quality System Audit and QP 104; Quality Surveillances for: a. Types of findings, b. Frequency of findings, c. Severity of findings, d. Adequacy of responses, e. Response time, f. Planned corrective actions, g. Actual corrective actions, h. Timeliness of corrective action completion.		
3	Review implementation of QP 105; Corrective and Preventive Action.		
4	Review results of third-party Audits, Surveillances or reviews.		
5	Review Construction Nonconformance Reports.		
6	Review timeliness of corrective action responses and completion of implementation.		

Item #	Assessed Item	Assessment Results & Recommendations	Corrective Action Completed
7	Review subcontractor & supplier QMS for: A. Approval status B. Quality of plan implementation		
8	Review training activities.		
9	Review identification of any adverse quality trends.		
10	Review quality procedures development activities.		
11	Summary of an overall assessment regarding the general adequacy and effectiveness of the quality management system.		

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN-BUILD	Quality Procedure QP 103	
QUALITY AUDIT SYSTEM	Rev. #	Date Approved
	0	

1.0 PURPOSE/SCOPE

This procedure describes the requirements and responsibilities for performing audits of the Quality Management System and for resolving any nonconformances detected during reviews. This procedure applies to all Project activities.

2.0 DEFINITIONS

Auditor	A technical specialist, management representative, or other individual performing audit activities under the direction of a lead auditor.
Audit Checklist	A tool used to identify requirements to be reviewed during the audit.
Audit Finding	Results identified during an audit, which affect implementation and/or documentation of contract, quality system, and/or associated procedures.
Audit Plan	A document prepared to instruct the audit team members. The plan identifies the audit scope, objectives, audit team members, organization being audited, audit time frame, and any other pertinent information necessary for the audit.
Audit Schedule	A document issued to identify planned audits. The schedule may be revised, updated, and supplemented as necessary to provide adequate coverage.
Conditions Adverse to Quality	An all-inclusive term used in reference to any of the following: errors, omissions, failures, malfunctions, deficiencies, defective items, and audit and surveillance non-conformances.
Corrective Action Request (CAR)	Form used for documenting and closing audit findings.
External Audit	Audits of Suppliers and Subcontractors.
Final Audit Report	A formal report which provides a general narrative and identifies all Audit Findings and recommendations.
Internal Audit	Audits of activities performed by the SFJV.

Quality Audit System	QP 103; Rev. 0
-----------------------------	-----------------------

Lead Auditor	An individual qualified by the Quality Manager to perform, direct, coordinate, and document audit activities.
Observation	Comments, concerns, suggestions and/or recommendations for the benefit of the auditee; opportunities for improvement; situations with potential to become nonconformances.
Pre-Audit Meeting	A meeting of audit team members and management of the audited area, held prior to the start of the audit, to review the audit plan and coordinate specific audit details.
Post-Audit Meeting	A meeting of audit team members and management of audited area, held to review audit results. The validity of Audit Findings is agreed to by applicable parties prior to adjournment of the meeting.
Quality Audit	A systematic, independent documented examination to determine whether quality activities and corresponding results comply with the applicable requirements.
Significant Conditions Adverse to Quality	A condition, which if not corrected, could have a serious adverse effect on safety or conformance with the quality system and/or Project requirements. A Significant Condition Adverse to Quality frequently involves a situation where the condition may reoccur which therefore requires measures to preclude repetition of the condition.

3.0 REFERENCES

3.1 The SFJV Project Wide QAQC Plan

3.2 QP 105; Corrective and Preventive Action

4.0 PROCEDURE

4.1 General

Quality Management System audits are performed by qualified personnel, independent of those having direct responsibility for the activity being audited, assigned or selected by the Quality Manager (QM). The Lead Auditor will be certified in accordance with this procedure.

4.2 Qualification of Lead Auditor

An individual is qualified to be a Lead Auditor when their qualifications have been reviewed and approved by the Quality Manager.

The Quality Manager:

- Reviews Lead Auditor candidate qualifications,
- Approves Lead Auditor as appropriate,
- Documents Lead Auditor approval,
- Reviews Lead Auditor qualifications annually.

4.3 Conducting the Audit

A brief pre-audit meeting with the management of the auditee will be held to discuss the scope of the Audit and Audit process.

Audits will be conducted using the applicable documents which delineate relevant requirements through interviews and/or examinations of objective evidence. Checklist(s) shall be used during this process.

After the investigative phase of the audit, and prior to the presentation of audit results to the auditee(s), the Auditor will review and evaluate the results. An Audit Finding the Lead Auditor determines is a "Significant Condition Adverse to Quality" will be documented on a Corrective Action Report, as defined in Reference 3.2. Audit Findings determined not to be a "Significant Condition Adverse to Quality" will be considered an Observation within the audit report and not require a response from the auditee. Observations are meant to identify areas needing improvement, which could cause a potential nonconformance. Any other Observations the Auditor(s) intend to include in the audit report shall also be documented.

A post audit meeting will be held by the Lead Auditor, Audit team members, and those audited. An objective summary of the audit will be presented outlining the audit results for discussion, to avoid any misunderstanding.

A Final Audit Report will be issued to the audited group.

4.4 Responsibilities

The QM shall be responsible for the following:

- Approves personnel qualified to serve as Lead Auditor,
- Assigns Lead Auditor and Auditors to perform audits,
- Audit plan and checklist preparation,
- Conducts pre-audit meeting,
- Conducts or supervises the audits and issues CARs where necessary,
- Conducts post-audit meeting,
- Preparing and issuing audit reports,
- Verifies corrective action establishment and implementation,
- Following up and closing out CARs/Audit Reports,
- Ensuring relevant records generated by this procedure are provided to Document Control.

Management of audited area shall be responsible for:

- Attending pre-audit meeting,
- Accommodating audit team needs by providing facilities, personnel and documentation as required,
- Attending post-audit meeting,
- Providing responses to audit findings and any CARs by the scheduled completion date(s),
- Implementing appropriate corrective/preventive action(s) so the CARs can be closed,
- Notifying the QM when corrective/preventive actions (s) have been completed,

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN-BUILD	Quality Procedure QP 104	
QUALITY SURVEILLANCE	Rev. #	Date Approved
	0	

1.0 PURPOSE/SCOPE

This procedure describes the requirements and responsibilities for performing Surveillances of the Contractor's and Subcontractor's work processes and for resolving any deficiencies during reviews.

2.0 DEFINITIONS

Conditions Adverse to Quality	An all-inclusive term used in reference to any of the following: errors, omissions, failures, malfunctions, deficiencies, defective items, and audit and surveillance non-conformances.
Quality Surveillance	A systematic in-process review of internal or subcontract work activities. Surveillance is not intended to be all encompassing, but rather a detailed review of a process for conformance with specific documented requirements of the quality system.
Significant Conditions Adverse to Quality	A condition, which if not corrected, could have a serious adverse effect on safety or conformance with the quality system and/or Project requirements. A Significant Condition Adverse to Quality frequently involves a situation where the condition may reoccur, which therefore, requires measures to preclude repetition of the condition.
Surveillance Checklist	A tool used to identify requirements to be reviewed during the Surveillance.
Surveillance Finding	Deficiencies found from a Surveillance which are relevant to quality system procedures or Contract requirements and are verifiable.
Surveillance Personnel	A technical specialist, quality personnel, or other individual performing Surveillance activities under the direction of the Quality Manager
Surveillance Report	A report, in memo form, which provides a general narrative and identifies all Surveillance Findings and recommendations.

3.0 REFERENCES

3.1 The SFJV Project Wide QAQC Plan

3.2 QP 105; Corrective and Preventative Action

4.0 PROCEDURE

4.1 General

Surveillances are performed by qualified personnel, independent of those having direct responsibility for the activity being surveilled, assigned or selected by the Quality Manager.

Conditions adverse to quality noted during a Surveillance are documented as Surveillance Findings. These Findings will be transmitted to the manager of the area being surveilled for corrective action. Surveillance Findings identified as "Significant Conditions Adverse to Quality" will be reported and dispositioned in accordance with the Corrective and Preventative Action procedures identified in Reference 3.2. Findings will require a corrective action response within the time specified in the Corrective Action Request (CAR) document.

4.2 Surveillance Procedure

The QM periodically will initiate a Surveillance using qualified personnel. Surveillances are scheduled and coordinated by the QM, based on the status and importance of the activity to be surveilled as well as the results of previous Surveillances.

The personnel assigned to conduct the Surveillance activity will prepare a checklist, Form QP 104.01, and perform the task as directed by the QM. Both satisfactory conditions and unsatisfactory conditions will be so indicated on the Surveillance Checklist. The Surveillance will be performed through interviews, examination of documentation, and/or observation of activities.

Unsatisfactory conditions identified during the Surveillance, but which are corrected during the Surveillance, are indicated on the completed Surveillance Checklist. Unsatisfactory conditions which cannot be corrected during the course of the Surveillance are documented as unsatisfactory on the Surveillance Checklist and become Surveillance Findings. Any Surveillance Finding the QM determines is a "Significant Condition Adverse to Quality" will be documented on a Corrective Action Report, as defined in Reference 3.2.

The QM reports the results of the Surveillance activity by completing a Surveillance Report and includes the Surveillance Checklist and any CARs.

4.3 Closing Actions

The QM verifies that actions requested on memos, CARs, etc., are closed in accordance with procedures controlling their use.

Surveillance Reports remain open until all corrective action is verified as being completed.

The QM maintains a Surveillance Log Form QP 104.2, which lists the Surveillance Report number, the activity surveyed, report issue date, any CARs issued, and date the Surveillance was closed.

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN-BUILD	Quality Procedure QP 105	
CORRECTIVE AND PREVENTATIVE ACTION	Rev. #	Date Approved
	0	

1.0 PURPOSE/SCOPE

The purpose of this procedure is to promptly identify and take preventative action on conditions adverse to quality. In the case of a “Significant Condition Adverse to Quality,” the cause of the condition shall be determined, and corrective action taken to preclude recurrence. The identification, cause, and corrective action for a “Significant Condition Adverse to Quality” is documented and reported to the appropriate level of Management; follow-up action is taken to verify implementation of corrective action.

This procedure also establishes controls such as work process checks and project surveillances, to identify, document, and report “Conditions Adverse to Quality” and to assure these conditions are corrected to preclude recurrence.

2.0 DEFINITIONS

Preventive Action	Action taken to eliminate the causes of potential deficiencies.
Conditions Adverse to Quality	An all-inclusive term used in reference to any of the following: errors, omissions, failures, malfunctions, deficiencies, defective items, and surveillance non-conformances.
Significant Conditions Adverse to Quality	A condition, which if not corrected, could have a serious adverse effect on safety or conformance with the quality system and/or Project requirements. A Significant Condition Adverse to Quality frequently involves a situation where the condition may reoccur; which therefore requires measures to preclude repetition of the condition.
Corrective Action Request (CAR)	Form used for documenting and closing findings that are determined to be significant conditions adverse to quality

3.0 REFERENCES

3.1 The SFJV Project Wide QAQC Plan

3.2 QP 102; Quality Management System Review

3.3 QP 103; Quality System Audit

3.4 QP 104; Quality Surveillances

3.5 QP 106; Quality Control Verification

3.6 QP 107; Control of Nonconformances

4.0 PROCEDURE

4.1 Corrective Action

Corrective Action Requests (CARs) are used to document, resolve, and close "Significant Conditions Adverse to Quality" that are identified by the Skanska project team members. These conditions may be identified during surveillances, management reviews, trending of nonconformance reports and inspection results.

In the event a "Significant Condition Adverse to Quality" is identified during the course of a surveillance, it will be the QCM or designee's responsibility to document the finding on a CAR, and the cause of the conformity will be documented as identified in Section 4.2 of this procedure.

4.2 Processing of CARs

Any project team member who identifies a suspected significant condition adverse to quality shall initiate a CAR using the Corrective Action Request form.

The Quality Control Manager (QCM) or designee will review the CAR to determine if the described condition is in fact a "Significant Condition Adverse to Quality" and is clearly described. If the QCM agrees the CAR is valid, the QCM assigns a CAR number, signs and dates the CAR, and sends it to the responsible manager.

The responsible manager receiving the CAR shall respond by identifying the cause, corrective action, and action to prevent recurrence by the response due date and returns the CAR back to the QCM for approval.

Once the responsible manager obtains the QCM's approval, he or she then proceeds with completing approved corrective action, and actions to prevent recurrence, and notifies the QCM when completed.

The QCM verifies completed actions and completes processing the CAR by sending the closed CAR to Document Control for distribution to management.

4.3 Preventive Action

Skanska performs the following activities in an effort to detect, analyze and eliminate potential cause for nonconformances and “Conditions Adverse to Quality”:

- Quality Management System Reviews,
- Quality Surveillances,
- Use of Construction Quality Work Plans and Pre-Construction Meetings,
- Trending of Nonconformance Reports.

Steps in dealing with problems requiring preventive action and follow-up activities are commensurate with the severity of the potential deficiency. These activities will be reviewed as part of the Management Review process to ensure effectiveness of the actions taken.

5.0 PROJECT RECORDS

Copies of CARs are maintained in the project files. After project completion they are processed in accordance with the Document Control Procedures.

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN-BUILD	Quality Procedure QP 106	
QUALITY INSPECTION AND VERIFICATION	Rev. #	Date Approved
	1	

1.0 PURPOSE/SCOPE

The purpose of this procedure is to establish a consistent and uniform approach to the general duties and responsibilities of the SFJV quality inspectors for performing inspections and documenting inspection results.

The duties and responsibilities contained in these inspection instructions are general in nature and are to be used in conjunction with various detailed inspection and test plans (ITPs), and inspection checklists, developed and issued by the SFJV Quality Department.

2.0 DEFINITIONS

Documentation	Any written or pictorial information describing, defining, specifying, reporting, or certifying activities, requirements, procedures, or results.
Checklist	A form used to clearly document acceptance status of inspection and test attributes.
Construction Work Plan (CWP)	A plan established and approved prior to the start of a major work activity to address all the pertinent aspects required to perform and complete the work in an acceptable manner.
Examination	An element of inspection consisting of investigation of materials, components, supplies, or services to determine conformance to those specified requirements that can be determined by such investigation. Examination is usually nondestructive and includes simple physical manipulation, gauging, and measurement.
Hold Point	Mandatory inspection of critical construction activities that need to be verified by SFJV QC, Client or AHJ (as delineated), prior to continuation of further construction.
Inspector	A qualified person whose duties include the verification of quality related activities or installations or both.

Inspection	A phase of quality that uses examination, surveillance, or verification to establish the conformance of materials, supplies, components, parts, appurtenances, systems, processes, or structures to conform to predetermined quality requirements
Inspection and Test Plan (ITP)	A document that tabulates information on the required tests, inspections, and verifications. This document ensures inspection requirements (inspections, tests, and documentation) are adequately defined and recorded, and are consistent with established requirements.
Monitor	To watch over, observe, or examine an in-process work operation. Results of the observations and examination may be recorded; however, signoff responsibility is not included.
Nonconformance	A deficiency in characteristic, documentation, or procedure that renders the quality of an item unacceptable or indeterminate. Examples of nonconformance include physical defects, test failures, incorrect or inadequate documentation, or deviation from prescribed processing, inspection, or test procedures.
Procedure	A document that specifies or describes how an activity is to be performed. A procedure may include methods to be employed, equipment or materials to be used, and/or a sequence of operations.
Open Item List	A log of in-process work items identified by or to the Skanska QCM, which have potential of becoming nonconformances.
Pre-Construction Meetings	A meeting held prior to the start of a major new construction work activity. The PSQCP is used as the meeting agenda. These are attended by Construction, Quality and the Client.
Shop Drawing	Drawings, diagrams, schedules, and other data specifically prepared by the design/builder pursuant to the work showing, in detail, the proposed fabrication and assembly of a special component of the work or the installation of a special component of the work.

Submittal	Consists of detailed information provided by the design/builder, based on the design documents, which may consist of working or shop drawings, product data, material certifications, samples, calculations, etc., for review and approval.
Surveillance	A broad term pertaining to, and including, both monitoring and witnessing.
Testing	The determination or verification of the capability of an item to satisfy a set of physical, chemical, environmental, or operating conditions or procedures.
Verification	An act of confirming, substantiating, and assuring that an activity or a condition has been implemented in conformance with the specified requirements.
Witness	To watch over, observe, or examine a specific test or work operation, including signoff responsibility.
Working Drawing	Drawings prepared and submitted, as required, by the design/builder, illustrating work required for construction, but which will not become an integral part of the completed work or project. This includes drawings for temporary structures, such as decking, temporary bulkheads, excavation supports, utility supports, groundwater control, forming, and false work.

3.0 REFERENCES

- 3.2 QP 107; Control of Nonconformances**
- 3.3 QP 108; Project Specific Quality Control Plans**
- 3.4 QP 109; Inspection and Test Plans**

4.0 PROCEDURE

4.1 General

Prior to any major work activity taking place, three elements of the quality program will be completed:

- Project Specific Quality Control Plans (PSQCPs) shall be developed by Construction Field Engineers and approved by the QCM and the Client. Refer to Reference 3.3 for a further description of PSQCPs.
- Inspection and Test Plans (ITPs) will be developed and approved, with checklists, and become a part of the PSQCP. Refer to Reference 3.4 for a further description of ITPs.
- Pre-Construction Meetings will be held between SFJV and the Client, where the PSQCP will serve as the agenda to discuss the upcoming work activity.

During the construction activity, an Initial Inspection Meeting and Follow-up Inspections will be performed as follows:

- QCM will hold an Initial Inspection Meeting with the contractor or subcontractor supervisor, foreman, QC Inspector, ITL Technician, and LAWA representatives to discuss all aspects of the representative sample of work including establishing a baseline for quality and acceptability.
- Follow-up Inspections will be performed throughout the duration of the construction activity.

Inspectors will be assigned to the Project by the QCM to support ongoing field activities.

The inspectors responsible for work activities will:

- Review and have a thorough understanding of applicable quality procedures and processes
- Review the applicable PSQCP and included ITP with checklists
- Review the applicable design drawings and specifications
- Review applicable approved submittals and shop drawings
- Obtain any required tools to perform inspections

Whenever possible, inspectors will evaluate the work process, as well as the final product/installation for compliance with established acceptance criteria.

While monitoring the work process, the inspector will:

- Monitor all assigned work activities and perform required inspections

- Notify the SFJV construction supervision and the QCM of any activity that may result in unacceptable results
- Witness and document testing as required
- Document observations and notifications given to the Skanska construction staff and field engineers in their Daily Inspection Reports (DIRs)
- Complete applicable checklists as work is completed
- Notify the Skanska construction supervision of any unsafe conditions that are noted
- Identify any noted conflicts between the design requirements and/or existing conditions that may require a clarification or change

The inspector will perform inspections on in-process and completed installations in accordance with applicable design documents, approved submittals, and Quality Procedures. These inspections and their results will be documented in DIRs and on applicable checklists.

Where a nonconforming condition is identified, and the specific phase of work in question is no longer in-process, the inspector shall initiate a Nonconformance Report (NCR), Form QP 107.01; refer to Reference 3.2 for a further description of NCRs. For work still in-process, which may become nonconforming if not corrected, the Open Item List will be used for tracking items that are not resolved within a day or two using Form 106.02. The Open Item List is controlled and distributed by the SFJV QCM, as requested.

4.2 Recording Data

Daily Inspection Reports: The inspector is responsible for accurately recording inspection results in a way that will make them legible and understandable at a later time. Note that the DIR (Form QP 106.01) consists of multiple pages; the first page should always be used, along with any combination of the remaining pages as needed to document inspection results.

As a minimum, inspection information recorded on the DIR shall clearly identify:

- Contract name,
- Day and date of inspection,
- Skanska or subcontractor performing the work,
- Item(s) inspected and tested with applicable specification, drawings and submittals identified
- Acceptance status of inspections performed, clearly identified with deficiencies and/or NCRs noted where required,
- Location (design package, segment, stationing, room number, gridline, or other specific location designation as applicable),
- Inspector's name, both printed and signed, and date of signature,
- Information related to safety or accidents.

Checklists: It is intended that most acceptance inspections will be recorded on checklists. This helps ensure all applicable inspection attributes are evaluated and then clearly annotated as to their acceptance status; such checklists will be part of each ITP.

In addition to the inspector performing their inspections, Foremen and/or the responsible Field Engineer are required to inspect their crew's work and document their acceptance on the checklists. Acceptance shall be indicated of an inspection attribute on the checklist by placing their initials in the "Accept" column. Inspection attributes listed on the checklist not applicable at the time of inspection shall be marked "N/A." Both the Foreman or Field Engineer, and the Inspector, shall also provide his or her signature at the space provided at the bottom of the checklist.

The original completed checklist shall be attached to the Inspector's DIR.

4.3 Test Reports

Various organizations and individuals will perform testing. Copies of the test reports/results will be obtained when practical and attached to the inspectors DIR. The SFJV Independent Testing Laboratory shall submit their Test Reports to SFJV weekly as a minimum or as directed by the QCM.

4.4 Changes/Corrections

Changes or corrections made to inspection documents will be made by a single line-through with initials and a date. No white out, correction tape, etc., will be used on the Quality Records/inspection documents.

4.5 Responsibilities

The SFJV QCM has overall responsibility for implementation of the Quality Program and assuring an Inspection and Test Plan (ITP) has been established for each PSQCP that addresses construction installation. These ITPs will identify all significant inspection and testing attributes with acceptance criteria. The ITP may include a checklist to document the inspection and test results. The QCM, or designee, attends all Pre-Construction Meetings.

Inspectors are responsible for observing/inspecting all assigned work activities through examination, surveillance, and verification. They are also responsible for documenting the results of those observations as they relate to the acceptance criteria defined in the design documents. The inspector is responsible for understanding the design requirements unique to the inspector's assigned area of responsibility.

Technicians from independent testing laboratories will be utilized to supplement the inspection staff to perform specific inspections and required testing. They are responsible for documenting the results of their observations and test results as they relate to the acceptance criteria defined in the design documents. The technician is responsible for understanding the design requirements unique to the technician's assigned area of responsibility. Note that references to inspectors in this and other procedures are intended to include technicians in defining their responsibilities and duties.

Safety awareness is a responsibility for all inspection staff. Each inspector or technician will be familiar with the general safety requirements outlined in the SFJV Safety Manual. Each inspector will report incidents of unsafe conditions or practices to the SFJV supervision, as well as to the Safety Manager, if warranted.

5.0 PROJECT RECORDS

Copies of Quality Verification documentation are maintained in the project files. After project completion they are processed in accordance with the Document Control Procedures.

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN- BUILD	Quality Procedure QP 107	
CONTROL OF NONCONFORMING ITEMS	Rev. #	Date Approved
	0	

1.0 PURPOSE/SCOPE

This procedure describes the identification and control of products that do not conform to specified requirements and what will be done to prevent their inadvertent use or installation. This procedure also applies for deficiencies identified during material receipt inspection, and for deficiencies identified during off-site fabrication and/or manufacturing. All subcontractor nonconformances shall be processed in accordance with this procedure and through the SFJV Quality Organization. However, suppliers and fabricators with approved quality programs may use their own nonconformance process for self-identified nonconformances.

2.0 DEFINITIONS

Conformance	An affirmative indication or judgment that the condition of an item meets the requirements of relevant specifications, Contract, and/or regulations.
Corrective Action	Documented commitment of specific action planned or being implemented to resolve a known condition or conditions that adversely affect quality. Corrective action must address both remedial action to correct the known discrepancy and action to prevent recurrence based on the identified root cause.
Corrective Action Request (CAR)	Form used for documenting and closing surveillance, inspection, and audit findings.
Disposition	The statement describing the manner in which a deficiency or nonconformance is to be resolved.
Hold Tag	A status tag used to prevent a nonconforming item from being incorporated into the work. Hold Tags may only be removed by a QC representative. <i><u>Note: Any willful removal or by-passing of a Hold Tag may result in disciplinary action of up to and including removal from the project for the individuals responsible for the violation.</u></i>
Nonconformance	A deficiency in characteristic, documentation, or procedure that renders the quality of an item unacceptable or indeterminate. Examples of nonconformance include physical defects, test

failures, incorrect or inadequate documentation, or deviation from prescribed processing, inspection, or test procedures.

Nonconformance Report (NCR)

A form used to identify a nonconforming condition and to document a proposed corrective action for consideration by the appropriate organization(s), i.e. Client, Design Engineer, Quality Control, Safety, etc.

Reject

A disposition that indicates an item is unsuitable for its intended purpose and economically or physically incapable of being reworked or repaired.

Repair

A disposition that will result in making an item acceptable for its intended use, even though it is not restored to a condition which meets all specification requirements. Repair dispositions require approval by the Design Engineer and the Client.

Rework

A disposition that indicates the nonconformance can be brought into Conformance with the original drawing, specification, etc., requirements through subsequent re-machining, reassembling, reprocessing, reinstallation, or completion of the required operations.

Accept As-Is

A disposition that allows the use of an item which does not meet all design requirements when the Design Engineer determines the item will satisfy its intended use. Accept As-Is dispositions require approval by the Design Engineer and the Client.

3.0 REFERENCES

3.1 The SFJV Project Wide QAQC Plan

3.2 QP 105; Corrective and Preventative Action

4.0 PROCEDURE

4.1 Preparing Nonconformance Report

Any employee may initiate a Nonconformance Report (Form QP 107.01) when nonconforming work is found. The employee tags (Hold Tag), segregates, or otherwise identifies the nonconforming work in question to prevent inadvertent use, acceptance, or installation. The

employee then gives the NCR to the Quality Control Manager (QCM) for validation and further processing.

When the QCM determines the proposed NCR is valid, the NCR is assigned a NCR number and is signed and dated by the QCM, with the response due date identified based on current schedule. The QCM then forwards the NCR to the Responsible Party for review and to propose a Recommended Disposition.

Upon return of the Recommended Disposition from the Responsible Party, the Quality Control Manager (QCM) reviews and distributes the NCR to the following individuals for comment and/or approval, as required:

- Client
- Project Manager
- Originator
- Construction Manager
- Document Control

After approval of a Recommended Disposition, any Hold Tag that had been placed is removed by a QC representative from the nonconforming item so that work on the item may proceed. Then the corrective action is carried out and Skanska QC personnel conduct inspections to verify completion in accordance with the NCR instructions. The method of verification and the results of the verification/inspection are documented in the "Closure of NCR" section on Page 2 of the NCR. When all actions are accepted, the QCM signs and dates the "Closure of the NCR."

Detailed instructions for completing the NCR can be found on Pages 3-4 of the NCR Form. Instructions include:

- Initiating an NCR
- Recommended Dispositions
- Disposition Approval
- Closure of NCRs
- Conditional Releases
- Additional Information

4.2 Nonconformance Report Log

The QCM will maintain the current status of all NCRs in a Nonconformance Log. A sequential numbering system for the NCRs will be used continuously throughout the Project.

The QCM will review the NCR Log on a monthly basis to assure prompt closure of outstanding NCRs.

4.3 Closeout and Distribution

After the "Closure of NCR" is complete, copies of the completed NCR will be sent to those individuals on the original NCR distribution list.

4.4 Responsibilities

4.4.1 Quality Control Manager

The QCM is responsible for ensuring compliance with the requirements of this procedure, including:

- Reviewing the nonconformance description for accuracy and completeness
- Validating an NCR is warranted
- Providing a response due date based on current schedule
- Forwarding the NCR to the Responsible Party for proposed response
- Ensuring the corrective action is accomplished in accordance with the corrective action stated through inspections by QC personnel, as required
- Closing the NCR when all corrective actions have been completed and accepted
- Routing the NCR to appropriate individuals for review and approval
- Initiating and coordinating required meetings, reviews, etc., with the Client, Contractor, Engineer, AHJ, or other organizations to resolve the NCR
- Reviewing the approved NCR disposition to verify all nonconforming conditions have been addressed and the NCR disposition identifies the correct status as:
 - ✓ Reject
 - ✓ Rework
 - ✓ Repair
 - ✓ Accept As-Is
- Distributing of NCRs
- Reviewing trends identified in NCRs and determining the need to issue a Corrective Action Request (CAR).
- Maintaining the Nonconformance Report Log (Form QP 107.02),

4.4.2 Responsible Party

The Responsible Party is the entity performing the work in question, and with regards to the NCR process is responsible for:

- Reviewing the nonconforming condition described in the NCR,
- Evaluating the root cause of the nonconforming condition,

- Proposing a method of correcting the nonconforming condition as either "Reject," "Rework," "Repair," or "Accept As-Is."
- Providing sufficient detail required for an accurate interpretation of the corrective action to correct the nonconformance, addressing preventative action to preclude recurrence, and addressing any proposed Conditional Releases.

4.4.3 Project Manager

The Project Manager is responsible for:

- Reviewing the NCRs and concurring or commenting, as appropriate, to the Recommended Disposition,
- If a Conditional Release is proposed, reviewing and approving the justification and limitations of the work,
- Complying with the approved disposition, as appropriate.

4.4.4 Design Engineer

If the Recommended Disposition is "Repair" or "Accept As-Is" the Design Engineer is responsible for ensuring the Contractor's proposed corrective action resolves the nonconformance in an acceptable manner.

4.4.5 Client

The Client is responsible for reviewing NCRs and concurring or commenting as appropriate to Recommended Dispositions of "Repair" or "Accept As-Is."

For any non-conformance documents received from the client, they will follow a similar process and be returned to the client when corrective actions have been completed.

5.0 PROJECT RECORDS

Copies of NCRs and the Nonconformance Report Log are maintained in the project files. After project completion they are processed in accordance with the Document Control procedures.

[illegible]

NONCONFORMANCE REPORT INSTRUCTIONS

Initiating an NCR

1. Location: Record specific location of the nonconforming item.
2. Originator: Print name of person initiating NCR.
3. Supplier/Subcontractor: Record the name of the organization causing the nonconformance.
4. Purchase Order or Subcontract Number: Record the P. O. number or Subcontract number if the nonconformance was caused by a Supplier or Subcontractor.
5. Date: Record the date the Nonconformance report was initiated.
6. Specification/Rev: Record the specification number and revision.
7. Drawing/Rev: Record the drawing number and revision – design & shop drawings if applicable.
8. Contract Requirement: Describe the requirement as defined by the specification or drawing that is not being complied with.
9. Nonconforming Condition: Describe the nonconforming product and how it deviates from the specification or drawing (add additional pages as required, sketches, pictures, etc.).
10. Check appropriate box for the cause of the deviation; construction, subcontractor or supplier.
11. Originator enters signature and date.
12. QC Manager reviews and enters signature and date for valid NCRs, enters the next consecutive number for the NCR and identifies who is responsible for replying to the NCR and response due date based on current schedule.

Recommended Disposition *(Response, even if it is an interim response, must be returned by the indicated due date.)*

13. Check one of three boxes to identify the type of deviation.
14. Enter root cause of the problem and what action will be taken to prevent recurrence.
15. Provide a detailed description of how to implement the recommended disposition to close the NCR.
16. Check one of the four boxes to describe the action category necessary to close the nonconformance.
 - **Rework** - Action taken on a nonconforming product so that it conforms to specified requirements.
 - **Reject** - Nonconforming product that is returned to the vendor, rejected, or removed from service.
 - **Accept As-Is** - Nonconforming product requires no corrective action before use, but must be technically justified as meeting its intended use. This may require a change in Design Requirements / Quality attributes. An "Accept As-Is" NCR requires review and approval by the Design Engineer and the Client.
 - **Repair** - An action taken on a nonconforming product so it will fulfill the intended usage requirements, although it may not conform to the originally specified requirements. A "Repair" NCR requires review and approval by the Design Engineer and the Client.
17. Provide implementation dates for Preventive and Corrective Actions

18. Check the Conditional Release box if nonconforming product is to be processed further prior to final approval of the recommended disposition and complete steps 26 through 29 of this form.
19. Individual recommending proposed disposition enters signature and date.

Disposition Approval

20. Project Manager signs and dates indicating approval of proposed disposition.
21. For Repair and Accept As-Is NCRs, the responsible Design Engineer signs and dates indicating approval of proposed disposition.
22. QCM signs and dates indicating approval of proposed disposition.
23. For Repair and Accept As-Is NCRs, NCRs are sent to the Client for approval. The Client representative enters signature and date.

Closure of NCR

24. Corrective Actions Complete/NCR Closeout: Add comments, if required.
25. QCM: Signature and date of the QCM verifying corrective action and closeout of the NCR have been completed.

Conditional Release

26. Justification: Describe the facts justifying the conditional release of nonconforming product for use before final approval of the recommended disposition.
27. Limitations/Control: Describe limitations of conditional use of the nonconforming product and associated controls to prevent these limitations from being exceeded.
28. Project Manager: Signature and date of the Project Manager authorizing the Conditional Release of nonconforming product.
29. QCM: Signature and date to indicate concurrence of conditional release conditions.

Additional Information

30. Supplier/Subcontractor Notified: Enter a contact name and the date of notification.
31. Extra Work Order/Backcharge No.: Enter the applicable number, if one is issued, to provide a cross-reference.

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN- BUILD	Quality Procedure QP 108	
CONSTRUCTION QUALITY CONTROL PLANS AND PRECONSTRUCTION MEETINGS	Rev. #	Date Approved
	1	

1.0 PURPOSE/SCOPE

The purpose of this procedure is to establish a consistent and uniform approach to developing Project Specific Quality Control Plans (PSQCP) for individual work activities. These PSQCPs take a step-by-step look at the requirements needed to accomplish the work, to communicate areas of concern, ensure adequate preparation for the activity, requirements of preconstruction meeting and assist in good coordination with all third-party participants.

All major work activities will have a PSQCP established, which will be reviewed along with agenda and Construction Work Plan (CWP) for preconstruction meetings held prior to the subject work activity beginning. In preparing the PSQCP a series of internal reviews by SFJV QCM and area leads will be conducted, along with the PSQCP submitted to LAWA for approval.

After the Preconstruction Meeting is held, comments will be incorporated into a final PSQCP which will be approved and signed by the Construction Manager or Area Lead and the Quality Control Manager (QCM) then submitted to LAWA for record only.

2.0 DEFINITIONS

Project Specific Quality Control Plans (PSQCP)

The SFJV PSQCP fulfills the requirements of ATMP Roadway Improvements Project Requirements PR13/14

Hold Points

A point at which an inspection activity required by project planning documents shall be performed, and beyond which work may not proceed without release by the designated personnel identified in the project planning documents.

Inspection and Test Plan

A document that tabulates information on the required tests, inspections, and verifications. This document ensures inspection requirements (inspections, tests, and documentation) are adequately defined and recorded, and are consistent with established requirements.

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN-BUILD	Quality Procedure QP 108	
CONSTRUCTION QUALITY CONTROL PLANS AND PRECONSTRUCTION MEETINGS	Rev. #	Date Approved
	0	

3.1 REFERENCES

3.2 Project Requirements PR13/14

3.3 QP 109; Inspection and Test Plans

4.0 PROCEDURE

4.1 Development of the Project Specific Quality Control Plan

Project Specific Quality Control Plan process will be initiated through an internal PSQCP pre-activity meeting for discussion with the Quality Control Manager and Area Lead. Major discussion points of this meeting include refining the scope of work, sequencing concerns, prerequisite activities, required submittals and inspection/testing requirements.

A draft of the PSQCP is then prepared by Construction Staff which includes, but is not limited to, all the following items:

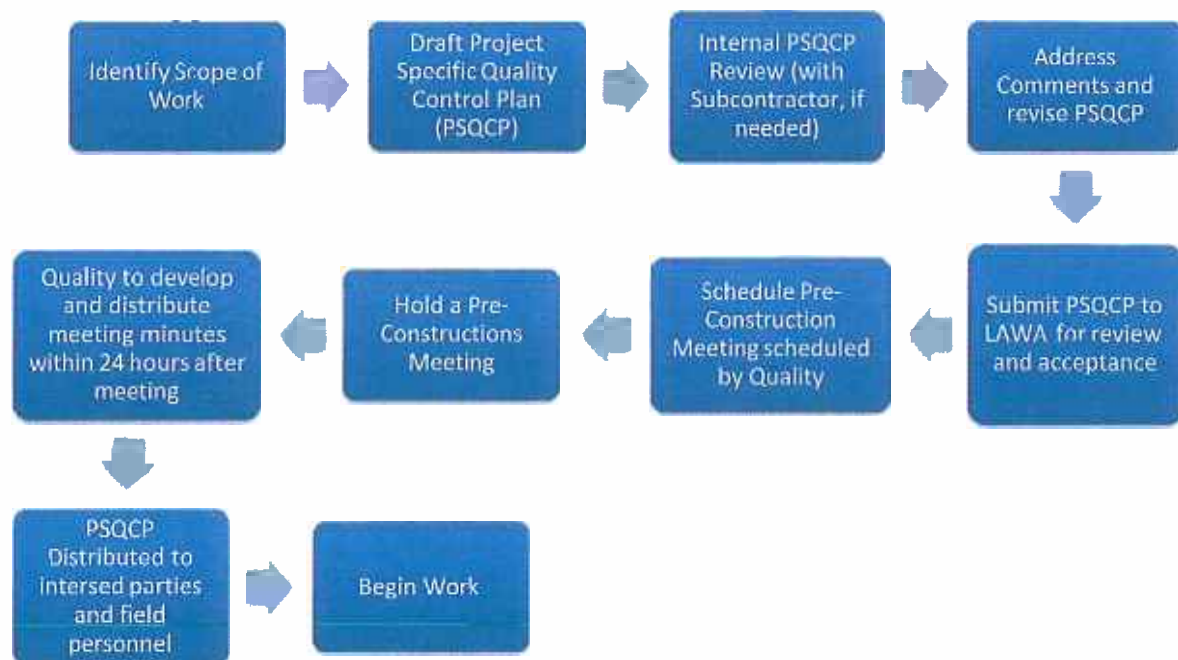

- Description of the Work with step-by-step sequence for the work
- List of prerequisite activities required
- List of applicable design specification Sections
- List of applicable design drawings
- List of RFI's and status
- List of required Submittals and their respective Status
- List of materials to be used
- List of individuals responsible for supervision of the Work, including subcontractor supervision. List includes individuals' positions and phone numbers
- Scheduled start date, work hours, and expected duration
- Completed Inspection and Test Plan including Hold Points
- Competent person forms
- Pothole data sheets

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN-BUILD	Quality Procedure QP 108	
CONSTRUCTION QUALITY CONTROL PLANS AND PRECONSTRUCTION MEETINGS	Rev. #	Date Approved
	0	

The draft PSQCP is circulated to the responsible area lead, superintendent and Construction Manager for review and comment. After the review is completed, the PSQCP will be revised to address any comments. The PSQCP will be signed by the Construction Manager or area lead and the QC Manager. Submission of the PSQCP to LAWA for review and acceptance will occur prior to the scheduled start of construction activities and a Pre-Construction Meeting will be scheduled. A draft of the PSQCP is then distributed to LAWA for review and comment. LAWA comments are then incorporated into the PSQCP. The PSQCP is then submitted to LAWA for approval, and a preconstruction meeting is scheduled prior to permanent work starting.

Copies of the approved PSQCP are to be distributed and maintained at the Work area for use by the field staff.

4.2 Approval Flow Chart for the Project Specific Quality Control Plan

5.0 Preconstruction Meetings

Prior to starting work, SFJV will hold a preconstruction meeting with LAWA, AHJ's, sub- contractors, Superintendents and Safety. The Preconstruction meeting will be coordinated by Skanska Quality Control Department. The meeting agenda, CWP and PSQCP will be distributed

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN-BUILD	Quality Procedure QP 108	
CONSTRUCTION QUALITY CONTROL PLANS AND PRECONSTRUCTION MEETINGS	Rev. #	Date Approved
	0	

to all responsible parties prior to start of meeting. During the preconstruction meeting SFJV safety manager will discuss safety, SFJV or subcontractor performing the work will present the Construction Work Plan and schedule, Quality Control will review the PSQCP. Meeting minutes will be recorded and distributed after preconstruction meeting is held.

Attendance sign-in sheets will be used to document all Preconstruction Meetings. Preconstruction meeting sign-in sheets will be retained as a quality record in Procore.

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN- BUILD	Quality Procedure QP 109	
INSPECTION AND TEST PLANS	Rev. #	Date Approved
	0	

1.0 PURPOSE/SCOPE

The purpose of this procedure is to establish a system for development and control of Inspection and Test Plans (ITPs) and ensure proper documentation quality procedures have taken place.

The purpose of an ITP is to develop a single document that references all inspection and testing requirements relevant to the work process. The ITP identifies the materials to be inspected and tested, the required frequency, relevant standards, records to be maintained, as well as "Hold Points" required throughout the work.

2.0 DEFINITIONS

Hold Points	A point at which an inspection activity required by project planning documents shall be performed, and beyond which work may not proceed without release by the designated personnel identified in the project planning documents.
Inspection Personnel	The individual(s) responsible for performing required inspections, tests, and verifications.
Nonconformance	A deficiency in characteristic, documentation, or procedure that renders the quality of an item unacceptable or indeterminate. Examples of nonconformance include physical defects, test failures, incorrect or inadequate documentation, or deviation from prescribed processing, inspection, or test procedures.

3.0 REFERENCES

- 3.1 The SFJV Project Wide QAQC Plan
- 3.2 QP 107; Control of Nonconforming Items
- 3.3 QP 108; Construction Quality Control Plans

4.0 PROCEDURE

4.1 Inspection and Test Plan Planning

When inspection and testing is required to support project activities, the Construction Manager will convey the activity scope to QC Personnel for development and inclusion of the QC Inspection and Test Plan into the Project Specific Quality Control Plan, refer to Reference 3.3 for a further description of PSQCP .

ITPs will be developed by SFJV QC Personnel, and will include information from the following sources:

- Contract Requirements
- Applicable Specification(s)
- Drawings
- Design Criteria Documents
- Codes, Standards, Permits, etc.

The ITPs will include:

- Inspection/Test Activity Description
- Responsibility for performing the inspection/test
- Inspection/Test Requirements and Standards
- Type and Frequency of Tests
- Inspection/Test Result Documentation References
- "Hold Points" as required by SFJV, the Client or AHJs

4.1.1 ITP Review and Approval

Prior to use for testing or inspection, the ITP will be approved by the Quality Control Manager (QCM) and submitted to the Client for review and approval as required. The ITP will be incorporated into the PSQCP.

4.1.2 ITP Revisions

If changes are required, the ITP will be revised and processed in the same manner as the original.

4.2 Inspection and Test Plan Activities

The inspection and testing will be performed by personnel knowledgeable in the inspection/test processes. Certifications of personnel and equipment for performing inspections and tests will be available upon request in accordance with the QP, refer to Reference 3.1 for the complete SFJV Project Wide QAQC Plan.

Inspection and test requirements identified as "Hold Points" will be noted on the ITPs. "Hold Points" will be discussed and defined further with Project personnel during the Pre- Construction Meetings. Construction management will be responsible for notifying the QCM when "Hold Points" occur and for coordinating with the Client or AHJs if their presence is required.

Inspection and test results will be recorded on forms referenced on the ITP. The forms to be used will be those provided by or approved by the Quality Control Manager. In most cases the ITP inspection will be documented on checklists and test results recorded on test reports. These checklists and test reports will be attached to the ITP. These forms will serve as documentation of conformance with the Project requirements.

If an inspected/tested condition meets the definition of a nonconformance, it will be processed in accordance with the NCR procedure, refer to Reference 3.2 for a further description of NCRs.

5.0 PROJECT RECORDS

A copy of the Inspection and Test Plans are retained in accordance with the Document Control procedures.

SUBJECT: _____

DATE: _____

SPECIFICATION REFERNECE: _____

[illegible]

SKANSKA FLATIRON	Quality Procedure QP 110	
QUALITY STOP WORK ORDER	Rev. #	Date Approved
	0	

1.0 PURPOSE/SCOPE

This procedure describes the method for initiating, documenting, implementing, and releasing Stop Work Orders (SWO) imposed for quality related deficiencies to on-going work activities.

A SWO is a written notice directing construction supervision and management to stop work relating to specific activities due to one of the following situations:

- Activity is proceeding in violation of drawing or specification requirements,
- Defective material or equipment is used or being installed,
- Activity fails to follow approved procedures,
- Previous attempts to accomplish corrective action have failed.

2.0 DEFINITIONS

Nonconformance	A deficiency in characteristic, documentation, or procedure that renders the quality of an item unacceptable or indeterminate. Examples of nonconformance include physical defects, test failures, incorrect or inadequate documentation, or deviation from prescribed processing, inspection, or test procedures.
Condition Adverse to Quality	An all-inclusive term used in reference to any of the following: errors, omissions, failures, malfunctions, deficiencies, defective items, and audit and surveillance non-conformances.

3.0 REFERENCES

- 3.1 The SFJV Project Wide QAQC Plan
- 3.2 QP 107; Control of Nonconforming Items

4.0 PROCEDURE

4.1 Quality Stop Work Order

When a Condition Adverse to Quality is identified through an NCR, the condition will be evaluated by the Quality Manager (QM) to consider the potential of a SWO being warranted.

If the QCM believes a SWO may be necessary, the QCM consults with the Quality Manager (QM). If the QM concurs, and the affected work activity has not already stopped, the QM will issue a SWO. Upon issuing the SWO, Construction Management will be verbally notified and written documentation will be sent to the Project Manager, Construction Manager, Superintendent, and the Client.

Within the Stop Work Order document, the following items will be addressed by the QCM:

- The party responsible for performing the subject work
- The activity being stopped
- The reason for the work stoppage
- The actions required to resume the work

Personnel involved in the SWO will be indicated on the form; this will include a record of the SWO verbal notification, the individual responsible for initiating the SWO, and the QCM enacting the SWO.

Note: Any willful violation of a Stop Work Order may result in disciplinary action of up to and including removal from the project for the individuals responsible for the violation.

Prior to restarting the subject work, the SWO form will be returned to the QCM with the responsible party's proposed procedure for correcting the work. When the QCM approves the proposed corrective action, work may be resumed and copies of the SWO documentation will be distributed to the Project Manager, General Superintendent and the Client.

The Stop Work Order form can be seen as attached Form QP 110.01.

4.2 Stop Work Order Log

The QC Manager will maintain the current status of all SWOs in a Stop Work Order Log. A sequential numbering system for the SWOs will be used continuously throughout the Project.

The QC Manager will review the SWO Log to assure prompt corrective action is being taken on outstanding SWOs.

5.0 PROJECT RECORDS

Copies of SWOs are maintained in the project files. After project completion they are processed in accordance with the Document Control Plan.

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN- BUILD	Quality Procedure QP 111	
QUALITY TRAINING	Rev. #	Date Approved
	0	

1.0 PURPOSE/SCOPE

The purpose of this procedure is to assist employees in acquiring and maintaining the knowledge, skills, and abilities to provide and construct quality products. SFJV Management will identify, and document training needs to support work in the Contract documents and provide for the training of all personnel performing activities affecting quality. Adequate training allows the opportunity for professional growth and for employees to adapt to advance and improve performance.

2.0 DEFINITIONS

Orientation	The providing of instruction sufficient to familiarize the individual with the scope and requirements of a particular activity or responsibility.
On-the-job Training	Orientation, indoctrination, and/or training received or acquired while one undertakes a specific work assignment.
Training	An organized and planned process of instruction administered to individuals in such a manner as to make them proficient in, or qualified to perform a defined task or duty. Training includes orientation.

3.0 REFERENCES

3.1 The SFJV Project Wide QAQC Plan

4.0 PROCEDURE

4.1 Orientation

Orientation is required for all project personnel. At the completion of Orientation, each individual will sign an Attendance Record.

4.2 Continuous Training

The purpose of continuous training is to adapt to a changing environment. The need for additional training may be warranted by issuance of new major revisions to procedures.

SKANSKA FLATIRON ATMP Roadway Improvements Project – DESIGN- BUILD	Quality Procedure QP 112	
CONTROL OF MEASUREMENT & TEST EQUIPMENT	Rev. #	Date Approved
	0	

1.0 PURPOSE/SCOPE

This procedure describes the requirements and responsibilities for calibrating and storage of inspection, measuring and test equipment (MTE) used to make acceptance decisions on the Project.

2.0 DEFINITIONS

MTE Measuring and Test Equipment

NIST National Institute of Standards and Technology

3.0 REFERENCES

3.1 The SFJV Project Wide QAQC Plan

4.0 PROCEDURE

4.1 General

The calibration and adjustment of MTE will be performed by companies or people qualified to calibrate or adjust the equipment. Calibration certification of MTE will be performed before its use on the Project and at intervals not to exceed twelve months unless noted otherwise. Calibration standards will be traceable to the National Institute of Standards and Technology (NIST), where applicable. Calibration certificates will be provided when requested by LAWA.

MTE will be properly handled, preserved, stored, and safeguarded to maintain the integrity of the equipment, and where manufacturer's recommendations on packaging, shipping, use and storage are provided, they will be followed.

4.2 Identifying and Adjusting Calibration, Inspection and Test Equipment

Throughout the project, identifying inspection and test equipment requiring calibration will be the responsibility of the independent testing laboratory manager or subcontractor's designated quality control personnel. This person's responsibilities will include:

- Reviewing plans and specifications to determine the type and accuracy of the MTE necessary to support the Project requirements

- Receiving inspection of MTE and verifying the calibration certificate was included by the vendor, if requested. If calibration certification was not requested, the equipment must be calibrated prior to use, if used for acceptance of the work
- Completing an Inspection Measuring and Test Equipment Log entry for each MTE requiring calibration
- Filing equipment calibration certificates in the MTE file
- Ensuring the MTE is calibrated / re-calibrated or adjusted at intervals stipulated by the equipment manufacturer or by the standard to which the tests are being performed, whichever is more frequent
- Ensuring damage or malfunctioning MTE is immediately removed from service and is re-calibrated or adjusted by qualified companies or people or replaced

4.3 Assessing the Validity of Previous Inspection, Measuring and Test Results

Assessing the validity of previous inspection, measuring, and test results begins with the personnel operating the equipment. If the MTE is suspected to be out of calibration, the equipment operator should notify the QCM or independent testing laboratory manager.

The QCM will then coordinate with qualified calibration personnel to check the equipment. If the equipment is found to be out of calibration, the QCM will review test records to determine how many, and which tests, were performed with the defective equipment and what, if any, tests need to be re-performed.

5.0 PROJECT RECORDS

Copies of measurement and testing equipment records are maintained in the project files. After project completion they are processed in accordance with the Document Control procedures.

6.0 ATTACHMENTS

					Received	Calibrated	Calibrated	Calibrated	

Continuous training may be performed using either the classroom or self-study. Management will determine when continuous training is required and what method will be used, classroom or self-study.

4.3 Conducting Training

Classroom presentations will be planned and presented using a Training Syllabus, Power Point presentation, demonstration, and/or providing a CD with relevant information or individual training, as appropriate.

4.4 Responsibilities

4.4.1 Management

The Project Manager is responsible for ensuring the implementation of this procedure. Management is also responsible for ensuring the development and implementation of continuing training programs.

4.4.2 Project Personnel

Project personnel are responsible for attending assigned training sessions, completing required reading assignments in a timely fashion, and documenting completion of required training activities as required by management.

5.0 PROJECT RECORDS

Copies of Training documentation are maintained in the project files. After project completion they are processed in accordance with the Document Control Procedures.

QP 111.01

SKANSKA	FLATIRON	ATMP Roadway Improvements Project – DESIGN- BUILD	Quality Procedure QP 113	
PROJECT CLOSEOUT			Rev. #	Date Approved
			0	

1.0 PURPOSE/SCOPE

This procedure describes the work process for tracking and closeout of outstanding construction, testing or documentation items necessary for completion of project facilities, systems, and components for subsequent turnover to LAWA or other 3rd party Stakeholder by SFJV.

2.0 DEFINITIONS

Punchlist A listing of contractually required items determined to be incomplete or deficient during a preliminary or final walkdown inspection. It is not used for repair of nonconforming work that needs the engineer's disposition. The punchlist is maintained in Procore under the purview of the Quality Control Manager.

Punchlist Item An individual item or element identified on the punchlist as not being acceptably completed.

Punchlist Item Status

1. Open: A punchlist item which has not been completed and closed
2. Completed: A punchlist item that construction has completed all work associated with the identified element of work.
3. Closed: A punchlist item that SFJV Quality Control has independently verified as being completed and coordinated with any other AHJ.
4. Exception: A punchlist item that has concurrence from the receiving organization (Startup, Client, etc.) that it has determined that the item may remain open or incomplete during initial turnover. The Contractor remains responsible for the closure of the item through coordination with the receiving organization.
5. Out-of-Scope: A punchlist item that has been listed on the punchlist but is determined not to be in the scope of the contract.

Originator The person participating in a walkdown that identifies and documents a punchlist item(s) of incomplete work.

Partial Acceptance	PARTIAL ACCEPTANCE - Any portion of the work which has been completed in accordance with the contract Documents and has been accepted in writing by LAWA prior its intended use and purpose
Punchlist Coordinator	The individual responsible for updating and maintaining the punchlist under supervision of the Quality Control Manager.
Punchlist Item Owner	The individual responsible for assuring the open punchlist item is completed (e.g. field engineer, superintendent, subcontractor representative, etc.)
Final Completion	Once Design Builder has received certificate of substantial completion and corrected any minor items on LAWA punch list Design Builder will request for Final Completion.
Substantial Completion	The stage in the progress of the Work where it is sufficiently and suitably complete in accordance with the Contract Documents for LAWA, in its sole discretion, to beneficially occupy or utilize the Work for the purposes for which it was intended.
Final Acceptance	Design Builder notifies LAWA that final completion has been accomplished. LAWA verifies all items on punchlist are complete and issues notice of final completion.

3.0 REFERENCES

3.1 The SFJV Project Wide QAQC Plan

3.2 PR-27 Project Closeout

4.0 PROCEDURE

4.1 Pre-Substantial Completion Work

Once SFJV has completed sections of work that are ready to turnover to LAWA for substantial completion. A Punchlist will be generated by SFJV QC department to verify all incomplete items and items requiring correction are completed.

4.2 Generating Punchlist

When a specified work package is identified as nearing completion or is complete, and SFJV's internal verification that all work is complete, a punchlist will be generated by SFJV QC and all parties responsible for the work.

Using design drawings, specifications, shop drawings, approved submittals, and other contract documents, all work is reviewed for completeness and acceptability. All items not acceptably completed are identified and added to the punchlist.

Any required documentation associated with the work that has not been received, reviewed, and approved as necessary, will be added to the punchlist.

The punchlist item will clearly identify the scope, location, and applicable contract documents.

The Originator for each punchlist item shall provide all required information on the Punchlist Item Identification Form. This information is provided to the Punchlist Coordinator.

The Punchlist Coordinator maintains a complete punchlist for each work package and distributes the punchlist to those responsible for the work.

As work is completed for the punchlist items, the Quality Control Manager shall be notified. Items are then verified by the Quality inspection staff. This verification is documented on the inspector's Daily Inspection Report or visually verified by Quality Control Manager. The Punchlist Coordinator updates the punchlist as punchlist items are verified as complete or if additional items are identified. A closed punchlist item shall not be re-opened. If necessary, a new punchlist item will be initiated.

4.4 Notification of substantial completion

After punchlist items have been completed, closed and final cleaning has been completed, a notice of substantial completion inspection will be transmitted to LAWA which will include a list of minor items from the punchlist that are still pending completion or could not be completed prior to notice of substantial completion.

4.6 Substantial Completion Inspection

After LAWA has received notice of substantial completion from design builder QC manager, LAWA will then create a punchlist that will be sent to Skanska. Once punchlist is received SFJV will immediately begin corrections. After items on LAWA punch list have been completed and verified by Quality Control, LAWA will be notified for verification of punch list items. Should additional re-inspection be required, LAWA will make one repeat inspection

which design builder shall reimburse LAWA. Once LAWA has verified all items are complete a certificate of substantial completion will be issued by LAWA.

4.7 Final Completion

After receipt of substantial completion certificate. Skanska will complete any minor items that remain, and the QC manager will notify LAWA for final inspection. This final inspection will include meter readings for utilities, all record documents in accordance with PR-24, final maintenance and operations manuals, photographs, property survey, warranties, maintenance agreements, certifications, releases from AHJ, As-builts drawings, BIM mode per PR-21, all submittals and miscellaneous equipment.

4.8 Final Acceptance

Once all items referenced above are complete SFJV will complete a verification of each item contained on LAWA's punch list, once LAWA has review and found all items satisfactory, LAWA will issue a letter of final acceptance. LAWA will file the notice of final completion and acceptance of public works project with the Country Recorder's Office.

5.0 PROJECT RECORDS

Completed punchlists and the quality reports verifying completion and closure of punchlist items will be part of the project's quality records and stored in Procore. After project completion they are processed in accordance with Document Control procedures.

DEFINITIONS

Accept-As-Is – A potential disposition proposed by a Contractor to address a nonconforming condition. This disposition suggests the contractor prefers to accept the nonconforming condition in its current state and seeks engineering and potentially client approval of this disposition. This disposition requires an engineering evaluation and response which is subject to quality check and review activities in accordance with this quality plan.

Accuracy Check – A check performed during the Discipline QC Check to verify that project deliverable inputs and outputs are correct, and that assumptions and conclusions are accurate.

Backchecker – An individual, typically the Originator of a project deliverable, who is responsible for reviewing comments made by a Checker and documenting agreement or disagreement with those comments. The Backchecker is also responsible for resolving any differences of opinion with the Checker.

BIM – Building Information Model is a 3D model that may or may not contain attributed information.

Bluebeam – A software application that facilitates the electronic execution of DQMP required quality checks/reviews while providing all reviewers simultaneous access to the CheckPrint with visibility to all comments. Bluebeam maintains an audit trail of check, backcheck, update, and verify activities.

Checker – A qualified individual with sufficient, relevant experience in the area of what is to be checked, and in some cases possessing specific subject matter expertise. The Checker shall be independent of the production of the deliverable being checked, but should have familiarity with the client, contractual requirements, and the approved design criteria.

CheckPrint – A hardcopy or electronic copy of a project deliverable that is submitted for the quality check and review process. This term may apply to plans, specifications, reports, studies, calculations, or other project deliverables. The CheckPrint is used to record Check, Backcheck, Update and Verify activities.

Client Deliverable Quality Matrix – A matrix developed during the project quality planning process used to identify the types of quality checks and reviews required for each client deliverable or submittal, inclusive of internal deliverables. This matrix forms the basis of the DQMP.

Conformance Check – A check performed during the Discipline QC Check to verify the deliverable meets the design criteria, applicable technical or building codes or other deliverable requirements. Conformance Checks are performed using the design criteria itself (when sufficiently detailed), a client provided design criteria report or checklist, or a discipline specific design criteria checklist developed by the Task Lead to ensure key discipline specific criteria and code requirements are fulfilled. This check also involves assurances of consistency between various deliverable formats, e.g. 2D plans, 3D models, calculations, specifications, reports, etc.

Constructability Review – A review of project deliverables performed by Contractor representatives to identify and address opportunities to improve the cost effectiveness of construction, the suitability of the design to traditional construction means and methods, and the clarity of the construction documents.

Construction Submittals - During construction the contractor transmits to HNTB Submittals typically consisting of shop drawings, material or product data, and samples for review by HNTB. The purpose of Submittals is to demonstrate the way by which the Client proposes to conform to the information given and the design concept expressed in the Contract. The designer reviews the Submittals for conformity to the requirements of the Contract Documents and to the intent of the design. Required Submittals are typically defined within the Specifications portion of the Contract Documents.

Corrective Action – An improvement action taken in response to a confirmed nonconformance, to address and prevent recurrence of the root cause of the nonconformance.

Deliverables - Deliverables consist of formal project deliverables provided to the client as documented within the project scope as well as internal deliverables captured during the work planning process. All such deliverables shall be captured within the Client Deliverable Quality Matrix and subject to quality checks and reviews.

Design Criteria – Design criteria consists of published design standards, technical or building codes, client provided special standards or specifications, client provided criteria/checklists, as well as HNTB developed discipline specific criteria checklists.

Design Quality Management Plan – The compiled set of documents, inclusive of this Quality Manual, Quality Procedures and Quality Forms that describe the commitments, procedures and resulting objective evidence necessary to manage the quality of project design deliverables consistent with contract requirements.

Design Services During Construction – Design services during construction are those services provided by the

design engineering team to support construction and consist in general of responses to Requests for Information (RFI), review of construction submittals, review of nonconformance disposition proposed by the contractor, and preparation of As-Built or Record Drawings in accordance with contractual requirements.

Design Services During Construction PM/Lead – The HNTB project team member responsible for project management during the construction phase of the project.

Discipline QC Check – The first in the sequence of quality checks and reviews performed on all project deliverables by an independent qualified checker, within the discipline, to check the conformance, accuracy, scope, and style of a project deliverable. The Discipline QC Check process involves Checking, Backchecking, Updating and Verifying.

Engineer of Record – The professional engineer responsible for signing, sealing and issuing project deliverables that were developed or prepared under their supervision.

Field Design Change - Design changes initiated by the Contractor to documents approved and Released for Construction (RFC) are typically completed under a Field Design Change (FDC). FDCs are subject to quality check or review activities.

Field Review – A review of the design conducted by the Task Lead or Designer in the field to confirm the adequacy of the design to the actual location.

Independent Design Check – An independent check performed on project deliverables, when required by the Client Deliverable Quality Matrix, to gain a higher level of confidence that inputs and outputs used in the design are correct, to verify general compliance with design criteria, and to conduct independent analysis of critical project elements. Independent Design Check is performed through the development of independent calculations, without reference to the original calculations.

Interdisciplinary Review – A review performed on project deliverables comprised of multiple disciplines to ensure consistency of the design between disciplines and segments; between design prepared by HNTB and its subconsultants; between design of the project and potential adjacent projects; between design of the project and the potential affected facilities owned by other stakeholders; and to prevent coordination errors in construction documents.

Nonconformance Reports (NCR) - A report issued typically during construction noting an observed nonconformance of the work constructed when compared with released plans and specifications.

Notice of Design Change (NDC) - Design changes initiated by the designer to documents approved and/or released for construction are typically completed under a Notice of Design Change (NDC). NDCs are subject to quality check or review activities.

Over the Shoulder Review – A review of project deliverables performed with the Contractor between formal submittals to confirm that the design, as it progresses, fulfills Contract Document requirements.

Preventive Action – An improvement action taken in response to a potential nonconformance, to address and prevent occurrence of the root cause of the potential nonconformance.

Quality Assurance (QA) – Those activities performed to assure that quality control activities were performed on project deliverables in accordance with the DQMP and to assure that those quality control activities were

effective to meet project requirements.

Quality Assurance (QA) Review – The final quality review completed on project deliverables.

This QA Review, performed by the Design Quality Assurance Manager, is performed to assure that all other required quality control activities, as determined by the DQMP and Client Deliverable Quality Matrix have been performed and that corresponding records are available.

Quality Audit – A systematic process by which an independent and qualified party performs an objective review of the project to confirm implementation of the DQMP, and to identify opportunities for improvement in processes and systems.

Quality Control (QC) – Those activities performed to check and review project deliverables to assess compliance with Contract Document requirements and to subsequently correct noncompliances.

Quality Management – Those activities performed to plan for, control, monitor and assure that project deliverables meet project requirements. The entirety of the processes described in the DQMP.

Quality Record – A record, potentially a completed form, CheckPrint, or other documented evidence (either in electronic or hardcopy format) to indicate execution of and compliance with the DQMP.

Record Drawing – An official record of the project at the time construction is completed based on the original construction documents revised to show all additions, deletions, or any other changes made during construction. Record Drawings are subject to quality check or review activities.

Repair – A potential disposition proposed by a Contractor to address a nonconforming condition. This disposition suggests the contractor prefers to repair the nonconforming condition such that form, fit or function are restored, but the repaired condition will not fully comply with plans or specifications, and seeks engineering and potentially client approval of this disposition. This disposition requires an engineering evaluation and response which is subject to quality check and review activities in accordance with this quality plan.

Replace – A potential disposition proposed by a Contractor to address a nonconforming condition. This disposition suggests the contractor prefers to fully replace the nonconforming and return full compliance with plans or specifications. Response to this disposition does not require any engineering evaluation and hence this response is not subject to quality check or review activities.

Requests for Information (RFI) – During construction RFIs are used to formally ask a question or request direction or clarification from the Engineer of Record. Responses to RFIs are subject to quality check or review activities.

Rework – A potential disposition proposed by a Contractor to address a nonconforming condition. This disposition suggests the contractor prefers to fully rework the nonconforming and restore full compliance with plans or specifications. Response to this disposition does not require any engineering evaluation and hence this response is not subject to quality check or review activities.

Scope Check – A check performed during the Discipline QC Check to ensure the design meets the required level of completeness and contractually required level of detail for the phase/milestone being submitted.

Senior Technical Review – A review performed on project deliverables, when required by the Client Deliverable

Quality Matrix, by subject matter experts in order to review high risk and complex project elements. These reviews are intended to ensure that the design fulfills the intended use and meets the basis of design and/or approved design criteria. These reviews are also used to ensure that the design has been developed in accordance with applicable standards of professional practice.

Style Check – A check performed during the Discipline QC Check to verify compliance with applicable CADD standards and style requirements.

Task Lead – A qualified individual responsible for the production and quality of project deliverables within a given discipline.

Updater – An individual who is responsible for making updates or corrections to project deliverables in accordance with the Backchecker's resolution of the Checker's comments.

Verifier – An individual, typically the Checker, who is responsible for verifying that Checker comments have been resolved as intended.

Visual Check – A visual check of the final project deliverable to confirm that it is complete, in the proper order, and printed/plotted or electronic appearance is in accordance with requirements.

1.0 PURPOSE

The purpose of the DQMP is to define the quality management processes, their inter-relationships, inclusive of risk mitigation strategies to be utilized by Skanska-Flatiron a Joint Venture to produce quality deliverables that meet the requirements of the Contract Documents; maintain consistent quality records, and establish the basis for continual improvement. This Quality Manual along with the Procedures and Forms in the Appendices comprise the DQMP.

2.0 SCOPE

The DQMP shall apply to the quality management of design deliverables provided by Skanska-Flatiron a Joint Venture on the Contract for the Los Angeles World Airports Airfield & Terminal Modernization Program Landside Improvements (LAWA-ATMP).

3.0 DOCUMENT CONTROL

The DQMP is developed and maintained by the Design Quality Assurance Manager (DQAM) and is reviewed and approved by the HNTB Design-Build Chief Engineer (DBCE), the HNTB Corporate Quality Officer (CQO), Skanska-Flatiron a Joint Venture and LAWA prior to release. Updates to the DQMP undergo the same level of review and approval and are described within the Revision History. Current versions of the DQMP are made available to project staff through publication on the HNTB ACC and the internal HNTB Project Sharepoint site: <https://projects.hntb.com/p4/71473/qdl/Forms/AllItems.aspx>.

Printed copies of these documents become uncontrolled. Users must go to the electronic repository to ensure they are accessing the current version.

4.0 QUALITY RECORD CONTROL

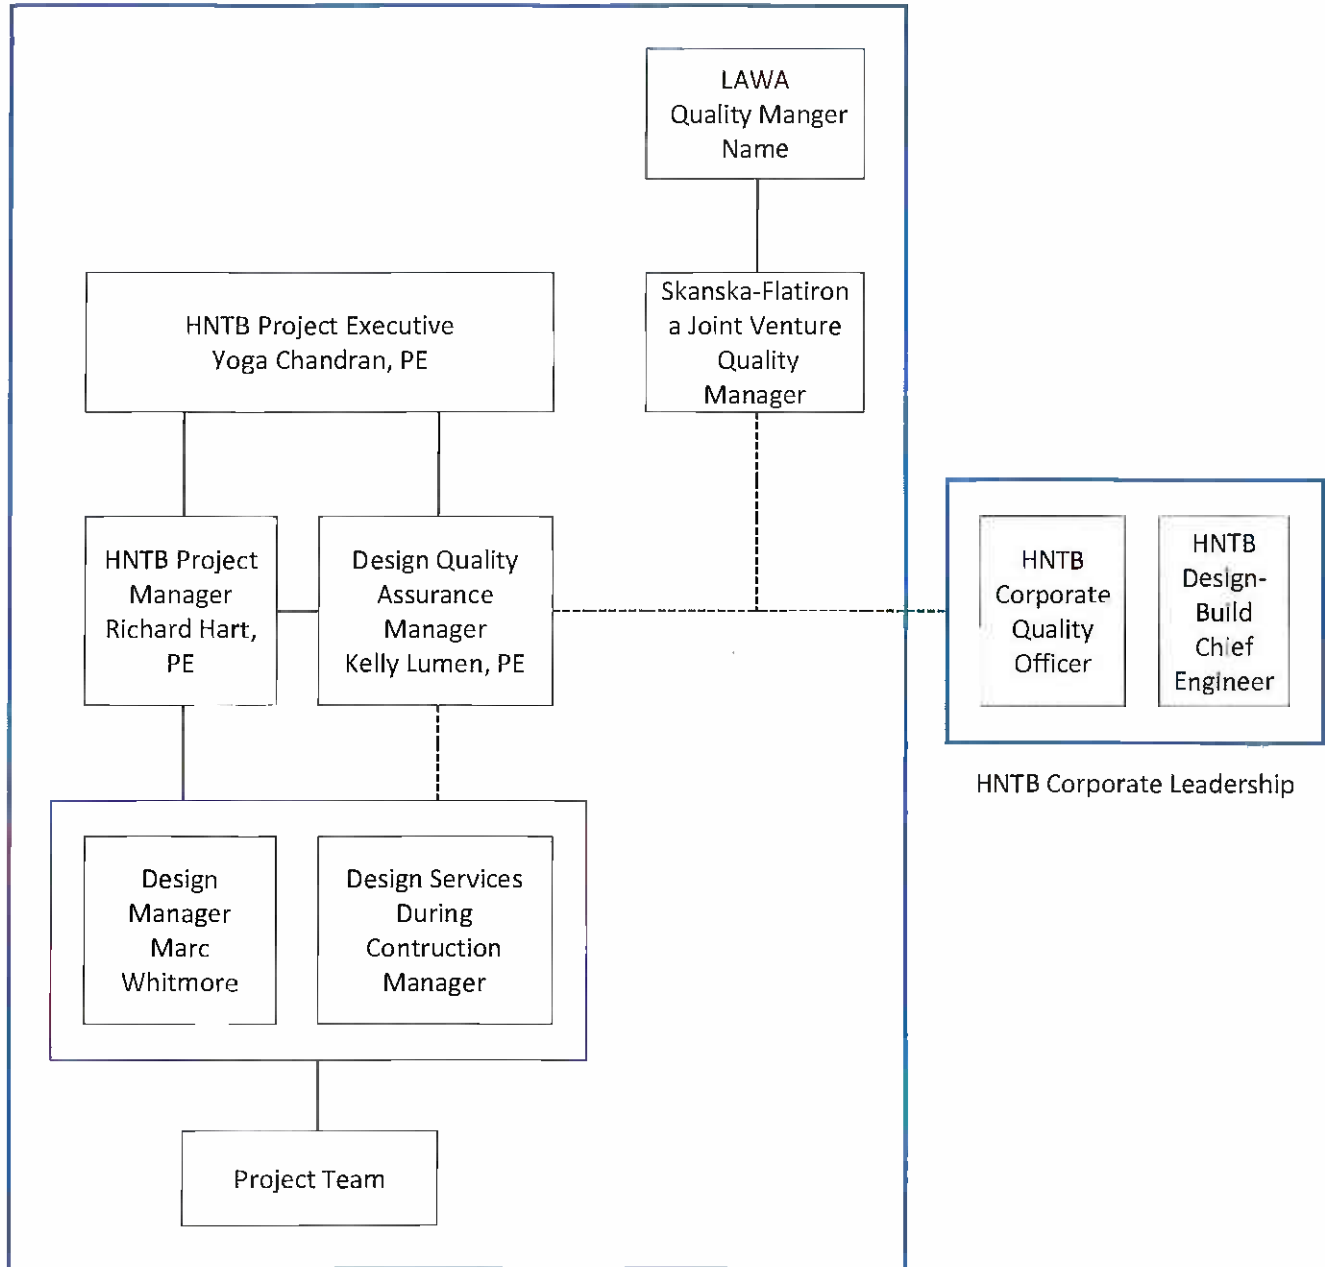

Design quality records that are generated through the execution of the DQMP shall be maintained in accordance with the Contract Documents and quality record repository requirements as documented within the DQMP. Project design quality records shall be identified and organized to facilitate easy retrieval. Procedure QP 03, Control of Project Quality Records describes this process in detail.

5.0 MANAGEMENT RESPONSIBILITY AND REVIEW

Project design leadership is decidedly client focused, and continually and strongly communicates the importance of anticipating, understanding, and meeting the needs of our clients and other stakeholders, including the assessment and mitigation of associated risks. Leadership is committed to fulfilling the quality expectations and requirements of our clients, and to continual improvement through the execution of this DQMP. To assure the independence of the design quality organization, the below organizational structure has been established.

DESIGN QUALITY ORGANIZATION

5.1 ROLES AND RESPONSIBILITIES

5.1.1 Corporate Quality Officer (CQO) – The CQO is responsible for:

- Providing quality management guidance to the PEX, when needed
- Approval of the DQMP
- Assisting the DQAM in resolving client comments to the DQMP, when needed
- Conducting quality audits, as necessary, to assure DQMP compliance
- Assisting DQAM and/or PEX in achieving effective DQMP compliance, when needed

- 5.1.2** Design-Build Chief Engineer (DBCE) – The DBCE is responsible for:
- Approval of the DQMP
 - Assisting DQAM and/or PEX in achieving effective DQMP compliance, when needed
- 5.1.3** HNTB Project Executive (PEX) – The PEX is responsible for:
- Assembling the HNTB resources needed to deliver the project
 - Providing proactive leadership to the HNTB Project Manager
 - Championing the implementation of the DQMP
 - Serving as the top-level HNTB resource to the DQAM to resolve quality issues
 - Participating in or monitoring Monthly Project Reviews to assess continuing adequacy and suitability of the DQMP
- 5.1.4** HNTB Project Manager (PM) – The PM is responsible for:
- Compliance of project deliverables with Contract Document requirements
 - Supporting the DQAM in the development of the DQMP
 - Overseeing the implementation of the DQMP and resolving related issues
 - Ensuring appropriate resources, schedule, and budget for DQMP activities are included in the Work Plan
 - Review and concurrence with the DQMP
 - Presenting the DQMP to the client, working with the DQAM to address client feedback, and obtaining client approval of the final DQMP
 - Participating in Monthly Project Reviews to assess continuing adequacy and suitability of the DQMP
- 5.1.5** Design Quality Assurance Manager (DQAM) – The DQAM is an key member member of the HNTB design leadership team, reporting to the HNTB PM, but also with independent reporting responsibility to the HNTB PEX. The DQAM is responsible for:
- Developing the DQMP that incorporates contractual requirements and those of the HNTB Quality Management System
 - In coordination with the HNTB PM, addressing client feedback, and achieving client approval of the DQMP
 - Submitting the DQMP to the DBCE and CQO for review and approval
 - Maintaining and updating the DQMP throughout the life cycle of the project and submitting for necessary approvals
 - Working with the DM and Task Leads to determine the need for discipline specific criteria checklists
 - Providing training to the project team on the DQMP
 - Reviewing subconsultant quality plans and auditing subconsultants for adherence to those plans
 - Performing quality assurance (QA) reviews on design deliverables to verify compliance with the DQMP
 - Overseeing the effective implementation of the DQMP, and communicating any issues or potential issues early to the HNTB DM, PM, PEX and when necessary to the DBCE and CQO.
 - Participating in Monthly Project Reviews to report on quality performance and effectiveness of the DQMP
- 5.1.6** Design Manager (DM) – The DM is responsible for:
- Participating in quality training, including training specific to the DQMP

- Overseeing the implementation of the DQMP and resolving related issues
- Working with the DQAM and Discipline Leads to assure contractual requirements and Owner expectations are understood
- Working with the DQAM and Task Leads to determine the need for discipline specific criteria checklists to support design and QC processes
- Participating in quality audits and responding to corresponding Corrective/Preventive Action requests to address audit findings

5.1.7 Design Services During Construction Project Manager (DSDC PM) – The DSDC PM is responsible for:

- Working with the DQAM to make appropriate updates to the DQMP as the project moves into construction
- Participating in quality training, including training specific to the DQMP
- Overseeing the implementation of the DQMP and resolving related issues
- Working with the DQAM and Task Leads to assure contractual requirements and Owner expectations are understood
- Participating in quality audits and responding to corresponding Corrective/Preventive Action requests to address audit findings

5.1.8 Project Team Members – The project team members are responsible for:

- Participating in quality training, including training specific to the DQMP
- Developing deliverables in accordance with Contract Document requirements
- Performing a self-check of all deliverables prior to submittal into quality processes
- Complying with the DQMP
- Design Discipline Leads are responsible for assuring effective completion of DQMP processes prior to QA Review and for communicating any challenges to the DQAM and DM
- Maintaining project quality records in accordance with QP 03, Control of Project Quality Records
- Participating in quality audits and responding to corresponding Corrective/Preventive Action requests to address audit findings

5.2 MANAGEMENT REVIEW

The effectiveness and adequacy of the DQMP to provide services and design deliverables meeting the requirements of the Contract Documents are reviewed during HNTB Monthly Project Reviews. DQMP components reviewed during Monthly Project Reviews include:

- Audit results
- Status of Corrective/Preventive Actions
- Completion of required quality checks/reviews
- Conformance of design deliverables to Contract Document requirements
- Client review comments
- Risks impacting successful implementation of the DQMP
- Improvements or changes to the DQMP
- Actions from previous Monthly Project Reviews

6.0 QUALITY PLANNING

Quality work is not accidental and cannot be achieved on a project without planning for it. Quality planning is achieved through the following activities/processes:

6.1 WORK PLAN/CLIENT DELIVERABLE QUALITY MATRIX

As client deliverables, according to milestones or phases, are identified through the work planning process, they shall be documented within Form QF 02, Client Deliverable Quality Matrix (CDQM). The DM, in concert with the DQAM and Task Leads, shall determine the quality checks and reviews necessary to assure quality for each deliverable, and shall document those required checks and reviews within the CDQM. The Discipline QC Check, Visual Check, and QA Review are mandatory for all deliverables, and Interdisciplinary Review is mandatory for all deliverables involving more than one discipline. Constructability Review is also a mandatory review, being performed by the Contractor. Other reviews such as Over the Shoulder Review, Senior Technical Review, and Independent Design Check shall be applied to deliverables as required by the client and/or based upon complexity and risk.

Once determined, the required quality checks and reviews shall be incorporated into the project work plan, including appropriate resources, budget, and schedule

The resulting CDQM shall be maintained by the DQAM and shall serve to communicate to the project team the quality check and review activities to be carried out on each deliverable prior to submittal to the client. This matrix shall also be used to communicate the "quality" schedule on the project. The matrix shall identify the start and end dates for all quality check and review activities in order to facilitate time for effective reviews and resolution of resulting comments prior to due dates to clients. This process is described within Procedure QP 01, Quality Planning.

6.2 DQMP TRAINING

As soon as possible after Notice to Proceed (NTP) and prior to the scheduled completion of any quality check or review activities, the DQAM shall provide training on the DQMP to design project team members, including Contractor and Owner staff when applicable.

The purpose of the training is to ensure all design project team members understand the DQMP and have detailed knowledge of the required quality checks and reviews to be completed on each deliverable prior to submittal to the client. The training shall cover the records, checklists or forms that are required to show evidence of completion of the required quality checks and reviews and shall inform team members where/how such records are to be stored.

In all cases, project team members need to receive DQMP training prior to conducting quality check or review activities. DQMP training shall be performed again as projects transition from Pre-Award, Post-Award, or into Construction Phase Services as project team members and deliverables change. Records of participation in DQMP training shall be maintained on Form QF 03, Attendance Roster. DQMP training shall be provided on a recurring basis to address new/changing project team members. Procedure QP 02, Project Quality Plan Training describes this process in detail.

7.0 QUALITY MANAGEMENT OF SUBCONSULTANTS

When it is necessary to utilize subconsultants for project delivery, either to augment HNTB capabilities or to fulfill client goals, HNTB selects subconsultants based upon:

- Understanding of project requirements
- Demonstrated professional and technical competence
- Previous successful quality delivery with HNTB and/or the particular client

- Capability/resource availability to fulfill the requirements within the project schedule
- Client preference or direction

The design subconsultants used on this project and their scope are:

PSOMAS – Survey

DYA – Geotechnical

IDC – Structures

MGE – Structures

MA Engineering - Civil/Utilities/Drainage

TAG - Civil/Utilities/Drainage

BA – Utilities

Lynn Capouya – Landscape

Paul Murdoch Architects – Architect/ Aesthetics

Selbert Perkins – Airport Signage

7.1 QUALITY PLANS

The quality of subconsultant work is of critical importance to project success and as such, HNTB exercises quality management of subconsultants through one of two methods. Based upon the scope of subconsultant deliverables, specialized expertise involved, and the integration of those deliverables with HNTB deliverables, the DM and DQAM shall determine whether the subconsultant will be requested to adopt this DQMP, or whether the subconsultant may follow a quality plan of their own, provided it is, at a minimum, as rigorous as this DQMP. Requirements for quality management are documented within respective Subconsultant Agreements.

7.1.1 When following this DQMP, subconsultants shall receive training to the DQMP as described in Section 6.2 and shall be expected to follow this DQMP for quality management of their deliverables, including the submittal of quality records required by this DQMP.

7.1.2 When the decision is made for the subconsultant to follow their own quality plan, the subconsultant shall submit that quality plan to the DQAM for review and approval. The subconsultant quality plan shall be appropriate to the scope of services provided by the subconsultant and describe how the subconsultant ensures conformance of their services and/or deliverables to requirements. The plan shall include a description of the quality control check and review procedures used and the resulting quality records. Form QF 16, Subconsultant Quality Plan Approval Form shall be utilized to facilitate and record review and approval.

In lieu of a documented quality plan, subconsultants may complete and submit Form QF 17, Subconsultant Quality Plan Coversheet to the DQAM for review and approval.

- 7.1.3** In either case, the DQAM shall perform audits of subconsultants to assess their compliance with their own quality plan, or this DQMP, these reviews should also include an assessment of technical conformance of subconsultant work products. The DQAM may be assisted by a Subject Matter Expert when necessary to make this assessment. Section 10.0, Quality Audit of this Manual describes this process.

7.2 VERIFICATION OF SUBCONSULTANT DELIVERABLES

Subconsultants are responsible for performing the necessary quality control checks and reviews to ensure their deliverables meet requirements in accordance with this DQMP, or their own quality plan.

In cases when subconsultants follow their own quality plan, they shall submit, at a minimum, a certificate of compliance certifying that deliverables have been checked and reviewed in accordance with their approved quality plan. Depending upon the criticality of subconsultant deliverables, the decision may be made by the DM and DQAM that the subconsultant shall submit actual quality records in lieu of a certificate of compliance.

In cases when subconsultants follow this DQMP, they shall submit actual quality records as required herein, including a certificate of compliance, QF 07A Subconsultant Certificate of Quality Plan Compliance, certifying that deliverables have been checked and reviewed in accordance with this DQMP.

- 7.2.1** The DQAM shall perform a quality assurance review, or QA Review of subconsultant deliverables. This QA Review shall consist of a review of the subconsultant provided certificates and actual quality records to confirm that these processes have been followed. Procedure QP 12, QA Review describes this process in detail.
- 7.2.2** Subconsultant deliverables may also be subject to Senior Technical Review or Independent Design Check based upon scope, risk or Contract Document requirements. In these cases, these necessary quality checks or reviews shall be determined during the Quality Planning process and documented within the CDQM in accordance with Procedure QP 01, Quality Planning.

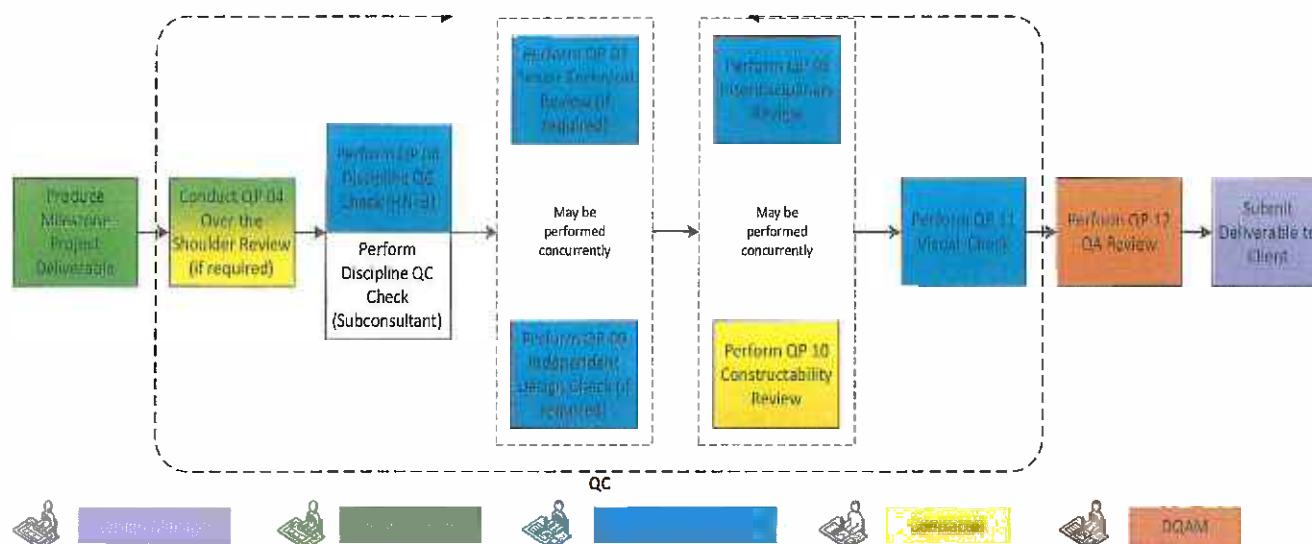

8.0 DESIGN AND DEVELOPMENT

The quality management of project deliverables is accomplished through a series of quality control checks and reviews, and a quality assurance review, specifically determined for each design deliverable through the quality planning process, in accordance with Procedure QP 01, Quality Planning, and documented within Form QF 02, CDQM. Sections below describe the various quality checks and reviews required. It should be noted that it is required that project design deliverables are in a completed state, and have undergone self-check (for that milestone or phase) when submitted for quality checks and reviews.

It is required that Discipline QC Check, Independent Design Check (when applicable), and Senior Technical Review (when applicable) be completed and those comments resolved and verified prior to beginning Interdisciplinary or Constructability Review. All required checks and reviews must be completed, and those comments resolved and verified prior to completing the QA Review. The primary purpose of QA Review is to ensure that **all** required checks and reviews have been completed and comments resolved and verified. The CDQM defines Start and End Dates for all quality checks and reviews in order to complete these activities prior to submittal of a deliverable to the client.

The diagram below depicts the expected sequence and inter-relationship of quality checks/reviews performed on project deliverables prior to submittal to the client. Exceptions to this sequence, meaning allowing additional concurrence of check and review activities may be approved by the PEX, DBCE and CQO when project requirements dictate. When this situation occurs, the DQAM shall define the process by which comments from concurrent checks and reviews will be resolved and potentially re-verified, including corresponding documented records to support QA Review.

All required checks and reviews shall be completed, and comments resolved and verified prior to the submittal of any deliverable to the client.

8.1 DESIGN INPUT

Inputs to the design process such as design criteria (inclusive of infrastructure mobility equity considerations) shall be documented in accordance with Contract Document requirements. The resulting design criteria shall be reviewed in accordance with the DQMP, and approved by the Contractor and/or Owner, prior to design development activities. Any conflicts in design criteria as a result of conflicting standards or requirements by multiple stakeholders shall be resolved with engagement or concurrence of the Contractor and/or Owner.

8.2 DESIGN OUTPUT

Design output shall be defined within approved design criteria, discipline specific checklists (including applicable infrastructure mobility equity requirements), or other design checking aids to facilitate conformance checking to assure that design deliverables meet Contract Document requirements. Conformance with design criteria is assessed within the Discipline QC Check in accordance with Procedure QP 06, Discipline QC Check.

8.3 VALIDATION OF SOFTWARE/APPLICATIONS

Validation of design and development software/applications used during design development is performed through an assessment of inputs and a review of outputs to confirm appropriate results.

This validation can be performed with independent hand calculations or by another suitable replication of the results. Changes in software versions and design criteria shall be considered for re-validation.

Formulas utilized in spreadsheets shall be validated with manual calculations the first time and spot checked thereafter. These validations are performed as part of the Accuracy Check required in Discipline QC Check in accordance with Procedure QP 06, Discipline QC Check.

8.4 SELECTION AND USE OF SOFTWARE/APPLICATIONS

The DM and Task Leads shall determine and select the most appropriate design and development software/application to meet project needs. These decisions are based upon project design and development needs, the need to coordinate with other disciplines, and the need to effectively communicate design development with the client.

8.5 OVER THE SHOULDER (OTS) REVIEWS

OTS Reviews shall be performed on project deliverables when required by the CDQM. OTS Reviews represent informal opportunities to check in with the Contractor, between formal deliverable submittals to confirm that the design, as it progresses, fulfills requirements and expectations relative to design criteria, project BIM requirements and other contractual requirements. Comments generated through OTS reviews shall be documented for communication back to the project team. Procedure QP 04, Over the Shoulder Reviews describes this process in detail.

8.6 DISCIPLINE QC CHECK

Discipline QC Check is required prior to submittal to the Client on all project design deliverables; and applies to the detailed checking of plans, calculations (including quantities and construction cost estimates), specifications, reports and studies. Discipline QC Check shall be performed by a qualified Checker with sufficient, relevant experience in the discipline of the deliverable being checked, and in some cases, may possess specific subject matter expertise. The Checker shall be independent of the Originator of the deliverable being checked, but should have familiarity with the client, contract requirements and the design criteria. The DM with input from the Task Leads shall identify independent and qualified Checkers within each design discipline and provide a list of those qualified Checkers to the DQAM for verification during QA Review.

During Discipline QC Check, the Checker shall perform:

- A Conformance check to verify the deliverable meets the design criteria, including any approved design changes, project BIM requirements, infrastructure mobility equity requirements, other contractual requirements and consistency between deliverable formats.

Note: Conformance Checks shall be performed using the design criteria itself (when sufficiently detailed), a client provided design criteria report or checklist, or a discipline specific design criteria checklist developed by the Task Lead to ensure key discipline specific criteria are met. These checklists are not intended to be duplicates of the design criteria, but are intended to capture, based on experience, those discipline specific critical items in danger of being missed and that are not adequately checked by other means. The conformance check should also include a check that Contractor and Owner comments from previous submittals have been resolved and verified as agreed upon, and that any deferred comments have been addressed.

- An **Accuracy** check to verify that design outputs are correct, that calculations and reports do not contain mathematical inconsistencies, and that information on drawings is consistent with the results of calculations and reports.
- A **Scope** check to ensure the deliverable meets the required level of completeness and/or level of detail for the phase/milestone being submitted
- A **Style** check to verify compliance with applicable CADD standards and style requirements.

Note: It is not intended that each of these checks be performed discretely, but rather the intent here is to describe the full scope of the Discipline QC Check activity.

Comments made by the Checker shall be documented, backchecked by the Originator, updated by an Updater, and verified by the Verifier. Records of Discipline QC Check shall be maintained. Procedures QP 06, Discipline QC Check and QP 05, Quality Check-Review Color Codes, and QP 20 Bluebeam QMS Review describe these processes in detail.

8.7 SENIOR TECHNICAL REVIEW

Senior Technical Reviews shall be performed on project design deliverables when required by the CDQM. It should be noted that Discipline QC Check shall be completed prior to engaging in Senior Technical Review. Senior Technical Reviews are performed by subject matter experts, independent of the design team, in order to review high risk and complex design elements. These reviews involve an independent review of project concepts and design methodology, and are intended to ensure that the design fulfills the intended use and that it meets the design criteria, project BIM requirements, or other contractual requirements. These reviews are also used to ensure that the design has been developed in accordance with applicable standards of professional practice.

All comments resulting from Senior Technical Review must be responded to, resolved, and verified. Records of Senior Technical Review shall be maintained. Procedure QP 07, Senior Technical Review and QP 20 Bluebeam QMS Review describe this process in detail.

8.8 INDEPENDENT DESIGN CHECK

Independent Design Check shall be performed on project design deliverables as required by the CDQM. It should be noted that Discipline QC Check shall be performed prior to engaging in Independent Design Check.

Independent Design Check shall be performed by a qualified individual independent of the production of the design, and may be conducted by another HNTB Office, an independent firm or a subconsultant as dictated by Contract Document requirements.

Independent Design Check is performed through the development of independent calculations, without reference to the original calculations. Calculations shall be based on the design drawings provided and shall not represent alternative design approaches or redesign. All comments resulting from Independent Design Check must be responded to, resolved, and verified. Records of Independent Design Check shall be maintained. Procedure QP 09, Independent Design Check describes this process in detail.

8.9 INTERDISCIPLINARY REVIEW

Interdisciplinary Review shall be performed on project design deliverables involving more than one discipline, and as defined in the CDQM. Interdisciplinary Reviews are performed by the Task Leads, or designees (including subconsultants, if applicable) to ensure consistency of the design between disciplines and segments; between design prepared by HNTB and its subconsultants; between design of the project and potential adjacent projects; between design of the project and the potential affected facilities owned by other stakeholders; and to prevent coordination errors in construction documents.

To ensure the effectiveness of Interdisciplinary Review, deliverable packages should not be submitted for Interdisciplinary Review until Discipline QC Check, Senior Technical Review (if applicable), and Independent Design Check (if applicable) have been completed and comments resolved and verified. All comments resulting from Interdisciplinary Review shall be responded to, resolved, and verified, and all impacted disciplines must participate in the review. Records of Interdisciplinary Review shall be maintained. Procedure QP 08, Interdisciplinary Review and QP 20 Bluebeam QMS Review describe this process in detail.

8.10 CONSTRUCTABILITY REVIEW

Constructability Review is performed by the Contractor in accordance with the CDQM. Constructability Review is performed to identify and address opportunities to improve the cost effectiveness of construction, the suitability of the design to construction means and methods, and the clarity of construction documents, while maintaining conformance with Contract Document requirements. All comments resulting from Constructability Review shall be responded to, resolved, and verified. Records of Constructability Review shall be maintained. Procedure QP 10, Constructability Review and QP 20 Bluebeam QMS Review describe this process in detail.

8.11 VISUAL CHECK

Visual Check is required on all deliverables. Visual Check is performed to ensure that the deliverables are complete, in order, and have been scanned, printed or converted as intended, and are representative of the electronic files that have been checked/reviewed, updated and verified in accordance with the DQMP. The DM shall notify the CADD Manager, BIM Manager, or designee, to scan, print/plot or convert the deliverable in accordance with Contract Document requirements. Visual Checkers shall check the scanned, printed/plotted or converted files to verify that the deliverable has been printed or converted as intended. Visual Checkers shall document the results of Visual Check and any noted issues shall be resolved by the CADD Manager, BIM Manager, or designee, and verified by the Visual Checkers. Records of Visual Check shall be maintained. Procedure QP 11, Visual Check describes this process in detail.

8.12 QA REVIEW

Quality Assurance Review or QA Review is required prior to submittal to the Client on all formal deliverables and shall be the last review completed in the series of quality checks and reviews as defined by the CDQM. It is important to note that QA Review activities may be started as soon as practical but cannot be considered complete until all other required checks and reviews have been completed, and resulting comments resolved and verified.

QA Review shall be performed by the DQAM. The DQAM shall review the CDQM to determine those quality control checks and reviews that were determined as required for the deliverable. Through examination of records of quality checks and reviews, the DQAM shall assess compliance with the DQMP and shall confirm the completion of required checks and reviews, including comment resolution and verification. The DQAM shall verify through the examination of subconsultant certifications (or subconsultant quality records, if necessary) that subconsultant deliverables have been checked/reviewed in accordance with the DQMP, or approved subconsultant quality plan. The DQAM shall verify that checks or reviews have been performed by independent and qualified Checkers as defined by the DM and Task Leads. The DQAM shall verify through the review of comment resolution documents that comments, on previous submittals, made by the Contractor and/or Owner have been resolved and verified as agreed upon, including verification that deferred comments from previous submittals have been addressed.

In addition to reviewing quality records, the DQAM shall perform spot check verification to confirm that verified changes have been incorporated in submittal documents.

The DQAM shall document the results of QA Review on Form QF 08, QA Review Record, and shall bring to the attention of the DM, PM, PEX, and the DBCE and CQO when necessary, any nonconformances with the DQMP or the CDQM, as well as any concerns over the implementation of the DQMP, unapproved additional concurrence of reviews, compressed review schedules, including excessive deferred comments or excessive Contractor and/or Owner comments, etc.

Dependent upon the nature of the nonconformance and the actions necessary to remedy, the DM and DQAM shall determine if any or all of the quality checks or reviews should be repeated prior to resubmission for QA Review. The DM, Task Lead, or designee, shall resolve any issues and provide the necessary evidence to the DQAM for verification. Upon successful completion of QA Review, when contractually required, the DQAM shall prepare a Certificate of DQMP Compliance (Form QF 07). Deliverables shall not be submitted to the client without successful completion of the QA Review. Records of QA Review shall be maintained. Procedure QP 12, QA Review describes this process in detail.

8.13 CLIENT/OWNER/THIRD PARTY REVIEW AND COMMENT

Upon submittal of project deliverables, the client/owner or third party (when involved) may make comments requiring response and resolution.

When Bluebeam is used to manage the client/owner/third party review process, the PM shall establish a Bluebeam Studio Session and invite client representatives to the session to review and comment on deliverables. Client comments shall be responded to by the PM, Designee or Task Leads within the Studio Session. When the PM, Designee, or Task Leads disagree with a client/owner/third party comment, the PM shall facilitate comment resolution. Task Leads shall make revisions to deliverables to address client comments and update within the Bluebeam Studio Session. Verification of incorporation of client comments shall be performed and documented within the Bluebeam Studio Session. Procedure QP 19, Bluebeam Client/Owner/Third Party Review describes this process in detail.

8.14 ISSUED FOR CONSTRUCTION

When comments have been received from client/owner/third party review process on the final design milestone submittal, designer reviews, responds and coordinates with client/owner/third party review to resolve all open comments (see QP19, Bluebeam Client-Owner-Third Party Review). All comments

must be resolved to satisfaction of the Design Quality Assurance Manager (DQAM); if any comments cannot be resolved, the issue is escalated to the PM for resolution with the Department.

After the comments from the final design milestone submittal have been addressed, the PM or designee reviews the package to confirm that design has been performed in accordance with Contract Requirements. The DQAM reviews the package to confirm the package has been reviewed in accordance with the DQMP and comments and questions have been resolved to the satisfaction of the Department. The DQAM then informs the PM that the package is ready for RFC.

8.15 QUALITY MANAGEMENT OF DESIGN CHANGES

Revisions or changes to design deliverables shall undergo the same quality check and review processes as defined within the DQMP, and the CDQM as the original deliverables. Consideration shall be given to the scope of the revision or change, however, and if such changes do not impact the design configuration, they may require only limited checking. The DM or Task Lead and DQAM shall agree upon limited checks or reviews when all the required checks and reviews for the deliverable, per the CDQM aren't warranted.

Records of Design Changes shall be maintained. Procedure QP 14, Control of Design Changes describes this process in detail.

9.0 DESIGN SERVICES DURING CONSTRUCTION (DSDC)

DSDC deliverables are defined below with their respective quality management requirements.

These deliverables shall be prepared in accordance with the respective HNTB Design-Build Guidelines:

[RFI Guidelines and Related Materials](#)

[Construction Submittal / Shop Drawing Guidelines and Related Materials](#)

[NDC Guidelines and Related Materials](#)

[FDC Guidelines and Related Materials](#)

[NCR Guidelines and Related Materials](#)

[As-Built Guidelines and Related Materials](#)

9.1 RESPONSES TO REQUESTS FOR INFORMATION (RFI)

All responses to RFIs require review by the DSDC Lead prior to transmittal.

9.1.1. Responses to Simple RFIs – Simple RFIs are those RFIs resulting in responses that provide minor clarification, with little or no calculations or engineering analysis required, driven by small changes with predictable changes in the outcome. Responses to Simple RFIs require:

- Discipline QC Check in accordance with QP06, with the Style Check portion of this check sufficing as the Visual Check for the response. For Simple RFIs, this may be performed by the DSDC Lead and must be documented with evidence of the name/date of the responder and the name/date of the reviewer to demonstrate independence. Evidence of completion of Discipline QC Check for the Simple RFI may be documented within an email with supplementary attachments where necessary. When email is utilized as the record of Discipline QC Check, the email evidence must be linked to the RFI response to support ready retrieval of the associated quality record. This is typically done using an RFI log.

- Periodic quality audit (suggest monthly), performed by the PQM to assure Discipline QC Check has been completed and documented. Results of quality audits must be documented.
- Upon review of the response by the DSDC Lead, a decision may be made to utilize the approach for a Complex RFI.

- 9.1.2. Responses to Complex RFIs** – Complex RFIs are those RFIs that result in changes to Contract Documents, requiring sketch, calculation or engineering analysis to address the request. Responses to Complex RFIs shall be listed on the Client Deliverable Quality Matrix and require:
- Discipline QC Check in accordance with QP06, and shall be performed by the appropriate Discipline Lead (preferably the Discipline Lead responsible for the original design). Records of Discipline QC Check shall be in accordance with permissible quality records per QP06, showing evidence of check, backcheck, update and verify steps.
 - Senior Technical Review in accordance with QP 07, and/or Interdisciplinary Review in accordance with QP 08, as determined by the DSDC Lead in concert with the PM, Discipline Lead, and with concurrence by the PQM. Records of Senior Technical Review and Interdisciplinary Review shall be in accordance with acceptable quality records per QP 07 and QP 08, showing evidence of check, backcheck, update and verify steps.
 - Visual Check in accordance with QP 11, may be performed by the DSDC Lead.
 - QA Review in accordance with QP 12, performed by the PQM and documented on QF 08, QA Review Record

All corresponding records of checks/reviews shall be maintained in accordance with QP 03, Control of Project Quality Records.

9.2 CONSTRUCTION SUBMITTAL/SHOP DRAWING REVIEWS

The purpose of the review of construction submittals or shop drawings is to determine general conformance with the design concept and contract documents, with responsibility for compliance remaining with the contractor. Construction submittals and shop drawings shall be reviewed by the Task Lead, the Design Manager, DSDC Lead, or other qualified individual designated by the Task Lead, or Design Manager, or DSDC Lead.

If such reviews are performed by designees without experience equivalent to the Task Lead, then either the Task Lead, or the Design Manager, or DSDC Lead shall review, and document, the designee reviewer's selected action code and review comments (if they exist). In all instances where comments provide design direction, review by the Design Manager or DSDC Lead is required. This review may be documented within an email with supplementary attachments where necessary. When email is utilized as the record of this review, email evidence must be linked to the submittal response to support ready retrieval of the associated quality record. This is typically done using a submittal log.

Construction submittal reviews shall be subject to periodic quality audit (suggest monthly), performed by the PQM to assure reviews have been performed by appropriately experienced personnel. Results of quality audits must be documented.

Records of these quality reviews of the action code and review comments shall be maintained in accordance with QP 03, Control of Project Quality Records.

9.3 NOTICES OF DESIGN CHANGES (NDC) AND FIELD DESIGN CHANGES (FDC)

All changes to design deliverables whether generated through a NDC or an FDC shall be documented on the Client Deliverable Quality Matrix and are subject to the same quality checks and reviews as the original design deliverable, inclusive of QA Review being performed by the PQM, as noted in the Client Deliverable Quality Matrix with corresponding records maintained in accordance with QP 03, Control of Project Quality Records.

9.4 RESPONSES TO NONCONFORMANCE REPORTS (NCR)

Responses to NCRs may involve deliverables such as review comments, calculations, engineering analysis, estimates, or recommendations. The quality checks and reviews performed on these deliverables is dependent upon the disposition proposed by the Contractor.

When the proposed disposition by the Contractor is to Accept-As-Is, or to Repair or Rework a quality review of the response is required. Quality review should be considered in instances when the disposition is to Replace in light of work that remains.

9.4.1. Responses to Simple NCRs - Simple NCRs are those NCRs resulting in responses that provide concurrence with proposed disposition with minor clarification, little or no calculations or engineering analysis required. Responses to Simple NCRs require:

- Discipline QC Check in accordance with QP06, with the Style Check portion of this check sufficing as the Visual Check for the response. For Simple NCRs, this may be performed by the DSDC Lead and must be documented with evidence of the name/date of the responder and the name/date of the reviewer to demonstrate independence. Evidence of completion of Discipline QC Check for the Simple NCR may be documented within an email with supplementary attachments where necessary. When email is utilized as the record of Discipline QC Check, the email evidence must be linked to the NCR response to support ready retrieval of the associated quality record. This is typically done using an NCR log.
- Periodic quality audit (suggest monthly), performed by the PQM to assure Discipline QC Check has been completed and documented. Results of quality audits must be documented.
- Upon review of the response by the DSDC Lead, a decision may be made to utilize the approach for a Complex NCR.

9.4.2. Responses to Complex NCRs – Complex NCRs are those NCRs requiring calculation or engineering analysis to address the request. Responses to Complex NCRs shall be listed on the Client Deliverable Quality Matrix and require:

- Discipline QC Check in accordance with QP06, and shall be performed by the appropriate Discipline Lead (preferably the Discipline Lead responsible for the original design). Records of Discipline QC Check shall be in accordance with permissible quality records per QP06, showing evidence of check, backcheck, update and verify steps.
- Senior Technical Review in accordance with QP 07, and/or Interdisciplinary Review in accordance with QP 08, as determined by the DSDC Lead in concert with the PM, Discipline Lead, and with concurrence by the PQM. Records of Senior Technical Review and Interdisciplinary Review shall be in accordance with acceptable quality records per QP 07 and QP 08, showing evidence of check, backcheck, update and verify steps.
- Visual Check in accordance with QP 11, may be performed by the DSDC Lead.
- QA Review in accordance with QP 12, performed by the PQM and documented on QF 08, QA Review Record.

All corresponding records of checks/reviews shall be maintained in accordance with QP 03, Control of Project Quality Records.

9.5 RECORD DRAWINGS/AS-BUILTS

The contractor shall provide marked up drawings (including incorporated changes), specifications or both (representing the Work as constructed) upon completion of construction on a particular design package or unit.

The party responsible for signing/sealing the documents, or designee, shall incorporate the noted revisions into the corresponding drawings and/or specifications.

Record Drawings shall be subject to:

- Discipline QC Check in accordance with QP06 to insure redlines have been incorporated properly, with the Style Check portion of this check sufficing as the Visual Check. For Record Drawings, this may be performed by the DSDC Lead. Records of Discipline QC Check shall be in accordance with acceptable quality records per QP 06, showing evidence of check, backcheck, update and verify steps.
- Periodic quality audit (suggest monthly), performed by the PQM to assure Discipline QC Check has been completed and documented. Results of quality audits must be documented.

All corresponding records of checks/reviews shall be maintained in accordance with QP 03, Control of Project Quality Records. Record Drawings shall be submitted to the contractor for review to verify that Record Drawings include all deviations in the constructed Work with respect to the latest design documents. Contractor comments shall be documented, resolved, and verified in accordance with Procedure QP 13, Client Review and Comment.

10.0 QUALITY AUDIT

When contractually required, when requested by project leadership, or at the direction of HNTB Corporate, Design-Build, Division, or Office, Quality Audits shall be conducted to verify implementation of the DQMP and may include quality audits of subconsultants. Auditors shall be independent of the activity being reviewed.

10.1 QUALITY AUDIT SCHEDULE

Quality Audit schedules shall be developed such that a variety of project elements can be audited over the duration of the project, may be based upon previous audit results, and may be adjusted to address critical issues.

10.2 QUALITY AUDIT PREPARATION

The quality auditor shall schedule a quality audit by working with the PM, DM or DSDC PM and DQAM, in advance of the audit, to determine an appropriate time to conduct the audit. The PM, DM or DSDC PM shall be notified of the scope of the audit, potential participants, and approximate duration of the quality audit. The Quality Auditor may prepare QF 18, Quality Audit Plan to advise the auditees of the scope and schedule of the audit.

The DQAM may also utilize the quality audit process to perform a deeper investigation into DQMP

implementation or quality performance of HNTB or subconsultant design teams.

Quality auditors shall review documentation to familiarize themselves with the specified requirements, such as contract documents relative to the scope of services, and the DQMP.

The quality auditor should also review the previous quality audit report (if one exists) to determine areas of follow-up, inclusive of resulting corrective or preventive improvement actions.

10.3 OPENING MEETING

Quality auditors shall conduct an opening meeting, inviting the PM, DM or DSDC PM, and DQAM, Task Leads and any other project team members that may be applicable to the scope of the quality audit. The purpose of the opening meeting is to go over the scope and duration of the audit, the identification of any other potential participants, the handling of observations, findings and improvement opportunities, timing for the closing meeting, and content and expected date of quality audit report. Participant attendance at the opening meeting shall be captured on Form QF 11, Quality Audit Roster.

10.4 CONDUCTING THE QUALITY AUDIT

Quality audits shall be conducted in a professional and courteous manner. As it is the objective of the quality audit program to identify improvement opportunities and proactively mitigate risk, the professional manner in which the review is conducted serves to communicate this intent and to facilitate an environment of continual improvement.

Quality auditors shall conduct the quality audit using Form QF 12, Quality Audit Checklist, but shall not be limited to those questions on the checklists. Quality audits shall include interviews as well as examination of objective evidence. Quality auditors shall be free to follow the audit trail to accurately and thoroughly assess intent and compliance to specified requirements. During the quality audit, the quality auditor shall alert the participants to any potential findings to allow the participant to present additional information and to ensure that potential findings are understood and reflect actual observed conditions.

It is important to note that findings may point to necessary improvements to the DQMP, or design quality management activities.

Quality auditors shall maintain their completed checklist, supporting documentation and comments made during the quality audit to support review conclusions.

10.5 CLOSING MEETING

Quality auditors shall conduct a closing meeting (this meeting may not be necessary if the audit results in no findings), inviting the PEX, PM, DM or DSDC PM, DBCE, CQO, DQAM, Task Leads and any other project team members that participated in the quality audit. The purpose of the closing meeting is to review findings, observations, and improvement opportunities, the handling of findings, and the content and expected date of quality audit report. Participant attendance at the closing meeting shall be captured on Form QF 11, Quality Audit Roster.

10.6 QUALITY AUDIT REPORT

The quality auditor shall prepare a quality audit report using Form QF 13, Quality Audit Report, and shall

submit the quality audit report to the PEX, PM, DM or DSDC PM, DBCE, DQAM, OL, OQM, DQM and the CQO. Findings shall be handled in accordance with Section 11.1 of this Manual, Corrective and Preventive Action.

The quality audit report and roster shall be maintained as quality records.

11.0 CONTINUAL IMPROVEMENT, CORRECTIVE AND PREVENTIVE ACTION

Continual improvement will be managed through the execution of a Corrective and Preventive Action System. Nonconformances and potential nonconformances may be realized through results of QA Review, quality audits, Contractor or Owner satisfaction, monthly project reviews, nonconformance trends, or improvement ideas.

11.1 CORRECTIVE AND PREVENTIVE ACTION

Corrective action shall be taken to identify the root cause of confirmed nonconformances and subsequent determination and implementation of an action plan sufficient to prevent recurrence of the nonconformance.

Preventive action shall be taken to identify the root cause of potential nonconformances and subsequent determination and implementation of an action plan sufficient to prevent occurrence of the potential nonconformance.

In both cases, verification activities shall occur to assure that approved action plans have been taken and proven effective to prevent recurrence or occurrence of the root cause prior to closure.

- 11.1.1** Upon notice of a potential corrective or preventive action opportunity, anyone on the project team may serve as an Originator and may submit a corrective/preventive action request (CAR/PAR).
- 11.1.2** The Originator shall submit a corrective/preventive action request by filling out Form QF 15, Corrective/Preventive Action Request describing the nonconformance or potential nonconformance in sufficient detail, and the name of the Responsible Manager with responsibility and authority to address the issue and submit to the DQAM.
- 11.1.3** The DQAM shall issue to the CAR/PAR to the Responsible Manager with a response due within 14 calendar days.
- 11.1.4** The Responsible Manager shall determine and enter into Form QF 15, Corrective/Preventive Action Request, the date of response, root cause of the nonconformance or potential nonconformance, an action plan sufficient to prevent recurrence or occurrence, and the date upon which the action plan will be implemented.
- 11.1.5** The DQAM shall review the root cause, action plan and implementation date to determine if indeed root cause has been determined, that the action plan appears sufficient to prevent recurrence or occurrence, and that the implementation date is reasonable in terms of program objectives, client or stakeholder requirements, and schedule, and approve the response.
- 11.1.6** Upon implementation, the DQAM shall take appropriate actions to verify that the action plan

was indeed implemented and that it was effective to resolve the nonconformance or potential nonconformance, and at that point shall close the CAR/PAR. The Responsible Manager may be required to submit data or other verification information to support this decision.

11.1.7 CAR-PAR records shall be maintained.

12.0 REVISION HISTORY

Revision No.:	Revised By:	Revision Date:	Description of Change
0	Kelly Lumen	12/28/2022	Original Release

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 01
Quality Planning	Revision Number: 0	Revision Date: 6/19/23	Page 1 of 5
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities and process by which client deliverables are identified and the applicable quality check and review activities associated with each deliverable are determined. This procedure also defines the roles, responsibilities, and process by which Design Quality Management Plans (DQMP) are created.

2.0 SCOPE

This procedure shall apply to design-build projects and covers defining the necessary quality check and review activities for all contractual deliverables to a client, at each phase of the project, and the development of a DQMP for each project.

3.0 REFERENCES

3.1 Procedure QP 02, Project Quality Plan Training

3.2 Procedure QP 03, Control of Project Quality Records

4.0 ROLES and RESPONSIBILITIES

4.1 Project Manager (PM) – The PM, or designee, shall be responsible for:

- 4.1.1 Reviewing the contract or work plan and identifying all contractual client deliverables.
- 4.1.2 Determining, in concert with the DQAM, the Task Leads, and as necessary, the Divisional/National Practice/Market Sector Lead, the required quality check and review activities that shall be carried out for each deliverable.
- 4.1.3 When required by contract, submitting the DQMP to the client for review and approval.
- 4.1.4 Supporting the DQAM in the development of the DQMP when necessary.

4.2 Design Quality Assurance Manager (DQAM) - The DQAM shall be responsible for:

- 4.2.1 Working with the PM and Task Leads and providing concurrence to the required quality check and review activities.
- 4.2.2 Documenting the deliverables and the required quality checks and reviews within Form QF 02, Client Deliverable Quality Matrix, and updating this matrix as project conditions dictate.
- 4.2.3 Ensuring that Task Leads have access to and are trained or made aware of the matrix and the required checks for each deliverable.
- 4.2.4 Developing the DQMP, with assistance by the PM when necessary.
- 4.2.5 Submitting the DQMP to the DBCE and CQO for review and approval.
- 4.2.6 Revising and resubmitting the DQMP if necessary, to address review comments.

4.3 Design-Build Chief Engineer (DBCE) – The DBCE shall be responsible for review and approval of the DQMP.

4.4 Corporate Quality Officer (CQO) – The CQO shall be responsible for review and approval of the DQMP.

4.5 Task Leads – The Task Leads shall be responsible for:

- 4.4.1 Working with the PM and DQAM to determine the required quality check and review activities for deliverables and consulting with Divisional/National Practice/Market Sector Leads when necessary.

4.6 Divisional/National Practice/Market Sector Leads – The Divisional/National Practice/Market Sector Leads, when requested, shall be responsible for:

- 4.5.1 Working with the PM to determine the required quality check and review activities for each deliverable, with specific attention to potential Senior Technical Review and Independent Design Check activities.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 01
Quality Planning	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 5
Project Name: ATMP Roadway Improvement Project		Project No.. 71473	

5.0 PROCEDURE

- 5.1 The PM in concert with the DQAM and Task Leads shall review the contract documents or work plan and shall identify each deliverable required to be submitted to the client. Deliverables shall be identified for each phase of the project and shall be inclusive of client deliverables prepared by HNTB as well as subconsultants. Consideration shall be given to interim deliverables for which quality reviews must occur to support formal deliverables. Deliverables shall also be broken down to a level to support all necessary reviews.
- 5.2 Once identified, the DQAM shall enter the deliverables into Form QF 02, Client Deliverable Quality Matrix.
- 5.3 The PM in concert with the DQAM, and Task Leads shall determine the required quality checks and reviews to be completed prior to submittal for each deliverable and shall document the required checks and reviews within the matrix. Required quality checks and reviews, along with qualified resources, shall also be determined during Contract Work Planning sessions.
 - 5.3.1 The Discipline QC Check, Visual Check, and QA Review are mandatory for all deliverables, and Interdisciplinary Review is mandatory for all deliverables involving more than one discipline. Other reviews such as Over the Shoulder Review, Senior Technical Review, Independent Design Check, and Constructability Review shall be applied to deliverables as required by the client and/or based upon complexity and risk.
 - 5.3.2 Dependent upon project scope, previous successful experience of the local office on similar projects, client sensitivity and project risk, the PM, DQAM, and Task Leads may consult National/Divisional Practice and Market Sector Leads in the determination of appropriate quality checks and reviews such as Senior Technical Review and Independent Design Check (including the identification of appropriately qualified resources to perform those reviews).
 - 5.3.3 The DQAM with input from the PM and Task Leads shall enter date upon which quality checks/reviews shall begin and end in order to fulfill the deliverable dates. An adequate time for quality checks/reviews shall be afforded dependent upon the volume and complexity of the deliverable being checked/reviewed. Time afforded for quality checks and reviews shall include time to perform the checking/review activity as well as time to resolve and verify comments. Dates should be backed out from the QA Review date such that ample time is provided for completion of the QA Review prior to submittal of the deliverable to the client.
 - 5.3.4 The Client Deliverable Quality Matrix shall be completed prior to Work Plan approval and shall be noted on and included with the Work Plan Approval Form.
- 5.4 The PM in concert with the DQAM, and CQO/DBCE when needed, shall determine any necessary customization to the DQMP based upon contractual requirements.
 - 5.4.1 The DQAM, with assistance by the PM and CQO/DBCE if necessary, shall develop the elements of the DQMP requiring customization using the custom DQMP templates as the basis for project specific tailoring. Tailoring may require reorganization, incorporation of project specific roles, more stringent client, or project requirements, or to accommodate client engagement, but in no case, shall tailoring result in a DQMP less stringent than the HNTB QMS.
 - 5.4.2 The DQAM shall complete Form QF 01, Project Quality Plan Approval Form and include the custom elements of the DQMP along with the completed Form QF 02, Client Deliverable Quality Matrix and submit it to the DBCE and CQO for review and approval.
 - If required by contract, the PM shall submit the DQMP to the client for review and approval.
 - The PM and DQAM shall work together to resolve client comments and resubmit if necessary, gaining assistance from the CQO/DBCE when needed.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 01
Quality Planning	Revision Number: 0	Revision Date: 6/19/23	Page 3 of 5
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- The Project Quality Plan Approval Form shall be completed and approved by the DBCE/CQO in accordance with the project deliverable schedule, or by the first monthly Project Review, and prior to the first occurrence of quality checks and reviews.

5.5 Based upon the scope of subconsultant deliverables, specialized expertise involved, and the integration of those deliverables with HNTB deliverables, the PM and DQAM shall determine whether subconsultants will be requested to adopt the HNTB DQMP or whether the subconsultant may follow a quality plan of their own.

5.5.1 If it is determined that subconsultants will be requested to adopt the HNTB DQMP, the DQAM shall provide a copy of the approved DQMP to the subconsultant in sufficient time to support subconsultant scope, schedule, and fee development, and shall include the subconsultant in DQMP training in accordance with Procedure QP 02, Project Quality Plan Training.

5.5.2 If it is determined the subconsultants will follow a quality plan of their own, the DQAM shall review and approve the subconsultant QP, using Form QF 16, Subconsultant Quality Plan Approval Form, or Form QF 17, Subconsultant Quality Plan Coversheet (in instances when the subconsultant does not have a documented quality plan of their own).

- Subconsultant quality plans must be reviewed and approved in advance of subconsultant agreement execution to assure required quality management activities have been incorporated and included within subconsultant work plans.
- Accepted subconsultant quality plans, and approval records shall be filed in accordance with Procedure QP 03, Control of Project Quality Records.

5.6 Upon approval of the DQMP, the DQAM shall file the DQMP in accordance with Procedure QP 03, Control of Project Quality Records

5.6.1 The following documents shall be filed and made available to project team members, including other supporting HNTB offices:

- PQP inclusive of Project Quality Manual, Project Quality Procedures, and Project Quality Forms.
- Form QF 01, Project Quality Plan Approval Form (showing evidence of approval).
- Form QF 02, Client Deliverable Quality Matrix.
- Evidence of client approval, if required.

5.7 Should project conditions dictate, the DQAM shall revise the DQMP and submit for review and approval in accordance with this procedure.

Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

8.0 REVISION HISTORY

Revision No.:	Revised By:	Revision Date:	Description of Change
0	Kelly Lumen		Original Release

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 02
Project Quality Plan Training	Revision Number: 0	Revision Date: 6/19/23	Page 1 of 2
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities, and process for conducting Design Quality Management Plan (DQMP) training. The purpose of design quality management plan training is ensure that all project team members (including other HNTB offices and subconsultants, if following the HNTB DQMP) have an understanding of the DQMP including a detailed knowledge of the required quality checks and reviews to be completed on each deliverable prior to submittal to the client. Quality plan training should also ensure that project team members know where and how project quality records are to be stored.

2.0 SCOPE

This procedure shall apply to all design-build projects. Training on the DQMP shall be provided as soon as possible after NTP, prior to applicable quality checks/reviews, and shall include those responsible for producing deliverables and performing quality checks and/or reviews, including those in other HNTB offices and subconsultants and client team members (if applicable). Records of DQMP training shall be maintained.

3.0 REFERENCES

3.1 Procedure QP 01, Quality Planning

3.2 Procedure QP 03, Control of Project Quality Records

4.0 ROLES and RESPONSIBILITIES

4.1 Project Manager (PM) -- The PM shall be responsible for:

- 4.1.1 Ensuring appropriate schedule and budget for DQMP training has been included in the Work Plan (including staff from other HNTB offices and subconsultants, if applicable).
- 4.1.2 Making the DQAM aware of the project team members and notifying the DQAM when new members join the project team.

4.2 Design Quality Assurance Manager (DQAM) – The DQAM shall be responsible for:

- 4.1.1 Developing training materials.
- 4.1.2 Inviting attendees to training sessions and making determination to hold local or remote sessions.
- 4.1.3 Providing training on the DQMP to project team members, including those in other HNTB offices and subconsultants and client team members (as applicable).
- 4.1.4 Maintaining records of DQMP training.
- 4.1.5 Monitoring compliance with the DQMP to identify any refresher training needs.

4.3 Task Leads - The Task Leads shall be responsible for:

- 4.2.1 Verifying that all team members within their discipline receive DQMP training as soon as possible upon assignment to the project.
- 4.2.2 Notifying the DQAM when new members join the project team.
- 4.2.3 Assisting the DQAM in monitoring compliance with the project quality plan to identify any refresher training needs.

4.4 Project Team Members – The project team members shall be responsible for:

- 4.3.1 Participating in DQMP training and signing attendance roster or other record of attendance.
- 4.3.2 Requesting refresher training, if needed.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 02
Project Quality Plan Training	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 2
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

5.0 PROCEDURE

- 5.1 As soon as possible upon NTP, and prior to any required quality checks or reviews, the DQAM shall schedule training on the project quality plan. DQMP Training must be provided on all new projects, task orders, work authorizations, etc. Attendees of the DQMP training shall include the project team members responsible for production and/or quality checks and reviews of deliverables, including project team members from other HNTB offices, and subconsultants or client team members if they are required to follow the HNTB DQMP.
- 5.2 The training may be performed in the venue or format suitable to the location of the project team members (e.g. classroom training, webinar, etc.), the level of detail to be provided, and shall cover the elements of the DQMP with specific attention to:
 - 5.2.1 Client specific requirements
 - 5.2.2 Client Deliverable Quality Matrix
 - 5.2.3 Procedures for required quality checks and reviews
 - Quality Checking Color Codes
 - Checklists to be used
 - 5.2.4 QA Reviews
 - 5.2.5 Quality Records showing evidence of required quality checks/reviews
 - 5.2.6 Project Quality Record repository
 - 5.2.7 Lessons learned from similar projects
- 5.3 Project team members shall sign Form QF 03, Attendance Roster, or other appropriate attendance record, to indicate completion of the training.
- 5.4 As new members join the project team, the PM or Task Leads shall notify the DQAM who shall schedule and conduct recurring PQP training. For recurring training, it is permissible to instruct team members to view a recorded training session, sign a training roster, and seek out the DQAM with any questions or needed clarification. When a recorded session is used, the DQAM shall follow up to assure requirements are understood.
- 5.5 DQMP training shall be repeated as projects transition between phases as team members and deliverables change.
- 5.6 The DQAM and Task Leads shall routinely monitor compliance with the DQMP to identify any refresher training needs.
- 5.7 The DQAM shall maintain records of DQMP training in accordance with Procedure QP 03, Control of Project Quality Records.

8.0 REVISION HISTORY

Revision No.:	Revised By:	Revision Date:	Description of Change
0	Kelly Lumen		Original Release

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 03
Control of Project Quality Records	Revision Number: 0	Revision Date: 6/19/23	Page 1 of 3
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities, and process for the filing of project quality records. Project quality records are those records that provide evidence of compliance with the Design Quality Management Plan (DQMP).

2.0 SCOPE

This procedure shall apply to project quality records generated through the execution of the DQMP on all design-build projects. Project quality records are determined through the scope of the DQMP, but include in general:

- DQMP
- Project Quality Plan Approval Form
- Subconsultant Quality Plans
- Subconsultant Quality Plan Approval Form
- DQMP Training Records
- Client Deliverable Quality Matrix
- Approved Design Criteria/Basis of Design
- Over the Shoulder Review Records
- Discipline QC Check Records
- Senior Technical Review Records
- Independent Design Check Records
- Interdisciplinary Review Records
- Constructability Review Records
- Visual Check Records
- QA Review Records
- Subconsultant Quality Records/Certificates of Compliance
- Client/Owner/Third Party Comment Resolution Records
- Quality Audit Reports
- Corrective and Preventive Action Reports

3.0 REFERENCES

- 3.1 Appendix A, Project Quality Record Filing Structure
- 3.2 Procedure QP 02, Project Quality Plan Training
- 3.3 Procedure QP 12, QA Review

4.0 ROLES and RESPONSIBILITIES

4.1 Project Manager (PM) – The PM, or designee, shall be responsible for:

- 4.1.1 Establishing a record repository for the filing of project quality records. Note: The repository for project quality records may be part of an overall record repository for the project.
- 4.1.2 Working with the DQAM to establish a file folder index or metadata, and naming convention (if required) for organization of project quality records
- 4.1.3 Establishing/communicating the record retention schedule in accordance with project, client, and/or state/federal requirements.
- 4.1.4 Working with the client to ensure requirements for transition of project quality records to the client at the completion of the project are known.

4.2 Design Quality Assurance Manager (DQAM) – The DQAM shall be responsible for:

- 4.2.1 Working with the PM to establish a file folder index or metadata, and naming convention

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 03
Control of Project Quality Records	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 3
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- (if required) for organization of project quality records
- 4.2.2 Including the filing index/folder structure, or metadata, and naming convention (if required) for project quality records within the DQMP and training project team members on same.
- 4.2.3 Performing assessments during QA Review to assure that project quality records are being filed, organized or named in accordance with requirements.
- 4.3 Project Team Members/Document Control Staff** - The Project Team Members and/or Document Control Staff shall be responsible for:
- 4.3.1 Filing project quality records in accordance with the established filing index/folder structure, or metadata, and using appropriate naming conventions (if required).

5.0 PROCEDURE

- 5.1 The PM, or designee, shall determine and establish an electronic repository for the filing of project quality records suitable to protect the integrity of the records. Examples of project quality record repositories are: SharePoint, ProjectWise, HNTB file servers, etc.
- 5.2 The PM and DQAM shall review the client requirements relative to project quality records and the Client Deliverable Quality Matrix to identify the filing index/folder structure or metadata that will be necessary to facilitate ready retrieval when necessary.
- 5.2.1 Folders or metadata for project quality records should be based on the deliverable and phase or milestone associated with the project, and the type of quality check/reviews required.
- 5.2.2 If the client/contract has not specified a filing index/folder structure, the suggested filing structure for project quality records can be found in Appendix A of this procedure.
- 5.3 The PM and DQAM shall also establish a naming convention for project quality records if required by contract, or deemed necessary to facilitate record retrieval.
- 5.4 Once established, the DQAM shall include the file index/folder structure or metadata requirements in the DQMP and shall train project team members on the same as part of DQMP training in accordance with Procedure QP 02, Project Quality Plan Training.
- 5.5 As the project is executed and quality activities are conducted in accordance with the PQP, Project Team Members and/or Document Control Staff shall name/file project quality records in accordance with the PQP file index.
- 5.6 The DQAM shall conduct periodic reviews to ensure project quality records are named and filed in accordance with the PQP, and shall also conduct these reviews as part of the QA Review in accordance with Procedure QP 12, QA Review.
- 5.7 Project quality records shall be maintained for the retention period required by HNTB, the contract, State or Federal requirements.

Maintained with Deliverables

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 04
Over the Shoulder Reviews	Revision Number: 0	Revision Date: 6/19/23	Page 1 of 3
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities and process for facilitating and responding to Over the Shoulder (OTS) Reviews of project deliverables. OTS Reviews provide an informal opportunity prior to formal submittals to review progress, to ensure client and/or potentially third-party requirements are being implemented as planned. OTS Reviews also serve to identify and potentially address issues relative to the cost-effectiveness of construction, and to verify the suitability of the design to intended means and methods.

2.0 SCOPE

This procedure shall apply to interim deliverables, when contractually required, and in other cases when deemed advantageous by the Project Manager and supported by the client/third party, such as in the case of multiple stakeholders, and/or a variety of preferences or alternatives are involved. When OTS Reviews are required, they shall be captured in the Client Deliverable Quality Matrix. OTS Review comments shall be documented and provided to the Task Leads to ensure they are addressed in the next submittal, but resolution and verification are not typically documented at this time. The verification of OTS Review comments occurs as part of the Discipline QC Check on the next milestone submittal.

3.0 REFERENCES

3.1 Procedure QP 03, Control of Project Quality Records

3.2 Procedure QP 06, Discipline QC Check

3.3 Procedure QP 12, QA Review

4.0 ROLES and RESPONSIBILITIES

4.1 Project Manager (PM) – The PM, or designee, shall be responsible for:

- 4.1.1 Determining the appropriate points in the development schedule for OTS Reviews and communicating those requirements to the Task Leads and the client and/or third party.
- 4.1.2 Working with the client and Task Lead to resolve any unresolved OTS Review comments.

4.2 Design Quality Assurance Manager (DQAM) – The DQAM shall be responsible for:

- 4.2.1 Documenting necessary OTS Reviews in the Client Deliverable Quality Matrix.
- 4.2.2 Verifying that OTS Review comments have been resolved and verified during QA Review

4.3 OTS Reviewers – OTS Reviewers shall be responsible for:

- 4.3.1 Documenting their review comments.

4.4 Task Lead – The Task Lead shall be responsible for:

- 4.4.1 Scheduling/facilitating the OTS Review.
- 4.4.2 Responding to and resolving OTS Review comments.
 - Working with the client and/or third party to understand OTS Review comments.
 - Elevating unresolved differences to the PM for resolution.
- 4.4.3 Incorporating agreed upon revisions in the next formal deliverable submittal.
- 4.4.4 Maintaining records of OTS Reviews.

5.0 PROCEDURE

5.1 In accordance with contract requirements or other advantageous situations, (such as when

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 04
Over the Shoulder Reviews	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 3

multiple stakeholders, and/or a variety of preferences/alternatives are involved) the PM shall determine the packages and appropriate points in the development schedule for OTS Reviews and communicate these requirements to the DQAM and Task Leads. The PM shall also ensure necessary OTS Reviews are reflected within the project schedule.

5.1.1 The DQAM shall document the necessary OTS Reviews in the Client Deliverable Quality Matrix.

5.2 The Task Lead, or designee, shall compile the interim deliverable package and shall submit it for OTS Review.

5.3 OTS Reviewers shall review the interim deliverable package to ensure client and/or potentially third party requirements are being implemented as planned. In the case of design-build projects, OTS Reviewers shall also review issues relative to the cost-effectiveness of construction, and verify the suitability of the design to intended means and methods.

5.4 OTS Reviewers, or the Task Lead/Designer, shall document the review comments. Comments shall be detailed enough to facilitate understanding by the Task Lead for resolution.

5.4.1 OTS Reviewers, or the Task Lead/Designer, shall document their review comments on Form QF 04, Comment Resolution Form, directly on hardcopy CheckPrints, or within Bluebeam.

5.5 The Task Lead shall review all the OTS Reviewers comments. If the Task Lead disagrees with the nature of the OTS Review comment, they shall discuss with the OTS Reviewer and come up with an agreed upon solution. If disputes continue, the issue shall be escalated to the PM for resolution.

5.6 The Task Lead, or designee, shall make the necessary revisions within the next formal deliverable submittal to address OTS review comments. Verification of OTS comments shall be performed as part of Discipline QC Check of the next formal deliverable submittal in accordance with QP 06, Discipline QC Check.

5.7 The DQAM shall verify that OTS comments have been resolved and verified as indicated in accordance with QP 12, QA Review.

5.8 The Task Lead shall maintain OTS review comments in accordance with Procedure QP 03, Control of Project Quality Records.

1.0 PURPOSE

The purpose of this procedure is to define the roles and colors to be utilized for electronic or hard copy quality check or review of project deliverables.

2.0 SCOPE

This procedure shall apply to all quality check or review activities performed on electronic or hardcopy CheckPrints of project deliverables, inclusive of plans, calculations, reports, specifications, etc. Note: When performing quality check/review via MS Products, there is no need to adhere to this color scheme, however, roles of parties must be identified.

3.0 REFERENCES

4.0 ROLES and RESPONSIBILITIES

- 4.1 Originator** – The Originator shall be responsible to prepare and submit the deliverable for checking.
- 4.2 Checker** - The Checker shall be responsible to check the deliverable and shall note correct items and items in error on the CheckPrint using the colors assigned below.
- 4.3 Backchecker** – The Backchecker (typically the Originator) shall be responsible to review the comments made the by Checker and document agreement or disagreement with Checker comments on the CheckPrint using the color assigned below.
- 4.4 Updater** – The Updater (may be the Originator) shall be responsible for making changes or corrections to the deliverable and for noting such corrections on the CheckPrint using the color assigned below.
- 4.5 Verifier** - The Verifier (must be the Checker or another qualified independent party, i.e. not Originator, Backchecker, or Updater, when the Checker is unavailable) shall verify that all agreed upon corrections have been made, and for noting such verification on the CheckPrint using the color assigned below.

5.0 PROCEDURE

- 5.1** When project deliverables are submitted for quality check or review and these reviews are performed utilizing an electronic or hardcopy CheckPrint, the colors and markings shown in the below table shall apply to each of the identified roles in the quality check or review process: In addition, when signing the hardcopy CheckPrint Stamp, each individual shall sign in the color assigned for their role. Note: When Check, Backcheck, Update and Verify are performed on a MS Word deliverable using Track Changes, adherence to this color scheme is not required as MS Word Track Changes assigns a distinct color to each editor.

Color	Instructions	Checker	Backchecker	Updater	Verifier
Yellow	Highlight items that are correct Note: It is not mandatory for the Checker to highlight all correct items in Yellow, especially in the case of electronic review. But in the case where a sheet would otherwise have no markings, a Yellow diagonal slash across the sheet or a notation of no	♦			♦

8.0 REVISION HISTORY

Revision No.:	Revised By:	Revision Date:	Description of Change
0	Kelly Lumen		Original Release

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 06
Discipline QC Check	Revision Number: 0	Revision Date: 6/19/23	Page 1 of 9
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities, and process for the detailed discipline specific QC check of project deliverables. Discipline QC check involves the performance of the following checks:

- **Conformance Check** to ensure project deliverables meet design criteria and/or other related technical requirements, and to ensure project elements are consistently developed between various deliverable formats.
- **Accuracy Check** to ensure that design outputs are correct, that calculations and reports do not contain mathematical inconsistencies, and that information on drawings is consistent with the results of calculations and reports.
- **Scope Check** to ensure the completeness of the deliverables, assuring all necessary components are included, and detail provided is consistent with client expectations for the phase.
- **Style Check** to ensure that project deliverables have been prepared in accordance with specified appearance requirements.

2.0 SCOPE

This procedure shall apply to the discipline QC check of all project deliverables prior to submission to a client. This procedure applies to the discipline QC check of drawings, building information models (BIM), specifications, calculations (including quantities and construction cost estimates), reports, and studies, etc. All deliverables, regardless of milestone or phase, shall undergo Discipline QC Check commensurate with the level of detail available for the milestone or phase of the deliverable being checked. While this procedure does not formally apply to interim or working drafts, it is important to note that interim day to day QC checking is essential throughout the design process to maintain project schedules and avoid rework.

3.0 REFERENCES

- 3.1 Procedure QP 03, Control of Project Quality Records
- 3.2 Procedure QP 05, Quality Check/Review Color Codes
- 3.3 Procedure QP 20, Bluebeam QMS Review

4.0 ROLES and RESPONSIBILITIES

- 4.1 **Project Manager/Design Manager or Task Lead** – The Project Manager, Design Manager, or Task Lead shall determine the need for an appropriately detailed discipline specific checklist inclusive of applicable design criteria, CADD standards, project BIM requirements and other relevant client requirements to facilitate deliverable development and quality review. The Project Manager, Design Manager or Task Lead shall also identify independent and qualified Checkers within each design discipline and provide a list of those qualified Checkers to the DQAM for verification during QA Review.
- 4.2 **Originator** - The Originator shall be a qualified individual with sufficient, relevant experience in the discipline of the deliverable being produced, applicable design criteria, project BIM requirements, other contractual requirements, and shall be responsible for:
 - 4.2.1 Production and submittal of the deliverable for Discipline QC Check in accordance with the established schedule in the Client Deliverable Quality Matrix.
 - 4.2.2 Performing a self-review, to include verification of any applicable Over the Shoulder (OTS) Review comments of interim deliverables, as well as verification of client/owner comments, and/or deferred comments from a previous submittal, prior to submittal for

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 06
Discipline QC Check	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 9
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- Discipline QC Check.
- 4.2.3 Reviewing the deliverable with the Checker to familiarize them with the design criteria, any design changes, CADD standards, project BIM requirements, and other client requirements.
- 4.2.4 Maintaining records of Discipline QC Check.
- 4.3 Checker** - The Checker shall be a qualified individual with sufficient, relevant experience in the discipline of the deliverable being checked, and in some cases, may possess specific subject matter expertise. The Checker shall be independent of the Originator of the deliverable being checked, but should have familiarity with the client, contractual requirements, approved design criteria, and project BIM requirements in the case where the deliverable is BIM. The Checker shall be responsible for:
- 4.3.1 Performing a **Conformance Check**.
- 4.3.2 Performing an **Accuracy Check**.
- 4.3.3 Performing a **Scope Check**.
- 4.3.4 Performing a **Style Check**.
- 4.3.5 Verifying that any applicable previous OTS Review comments from any interim deliverables have been addressed.
- 4.3.6 Verifying that any applicable client/owner review comments, and/or deferred comments from a previous submittal have been addressed.
- 4.3.7 Noting Discipline QC Check comments on the CheckPrint and providing the check comments to the Backchecker.
- 4.3.8 Participating in comment resolution with the Backchecker, if necessary.
- 4.4 Backchecker** – The Backchecker (may be the Originator) shall be a qualified individual with sufficient, relevant experience in the discipline of the deliverable being produced, applicable design criteria, project BIM requirements, other contractual requirements, and shall be responsible for:
- 4.4.1 Reviewing the comments made by the Checker to confirm the validity of such comments with respect to the project scope and requirements.
- 4.4.2 Noting agreement or disagreement with comments on the CheckPrint.
- 4.4.3 Working with the Checker to resolve comments with which they disagree.
- Any remaining disputes shall be escalated to the Task Lead or the Project Manager for resolution.
- 4.4.4 Providing Backcheck results to the Updater.
- 4.5 Updater** – The Updater (may be the Originator, Backchecker, or a qualified designee) shall be responsible for:
- 4.5.1 Making changes or updates to the deliverable based upon the Backchecker's disposition.
- 4.5.2 Noting the completion of those changes or updates on the CheckPrint.
- 4.5.3 Providing a revised copy of the deliverable to the Verifier.
- 4.6 Verifier** - The Verifier (must be the Checker or a similarly qualified, independent designee, i.e. not the Originator, Backchecker or Updater, when the Checker is unavailable) shall be responsible for:
- 4.6.1 Verifying that all agreed upon changes or updates have been made to the deliverable.
- 4.6.2 Noting verification those changes or updates on the CheckPrint.
- 4.6.3 Documenting concurrence when the Backcheck status is Disagree or Defer Comment.

5.0 PROCEDURE

- 5.1** The Project Manager, Design Manager or Task Lead shall make the determination and develop, if warranted, a sufficiently detailed discipline specific design criteria checklist to support deliverable development and subsequent quality review inclusive of relevant design criteria, CADD standards, project BIM requirements, and other contractual requirements. Note, the checklist

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 06
Discipline QC Check	Revision Number: 0	Revision Date: 6/19/23	Page 3 of 9
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

may require elements to assure consistency between varying deliverable data formats, such as 2D plans, 3D models, calculations, specifications, reports, etc.

- 5.2 The Project Manager, Design Manager or Task Lead shall also identify independent and qualified Checkers within each design discipline and provide a list of those qualified Checkers to the DQAM for verification during QA Review.
- 5.3 The Originator shall prepare the deliverable in accordance with the contract requirements, the approved design criteria, the level of completeness required, project BIM requirements, and in accordance with the schedule in the Client Deliverable Quality Matrix.
- 5.4 The Originator shall perform a self-review of the deliverable to ensure compliance with requirements including approved design criteria, any design changes, CADD standards, mathematical accuracy, level of completeness and project BIM requirements, and consistency between deliverable data formats . The Originator shall also verify that deferred comments, and/or comments from the client from a previous milestone or phase to be addressed within this milestone or phase, and any applicable OTS Review comments from previous interim deliverables have been incorporated as indicated. If a discipline specific design criteria checklist has been developed, the Originator shall document completion of the self-review upon that checklist.
- 5.5 The Originator shall prepare a CheckPrint of the deliverable and submit the deliverable to the Checker on or before the Start Date documented in the Client Deliverable Quality Matrix, along with the discipline specific checklist, if one has been developed. Once the deliverable has been submitted for review, it must be in a completed state relative to that milestone or phase so that the check performed represents the deliverable as it will be submitted to the client and to prevent additional design work from not being checked.
 - 5.5.1 If using hardcopy, the Originator shall apply a CheckPrint stamp (may be applied through CADD graphic) such as shown below to the CheckPrint and shall initial and date the Originator line, in BLACK ink. It may not be necessary to apply a CheckPrint stamp to every sheet, however, a new CheckPrint stamp must be applied when the specific individuals involved in the checking process change. When using a single CheckPrint stamp to cover a number of sheets, the range of sheets for which the CheckPrint stamp applies shall be noted.

DOCUMENT CHECK			
TYPE OF REVIEW: _____			
	PRINT NAME	INITIAL	DATE
ORIGINATOR	_____	_____	_____
CHECKER	_____	_____	_____

UPDATER	_____	_____	_____
VERIFIER	_____	_____	_____
HNTB	APPLIES TO _____ THROUGH _____		

- 5.5.2 If using Bluebeam for the Discipline QC Check, the Originator shall publish a .pdf CheckPrint and the check shall be performed in accordance with Procedure QP 20,

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 06
Discipline QC Check	Revision Number: 0	Revision Date: 6/19/23	Page 4 of 9
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

Bluebeam QMS Review. Note: If using Bluebeam for Discipline QC Check, the CheckPrint Stamp may be electronically incorporated to provide visible tracking of the QC process at the discretion of the PM, DQAM, or Task Lead.

- 5.5.3 Calculations shall be prepared in a neat and legible fashion on standard HNTB calculation sheets (hardcopy or Excel spreadsheet format). Form QF 06, Calculation Cover Sheet shall be attached to copies of calculations (for each revision) wherein the Originator shall:
- Fill out the header completely, including defining the design criteria document applicable to the calculation being checked.
 - Number the pages and indicate the total number of pages (in the top right corner of the Cover Sheet), including attachments.
 - Indicate the Revision number of the calculation being submitted for check. Indicate the Reason for Change (should be Original Issue for Rev 0, for future Revisions, describe what has changed). Note: For revisions in which only limited items have changed, the check may be limited to calculations impacted by the changes.
 - The Originator shall also note whether confirmation of calculations with other submittal components is required, and if so, which deliverables are impacted. Note: All required confirmations shall be accomplished by the Originator of the calculation prior to final submittal of calculations to the client.
 - Document the calculation objective, the methodology and list of assumptions, references and inputs, the attachments supporting the calculation and the conclusions drawn.
 - The Originator shall sign and date the Originator Line and provide the calculation, including cover sheet and attachments, to the Checker.
- 5.5.4 If using QF 04, Comment Resolution Form, the Originator shall complete the header information on the QF 04 Form in accordance with the Instructions Tab and submit the deliverable along with QF 04 to the Checker.
- 5.5.5 Specifications, Special Provisions, Reports and Studies prepared using MS Word format shall be submitted for Discipline QC Check utilizing Track Changes. The Originator shall generate Form QF 05, Discipline QC Check Record, initial and date on the Originator line and submit the electronic CheckPrint along with the form to the Checker. This form serves the purpose of the CheckPrint Stamp in the case of these electronic deliverables.
- 5.6** The Checker shall perform the following checks as part of Discipline QC Check:
- 5.6.1 Conformance Check
- Using the design criteria itself (including any design changes), a client provided criteria checklist (if applicable), or discipline specific criteria checklists developed for the project, the Checker shall verify that the project deliverable meets the requirements of the design criteria, project BIM requirements, and any other contractual requirements. The conformance check shall also assure consistency between various deliverable data formats such as 2D plans, 3D models, calculations, specifications, reports, etc. The conformance check should also include a check that environmental commitments and other commitments made during the planning phase have been incorporated. Methods used to perform this verification may include:
 - Direct observation, i.e., deliverable or software contains, references, or otherwise indicates the inputs used
 - Comparison with a similar design
 - Verification of consistency between deliverable data formats
 - Performing alternative calculations
 - Independent measurement, test or calculation
- 5.6.2 Accuracy Check

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 06
Discipline QC Check	Revision Number: 0	Revision Date: 6/19/23	Page 5 of 9
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- The Checker shall verify that design deliverable outputs are correct, that calculation inputs and outputs are correct and do not contain mathematical inconsistencies, that methodologies and assumptions and conclusions are accurate, that reports, and studies are accurate, that conclusions are supported by calculations and data, and that information shown on drawings or within models is consistent with the results of calculations and study reports. This verification may be done by direct observation or independent measurement/calculation.
 - Formulas utilized in calculations performed by spreadsheets shall be validated using manual calculations upon the first use and spot checked thereafter.
 - Hand calculations shall be validated.
- 5.6.3 Scope Check
 - The Checker shall verify that the deliverable is complete, meaning that all required components are present, such as 2D plans, 3D models, calculations, specifications, reports, etc.
 - The Checker shall also verify that the deliverable represents the level of completeness required in accordance with the phase or milestone associated with the deliverable (e.g. 60%).
- 5.6.4 Style Check
 - The Checker shall verify that the deliverable is compliant with associated CADD Manual or CADD requirements, project BIM requirements, Style Guide or other requirements relative to the appearance of the deliverable.
 - For pdf CheckPrints this verification may be done by reviewing the fonts, levels, line weights, use of language, annotation, grammar, spelling and overall white space management.
 - For 3D model CheckPrints, this verification may be done by verifying that modeled elements are assigned the correct feature definitions, levels/layers, line styles, weights, materials, attributed data, saved views, and coordinate systems, etc.
 - Note: The Style Check may be more effectively performed by a CADD Manager, BIM Manager, or individual with similar responsibility on the project.
- 5.6.5 The Checker shall verify that revisions resulting from comments from a previous milestone or phase, intended to be resolved within this milestone or phase (including deferred comments and/or comments from client/owner review), and any revisions made as a result of previous OTS Review comments have been incorporated.
- 5.6.6 The Checker shall record results of Discipline QC Check, noting errors and comments on the CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes.
 - If using hardcopy, the Checker shall initial and date the CheckPrint stamp on the Checker line, in RED ink.
 - If using QF 04, the Checker shall enter comments on the Comment Resolution Form in accordance with the Instructions Tab.
 - If using Bluebeam, the Checker shall document comments in accordance with Procedure QP 20, Bluebeam QMS Review.
 - If the Checker has no comments on a sheet, the Checker shall indicate "No Comments" on the CheckPrint sheet(s) to provide evidence of check or, in the case of hardcopy, may highlight all items verified as correct with Yellow highlight or make a single diagonal Yellow slash across sheet to indicate contents of sheet have been checked and are correct.
 - In the case of MS Word deliverables such as specifications, special provisions, reports or studies, the Checker shall utilize MS Word Track Changes to note Discipline QC Check comments, making changes or additions to the text or making

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 06
Discipline QC Check	Revision Number: 0	Revision Date: 6/19/23	Page 6 of 9
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

comments in the margin. Note, As the MS Word Track Changes feature assigns different colors to each editor; there is no need to attempt to comply with the colors in accordance with QP 05, Quality Check/Review Color Codes. The Checker shall initial and date Form QF 05 QC Check/Review Record on the Checker line.

- 5.7 The Backchecker shall review all the Checker's comments and shall note agreement or disagreement with the comments on the CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes. Rationale for disagreement must be documented. Should the Backchecker choose to defer a comment to a subsequent submittal, the rationale for deferment as well as the milestone to which the comment will be deferred must be documented.
 - 5.7.1 If using hardcopy, the Backchecker shall initial and date the CheckPrint stamp on the Backchecker line, in GREEN ink.
 - 5.7.2 If using QF 04, the Backchecker shall document agreement, disagreement, or deferral on the on the Comment Resolution Form in accordance with the Instructions Tab.
 - 5.7.3 If using Bluebeam, the Backchecker shall document agreement, disagreement or deferral in accordance with Procedure QP 20, Bluebeam QMS Review.
 - 5.7.4 In the case of MS Word deliverables such as specifications, special provisions, reports or studies, the Backchecker shall utilize MS Word Track Changes to note agreement, disagreement or deferral with Discipline QC Check comments, making changes or additions to the text or making comments in the margin. Note, As the MS Word Track Changes feature assigns different colors to each editor; there is no need to attempt to comply with the colors in accordance with QP 05, Quality Check/Review Color Codes. The Backchecker shall also initial and date Form QF 05 QC Check/Review Record on the Backchecker line.
 - 5.7.5 In cases where the Backchecker disagrees with the Checkers comment or prefers to defer resolution of the comment to a subsequent submittal, the Backchecker shall obtain documented concurrence from the Checker. If disputes remain, the issue shall be escalated to the Task Lead or Project Manager for resolution.
- 5.8 The Updater shall make the necessary updates to the native format of the deliverable and shall note completion of updates on the CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes.
 - 5.8.1 If using hardcopy, the Updater shall initial and date the CheckPrint stamp on the Updater line, in BLUE ink.
 - 5.8.2 If using QF 04, the Updater shall initial the Fixed column on the Comment Resolution Form in accordance with the Instructions Tab.
 - 5.8.3 If using Bluebeam, the Updater shall document completion of the update in accordance with Procedure QP 20, Bluebeam QMS Review.
 - 5.8.4 In the case of MS Word deliverables such as specifications, special provisions, reports or studies, the Updater shall utilize MS Word Track Changes and comment bubbles to accept or reject changes and incorporating comments as indicated by the Backchecker. The Updater shall also initial and date Form QF 05 QC Check/Review Record on the Updater line.
 - 5.8.5 Once all agreed upon updates have been made, the Updater shall prepare a revised version of the deliverable and shall provide it to the Verifier with original markups.
- 5.9 The Verifier shall verify that all agreed upon updates for comments they are assigned responsibility have been made to the deliverable and shall document verification on the CheckPrint, including concurrence with Backcheck status of Disagree and Defer Comment, in accordance with Procedure QP 05, Quality Check/Review Color Codes.
 - 5.9.1 If using hardcopy, the Verifier shall initial and date the CheckPrint stamp on the Verifier line, in BLACK ink.
 - 5.9.2 If using QF 04, the Verifier shall initial the Verified column on the Comment Resolution Form in accordance with the Instructions Tab.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 06
Discipline QC Check	Revision Number: 0	Revision Date: 6/19/23	Page 7 of 9
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

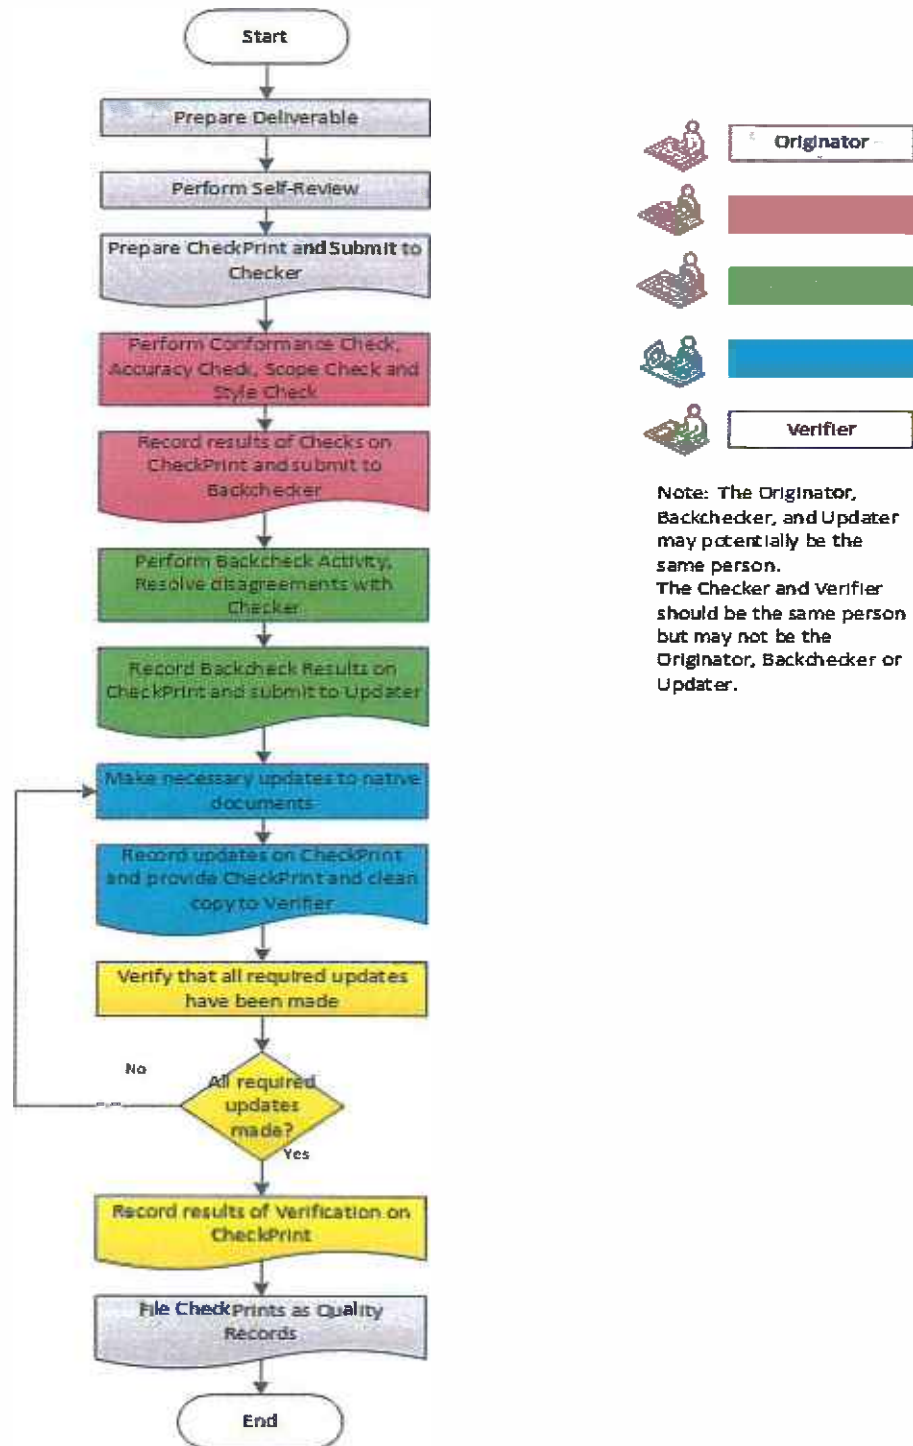

- 5.9.3 If using Bluebeam, the Verifier shall document verification in accordance with Procedure QP 20, Bluebeam QMS Review.
- 5.9.4 In the case of MS Word deliverables such as specifications, special provisions, reports or studies, the Verifier shall initial and date Form QF 05 QC Check/Review Record on the Verifier line.
- 5.9.5 Discipline QC Check should be complete by the End Date documented in the Client Deliverable Quality Matrix, including the verification of all updates.
- 5.10 The Originator shall maintain quality records in accordance with QP 03, Control of Quality Records:**
 - 5.10.1 If the check was completed using hardcopy, the Originator shall maintain copies of all CheckPrints with completed CheckPrint stamps, including Form QF 06, Calculation Cover Sheet.
 - 5.10.2 If the check was completed using the QF 04 Comment Resolution Form, the Originator shall maintain the completed QF 04.
 - 5.10.3 If the check was completed using Bluebeam the Originator shall generate a Discipline QC Check Summary Log, showing all the comments, evidence of Backcheck, Update and Verification and shall maintain a copy of this summary report along with copies of all electronic CheckPrints .
 - 5.10.4 If the check was completed using MS Word Track Changes, the Originator shall maintain a MS Track Changes version record demonstrating all four steps in the process (i.e. Check, Backcheck, Update and Verify steps) in accordance with Procedure QP 03, Control of Project Quality Records. When MS Track Changes application clearly demonstrates the individuals by name and role in the quality process, there is no need for the additional QF 05 Form.
 - 5.10.5 At the conclusion of the Discipline QC Check, all deferred comments shall be captured on QF 04, Comment Resolution Form and maintained for resolution and verification during the subsequent milestone review.

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities and process for conducting Senior Technical Review of project deliverables. The purpose of Senior Technical Review is to ensure that the design fulfills the intended use, meets the basis of design and/or approved design criteria, and that the design has been developed in accordance with applicable standards of professional practice. Senior Technical Reviews are conducted by subject matter experts in order to review high risk and complex project elements.

2.0 SCOPE

This procedure shall apply to the Senior Technical Review of project deliverables when required via the Client Deliverable Quality Matrix in accordance with QP 01, Quality Planning. In general, Senior Technical Review shall apply to specific deliverables or projects judged to be complex or critical. Senior Technical Reviews typically involve an independent review of project concepts, basis of design/design criteria and design methodology. Senior Technical Reviews may also be applied to subconsultant deliverables when determined through the Quality Planning process and documented in the Client Deliverable Quality Matrix. Discipline QC Check shall be completed prior to engaging in Senior Technical Review.

3.0 REFERENCES

- 3.1 QP 01, Quality Planning
- 3.2 QP 03, Control of Project Quality Records
- 3.3 QP 05, Quality Check/Review Color Codes
- 3.4 QP 20, Bluebeam QMS Review

4.0 ROLES and RESPONSIBILITIES

4.1 Project Manager (PM) – The PM shall be responsible for:

- 4.1.1 Identifying, in concert with the DQAM and Task Leads, and potentially Divisional/National Practice/Market Sector Leads (PSL/MSL), those project elements that shall receive a Senior Technical Review and documenting those required reviews within the Client Deliverable Quality Matrix in accordance with Procedure QP 01, Quality Planning.
- 4.1.2 Determining, in concert with the DQAM, the format for performing Senior Technical Reviews, i.e., using Bluebeam, hardcopy CheckPrints, or comment resolution form.

4.2 Task Lead - The Task Lead shall be responsible for:

- 4.2.1 Assisting the PM in making the determination as to the need for Senior Technical Review and in identifying qualified resources, consulting Divisional/National PSL/MSL when necessary.
- 4.2.2 Verifying that Discipline QC Check has been completed prior to engaging in Senior Technical Review.
- 4.2.3 Providing the design criteria and any approved design changes to the Senior Technical Reviewer.
- 4.2.4 Providing design deliverables to the Senior Technical Reviewer for review.
- 4.2.5 Responding to and resolving comments made by Senior Technical Reviewers.
- 4.2.6 Resubmitting revised drawings or other design documents to the Senior Technical Reviewer for verification.
- 4.2.7 Maintaining records of Senior Technical Review.

4.3 Design Quality Assurance Manager (DQAM) – The DQAM shall be responsible for:

- 4.3.1 Assisting the PM in making the determination as to the need for Senior Technical

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 07
Senior Technical Review	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 6

Review.

- 4.3.2 Ensuring Senior Technical Reviewers are familiar with the format chosen and working with the Delivery Technology Subject Matter Expert to provide training if Bluebeam is chosen.

4.4 Senior Technical Reviewer - The Senior Technical Reviewer shall be a qualified individual, independent of the production team, typically a senior level professional with specific subject matter expertise sufficient to perform a review in accordance with the purpose of this procedure. The Senior Technical Reviewer should have familiarity with the project, the client, contractual requirements, the approved design criteria, and project BIM requirements (when the deliverable is BIM). The Senior Technical Reviewer shall be independent of production of the deliverable being reviewed. The Senior Technical Reviewer shall be responsible for:

- 4.4.1 Reviewing the deliverable for fitness for use, conformance with the basis of design and/or design criteria, and for conformance with applicable standards of professional practice.
4.4.2 Documenting comments and errors as a result of the review.
4.4.3 Reviewing and discussing the results with the designer, reconciling comments and errors, and agreeing upon revisions to be made.
4.4.4 Verifying that agreed upon revisions have been incorporated.
4.4.5 Certifying that Senior Technical Review has been performed and any identified issues have been resolved, when contractually required.

4.5 Divisional/National Practice/Market Sector Leads (PSL/MSL) – The PSL/MSL shall be responsible for, when required:

- 4.5.1 Working with the PM and Task Leads to identify design deliverables requiring Senior Technical Review.
4.5.2 Collaborating to identify appropriately qualified Senior Technical Reviewers.

5.0 PROCEDURE

5.1 In accordance with Procedure QP 01, Quality Planning, the PM shall, in collaboration with the Task Leads and the DQAM, identify those deliverables that require Senior Technical Review. Those required reviews shall be recorded within Form QF 02, Client Deliverable Quality Matrix. Decisions to apply Senior Technical Reviews shall be dependent upon the nature of the project and design element but are typically applied to deliverables or projects judged to be complex or critical. Dependent upon project scope, previous successful experience of the local office on similar projects, client sensitivity and project risk, the PM, DQAM, and Task Leads shall consult Divisional/National Practice and Market Sector Leads in the determination of Senior Technical Review (including the identification of appropriately qualified resources to perform those reviews).

5.2 The PM shall, in collaboration with the Task Leads, identify qualified resources to perform Senior Technical Reviews.

5.2.1 Resources for Senior Technical Reviews and scheduled time shall have been accounted for within the Work Plan.

5.2.2 Task Leads shall provide the names of Senior Technical Reviewers to the DQAM for verification during QA Review.

5.3 When required by the Client Deliverable Quality Matrix, the Task Lead shall verify that Discipline QC Check has been completed and then provide the Senior Technical Reviewer with the design deliverable to be checked (by the Start Date documented in the Client Deliverable Quality Matrix); inclusive of basis of design/design criteria and any approved design changes.

5.4 The Senior Technical Reviewer shall review the design deliverable with a focus on project concepts, basis of design/design criteria, design methodology, fitness of the design for its intended use, and verifying the design has been developed in accordance with applicable standards of professional practice.

5.5 The Senior Technical Reviewer shall document comments via Bluebeam, in accordance with

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acufia	Document number: QP 07
Senior Technical Review	Revision Number: 0	Revision Date: 6/19/23	Page 3 of 6
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

Procedure QP 20, Bluebeam QMS Review, via hardcopy CheckPrint using the CheckPrint Stamp, in accordance with Procedure QP 05, Quality Check/Review Color Codes, via MS Word Track Changes (accompanied by Form QF 05), or within Form QF 04, Comment Resolution Form, and provide them to the Task Lead or Designer. If the Senior Technical Reviewer has no comments to make, they shall record "No Comments" within the electronic CheckPrint, Form QF 04 Comment Resolution Form, noted within MS Word Track Changes, or may make a diagonal yellow slash across the hardcopy CheckPrint (indicating the contents of the sheet have been checked and are correct), in order to provide evidence of the review. Note: If using Bluebeam for Senior Technical Review, the CheckPrint Stamp may be electronically incorporated to provide visible tracking of the review process at the discretion of the PM, DQAM, or Task Lead.

- 5.6 The Task Lead or Designer shall document response to all Senior Technical Review comments via Bluebeam, hardcopy CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes, MS Word Track Changes, or Form QF 04 Comment Resolution Form, and shall document agreement, deferral, or disagreement (including rationale) with the comment and the planned resolution.
 - 5.6.1 If the Task Lead or Designer disagrees with the Senior Technical Reviewer or prefers to defer resolution of the comment to a subsequent submittal, they shall come to a common resolution, obtaining the documented concurrence of the Senior Technical Reviewer. Remaining disputes shall be escalated to the PM and/or PSL/MSL.
- 5.7 The Task Lead or designee shall make the necessary revisions to the deliverable and record update activities.
 - 5.7.1 If using Bluebeam, the Task Lead shall record update in accordance with Procedure QP 20, Bluebeam QMS Review.
 - 5.7.2 Otherwise, the Task Lead shall record update on the hardcopy CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes, using MS Word Track Changes, or within Form QF 04 Comment Resolution Form.
- 5.8 Once all agreed upon revisions have been made the Task Lead shall provide the revised deliverable to the Senior Technical Reviewer for verification.
- 5.9 The Senior Technical Reviewer, or other qualified independent reviewer designated by the Senior Technical Reviewer (not the Task Lead), if the original reviewer is unavailable, shall verify that all agreed upon revisions have been made, and shall document that verification, including documenting concurrence with Disagree and Deferred status.
 - 5.9.1 If using Bluebeam, the Interdisciplinary Reviewer shall record verification in accordance with Procedure QP 20, Bluebeam QMS Review.
 - 5.9.2 Otherwise, the Interdisciplinary Reviewer shall record verification on hardcopy CheckPrints in accordance with Procedure QP 05, Quality Check/Review Color Codes, using MS Word Track Changes, or within Form QF 04, Comment Resolution Form.
 - 5.9.3 Senior Technical Review should be completed by the End Date documented in the Client Deliverable Quality Matrix, including the verification of all revisions.
- 5.10 If the review was completed using Bluebeam, the Task Lead, or designee, shall generate a Senior Technical Review Summary Log, showing all the comments, evidence of response, revision and verification and shall maintain a copy of this summary report along with copies of all electronic CheckPrints in accordance with Procedure QP 03, Control of Project Quality Records.
- 5.11 If the review was not completed using Bluebeam, the Task Lead, or designee, shall maintain a copy of hardcopy, or electronic CheckPrint with QF 05, or Form QF 04, Comment Resolution Form in accordance with Procedure QP 03, Control of Project Quality Records. When MS Track Changes application clearly demonstrates the individuals by name and role in the quality process, there is no need for the additional QF 05 Form.
- 5.12 When contractually required, the Senior Technical Reviewer shall prepare a Certificate indicating the completion of Senior Technical Review and the resolution of any identified comments. See Form QF 07, Certificate of Compliance.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 07
Senior Technical Review	Revision Number: 0	Revision Date: 6/19/23	Page 4 of 6
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

5.13 The Task Lead shall ensure that all Senior Technical Review records (including Form QF 07, Certificate of Compliance, if applicable) are maintained as quality records in accordance with Procedure QP 03, Control of Project Quality Records.

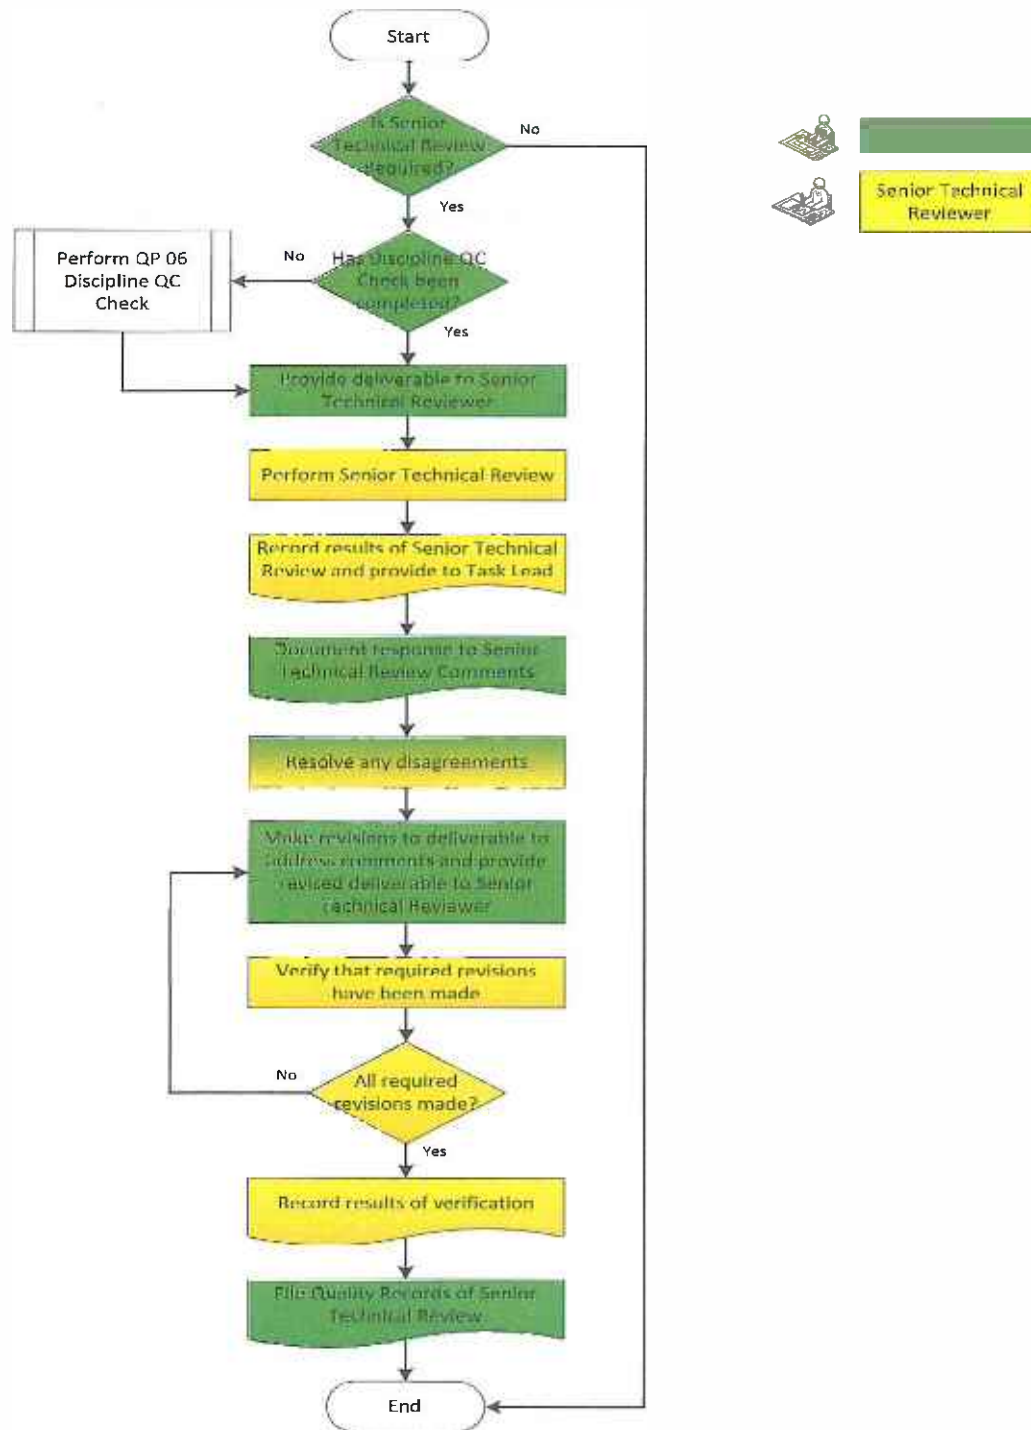

5.14 At the conclusion of Senior Technical Review, all deferred comments shall be captured on QF 04, Comment Resolution Form and maintained for resolution and verification during the subsequent milestone review.

Interdisciplinary Review	Revision Number: 0	Revision Date: 6/19/23	Page 1 of 6
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities, and process for Interdisciplinary Review of project deliverables. The purpose of Interdisciplinary Review is to ensure consistency of the design between disciplines and segments; between design prepared by HNTB and its subconsultants; between design of the project and adjacent projects; between design of the project and the affected facilities owned by other stakeholders; and to prevent coordination errors in construction documents.

Interdisciplinary Review is most effective when performed collectively in an interactive session to avoid duplicate or conflicting comments and to facilitate interdisciplinary solutions to the benefit of the project. It should be noted that while Interdisciplinary Review serves to identify and resolve coordination errors, the most effective method to prevent such issues is through frequent interdisciplinary coordination and interface management throughout the design development process.

2.0 SCOPE

This procedure shall apply to all project deliverables (constituting multiple disciplines) prior to submission to a client. Deliverable packages shall not be submitted for Interdisciplinary Review until Discipline QC Check, Senior Technical Review (if applicable), and Independent Design Check (if applicable) have been completed and comments resolved and verified.

3.0 REFERENCES

- 3.1 Procedure QP 01, Quality Planning
- 3.2 Procedure QP 03, Control of Project Quality Records
- 3.3 Procedure QP 05, Quality Check/Review Color Codes
- 3.4 Procedure QP 12, QA Review
- 3.5 Procedure QP 20, Bluebeam QMS Review

4.0 ROLES and RESPONSIBILITIES

4.1 Project Manager (PM) – The PM, or designee, shall be responsible for:

- 4.1.1 Determining, in concert with the DQAM the method for performing and capturing the records of Interdisciplinary Review, i.e., through the use of Bluebeam, hardcopy CheckPrints, or by capturing Interdisciplinary Review comments on Form QF 04, Comment Resolution Form.
- 4.1.2 Identifying those Task Leads and other qualified project team members who are required to participate in Interdisciplinary Review and providing a list of those names to the DQAM.
- 4.1.3 Scheduling/facilitating the Interdisciplinary Review.
- 4.1.4 Compiling and submitting the deliverable package in accordance with the project schedule for Interdisciplinary Review.
- 4.1.5 Resolving conflicts between Task Leads and Interdisciplinary Reviewers and identifying solutions.
- 4.1.6 Maintaining records of Interdisciplinary Review.

4.2 Design Quality Assurance Manager (DQAM) – The DQAM shall be responsible for:

- 4.2.1 Working with the PM to determine the method of performing and capturing the records of Interdisciplinary Review.
- 4.2.2 Training Interdisciplinary Reviewers on the method to be used. Note: this may require

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 08
Interdisciplinary Review	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 6
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

involvement of the Delivery Technology Subject Matter Expert to provide Bluebeam training when applicable.

- 4.2.3 Before Interdisciplinary Review begins, verifying that Discipline QC Check, Senior Technical Review (if applicable), and Independent Design Check (if applicable) have been completed, and comments resolved and verified.

4.3 Interdisciplinary Reviewers - Interdisciplinary Reviewers shall be qualified individuals with sufficient, relevant experience in the disciplines being reviewed. Interdisciplinary Reviewers are typically the Task Leads for the project (may be subconsultants), or their designees, and as such should have familiarity with the project, the client, contractual requirements, the approved design criteria, and project BIM requirements (when the deliverable is BIM). Note: Interdisciplinary Reviewers may also include Owners or Third Party Representatives when other project or existing facilities are involved. Interdisciplinary Reviewers shall be responsible for:

- 4.3.1 Reviewing the deliverable package for successful integration and conflicts. Specific areas to review are those interfaces between the disciplines and segments, between HNTB design and that of subconsultants, and adjacent projects, or existing conditions or facilities.
- 4.3.2 Documenting specific review comments as a result of the review.
- 4.3.3 Reviewing comments with the Task Leads and/or PM, reconciling comments and agreeing upon solutions and revisions to be made.
- 4.3.4 Verifying that agreed upon revisions have been incorporated.

4.4 Task Leads – The Task Lead shall be responsible for:

- 4.4.1 Responding to and resolving Interdisciplinary Review comments.
- Elevating unresolved differences to the PM for resolution.
- 4.4.2 Making revisions to deliverables to address comments and resubmitting revised deliverables to the Interdisciplinary Reviewer for verification.

5.0 PROCEDURES

- 5.1 In accordance with Procedure QP 01, Quality Planning, the PM shall determine design deliverables requiring Interdisciplinary Review. Those required reviews shall be recorded within Form QF 02, Client Deliverable Quality Matrix.
- 5.2 The PM, in concert with the DQAM, shall determine the method for performing and capturing record of Interdisciplinary Review, i.e., via Bluebeam, via hardcopy CheckPrints, or via Comment Resolution Form.
- 5.3 The PM shall identify the Interdisciplinary Reviewers (based upon impacted disciplines) required to participate in the review process. All identified reviewers must participate in the process to facilitate a full review.
- 5.4 The PM or designee shall provide a listing of the names of the identified Interdisciplinary Reviewers to the DQAM for verification during QA Review.
- 5.5 The DQAM shall train the identified Interdisciplinary Reviewers in the method to be used to document, respond to, resolve, and verify Interdisciplinary Review comments. Note: If using Bluebeam, the DQAM shall coordinate with the Delivery Technology Subject Matter Expert to provide Bluebeam training. Interdisciplinary Reviewers shall not be given access to Bluebeam sessions until they have received training.
- 5.6 The DQAM shall verify that Discipline QC Check, Senior Technical Review (if applicable), and Independent Design Check (if applicable) have been completed and comments resolved and verified prior to beginning Interdisciplinary Review. This verification may be performed in accordance with QP 12, QA Review and recorded on QF 08, QA Review Record. Once a deliverable has been submitted for Interdisciplinary Review, it should be in a completed state relative to that milestone or phase so that the review performed represents the deliverable as it will be submitted to the client and to prevent additional design work from not being checked.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 08
Interdisciplinary Review	Revision Number: 0	Revision Date: 6/19/23	Page 3 of 6
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- 5.7 The PM, or designee, shall compile the deliverable package and shall submit it for Interdisciplinary Review by the Start Date documented in the Client Deliverable Quality Matrix.
- 5.7.1 If the review is done via Bluebeam, Interdisciplinary Reviewers shall be invited to the session and the package shall be posted for review in accordance with Procedure QP 20, Bluebeam QMS Review.
- 5.7.2 Otherwise, the PM shall make the deliverable package available to the Interdisciplinary Reviewers along with Form QF 04, Comment Resolution Form. If the deliverable is in a MS Word format, the review may be completed using MS Word Track Changes (accompanied by Form QF 05, QC Check/Review Record).
- 5.8 Interdisciplinary Reviewers shall review the deliverable package with specific attention to potential physical conflicts between disciplines and segments, between design performed by HNTB and that performed by subconsultants, between this project and adjacent current or proposed projects, and between this project and existing facilities.
- 5.9 Interdisciplinary Reviewers shall document their review comments. Comments shall be detailed enough to facilitate understanding by the Task Lead for response and resolution. If the Interdisciplinary Reviewer has no comments, they shall document "No Comments" within the CheckPrint to provide evidence of the review or may place a yellow diagonal slash across the hardcopy CheckPrint, indicating the contents of the sheet have been checked and are correct.
- 5.9.1 If using Bluebeam, the Interdisciplinary Reviewers shall document their review comments in accordance with Procedure QP 20, Bluebeam QMS Review. Note: If using Bluebeam for Interdisciplinary Review, the CheckPrint Stamp may be electronically incorporated to provide visible tracking of the review process at the discretion of the PM, DQAM, or Task Lead.
- 5.9.2 Otherwise, Interdisciplinary Reviewers shall document their review comments on hardcopy CheckPrints in accordance with Procedure QP 05, Quality Check/Review Color Codes, using MS Word Track Changes (accompanied by Form QF 05), or on Form QF 04, Comment Resolution Form.
- 5.10 The PM shall ensure that all required Interdisciplinary Reviewers complete their reviews in accordance with the allotted time frame. All required Interdisciplinary Reviewers, or a qualified designee, must complete their review in order for the review to be considered complete.
- 5.11 The Task Lead shall review all the Interdisciplinary Reviewers comments and shall document a response or resolution to each comment, including documenting rationale for a disagree or deferred status. If there is a disagreement between the Task Lead and the Interdisciplinary Reviewer, they shall come to an agreed upon solution, including documented concurrence of the Reviewer, if disputes continue the issue shall be escalated to the PM for resolution.
- 5.11.1 If using Bluebeam, the Task Lead shall document their response and resolution to comments in accordance with Procedure QP 20, Bluebeam QMS Review.
- 5.11.2 Otherwise, the Task Lead shall document their response and resolution to the comments on the hardcopy CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes, using MS Word Track Changes, or within Form QF 04, Comment Resolution Form.
- 5.12 The Task Lead shall make the necessary revisions to the deliverable and record update activities.
- 5.12.1 If using Bluebeam, the Task Lead shall record update in accordance with Procedure QP 20, Bluebeam QMS Review.
- 5.12.2 Otherwise, the Task Lead shall record update on the hardcopy CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes, using MS Word Track Changes, or within Form QF 04 Comment Resolution Form.
- 5.13 Once all agreed upon revisions have been made the Task Lead shall provide the revised deliverable to the Interdisciplinary Reviewer for verification.
- 5.14 The Interdisciplinary Reviewer, or other qualified independent reviewer designated by the Interdisciplinary Reviewer (not the Task Lead), if the original reviewer is unavailable, shall verify

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 08
Interdisciplinary Review	Revision Number: 0	Revision Date: 6/19/23	Page 4 of 6
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

that all agreed upon revisions have been made, and shall document that verification, including documenting concurrence with Disagree and Deferred status.

- 5.14.1 If using Bluebeam, the Interdisciplinary Reviewer shall record verification in accordance with Procedure QP 20, Bluebeam QMS Review.
- 5.14.2 Otherwise, the Interdisciplinary Reviewer shall record verification on hardcopy CheckPrints in accordance with Procedure QP 05, Quality Check/Review Color Codes, using MS Word Track Changes, or within Form QF 04, Comment Resolution Form.
- 5.14.3 Interdisciplinary Review should be completed by the End Date documented in the Client Deliverable Quality Matrix, including the verification of all revisions.
- 5.15 If the review was completed using Bluebeam, the PM, or designee, shall generate an Interdisciplinary Review Summary Log, showing all the comments, evidence of response, revision and verification and shall maintain a copy of this summary report along with copies of all electronic CheckPrints in accordance with Procedure QP 03, Control of Project Quality Records.
- 5.16 If the review was not completed using Bluebeam, the PM, or designee, shall maintain a copy of hardcopy, or electronic CheckPrint with QF 05, or Form QF 04, Comment Resolution Form in accordance with Procedure QP 03, Control of Project Quality Records. When MS Track Changes application clearly demonstrates the individuals by name and role in the quality process, there is no need for the additional QF 05 Form.
- 5.17 At the conclusion of Interdisciplinary Review, all deferred comments shall be captured on QF 04, Comment Resolution Form and maintained for resolution and verification during the subsequent milestone review.

Independent Design Check	Revision Number: 0	Revision Date: 6/19/23	Page 1 of 5
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities and process for conducting Independent Design Checks of critical elements of design. The purpose of Independent Design Check is to gain a higher level of confidence that inputs and outputs used in the design are correct, to verify general compliance with design criteria, and to conduct independent analysis of critical project elements. Independent Design Check is performed by conducting mutually exclusive calculations (without reference to the Designer's calculations).

2.0 SCOPE

This procedure shall apply to the Independent Design Check of design when required via the Client Deliverable Quality Matrix in accordance with Procedure QP 01, Quality Planning. In general, Independent Design Check shall be applied to complex bridge projects, projects with unique or unusual structural elements, and when contractually required. Discipline QC Check shall be complete prior to engaging in Independent Design Check.

When HNTB is contracted to perform Independent Design Check services on designs prepared by another party, then these calculations (in this case the deliverable) shall be subject to Discipline QC Check and potentially other quality checks and reviews, such as Senior Technical Review, Visual Check and QA Review, in accordance with the Client Deliverable Quality Matrix.

In all cases, design criteria, assumptions and data inputs should be verified and not assumed correct.

3.0 REFERENCES

3.1 Procedure QP 01, Quality Planning

3.2 Procedure QP 03, Control of Project Quality Records

3.3 Procedure QP 05, Quality Check/Review Color Codes

4.0 ROLES and RESPONSIBILITIES

4.1 **Project Manager (PM)** – The PM shall be responsible for:

- 4.1.1 Identifying, in concert with the DQAM and Task Leads, and potentially Divisional/National Practice/Market Sector Leads (PSL/MSL), those critical project elements subject to Independent Design Check, and documenting those required checks within the Client Deliverable Quality Matrix in accordance with Procedure QP 01, Quality Planning.

4.2 **Task Lead or Designer** - The Task Lead or Designer shall be responsible for:

- 4.2.1 Assisting the PM in making the determination as to the need for Independent Design Check and in identifying qualified resources, consulting Divisional/National PSL/MSL when necessary, and providing a listing of the names of Independent Design Checkers to the DQAM.
- 4.2.2 Verifying that Discipline QC Check has been completed prior to engaging in Independent Design Check.
- 4.2.3 Initiating a kick-off meeting with Independent Checkers to provide an overview of the design, basis of design and/or design criteria, approved design changes, and the drawings subject to independent design check.
- 4.2.4 Responding to and resolving comments made by Independent Checkers.
- 4.2.5 Resubmitting revised drawings or other design documents to the Independent Checker for verification.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 09
Independent Design Check	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 5
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

4.2.6 Maintaining records of Independent Design Check.

4.3 Independent Checker - The Independent Checker may be an HNTB staff member or may be an external resource as required by the contract. The Independent Checker shall be a qualified individual with significant subject matter expertise and must be independent of the production of the design. The Divisional/National Practice or Market Sector Leaders shall be consulted on the selection of Independent Checkers and may require that Independent Checkers be from a different HNTB office. The Independent Checker shall be responsible for:

4.3.1 Conducting independent calculations.

4.3.2 Identify and document comments and errors in the design found through independent calculations.

4.3.3 Reviewing and discussing the results with the designer, reconciling comments and errors and agreeing upon revisions to be made.

4.3.4 Verifying that agreed upon revisions have been incorporated.

4.3.5 Certifying that Independent Design Check has been performed and any identified issues have been resolved, when contractually required.

4.4 Divisional/National Practice/Market Sector Leads (PSL/MSL) – The PSL/MSL shall be responsible for, when required:

4.4.1 Working with the PM and Task Leads to identify critical project elements that require Independent Design Check

4.4.2 Collaborating to identify appropriately qualified Independent Checkers.

5.0 PROCEDURE

5.1 In accordance with Procedure QP 01, Quality Planning, the PM shall, in collaboration with the DQAM and Task Leads shall identify those critical design elements that require Independent Design Check. Those required checks shall be recorded within Form QF 02, Client Deliverable Quality Matrix. Dependent upon project scope, previous successful experience of the local office on similar projects, client sensitivity and project risk, the PM, DQAM, and Task Leads shall consult PSL/MSL in the determination of Independent Design Check (including the identification of appropriately qualified resources to perform those reviews).

5.2 The PM, or designee shall identify qualified resources to perform the Independent Design Check.

5.2.1 The PM, or designee shall provide a listing of the names of Independent Design Checkers to the DQAM for verification during QA Review.

5.2.2 Resources for Independent Design Check and scheduled time shall have been accounted for within the Work Plan.

5.3 When required by the Client Deliverable Quality Matrix, the Task Lead or Designer shall verify that Discipline QC Check has been completed, and then provide the Independent Checker with the design to be checked (by the Start Date documented in the Client Deliverable Quality Matrix). The Task Lead or Designer shall also provide the Independent Checker with an overview of the design, the basis of design and/or approved design criteria, approved design changes, and any pertinent contact information. The Task Lead or Designer shall not provide any original calculations.

5.4 The Independent Checker shall perform independent calculations, without reference to the original calculations, which address as a minimum the structural geometry, material properties, member properties, loading intensities, and load combinations. Calculations shall be based on the structural design drawings provided by the Task Lead or Designer and shall not represent alternative design approaches or redesign.

5.4.1 Independent calculations shall be performed on standard calculation sheets or with approved software, and identified as "Independent Check Calculations"

5.5 The Independent Checker shall document comments or errors identified with the design via hardcopy CheckPrints, in accordance with Procedure QP 05, Quality Check/Review Color Codes,

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 09
Independent Design Check	Revision Number: 0	Revision Date: 6/19/23	Page 3 of 5
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

or via Form QF 04 Comment Resolution Form, and provide them to the Task Lead or Designer. If the Independent Checker has no comments to make, they shall record "No Comments" on the hardcopy CheckPrint or Comment Resolution form to provide evidence of the review.

- 5.6** The Task Lead or Designer shall respond to all Independent Checker comments in accordance with Procedure QP 05, Quality Check/Review Color Codes if using hardcopy CheckPrint, or via Form QF 04, Comment Resolution Form and shall document agreement or disagreement (including the rationale for disagreement) with the comment and the planned resolution.

5.6.1 If the Task Lead or Designer disagrees with the Independent Checker, they shall discuss and come to a common resolution, including obtaining documented concurrence from the checker. Remaining disputes shall be escalated to the PM and/or PSL/MSL.

- 5.7** The Task Lead or Designer shall ensure that agreed upon revisions are made to the design and shall document in accordance with Procedure QP 05, Quality Check/Review Color Codes if using hardcopy CheckPrint, or via Form QF 04, Comment Resolution Form, and provide revised design to the Independent Checker for verification.

- 5.8** The Independent Checker, or other qualified, independent checker designated by the Independent Checker (not the Task Lead or Designer), if the original checker is unavailable, shall verify that all agreed upon revisions have been made to the design and shall document verification in accordance with Procedure QP 05, Quality Check/Review Color Codes if using hardcopy CheckPrint, or via Form QF 04, Comment Resolution Form, including documenting concurrence with Disagree status..

5.8.1 Independent Design Check should be complete by the End Date documented in the Client Deliverable Quality Matrix, including the verification of all revisions.

- 5.9** When contractually required, the Independent Checker shall prepare a Certificate indicating the completion of Independent Design Check and the resolution of any identified comments. See Form QF 07, Certificate of Compliance.

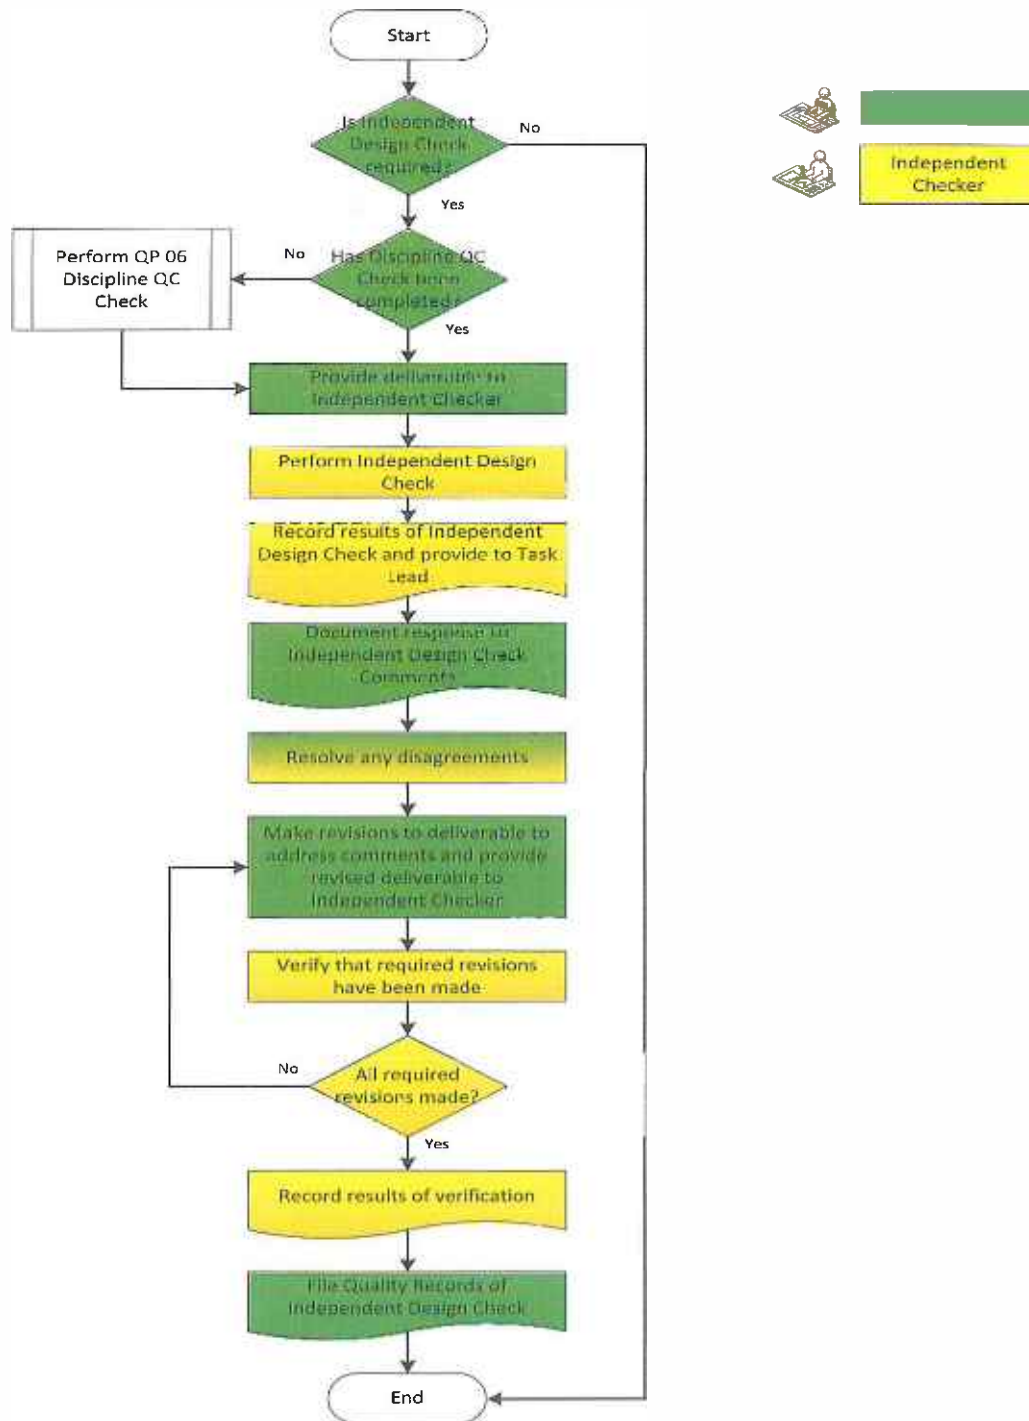

- 5.10** The Task Lead or Designer shall ensure that all Independent Design Check records (including independent check calculations and Form QF 07 Certificate of Compliance, if applicable) are maintained as quality records in accordance with Procedure QP 03, Control of Project Quality Records.

Constructability Review	Revision Number: 0	Revision Date: 6/19/23	Page 1 of 6
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities and process for conducting Constructability Reviews of project deliverables. The purpose of Constructability Review is to identify and address opportunities to improve the cost effectiveness of construction, the suitability of the design to construction means and methods, and the clarity of the construction documents.

2.0 SCOPE

This procedure shall apply to Constructability Review performed by the Contractor on design-build project deliverables when required by the Client Deliverable Quality Matrix, prepared in accordance with Procedure QP 01, Quality Planning. Deliverable packages shall not be submitted for Constructability Review until Discipline QC Check, Senior Technical Review (if applicable), and Independent Design Check (if applicable) have been completed and comments resolved and verified.

3.0 REFERENCES

- 3.1 Procedure QP 01 Quality Planning
- 3.2 Procedure QP 03, Control of Project Quality Records
- 3.3 Procedure QP 05, Quality Check/Review Color Codes
- 3.4 Procedure QP 20, Bluebeam QMS Review

4.0 ROLES and RESPONSIBILITIES

4.1 Project Manager (PM) – The PM, or designee shall be responsible for:

- 4.1.1 Identifying, in concert with the Contractor, Task Leads and the DQAM, the design deliverables to undergo Constructability Review and documenting those reviews in the Client Deliverable Quality Matrix.
- 4.1.2 Determining in concert with the Contractor and DQAM, the method for performing and capturing the records of Constructability Review, i.e., through the use of Bluebeam, hardcopy CheckPrint, or by capturing Constructability Review comments on Form QF 04, Comment Resolution Form.
- 4.1.3 Scheduling/facilitating the Constructability Review
- 4.1.4 Compiling and submitting the deliverable package in accordance with the project schedule for Constructability Review.
- 4.1.5 Resolving conflicts between Task Leads and Constructability Reviewers
- 4.1.6 Maintaining records of Constructability Review.

4.2 Design Quality Assurance Manager (DQAM) – The DQAM shall be responsible for:

- 4.2.1 Working with the Contractor, PM and Task Leads to identify the design deliverables to undergo Constructability Review.
- 4.2.2 Working with the Contractor, PM, and Task Leads to determine the method for performing and capturing the records of Constructability Review.
- 4.2.3 Training Constructability Reviewers on the method to be used. Note: this may require involvement of the Bluebeam Subject Matter Expert to provide Bluebeam training when applicable.
- 4.2.4 Prior to conducting Constructability Review, verifying that Discipline QC Check, Senior Technical Review (if applicable), and Independent Design Check (if applicable) have been completed, and comments resolved and verified.

4.3 Constructability Reviewers – The Constructability Reviewer shall be a Contractor representative with sufficient, relevant experience in the area of construction management and/or

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP10
Constructability Review	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 6
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

construction means and methods. The Constructability Reviewer shall be independent of the production of the deliverable being checked, but should have familiarity with the project, the client/owner, project requirements, the approved design criteria, and project BIM requirements (when the deliverable is BIM). Constructability Reviewers shall be responsible for:

- 4.3.1 Reviewing the deliverable package for the cost effectiveness, and the suitability of the design to construction means and methods.
- 4.3.2 Documenting specific review comments as a result of the review.
- 4.3.3 Reviewing comments with the Task Leads and/or PM, reconciling comments and agreeing upon revisions to be made.
- 4.3.4 Verifying that agreed upon revisions have been incorporated.
- 4.4 **Task Lead** - The Task Lead shall be responsible for:
 - 4.4.1 Assisting the PM in determining the deliverables for which Constructability Review shall be performed, including determining qualified resources.
 - 4.4.2 Responding to and resolving comments made by Constructability Reviewers.
 - 4.4.3 Resubmitting revised drawings or other construction documents to the Constructability Reviewer for verification.

5.0 PROCEDURE

- 5.1 In accordance with Procedure QP 01, Quality Planning, the PM, Contractor, Task Leads and DQAM shall determine those design packages requiring constructability review. Those required reviews shall be recorded within Form QF 02, Client Deliverable Quality Matrix.
- 5.2 The PM, in concert with the Contractor, Task Leads and DQAM, shall determine the method for performing and capturing record of Constructability Review, i.e., via Bluebeam, hardcopy CheckPrint, or QF 04 Comment Resolution Form.
- 5.3 The DQAM shall train the identified Constructability Reviewers in the method to be used to document, respond to, resolve, and verify Constructability Review comments (i.e., Bluebeam, hardcopy CheckPrint, or QF 04 Comment Resolution Form). Note: If using Bluebeam, the DQAM may coordinate with the Delivery Technology Subject Matter Expert to provide Bluebeam training. Constructability Reviewers shall not be given access to the review session until they have received training.
- 5.4 The DQAM shall verify that Discipline QC Check, Senior Technical Review (if applicable), and Independent Design Check (if applicable) have been completed and comments resolved and verified prior to beginning Constructability Review. Once a deliverable has been submitted for Constructability Review, it should be in a completed state relative to that milestone or phase so that the review performed represents the deliverable as it will be submitted to the client and to prevent additional design work from not being checked.
- 5.5 The PM, or designee, shall compile the deliverable package and shall submit it for Constructability Review, by the Start Date documented in the Client Deliverable Quality Matrix.
 - 5.5.1 If the review is done via Bluebeam, Constructability Reviewers shall be invited to the session and the package shall be posted for review in accordance with Procedure QP 20, Bluebeam QMS Review. Note: If using Bluebeam for Constructability Review, the CheckPrint Stamp may be electronically incorporated to provide visible tracking of the review process at the discretion of the PM, DQAM, or Task Lead.
 - 5.5.2 Otherwise, the PM shall make the deliverable package available to the Constructability Reviewers along with Form QF 04 Comment Resolution Form. If the deliverable being reviewed is in a MS Word format, the review may be completed using MS Word Track Changes and accompanied by Form QF 05, QC Check/Review Record.
- 5.6 Constructability Reviewers shall review the deliverable package with specific attention to:
 - 5.6.1 Adequacy and clarity of information
 - 5.6.2 Tolerances

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP10
Constructability Review	Revision Number: 0	Revision Date: 6/19/23	Page 3 of 6
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- 5.6.3 Site access and restrictions
- 5.6.4 Traffic maintenance and protection during construction
- 5.6.5 Construction sequence and methods
- 5.6.6 Cost effectiveness of design and materials
- 5.6.7 Availability of materials
- 5.6.8 Construction equipment and required labor
- 5.6.9 Consistency with environmental and other permit requirements
- 5.6.10 Potential interferences and conflicts between construction disciplines
- 5.6.11 Safety requirements
- 5.7 Constructability Reviewers shall document their review comments. Comments shall be detailed enough to facilitate understanding by the Task Lead for response and resolution. If the Constructability Reviewer has no comments, they shall indicate "No Comments" within the CheckPrint to provide evidence of the review, or if using hardcopy CheckPrints, may apply a diagonal yellow slash across the sheet, indicating the contents of the sheet have been checked and are correct.
 - 5.7.1 If using Bluebeam, the Constructability Reviewers shall document their review comments in accordance with Procedure QP 20, Bluebeam QMS Review.
 - 5.7.2 Otherwise, Constructability Reviewers shall document their review comments on hardcopy CheckPrints in accordance with Procedure QP 05, Quality Check/Review Color Codes, using MS Word Track Changes (accompanied by Form QF 05), or on Form QF 04 Comment Resolution Form.
- 5.8 The Task Lead shall review all the Constructability Reviewers comments and shall document a response or resolution to each comment, including documentation of the rationale for disagreement or deferral. If there is a disagreement between the Task Lead and the Constructability Reviewer, they shall come to an agreed upon resolution and obtain documented concurrence of the reviewer. If disputes continue the issue shall be escalated to the PM for resolution.
 - 5.8.1 If using Bluebeam, the Task Lead shall document their response and resolution to comments in accordance with Procedure QP 20, Bluebeam QMS Review.
 - 5.8.2 Otherwise, the Task Lead shall document their response and resolution to the comments on the hardcopy CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes, using MS Word Track Changes, or within Form QF 04 Comment Resolution Form.
- 5.9 The Task Lead shall make the necessary revisions to the deliverable and record update activities.
 - 5.9.1 If using Bluebeam, the Task Lead shall record update in accordance with Procedure QP 20, Bluebeam QMS Review.
 - 5.9.2 Otherwise, the Task Lead shall record update on the hardcopy CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes, using MS Word Track Changes, or within Form QF 04 Comment Resolution Form.
- 5.10 Once all agreed upon revisions have been made the Task Lead shall provide the revised deliverable to the Constructability Reviewer for verification.
- 5.11 The Constructability Reviewer shall verify that all agreed upon revisions have been made, and shall document that verification, including documenting concurrence with a Disagree or Deferred status.
 - 5.11.1 If using Bluebeam, the Constructability Reviewer shall record verification in accordance with Procedure QP 20, Bluebeam QMS Review.
 - 5.11.2 Otherwise, the Constructability Reviewer shall record verification on the hardcopy CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes, using MS Word Track Changes, or within Form QF 04 Comment Resolution Form.
 - 5.11.3 Constructability Review should be complete by the End Date documented in the Client Deliverable Quality Matrix, including the verification of all revisions.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP10
Constructability Review	Revision Number: 0	Revision Date: 6/19/23	Page 4 of 6
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

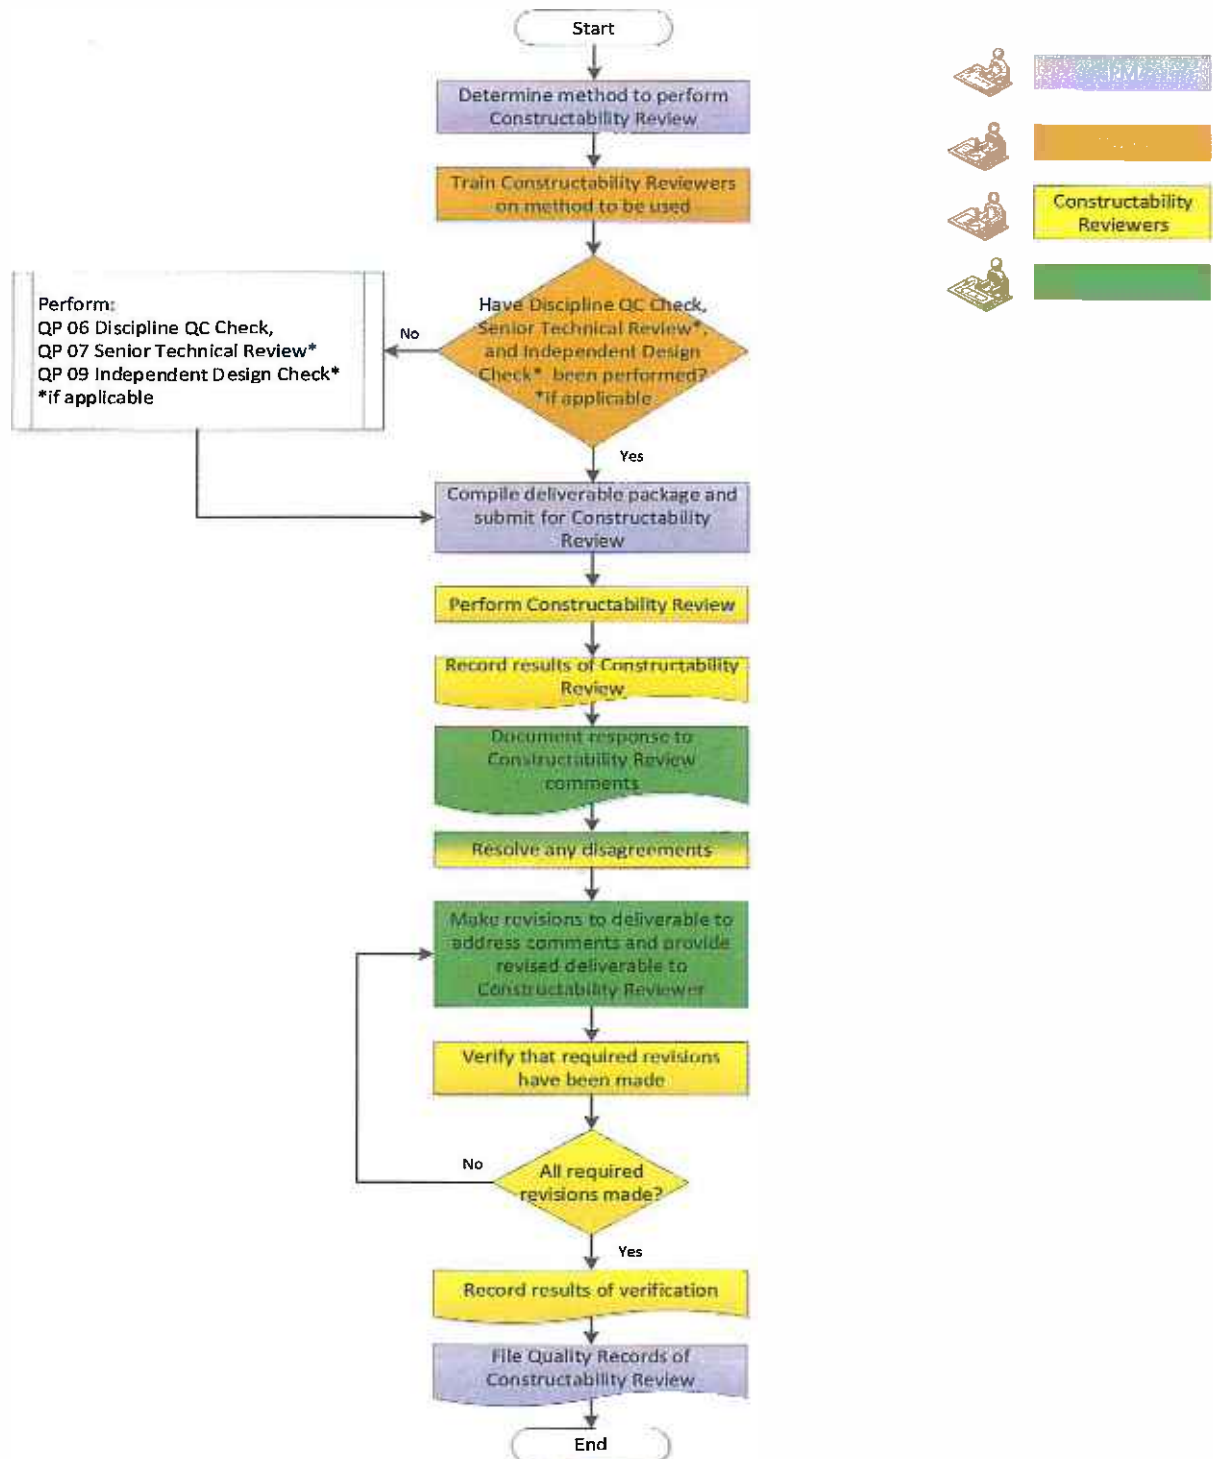

- 5.12** If the review was completed using Bluebeam, the PM, or designee, shall generate a Constructability Review Summary Log, showing all the comments, evidence of response, revision and verification and shall maintain a copy of this summary report along with copies of all electronic CheckPrints in accordance with Procedure QP 03, Control of Project Quality Records.
- 5.13** If the review was not completed using Bluebeam, the PM, or designee, shall maintain a copy of all electronic or hardcopy CheckPrints, QF 05, and/or Form QF 04 Comment Resolution Form in accordance with Procedure QP 03, Control of Project Quality Records. When MS Track Changes application clearly demonstrates the individuals by name and role in the quality process, there is no need for the additional QF 05 Form.
- 5.14** At the conclusion of Constructability Review all deferred comments shall be captured on QF 04, Comment Resolution Form and maintained for resolution and verification during the subsequent milestone review.

Visual Check	Revision Number: 0	Revision Date: 6/19/23	Page 1 of 4
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities and process for conducting a final visual check of the actual deliverable being submitted to a client. The purpose of the Visual Check is to ensure that the project deliverable is complete, in the proper order, has been scanned, printed or converted (e.g., to .pdf) as intended, and is representative of the project deliverable that have been checked/reviewed, updated and verified in accordance with the Design Quality Management Plan (DQMP).

2.0 SCOPE

This procedure shall apply to all project deliverables prior to the submittal to the client. Visual Check must be performed on the format in which the deliverable is to be presented to the client. All other quality checks and reviews assigned for the deliverable in accordance with the Deliverable Quality Matrix, with the exception of QA Review, shall have been completed, comments resolved and verified prior to Visual Check.

3.0 REFERENCES

- 3.1 Procedure QP 03, Control of Project Quality Records
- 3.2 Procedure QP 05, Quality Check/Review Color Codes
- 3.3 Procedure QP 20, Bluebeam QMS Review

4.0 ROLES and RESPONSIBILITIES

- 4.1 **Project Manager (PM)** – The PM, or designee, shall be responsible for:
 - 4.1.1 Verifying that all required quality checks and reviews have been completed, and comments resolved and verified.
 - 4.1.2 Notifying CADD Manager, or other party responsible for final production of the deliverable, to scan, compile and print, or convert the project deliverable for Visual Check.
- 4.2 **CADD Manager or other party responsible for production** - The CADD Manager, or other party responsible for production of the deliverable, shall be responsible for:
 - 4.2.1 Compiling the deliverable package.
 - 4.2.2 Converting the deliverable package to the client required format.
 - 4.2.3 Scanning, printing or plotting a copy of the deliverable in the client required format.
 - 4.2.4 Making adjustments to printer/plotter, or electronic files to address issues identified during Visual Check.
- 4.3 **Visual Checker(s)** – The Visual Checker(s) may be the PM or other designee independent of the compilation of the deliverable. The Visual Checker(s) shall be responsible for:
 - 4.3.1 Verifying that deliverables are complete, in the proper order, have been scanned, printed, plotted, or converted as intended, and are consistent with the electronic files that have been checked/reviewed, updated and verified in accordance with the DQMP.
 - 4.3.2 Recording the results of the Visual Check and providing to the CADD Manager or other responsible party for resolution.
 - 4.3.3 Verifying that print/plot or conversion adjustments have been made.
 - 4.3.4 Maintaining records of Visual Check.

5.0 PROCEDURE

- 5.1 The PM, or designee, shall verify that all required quality checks and reviews, in accordance with the Client Deliverable Quality Matrix have been completed, with the exception of QA Review.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 11
Visual Check	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 4
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- 5.2 The PM shall notify the CADD Manager, or other party responsible for deliverable production, to compile the deliverable package and to scan, print/plot or convert it in accordance with client requirements in preparation for Visual Check. Visual Check shall commence by the Start Date in the Client Deliverable Quality Matrix.
- 5.3 The CADD Manager, or other party responsible for deliverable production, shall compile the deliverable and shall print/plot or convert the deliverable package in accordance with client requirements.
- 5.4 The Visual Checker(s) shall review the scanned, printed/plotted or converted deliverable to verify that the deliverable is complete, in the proper order, and has been scanned, printed/plotted or converted as intended. This review also includes verification that the scanned, printed/plotted deliverable is consistent with the electronic files which have been checked/reviewed, updated and verified in accordance with the DQMP.
- 5.5 Visual Checker(s) shall document their review comments. Comments shall be detailed enough to facilitate understanding by the CADD Manager or designee for response and resolution. If the Visual Checker has no comments, they shall indicate "No Comments" within the CheckPrint to provide evidence of the review, or if using hardcopy CheckPrints, may apply a diagonal yellow slash across the sheet, indicating the contents of the sheet have been checked and are correct.
 - 5.5.1 If using Bluebeam, the Visual Checker(s) shall document their review comments in accordance with Procedure QP 20, Bluebeam QMS Review. If the Visual Checker has no comments, they shall indicate "No Comments".
 - 5.5.2 Otherwise, the Task Lead shall document their response and resolution to the comments on the hardcopy CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes, or within Form QF 04 Comment Resolution Form.
- 5.6 The CADD Manager or designee shall review all the Visual Checker(s) comments and shall document a response or resolution to each comment, including documentation of the rationale for disagreement or deferral. If there is a disagreement between the CADD Manager or designee and the Visual Checker, they shall come to an agreed upon resolution and obtain documented concurrence of the Visual Checker. If disputes continue the issue shall be escalated to the PM for resolution.
 - 5.6.1 If using Bluebeam, the CADD Manager or designee shall document their response and resolution to comments in accordance with Procedure QP 20, Bluebeam QMS Review.
 - 5.6.2 Otherwise, the CADD Manager or designee shall document their response and resolution to the comments on the hardcopy CheckPrint in accordance with Procedure QP 05, Quality Check/Review Color Codes, or within Form QF 04 Comment Resolution Form.
- 5.7 The CADD Manager, or other party responsible for deliverable production, shall make adjustments to the printed/plotted or converted electronic file and document update activities within the hardcopy CheckPrint in accordance with QP 05, Quality Check/Review Color Codes, within QF 04, Comment Resolution Form, or within Bluebeam in accordance with QP 20, Bluebeam QMS Review. The CADD Manager or designee shall provide updated printed/plotted or electronic copies to the Visual Checker for verification.
- 5.8 The Visual Checker(s) shall review the updated deliverable and shall record verification within the hardcopy CheckPrint in accordance with QP 05, Quality Check/Review Color Codes, within QF 04, Comment Resolution Form, or within Bluebeam in accordance with QP 20, Bluebeam QMS Review. Visual Check shall be completed by the End Date in the Client Deliverable Quality Matrix, including the verification of any comments.
- 5.9 The Visual Checker(s) shall maintain records of Visual Check in accordance with Procedure QP 03, Control of Project Quality Records.

Quality Assurance (QA) Review	Revision Number: 0	Revision Date: 6/19/23	Page 1 of 5
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities, and process for conducting Quality Assurance (QA) Reviews of project deliverables. The purpose of QA Review is to ensure that the deliverable has been processed in accordance with the Design Quality Management Plan (DQMP), and to ensure that all required checks and reviews have been completed, and comments resolved and verified (including the existence and proper filing of required records) prior to submittal of the deliverable to the client.

2.0 SCOPE

This procedure shall apply to all project deliverables being submitted to a client, inclusive of subconsultant deliverables.

All planned quality check and review activities, in accordance with the Client Deliverable Quality Matrix, prepared in accordance with Procedure QP 01, Quality Planning, shall have been completed, and all comments resolved and verified prior to completion of QA Review. All previous quality check and review activities shall have been scheduled to allow completion and resolution before QA Review and sufficient time shall be allotted for an effective QA Review. QA Review shall occur on all deliverables prior to submission to the client.

3.0 REFERENCES

3.1 Procedure QP 03, Control of Project Quality Records

4.0 ROLES and RESPONSIBILITIES

4.1 Project Executive (PEX) – The PEX shall be engaged in and responsible for decisions relative to issues related to PQP nonconformance.

4.2 Project Manager (PM) – The PM or designee shall be responsible for:

- 4.2.1 Ensuring that production and required quality check and review activities are completed in accordance with the project schedule and the Client Deliverable Quality Matrix.
- 4.2.2 Ensuring that all required quality check and review activities have been completed, and comments resolved and verified prior to submission for QA Review, including the resolution and verification of deferred comments and/or client comments from a previous submittal.

4.3 Task Lead - The Task Lead shall be responsible for:

- 4.3.1 Providing a listing of all identified independent and qualified Checkers and Reviewers to the DQAM.
- 4.3.2 Ensuring all other required quality checks and reviews in accordance with the Client Deliverable Quality Matrix have been completed, including the resolution and verification of deferred comments and/or client comments from a previous submittal.
- 4.3.3 Submitting deliverables and link to or location of quality check and review records to the DQAM for QA Review.
- 4.3.4 Responding to and resolving comments made by DQAM.
- 4.3.5 Resubmitting revised deliverables and quality records or other evidence of conformance with the DQMP to the DQAM for verification, when necessary.

4.4 Design Quality Assurance Manager (DQAM) – The DQAM shall be responsible for:

- 4.4.1 Reviewing the Client Deliverable Quality Matrix to identify the required quality checks and reviews to have been completed for the deliverable.
- 4.4.2 Verifying through review of completed quality check and review records that required

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 12
Quality Assurance (QA) Review	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 5
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

quality checks and reviews have been completed, and all comments resolved and verified, including the resolution and verification of deferred comments and/or client comments from a previous submittal.

- 4.4.3 Verifying that deliverables have been checked/reviewed by independent, qualified checkers and reviewers as provided by the Task Leads.
- 4.4.4 Verifying through certification or other subconsultant quality records that subconsultant deliverables have been checked and reviewed in accordance with the subconsultant quality plan or HNTB PQP (whichever is applicable).
- 4.4.5 Documenting the results of QA Review and providing those results to PM or Task Lead.
- 4.4.6 Escalating issues relative to DQMP nonconformance to the PM, OQM and/or PEX as well as any concerns over the implementation of the DQMP, unapproved additional concurrence of reviews, compressed review schedules, excessive deferred comments, or excessive client comments, etc.
- 4.4.7 Verifying that nonconformances have been addressed, when necessary.
- 4.4.8 Certifying that deliverables have been processed in accordance with the DQMP, when contractually required.
- 4.4.9 Maintaining records of QA Review.

5.0 PROCEDURE

- 5.1 The PM, DM or Task Leads shall provide a list of the independent, qualified checkers and reviewers for all deliverables to the DQAM.
- 5.2 The PM and/or Task Leads shall verify that all required quality checks and reviews, in accordance with the Client Deliverable Quality Matrix have been completed, including resolution and verification of deferred comments and/or client comments from a previous submittal prior submission for QA Review, including deliverables prepared by other HNTB offices and subconsultants.
 - 5.2.1 If not, the PM and/or Task Leads, shall work with other HNTB offices, Subconsultants, and applicable reviewers to ensure these checks and reviews are completed prior to QA Review.
- 5.3 The PM or Task Lead shall provide the deliverable, along with links to or locations of corresponding quality check and review records to the DQAM for QA Review by the Start Date in the Client Deliverable Quality Matrix. Note, while there is a defined Start and End Date in the Client Deliverable Quality Matrix for QA Review, the DQAM may begin this effort as soon as the earliest scheduled review has been completed.
- 5.4 The DQAM shall review the Client Deliverable Quality Matrix to determine the required quality checks and reviews that should have been completed for the deliverable. The DQAM shall note the required checks and reviews on Form QF 08, QA Review Record.
- 5.5 The DQAM shall also note on Form QF 08, QA Review Record, whether deferred comments or client comments from a previous submittal are intended to be resolved and verified during the QA Review at hand.
- 5.6 The DQAM shall verify through review of required quality checks and review records that all the required checks and reviews occurred, that all required reviewers participated (in the case of Interdisciplinary Review), and that all comments resulting from such reviews were responded to, resolved, and verified, including the resolution and verification of deferred comments and/or client comments from a previous submittal. For subconsultants following the HNTB DQMP, the DQAM shall verify completion of the Subconsultant Certificate of DQMP Compliance (QF 07A) as well as quality records required by this DQMP. For subconsultants following their own approved quality plan, the DQAM shall verify existence of a Certificate of Compliance prepared by the Subconsultant, or quality records determined as required by the PM or designee.
 - 5.6.1 The DQAM shall verify that checks have been performed by those individuals identified

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 12
Quality Assurance (QA) Review	Revision Number: 0	Revision Date: 6/19/23	Page 3 of 5
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

as independent, qualified checkers and reviewers.

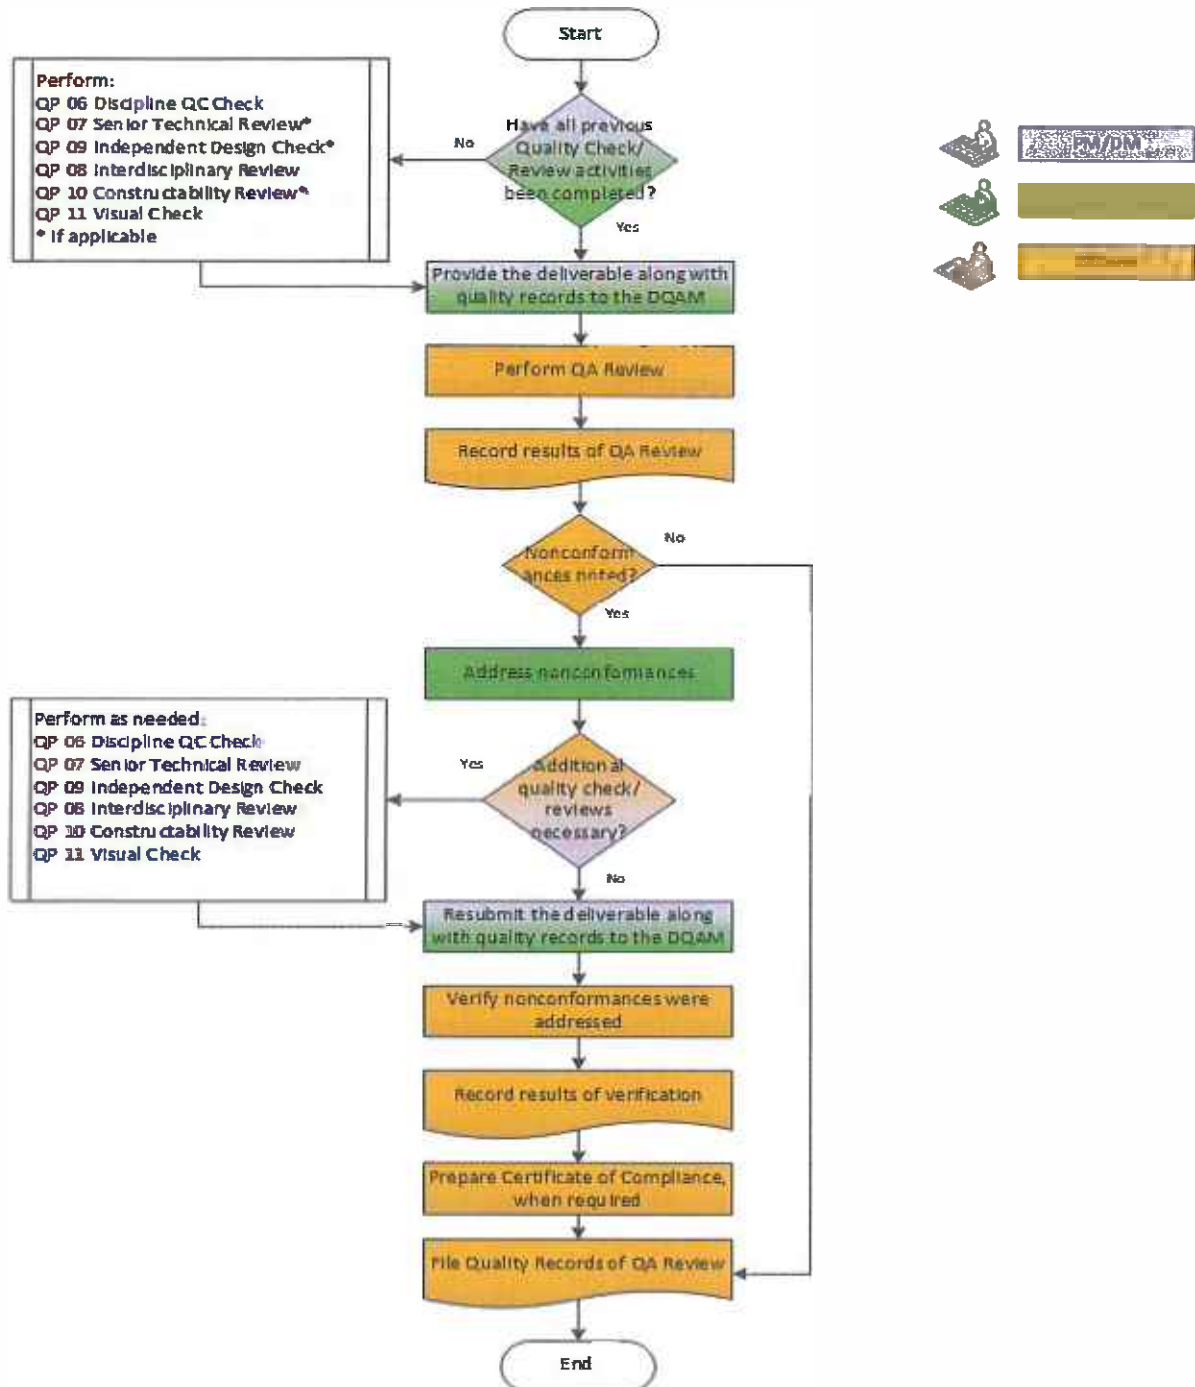

- 5.6.2 The DQAM shall also verify that all quality check and review records have been maintained in the appropriate filing location in accordance with Procedure QP 03, Control of Project Records.
- 5.7 The DQAM shall document the results of the QA Review on Form QF 08, QA Review Record and provide the results to the PM or Task Lead.
- 5.8 If there were instances of nonconformance with the DQMP requirements or the Client Deliverable Quality Matrix, the PM or Task Lead shall determine the cause of the nonconformance and shall resolve the nonconformance and provide the necessary evidence to the DQAM for verification.
- 5.9 The DQAM shall escalate issues relative to DQMP nonconformance as well as any concerns over the implementation of the DQMP, unapproved additional concurrence of reviews, compressed review schedules, excessive deferred comments, or excessive client comments, etc. to the PM, PEX, and or the DBCE or CQO for resolution as appropriate.
- 5.10 The DM and DQAM shall determine based upon the nature of the nonconformance and the scope of the remedy if additional quality check or reviews should be repeated prior to resubmittal for QA Review.
- 5.11 The DQAM shall review provided evidence to verify the resolution of nonconformances and shall note verification on Form QF 08, QA Review Record.
- 5.12 When contractually required, the DQAM shall prepare a Certificate of Compliance indicating that the deliverable has been processed in accordance with the DQMP and that required quality checks and reviews have been performed, see Form QF 07, Certificate of Compliance.
- 5.13 Deliverables shall not be submitted to clients without successful completion of the QA Review process.
- 5.14 The DQAM shall ensure that all QA Review records (including Form QF 07, Certificate of Compliance) are maintained as quality records in accordance with Procedure QP 03, Control of Project Quality Records.

Client/Owner/Third Party Review and Comment	Revision Number: 0	Revision Date: 6/19/23	Page 1 of 5
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities, and process for making formal submittal of project deliverables to clients/owners/third parties, receiving comments on those deliverables, responding to, resolving, and verifying those comments.

2.0 SCOPE

This procedure shall apply to client/owner/third party comment resolution on all submittals of project deliverables.

3.0 REFERENCES

- 3.1 Procedure QP 06, Discipline QC Check
- 3.2 Procedure QP 03, Control of Project Quality Records
- 3.3 Procedure QP 19, Bluebeam Client-Owner-Third Party Review

4.0 ROLES and RESPONSIBILITIES

4.1 Project Manager (PM) – The PM, or designee, shall be responsible for:

- 4.1.1 Making the formal submittal of a deliverable to the client/owner in accordance with client requirements.
- 4.1.2 Determining, in concert with the Contractor, Owner, and the DQAM, the format for performing Client-Owner-Third Party Reviews, i.e., use of Bluebeam, or use of a comment resolution form.
- 4.1.3 Receiving, consolidating, and distributing client/owner comments to Task Leads, including Subconsultants for response/resolution.
- 4.1.4 Liaising with client/owner/third party to assist Task Lead or Subconsultant in understanding the nature of comments, if necessary.
- 4.1.5 Providing response/resolution to comments to client/owner/third party to seek agreement/approval of resolution.
- 4.1.6 Facilitate comment resolution meetings with the Task Leads and the client/owner/third party, if necessary, to identify agreeable resolutions.
- 4.1.7 Determining in concert with the DQAM, the level of quality checks/reviews necessary for revised deliverables (when related to Final Design submittal) dependent upon the agreed upon/approved resolution.
- 4.1.8 Providing revised deliverables to the client/owner/third party following comment resolution and verification.

4.2 Design Quality Assurance Manager (DQAM) – The DQAM shall be responsible for:

- 4.2.1 Working with the PM to determine the level of quality checks/reviews required for revised deliverables (when related to the final milestone submittal) dependent upon the agreed upon/approved resolution.
- 4.2.2 Ensuring Client-Owner-Third Party Reviewers are familiar with the format chosen and working with the Delivery Technology Subject Matter Expert to provide any necessary training if Bluebeam is chosen.

4.3 Task Leads - The Task Leads or their designees shall be responsible for:

- 4.3.1 Reviewing and responding to each client/owner/third party comment.
- 4.3.2 Documenting response and planned resolution for each comment.
- 4.3.3 Participating in comment resolution meetings with client/owner/third party if necessary.
- 4.3.4 Ensuring deliverables are revised in accordance with agreed upon/approved resolutions.
- 4.3.5 Submitting revised deliverables along with Client-Owner-Third Party comments,

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 13
Client/Owner/Third Party Review and Comment	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 5
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

response, and planned resolution to the Verifier for verification.

4.3.6 Maintaining records of client/owner/third party comment resolution and verification.

4.4 Verifier – The Verifier shall be a qualified individual with sufficient, relevant experience in the discipline being commented upon. A Verifier is typically a senior individual, may be the Task Lead, and in some cases, may possess specific subject matter expertise. The Verifier shall be independent of the revisions made to the deliverable being checked, but should have familiarity with the client, contractual requirements, approved design criteria, and project BIM requirements (when the deliverable is BIM). The Verifier shall be responsible for:

4.4.1 Verifying that client/owner/third party comments have been addressed in accordance with the agreed upon/approved resolution.

4.4.2 Recording verification of resolution of comments.

5.0 PROCEDURE

5.1 The PM, or designee shall submit formal deliverables in accordance with client requirements.

5.2 The client/owner/third party may make comments on the formal deliverable to be responded to and resolved. If the client/owner has a comment resolution form to be used for this purpose, it may be used, however, it is preferred that the comment resolution form used contains fields for response, resolution, and verification of comments. It may be desirable to encourage the client/owner/third party to utilize Form QF 04, Comment Resolution Form, as it contains these fields.

5.2.1 The Client-Owner-Third Party Reviewer may make comments using Bluebeam in accordance with QP 19, Bluebeam Client-Owner-Third Party Review.

5.3 The PM, or designee, shall receive client/owner/third party comments. If the comments are not received within a comment resolution form, Bluebeam, the PM, or designee, shall transfer the comments to Form QF 04, Comment Resolution Form to facilitate complete tracking of, resolution and verification of all comments.

5.3.1 In instances in which the client/owner/third party provides comments via a marked-up copy of the deliverable, it may not be necessary to transcribe each comment to Form QF 04, however, each comment then shall be noted as A, B, C, etc., and then correspondingly A, B, C, etc. may be entered into Form QF 04 to represent the comment. The client/owner/third party markup must be attached to Form QF 04 and then resolution and verification of each comment shall be noted on Form QF 04 in accordance with this procedure.

5.4 The PM, or designee, shall distribute the client/owner/third party review comments to the Task Leads, or their designees for response.

5.4.1 The PM shall serve as a liaison between the client/owner/third party and the Task Lead, or designees, to facilitate understanding of any potentially unclear comments.

5.5 The Task Leads or their designees shall respond to each comment to indicate whether they agree or disagree with the comment and shall propose a resolution to each comment. If the comment is to be deferred to a future submittal, this must be noted as well. Responses and resolution to be recorded within Form QF 04, Comment Resolution Form, or the client's form if applicable, or within the Bluebeam session.

5.5.1 It will be important to refer to contract requirements and approved design criteria when reviewing client/owner comments to identify any potential contract changes, which would then be handled via the Project Change Management Plan.

5.6 The PM, or designee, shall review responses by Task Leads to ensure consistency between disciplines.

5.7 The PM shall provide responses and proposed resolutions to the client/owner/third party to seek agreement or approval of the proposed resolution or deferral.

5.7.1 The PM shall facilitate a comment resolution meeting with the client/owner/third party and

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 13
Client/Owner/Third Party Review and Comment	Revision Number: 0	Revision Date: 6/19/23	Page 3 of 5
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

Task Leads if necessary, to reach an agreeable resolution.

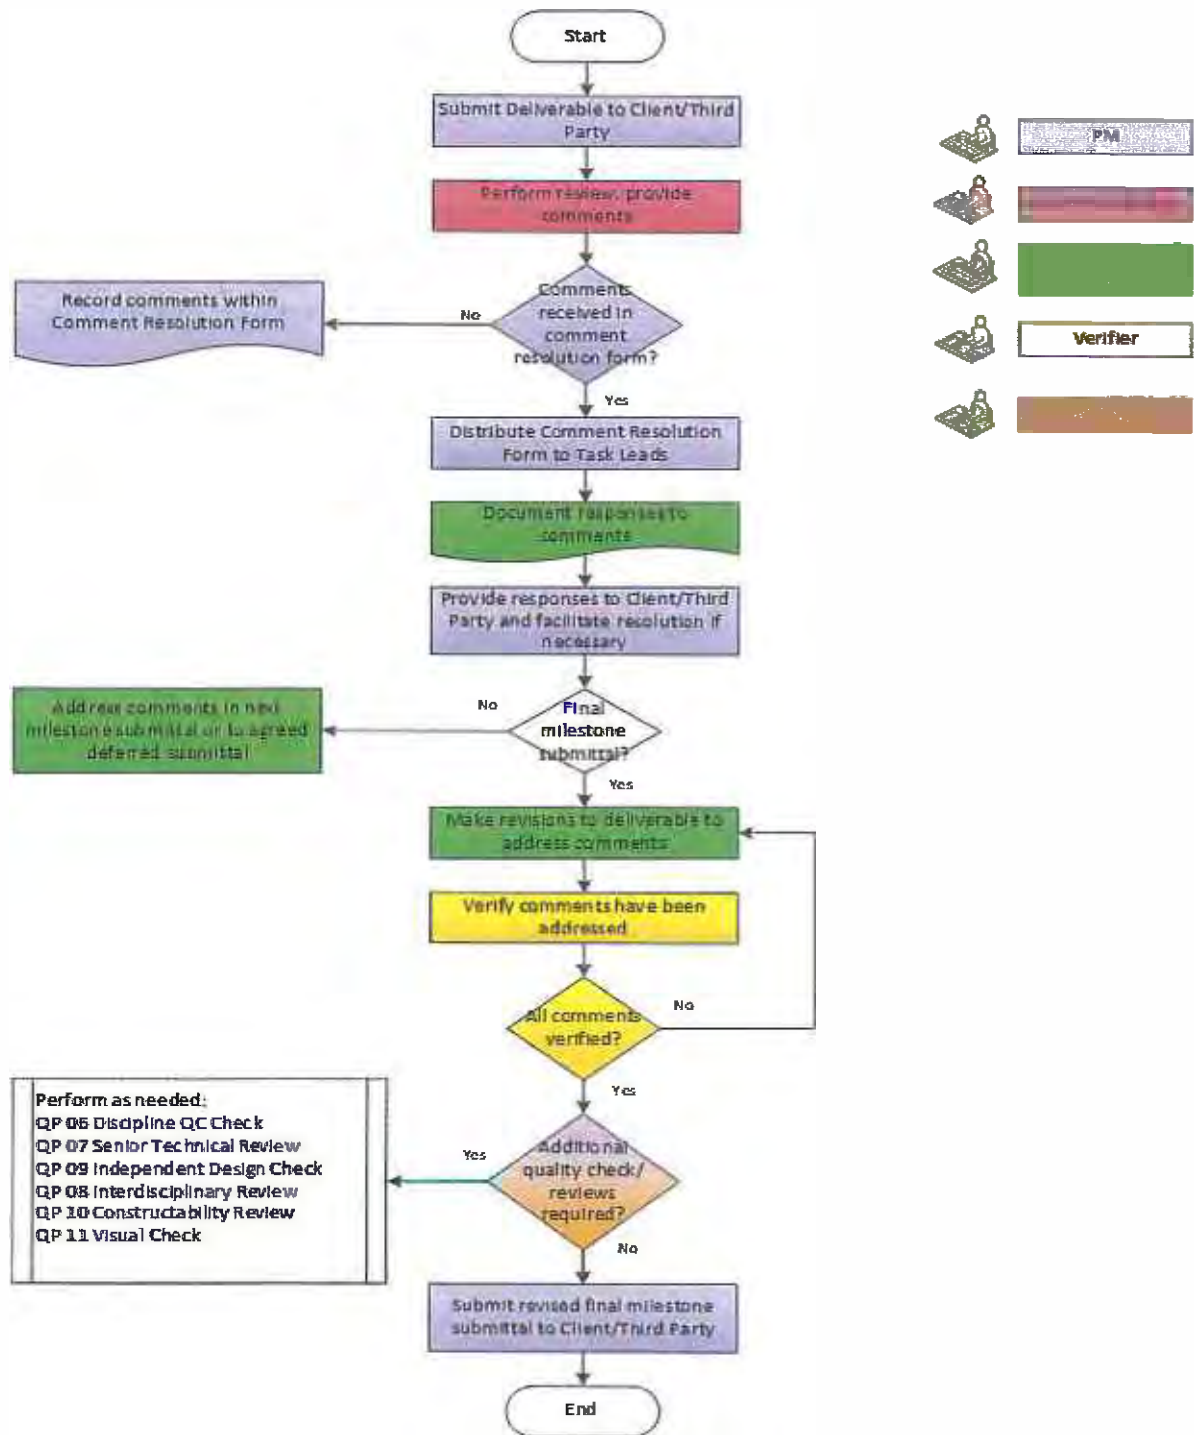

- 5.8 Unless at the final milestone submittal for that deliverable, the client/owner/third party comments will typically be addressed in the next milestone submittal, and then checked in accordance with Procedure QP 06, Discipline QC Check, but if at the final milestone submittal, then the comments shall be addressed in accordance with the remainder of this procedure.
- 5.9 Dependent upon the agreed upon/approved resolution, the PM/DQAM shall make a determination as to the level of quality checks and reviews to be applied to the revised deliverable (in the case of the final milestone submittal) prior to resubmission to the client.
- 5.10 The Task Lead, or designee, shall make revisions to the deliverable to address the client/owner/third party comments and shall submit the revised deliverable for the required quality checks/reviews in accordance with the DQMP, as determined by the PM/DQAM. Records of all required re-checks/reviews shall be maintained in accordance with Procedure QP 03, Control of Project Quality Records.
- 5.11 The Verifier shall review the revised deliverable to verify that the agreed upon/approved resolution has been made and shall indicate verification on Form QF 04, Comment Resolution Form, or on the client's form if used, or within the Bluebeam session.
- 5.12 Upon verification, the Task Lead shall provide the revised deliverable to the PM for resubmission to the client.
 - 5.12.1 If not at the final milestone submittal for the deliverable, the Task Lead and PM shall assure that client comments are addressed and checked as part of Procedure QP 06, Discipline QC Check during the next milestone submittal.
- 5.13 The Task Lead shall maintain records of client comment resolution in accordance with Procedure QP 03, Control of Project Quality Records

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities and process for controlling changes to design after design deliverables have been released for construction, to assure that adequate quality checks and reviews are applied to revised design deliverables.

2.0 SCOPE

This procedure shall apply to all changes to design deliverables after they have been released for construction. This procedure applies to changes to design directed or requested by the owner, contractor, designer or subconsultant.

3.0 REFERENCES

- 3.1 Procedure QP 01, Quality Planning
- 3.2 Procedure QP 03, Control of Project Quality Records
- 3.3 Procedure QP 12, QA Review

4.0 ROLES and RESPONSIBILITIES

- 4.1 **Originator** – The Originator shall be responsible for:
 - 4.1.1 Submitting direction or requests for design changes
- 4.2 **Project Manager (PM)** – The PM, or designee, shall be responsible for:
 - 4.2.1 Reviewing and approving, or obtaining owner approval, for requested design changes.
 - 4.2.2 Pursuing contract change if approved change warrants.
 - 4.2.3 Maintaining a log of design change requests.
 - 4.2.4 Evaluating the impact of design changes on other design deliverables/disciplines and coordinating the changes with all required Task Leads.
 - 4.2.5 Distributing approved design change requests to Task Leads.
 - 4.2.6 Ensuring revised design deliverables undergo the same quality check and review processes as original design or working in concert with DQAM to identify limited checks or reviews based upon content of revision.
- 4.3 **Design Quality Assurance Manager (DQAM)** – The DQAM shall be responsible for:
 - 4.3.1 Working with the PM to determine quality checks and reviews to be performed on revised deliverables.
 - 4.3.2 Performing QA Review on all revised design deliverables.
- 4.4 **Task Lead** - The Task Lead shall be responsible for:
 - 4.4.1 Making revisions to design deliverables in accordance with the approved design change request and coordinating with other disciplines to assess impact of changes to other disciplines.
 - 4.4.2 Submitting revised design deliverables for quality checks and reviews in accordance with the Client Deliverable Quality Matrix.

5.0 PROCEDURE

- 5.1 The Originator (may be the Owner, Contractor, Designer or potentially a subconsultant) shall generate a request for a change to design documents by filling out Form QF 09, Design Change Request and submit it to the PM. Note: If the change is being directed by the Client or Owner, the PM, or designee, may fill out the form on their behalf.
- 5.2 The PM, or designee, shall enter the Design Change Request in to Form QF 10, Design Change

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 14
Control of Design Changes	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 4

Request Log.

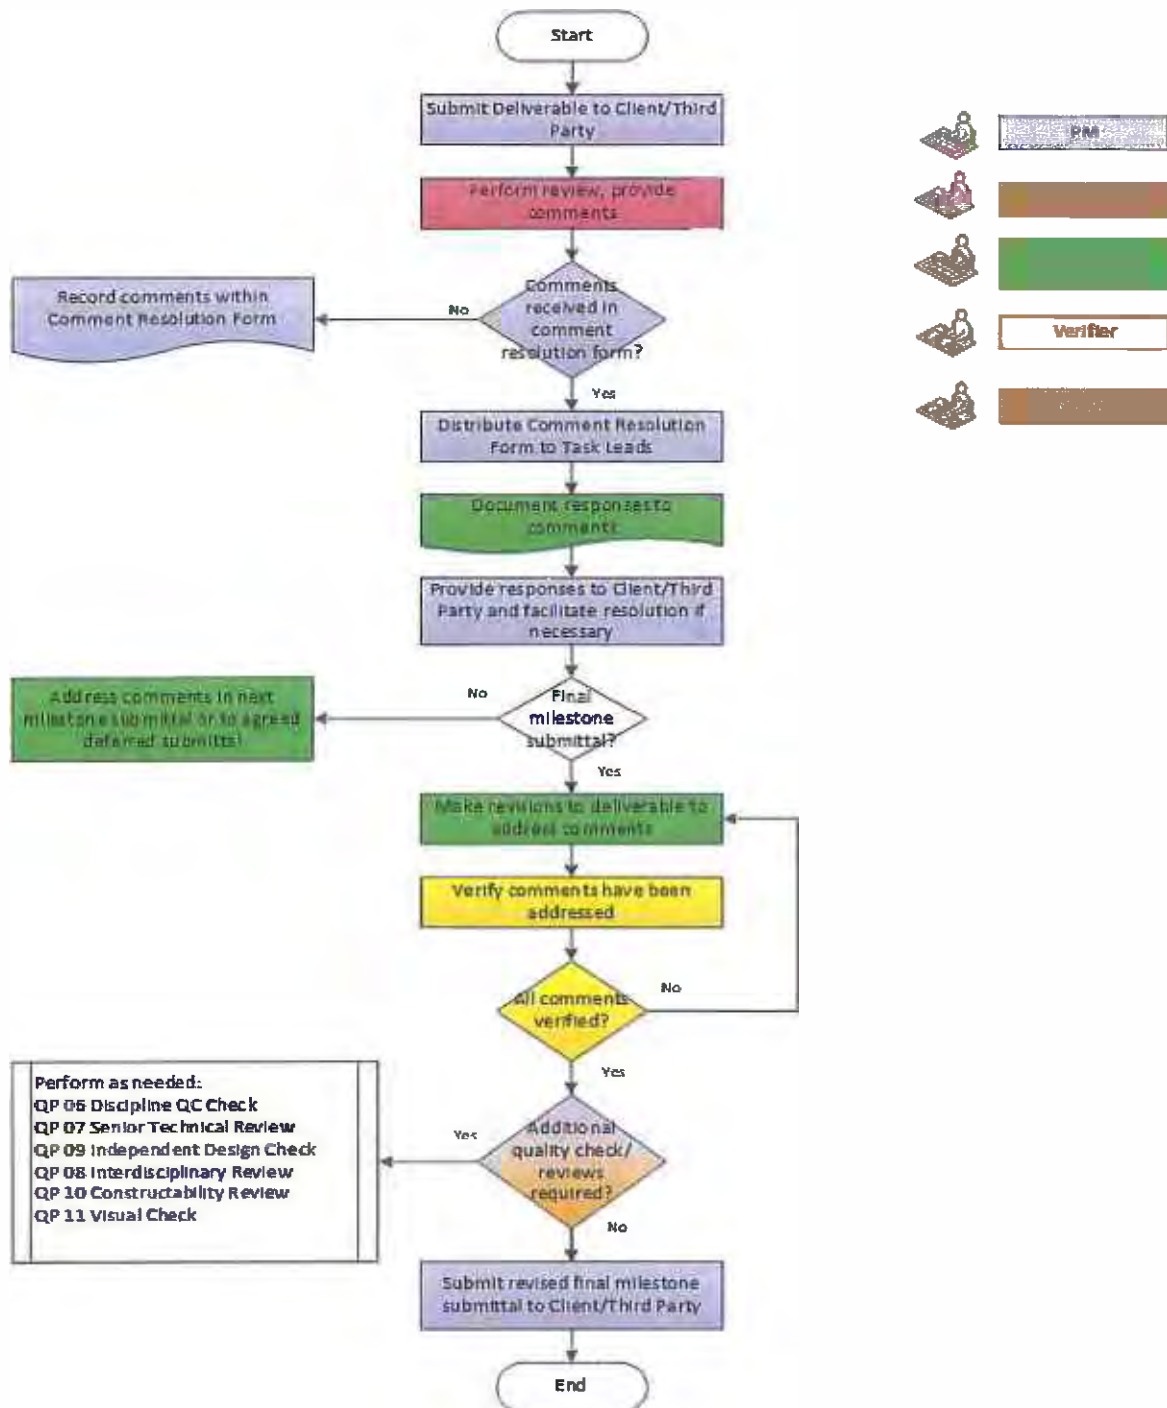

- 5.3 The PM, in concert with the Task Lead and the Engineer of Record (EOR), shall evaluate the requested change and approve or obtain approval in accordance with contract requirements. Changes impacting form, fit or function of the intended design shall be evaluated and approved by the EOR.
- 5.4 The PM, or designee, shall distribute the approved Design Change Request to the appropriate Task Lead or EOR to be addressed.
- 5.5 The Task Lead or EOR shall evaluate the approved change and determine the impact to other design documents or disciplines and notify the PM and other appropriate Task Leads.
- 5.6 The Task Lead(s) or EOR shall make appropriate revisions to design documents to address the requested design change.
- 5.7 The PM and DQAM shall determine the quality checks and reviews to be performed on the revised deliverable based upon the Client Deliverable Quality Matrix. If the decision is made, based upon the content of the change, for limited checks/reviews, concurrence of the PEX and/or DBCE shall be obtained.
- 5.8 The Task Lead shall submit the revised design deliverables for the required quality checks and reviews in accordance with the DQMP.
- 5.9 The DQAM shall perform QA Review on the revised design deliverables ensuring that all required quality checks and reviews have been completed and comments resolved and verified, in accordance with Procedure QP 12, QA Review and when contractually required, shall prepare a Certificate of Compliance, Form QF 07 indicating that the deliverable has been processed in accordance with the DQMP and that required quality checks and reviews have been performed.
- 5.10 The PM, or designee shall update Form QF 10, Design Change Request Log and shall provide revised design documents to the client in accordance with contractual requirements.
- 5.11 The PM shall maintain a copy of the approved Form QF 09, Design Change Request and Form QF 10, Design Change Request Log in accordance with Procedure QP 03, Control of Project Quality Records.

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities, and process for conducting Client/Owner/Third-Party Review of project deliverables using Bluebeam Revu and Studio Sessions. Client/Owner/Third-Party Review shall be governed by Procedure QP 13, Client/Owner/Third-Party Review and Comment.

2.0 SCOPE

This procedure shall apply to Client/Owner/Third-Party Review of project deliverables conducted in accordance with Procedure QP 13, Client/Owner/Third-Party Review and Comment when using Bluebeam to accomplish the review.

3.0 REFERENCES

3.1 QP 03, Control of Project Quality Records

3.3 Bluebeam Job Aids – Note, Additional job aids may exist beyond those specifically referenced in this procedure and are available in the [Bluebeam Resources Library](#).

4.0 ROLES and RESPONSIBILITIES

4.1 Project Manager (PM) or Designee – The PM or Designee shall be responsible for:

- 4.1.1 Determining in concert with the DQAM to utilize Bluebeam for Client, Owner, or Third-Party Review.
- 4.1.2 Working with the client to determine if Client/Owner/Third Party Internal Acceptance Team will be utilized.
- 4.1.3 Notifying the Bluebeam SME to facilitate project setup in Bluebeam and the provision of Bluebeam training.
- 4.1.4 Identifying those Reviewers who will be participating in the Bluebeam Studio Session.
- 4.1.5 Communicating in concert with the DQAM the use of Bluebeam to perform and capture records of Client/Owner/Third-Party Review.
- 4.1.6 Creating, configuring, and publishing the original deliverable in pdf file format to the Bluebeam Studio Session and for inviting the Reviewers to attend the Bluebeam Studio Session.
- 4.1.7 Managing the Bluebeam Studio Session throughout the review.
- 4.1.8 Publishing the revised deliverables to the Bluebeam Studio Session to the Reviewers for verification.
- 4.1.9 Entering from QF 04, Comment Resolution Form, all "**5.4 Defer Comment**" comments from **previous** reviews so they can be addressed or noted as resolved.
- 4.1.10 Finishing the Bluebeam Studio Session, creating the markup summary reports.
- 4.1.11 Creating the QF 04, Comment Resolution Form listing of any comments "**5.4 Defer Comment**" resulting from the **current** Bluebeam Studio session.
- 4.1.12 Maintaining records of Client/Owner/Third-Party Review.

4.2 Design Quality Assurance Manager (DQAM) – The DQAM shall be responsible for:

- 4.2.1 Working with the PM or Designee to communicate the use of Bluebeam to perform and capture records of Client-Owner-Third Party Review.
- 4.2.2 Coordinating with the Bluebeam SME to ensure training is provided to Designers and Reviewers.

4.3 Client/Owner/Third-Party Reviewers (Reviewer)- The Reviewers shall be responsible for:

- 4.3.1 Attending the Bluebeam Studio Session to perform the review electronically.
- 4.3.2 Documenting comments resulting from the review within the Bluebeam Studio Session

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 19
Bluebeam Client/Owner/Third-Party Comment and Resolution	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 11

- using the "QP19 BB Client/Owner/Third-Party Review" profile.
- 4.3.3 Reviewing and discussing the results with the PM, designee, or Design Response Team, reconciling comments, and agreeing upon revisions to be made.
 - 4.3.4 Attending any coordination meeting to discuss the response to their comments.
 - 4.4 Client/Owner/Third-Party Internal Acceptance Team** - The Client/Owner/Third-Party Internal Acceptance Team (when used as part of this process) shall be responsible for:
 - 4.4.1 Attending the Bluebeam Studio Session to perform the review electronically.
 - 4.4.2 Reviewing comments made by Reviewers and noting approval that the comment requires a response by the Designer or not by setting the Reviewer comment status.
 - 4.4.3 Reviewing and discussing the results with the PM, designee, or Design Response Team, reconciling comments, and agreeing upon revisions to be made.
 - 4.4.4 Attending any coordination meeting to discuss the response to their comments.
 - 4.5 Design Response Team** – The Design Response Team shall be responsible for:
 - 4.5.1 Responding to and resolving comments made by Reviewers, setting the comment status.
 - 4.5.2 Making revised deliverables available to the PM or designee for publishing within the Bluebeam Studio session for verification.
 - 4.6 Designer Verifier** – The Designer Verifier shall be an independent member of the design team (not the Design Response Team), and shall be responsible for:
 - 4.6.1 Attending the Bluebeam Studio Session to perform verification.
 - 4.6.2 Reviewing revised documents and verifying that revisions have been made in accordance with agreed upon resolutions, including verification of comments **"5.4 Defer Comment"** from previous reviews.
 - 4.6.3 Documenting verification using the QP19 BB Client/Owner/Third-Party Review profile, including setting the comment status.
 - 4.7 Reviewer Verifiers** – The Reviewer Verifiers shall be responsible for:
 - 4.7.1 Attending the Bluebeam Studio Session to perform verification.
 - 4.7.2 Reviewing revised documents and verifying that revisions have been made in accordance with agreed upon resolutions, including verification of comments **"5.4 Defer Comment"** from previous reviews.
 - 4.7.3 Reviewing Designer responses of **"2.2 Disagree"**, **"2.3 Clarification Required"**, and **"2.4 Not At This Stage"**, by setting the Verifier status accordingly and inputting replies.
 - 4.7.4 Documenting verification using the QP19 BB Client/Owner/Third-Party Review profile, including setting the comment status.
 - 4.8 Bluebeam Subject Matter Expert (SME)** – The Bluebeam SME shall be responsible for:
 - 4.8.1 Providing training, guidance, and support in the implementation of Bluebeam and Studio Sessions.

5.0 PROCEDURE

5.1 Planning

- 5.1.1 The PM shall determine in concert with the client and DQAM whether to use Bluebeam for Client/Owner/Third-Party Review.
- 5.1.2 The PM shall work with the client to determine if Client/Owner/Third Party Internal Acceptance Team will be used to reconcile comments prior to the Designer's response.
- 5.1.3 Upon determining to use Bluebeam, the PM, or designee, shall notify the Bluebeam SME a minimum of 30 days prior to the need to use the tool for the purposes of project setup within Bluebeam and training of Reviewers and Designers.
- 5.1.4 The PM, or designee, shall identify the Reviewers required to participate in the review process.
- 5.1.5 The DQAM shall coordinate with the Bluebeam SME to ensure Bluebeam Training is provided to all Reviewers. Note: Reviewers shall not be given access to the review session until they have received training.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 19
Bluebeam Client/Owner/Third-Party Comment and Resolution	Revision Number: 0	Revision Date: 6/19/23	Page 3 of 11
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- 5.1.6 All Studio Session hosts and participants will need to create a Studio Account to access the Studio Session, see [Job Aid, 0.1 Creating a Studio Account](#) for instructions.
- 5.1.7 The PM, DQAM, or designee, shall provide the "QP19 BB Client-Owner-Third-Party Review.bpx" file to the review team to install, see [Job Aid, 0.3 Install QP 19 BB Client-Owner-Third-Party Review](#) for instructions.

5.2 Configuring PDFs for a Studio Session – The PM or designee shall prepare and configure all pdfs hosted in a Studio Session by imbedding and verifying the Managed Statuses for QP19 BB Client-Owner-Third Party Reviewer into the PDF, enabling/disabling the appropriate Managed Status Model, flattening all "Autodesk SHX Text", and incorporate all deferred comments from previous milestones, see [Job Aid 1.0: Preparing and Configuring PDF Review Documents](#) for instructions. Note: This must be done **prior** to adding the pdfs to the Studio Session.

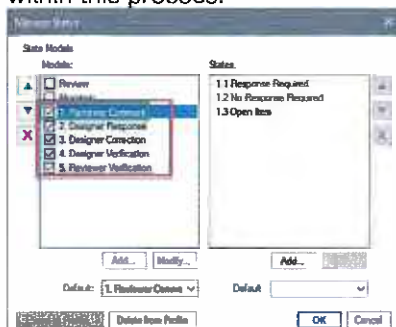

- 5.2.1 The PM or designee shall compile the deliverable package(s) for current review and any **"5.4 Defer Comment"** comments from previous milestones, including a description of how those comments were resolved, so the checker can verify resolution.
- 5.2.2 Assure that the active profile is **"QP19 BB Client-Owner-Third Party Review"**.

- 5.2.3 Open each .pdf document that will be included in the session.
- 5.2.4 Open the Manage Status dialog from the Markups list settings icon on the Status column.

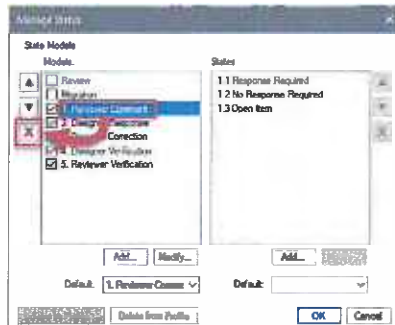

- 5.2.5 Verify the appropriate model and states are present. The **"1. Reviewer Comment"** is an optional model, based upon the use of Client/Owner/Third Party Internal Acceptance within this process.

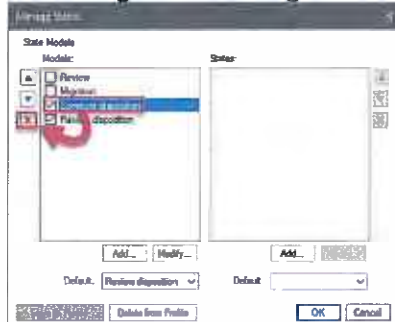

- 5.2.6 When a Client/Owner/Third-Party Internal Acceptance Team is not used, select the **"1. Reviewer Comment"** Model option and select the red **"X"** button to delete.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 19
Bluebeam Client/Owner/Third-Party Comment and Resolution	Revision Number: 0	Revision Date: 6/19/23	Page 4 of 11
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- 5.2.7 If the incorrect statuses are present, delete each model state, and then close and reopen the Manage Status dialog and verify the correct statuses are present as shown in section

- 5.2.8 Note that you cannot delete the default models "Review" and "Migration"; however, you do want to verify that these models are not enabled in the Managed Status dialog.
- 5.2.9 Save the document.
- 5.2.10 Repeat steps 5.2.1 through 5.2.9 embed and verify the correct statuses are added to each pdf to be included within the review.
- 5.2.11 When using the electronic CheckPrint Stamp for tracking of review activities, import the "Document Check" stamp provided in the "Stamps" toolset.
- 5.2.12 Verify that there aren't any undesired existing comments in the pdf, or that there aren't any "AutoCAD SHX Text" markups identified in the Markups List. If so, flatten the markups (Ctrl+Shift+M) within the pdf and enable the option to unflatten the markups displayed in the markups list.
- 5.3 Creating a Studio Session – The PM or designee shall publish the configured .pdfs(s) to a Bluebeam Studio Session and invite review participants to attend the session, as outlined in Job Aid, 1.1 Creating a Studio Session.**
- 5.3.1 Start a new Bluebeam Studio Session.
- 5.3.2 Define the Bluebeam Studio Session name. Required naming convention is [HNTB Project Number]-[Project Name]-[Review Milestone]-[Type-Review]-[Review Package]; i.e. "54321-Alpha Bridge Design-30%-CCR-Segment 1 Structures Pac". The maximum Studio Session name length is 60 characters.
- 5.3.3 Add the configured .pdf(s) to the Session.
- 5.3.4 Set Session Permission Options as required.
- 5.3.5 The PM, or designee, shall enter all "5.4 Defer Comment" comments from previous milestones, including a description of how those comments were resolved, so Reviewers can verify resolution.
- 5.3.6 Add the identified required attendees to the Bluebeam Studio Session by automatic invitation. Note: It is easier to add participants by creating a Contact Group in Outlook and then using the Address Book option for the Attendees dialog when creating a Session.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 19
Bluebeam Client/Owner/Third-Party Comment and Resolution	Revision Number: 0	Revision Date: 6/19/23	Page 5 of 11
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- 5.3.7 An optional message shall be entered with the schedule of the Client-Owner-Third Party Review, in accordance with the Start and End Dates in the Client Deliverable Quality Matrix. In addition to the automated email through Bluebeam. It is recommended that a separate email be sent with additional information about the review requirement also be sent, see **Job Aid, 1.2 Follow Up Email Example**.

5.4 Reviewer Comment–

5.4.1 Creating Comments:

The Reviewers shall join the Bluebeam Studio Session, see **Job Aid, 2.0 Joining into a Studio Session** for instructions, and document their review comments by using the toolset included in the "QP19 BB Client-Owner-Third Party Review" profile. Comments shall be detailed enough to facilitate understanding of the exact nature of the comment. Note: Remember to Group (Select items and Ctrl+G) comments together if they are intended to be tracked in the markups list as one comment, see Grouping Markups in **Job Aid, 2.5 Creating Markups**.

- 5.4.2 If the Reviewer has no comments, they shall place the "**No Comments**" stamp on the first sheet of the document to provide evidence of the review.

5.4.3 Setting the Status, see **Job Aid, 2.1 Setting the Status** for instructions;

Only in instances in which the Client makes use of an Internal Acceptance Team to reconcile comments prior to distribution to the Designer Team, Internal Acceptance Team shall review all comments provided by the Reviewers and set the 1. Reviewer Comment status in the markup list for each comment.

- **1.1 Response Required** – This markup status is intended to identify comments that the acceptance reviewer determines that the design team should respond to.
- **1.2 No Response Required** – This markup status is intended to identify comments that the acceptance reviewer determines that the design team should not respond to.
- **1.3 Open Item** – This markup status is intended to identify comments that require additional discussion within the Reviewer organization before making a determination. Upon discussion and resolution, all "**1.3 Open Item**" must be reassigned a status of "**1.1 Response Required**" or "**1.2 No Response Required**". Markups shall not remain in an "**1.3 Open Item**" state.

- 5.4.4 The PM shall ensure that Reviewers and Internal Acceptance Teams (when used) complete their reviews and approval in accordance with the allotted review timeframe.

5.5 Designer Response –

- 5.5.1 The Task Lead/Designer shall attend the Bluebeam Studio Session and review all the Reviewers' comments. In the case when an Internal Acceptance Team is used, the Task Lead/Designer shall only review those comments with a status of "**1.1 Response Required**". To aid in identifying those comments, it is recommended to use the filter feature to filter the Status column in the markups list by "**1.1 Response Required**", See **Job Aid, 2.2 Filtering the Markups List** for instructions.

5.5.2 Setting the Status, see **Job Aid, 2.1 Setting the Status** for instructions;

The Task Lead/Designer shall set the 2. Designer Response status for all comments.

- **2.1 Agree** - This markup status is intended to identify comments for which the design team agrees with the Reviewer comment and will revise the deliverable to address the comment. The Design Team shall use the Reply feature, when necessary to document additional detail that may be needed to address the comment.
- **2.2 Disagree** - This markup status is intended to identify comments for which the design team disagrees with the Reviewer's comment and therefore will take no further action. The Design Team shall use the Reply feature for all "**2.2. Disagree**" status comments to clarify the disagreement and communicate why the comment will not be addressed and send an Alert to the Reviewer.
- **2.3 Clarification Required** – This markups status is intended to identify comments that need more information provided by the Reviewer to fully understand the

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 19
Bluebeam Client/Owner/Third-Party Comment and Resolution	Revision Number: 0	Revision Date: 6/19/23	Page 6 of 11
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

comment. The Design Team shall use the Reply feature to describe the clarification needed and send an Alert to the Reviewer.

- **2.4 Not At This Stage** - This markup status is intended to identify comments that may or may not require revision to resolve, but which will be addressed in a subsequent milestone/phase review. The Design Team shall use the Reply feature to document the rationale for deferral and the milestone to which it is to be deferred and send an Alert to the Reviewer.

5.5.3 Adding a Reply, see **Job Aid, 2.3 Adding a Reply to a Markup** for instructions; The Designer shall add a Reply to all markups with a status of **"2.2 Disagree"**, **"2.4 Not at This Stage"**, and **"2.3 Clarification Required"** and may also add a Reply to markups with a status of **"2.1 Agree"** when additional information is to be provided to the Updater.

5.5.4 Sending a Markup Alert, see **Job Aid, 2.4 Creating a Markup Alert** for instructions; The Designer may send a Markup Alert to bring attention to a markup as needed. Additional follow up communications may be required to provide details on the alert.

5.5.5 The Designer shall also review all markups with a status of **"3.2 Clarification Required"**, which indicates that the Updater needs additional information to resolve the markup. The Designer shall respond using the Reply feature to provide clarifying information to the Updater on how to resolve the markup and update the 2. Designer Response status.

- Filter the Status column by **"3.2 Clarification Required"**.
- Review the Reply from the Updater.
- Add a Reply to clarify how to resolve the markup and set the status back to **"2.1 Agree"** to move the markup back into the Updater's court. Replies should be sufficiently detailed to facilitate effective resolution.
- Send a Markup Alert to the Design Updater.

5.5.6 The Designer shall also review the markups with a status of **"5.2 Rejected as Noted"**, which indicates that the Reviewer Verifier rejected the response provided and requires a different response to resolve the comment. The Designer shall respond to the Reviewer Verifier using the Reply feature and setting the status accordingly. Replies should be sufficiently detailed to inform the Verifier how/why the rejection will be resolved.

- Filter the Status column by **"5.2 Rejected as Noted"**.
- Review the reply from the Reviewer Verifier.
- Add a Reply and set the 2. Designer Response status accordingly.
- Send a Markup Alert to the Reviewer Verifier.

5.6 Designer Update –

5.6.1 The Design Updater shall join into the Studio Session, review **ALL** markups with a **"2.1 Agree"** or **"4.2 Revise as Noted"** status, and resolve them in the native file according to the Designer's direction. When necessary, the Design Updater can request additional information from the Designer by setting the status to **"3.2 Clarification Required"** and shall use the Reply feature to document additional direction requested.

5.6.2 Filtering the Markups List, see **Job Aid, 2.2 Filtering the Markups List** for instructions.; Filter the Status column by **"2.1 Agree"** and **"4.2 Revise as Noted"** in the Markups List to identify all markups that are to be updated.

5.6.3 Setting the Status, see **Job Aid, 2.1 Setting the Status** for instruction; The Design Updater shall set the 3. Designer Update status to all markups with a **"2.1 Agree"** and **"4.2 Revise as Noted"** status in the markups list after the revision has been completed on the original deliverable in its native format. When the 3. Designer Update status is set, it will serve as the indicator to the Design Verifier that the markup is ready to be verified when the updated document is provided.

- **3.1 Updated** - This markup status is intended to identify markups for which revisions to the original document have been completed in accordance with the Designer's response.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 19
Bluebeam Client/Owner/Third-Party Comment and Resolution	Revision Number: 0	Revision Date: 6/19/23	Page 7 of 11
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- **3.2 Clarification Required** – This markup status is intended to identify markups for which additional information is required from the Designer to revise the original document. The Designer shall use the Reply feature to provide the additional information requested and set the status to **"2.1 Agree"** to put the markup back in the Design Updater's court. When the additional information is provided by the Designer, the Design Updater shall make the updates as noted in the Reply and set the status to **"3.1 Updated"**. A Markup Alert can be sent to the Designer to expedite the review process.
- 5.6.4 Adding a Reply, see **Job Aid, 2.3 Adding a Reply to a Markup** for instructions; The Design Updater shall add a reply to a markup that they set the status to **"3.2 Clarification Required"** to notify the Designer that additional information is needed to resolve the markup.
- 5.6.5 Sending a Markup Alert, see **Job Aid, 2.4 Creating a Markup Alert** for instructions; The Design Updater may send an Alert to either the Designer or Verifier to expedite the review process.
- 5.6.6 The Design Updater shall also resolve any markups where the Design Verifier sets the status to **"4.2 Revise as Noted"**, indicating the markup was not resolved in accordance with the Designer's direction.
 - Filter the Status column by **"4.2 Revise as Noted"**.
 - Review the Reply from the Design Verifier and make revisions as noted in the native file.
 - If input from the Designer is required set the Status to **"3.2 Clarifications Required"** and add a Reply describing the additional information needed to resolve the markup.
 - When the revision is completed, set the Status to **"3.1 Updated"**.
- 5.6.7 The Design Updater shall provide an updated pdf(s) to the Session host to be published into the Studio Session for verification by the Design Verifier.
- 5.7 Designer Verification –**

The Design Verifier shall join the Bluebeam Studio Session to verify and document that markups have been resolved within the revised pdfs published to the Studio Session. To aid in this task, use the Filter function in the Markups List, the Split Screen, and the View Synchronization features to view and navigate the original and revised document simultaneously, see **Job Aid 2.5 Split Screen and Synchronize View** for instructions.
- 5.7.1 Filtering the Markups List, see **Job Aid, 2.2 Filtering the Markups List** for instructions; Filter the Status column by **"3.1 Updated"** in the Markups List to identify all markups that the Reviewer originated that were updated and ready for verification.
- 5.7.2 Setting the Status, see **Job Aid, 2.1 Setting the Status** for instruction; The Design Verifier shall set the 4. Designer Verification as noted below to the markups to verify.
 - **4.1 Verified** – This markup status is intended to identify markups that have been resolved acceptably when compared to the revised document.
 - **4.2 Revise as Noted** – This markup status is intended to identify those markups wherein the update has not been made in accordance with the Designer's direction. Reply to the markup with clarifying information on how to resolve the markup. A Markup Alert shall be sent to the Updater to expedite the review process.
- 5.7.3 Adding a Reply, see **Job Aid, 2.3 Adding a Reply to a Markup** for instructions; The Design Verifier shall add a Reply to all markups in which they set the stats to **"4.2 Revise as Noted"** to provide the rationale and further direction to the Updater.
- 5.7.4 Sending a Markup Alert, see **Job Aid, 2.4 Creating a Markup Alert** for instructions; The Design Verifier shall send an Alert to the Updater when the Status is set to **"4.2 Revise as Noted"** and to bring attention to a markup and expedite the review process. Additional follow up communications may be required to provide details on the alert.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 19
Bluebeam Client/Owner/Third-Party Comment and Resolution	Revision Number: 0	Revision Date: 6/19/23	Page 8 of 11
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

5.8 Reviewer Verification –

The Reviewers shall join the Bluebeam Studio Session, and verify and document that markups they originated, or have been designated to verify, have been resolved, unchanged, or deferred as agreed upon within the revised document. To aid in this task, use the Filter function in the Markups List to filter the Author column by YOUR name, and use the Split Screen and View Synchronization features to view and navigate the original and revised document simultaneously, see **Job Aid 2.5 Split Screen and Synchronize View** for instructions.

5.8.1 Filtering the Markups List, see **Job Aid, 2.2 Filtering the Markups List** for instructions; Filter the Status column by **"4.1 Verified"** AND the Author column by the **Reviewer's name** in the Markups List to identify all markups that the Reviewer originated that were updated, and ready for verification.

5.8.2 Setting the Status, see **Job Aid, 2.1 Setting the Status** for instruction; The Reviewers shall set the 5. Reviewer Verification status of each their markups(s) based on the Designer's response provided compared to the revised document.

- **5.1 Accepted and Verified** – This markup status is intended to identify comments for which the Reviewer accepts the design team's response to the original comment and that the revisions resolve the original intent of the comment.
- **5.2 Rejected as Noted** – This markup status is intended to identify those markups wherein the Reviewer rejects the Designer's response status of **"2.2 Disagree"** or **"2.3 Not At This Stage"**, or the Designer Verification status of **"4.1 Verified"** in instances in which the Designer's resolution does not meet the original intent of the comment. Reply to the markup with the rationale for rejection of the Designer's response. A Markup Alert shall be sent to the Designer to expedite the review process.
- **5.3 Clarification Provided** – This markup is used to indicate additional information has been provided in response to the **"2.3 Clarification Required"** status selected by the Designer. The Task Lead/Designer shall review the additional information and set the 2. Designer Response status accordingly. Should additional clarification still be required, a comment resolution meeting with the Reviewer shall be convened with the resulting decision being processed in accordance with this procedure.
- **5.4 Defer Comment** – This markup status is intended to identify comments for which the Reviewer agrees with the Design Team's rationale and milestone to which the comment will be deferred for this comment with a status of **"2.4 Not At This Stage"**.

5.8.3 Adding a Reply, see **Job Aid, 2.3 Adding a Reply to a Markup** for instructions; The Reviewer Verifier shall add a Reply to all markups in which they set the stats to **"5.2 Rejected as Noted"** and **"5.3 Clarification Provided"** to provide the rationale and further direction to the Designer.

5.8.4 Sending a Markup Alert, see **Job Aid, 2.4 Creating a Markup Alert** for instructions; The Reviewer Verifier shall send an Alert to the Designer when the Status is set to **"5.2 Rejected as Noted"** and **"5.3 Clarification Provided"** to bring attention to a markup and expedite the review process. Additional follow up communications may be required to provide details on the alert.

5.8.5 The Reviewer Verifier shall also review the markups with a Designer Response status of **"2.2 Disagree"**, which indicates that the Designer does not agree with the markup. The Reviewer Verifier shall respond using the Reply feature, change the status, and may send a Markup Alert to the Designer.

- Filter Author column by YOUR name and Status Column by **"2.2 Disagree"**.
- Review the Reply from the Designer.
- If the Reviewer Verifier doesn't concur with the Designer's status, they shall use the Reply feature to note disagreement with the **"2.2 Disagree"** and set the status

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 19
Bluebeam Client/Owner/Third-Party Comment and Resolution	Revision Number: 0	Revision Date: 6/19/23	Page 9 of 11
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

accordingly to **"5.2 Rejected as Noted"** to move the markup back into the Designer's court. Replies should be sufficiently detailed to facilitate effective resolution. Send a Markup Alert to the Designer.

- If the Reviewer Verifier concurs with the Design's status, they shall set the status accordingly to **"5.1 Accepted and Verified"** to confirm the markup will not be addressed.

5.8.6 The Reviewer Verifier shall also review the markups with a Designer status of **"2.3 Not At This Stage"**, which indicates that the Designer may agree with the markup but prefers to address in a future milestone. The Reviewer Verifier shall respond using the Reply feature, change the status, and may send a Markup Alert to the Designer.

- Filter Author column by YOUR name and Status Column by **"2.3 Not At This Stage"**.
- Review the Reply from the Designer.
- If the Reviewer Verifier doesn't concur that the markup should be deferred, they shall use the Reply feature to note disagreement with the **"2.3 Not At This Stage"** and set the status accordingly to **"5.2 Rejected as Noted"** to move the markup back into the Designer's court. Replies should be sufficiently detailed to facilitate effective resolution.
- Send a Markup Alert to the Designer.
- If the Reviewer Verifier agrees that the markup should be deferred, they shall set the status accordingly to **"5.4 Defer Comment"** to confirm delaying resolution until the identified milestone.

5.9 **Finishing a Studio Session:** After all the markups have been verified as agreed upon, the PM, or designee, shall Finish the Bluebeam Studio Session to download the session document, see **Job Aid 3.0 Finishing a Studio Session**.

5.10 **Generating Markups Summaries:**

The session host shall create QC Markup Summary reports for each review pdf and if needed complete the Form QF 04, Comment Resolution Form for all markups that have not been resolved during the current review milestone, see **Job Aid 3.1 Generating Markup Summaries** for instructions.

5.10.1 QP19 QC Markup Summary

The QC Markup Summary report shall be created for and appended to each review document. The combined QC Review Document and the appended QC Markup Summary comprise the QC Record Files for the project.

5.10.2 QP19 Deferred Comment Summary

If the Reviewer Verification status was set to **"5.4 Defer Comment"** the Designer shall generate a report from Bluebeam showing those comments and transfer them to Form QF 04, Comment Resolution Form in accordance with Procedure QP 03, Control of Project Quality Records for inclusion in the subsequent review. If the review is the final review no comments shall be left in a status of **"5.4 Defer Comment"**.

5.11 **Storing a Record Document** –The Designer, shall maintain a copy of this summary report along with copies of all electronic CheckPrints in accordance with Procedure QP 03, Control of Project Quality Records.

1.0 PURPOSE

The purpose of this procedure is to define the roles, responsibilities and processes required for performing digital checks and reviews of project deliverables using Bluebeam Revu and Studio Sessions. The check/review process shall be governed by the over-arching QMS procedures, QP 06, Discipline QC Check; QP 07, Senior Technical Review; QP 08, Interdisciplinary Review; and QP 10, Constructability Review.

2.0 SCOPE

This procedure shall apply to quality checks and reviews conducted in accordance with QMS procedures QP 06, Discipline QC Check; QP 07, Senior Technical Review; QP 08, Interdisciplinary Review; and QP 10, Constructability Review, when using Bluebeam to accomplish this check/review.

It must be noted that all markups, statuses, and replies entered into Bluebeam as dictated by this procedure shall be sufficiently detailed to support complete and accurate actions by the responsible parties. All markups, statuses and replies constitute part of the quality records for the project and should be treated professionally. It should also be noted that use of the Bluebeam markup, status and reply system is not intended to replace verbal conversations to understand issues quickly and thoroughly.

4.0 ROLES and RESPONSIBILITIES

4.1 Project Manager (PM) – The PM shall be responsible for:

- 4.1.1 Determining in concert with the DQAM to utilize Bluebeam for quality checks/reviews for project deliverables.
- 4.1.2 Identifying those individuals who will be participating in the quality check/review process and determining if Bluebeam training is necessary for session hosts and/or check/review participants.
- 4.1.3 Communicating to the project team, in concert with the DQAM, the use of Bluebeam to perform and capture records of quality checks/reviews.
- 4.1.4 Resolving escalated conflicts between Task Leads and Reviewers and identifying solutions.

4.2 Design Quality Assurance Manager (DQAM) – The DQAM shall be responsible for:

- 4.2.1 Working with the PM to communicate the use of Bluebeam to perform and capture records of quality checks/reviews using Bluebeam and Studio Sessions.
- 4.2.2 Coordinating with the Bluebeam SME to provide Bluebeam Reviewer and/or Session Host training if needed.
- 4.2.3 Determining in concert with the PM and/or Originator the individuals who will be involved in the Bluebeam quality review process and communicating their roles to identified individuals.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 20
Bluebeam QMS Review	Revision Number: 0	Revision Date: 6/19/23	Page 2 of 10
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

4.3 Originator – The Originator shall be a qualified individual with sufficient, relevant experience in the area of what is to be produced, and shall be responsible for:

- 4.3.1 Configuring all pdfs for review or verification.
- 4.3.2 Creating and hosting the Bluebeam Studio Session by publishing the original review document(s) to a Bluebeam Studio Session and invite attendees.
- 4.3.3 Publishing all deferred markups “**4.4 Defer Comment**” comments from QF 04, Comment Resolution Form from **previous** milestones into the Studio Session.
- 4.3.4 Managing the Bluebeam Studio Session throughout the review.
- 4.3.5 Publishing the revised deliverables to the Bluebeam Studio Session for verification.
- 4.3.6 Finishing the Bluebeam Studio Session when the review is complete.
- 4.3.7 Creating and appending the QC Markup Summary report.
- 4.3.8 Populating the QF 04, Comment Resolution Form with Deferred Comments from the Studio Session.
- 4.3.9 Storing and maintaining the quality records of checks/reviews in the project's quality record repository.

4.4 Checker – The Checker shall be a qualified individual with sufficient, relevant experience in the area of what is to be checked, and in some cases, may possess specific subject matter expertise. The Checker shall be independent of the Originator of the deliverable being checked, but should have familiarity with the client, project requirements and the approved design criteria. The Checker shall be responsible for:

- 4.4.1 Attending the Bluebeam Studio Session to perform the review.
- 4.4.2 Documenting review comments within the Bluebeam Studio Session and setting the status.
- 4.4.3 Verifying and documenting the resolution of “**4.4 Defer Comment**” comments from previous milestones.
- 4.4.4 Attending Resolution Meeting(s) when necessary.
- 4.4.5 Replying to markups within the Bluebeam Studio Session.
- 4.4.6 Sending Alerts within the Bluebeam Studio Session.

4.5 Backchecker – The Backchecker (typically the Originator) shall be responsible for:

- 4.5.1 Attending the Bluebeam Studio Session to backcheck ALL review markups and setting the status.
- 4.5.2 Coordinating with the Checker to conduct Resolution Meeting(s) when needed.
- 4.5.3 Replying to markups within the Bluebeam Studio Session.
- 4.5.4 Sending Alerts within the Bluebeam Studio Session.

4.6 Updater – The Updater (may be the Originator or a CADD technician) shall be responsible for:

- 4.6.1 Attending the Bluebeam Studio Session and review all markups.
- 4.6.2 Requesting clarification from the Backchecker when needed.
- 4.6.3 Making revisions to deliverables in accordance with markups.
- 4.6.4 Setting the status within the Bluebeam Studio Session.
- 4.6.5 Providing an updated .pdf copy of the deliverable to the Originator for inclusion into the Bluebeam Studio Session for purposes of verification.
- 4.6.6 Sending Alerts within the Bluebeam Studio Session.

4.7 Verifier – The Verifier (must be the Checker or another qualified independent party, when the Checker is unavailable, i.e., not the Originator, Backchecker or Updater) shall be responsible for:

- 4.7.1 Attending the Bluebeam Studio Session to verify markups which they originated or are designated to verify and setting the status.
- 4.7.2 Replying to markups in the Bluebeam Studio Session.
- 4.7.3 Sending Alerts within the Bluebeam Studio Session.

4.8 Bluebeam Subject Matter Expert (SME) – The Bluebeam SME shall be responsible for:

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 20
Bluebeam QMS Review	Revision Number: 0	Revision Date: 6/19/23	Page 3 of 10
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- 4.8.1 Coordinating with the DQAM to provide training resources for Bluebeam Training if required.

5.0 PROCEDURE

5.1 Planning

- 5.1.1 The PM, in concert with the DQAM, shall determine if the use Bluebeam Revu and Studio Sessions for the conducting of quality checks/reviews are appropriate and will be required.
- 5.1.2 When the use of Bluebeam Revu and Studio Sessions is required, the DQAM shall notify the Bluebeam SME for the purposes of coordinating any project setup and training of Studio Session hosts and review participants. The DQAM shall continue to coordinate Bluebeam training needs as team members change throughout the lifecycle of the project.
- 5.1.3 All Studio Session hosts and participants will need to create a Studio Account on studio.bluebeam.com to access the Studio Sessions. See [Creating a Bluebeam Studio Account](#) for instructions, see **Job Aid, 0.1 Creating a Studio Account**.
- 5.1.4 The PM, DQAM, or designee, shall provide the "QP20 BB HNTB QMS Review.bpx" to the review team to install, see **Job Aid, 0.2 Install QP 20 BB QMS Review Profile**.
- 5.1.5 The PM, DQAM, or designee, shall identify, document and communicate the quality check/review hosts and the review participants and their roles (Checker, Backchecker, Updater, Verifier) within the review.
- 5.1.6 Making a DMS connection to ProjectWise or SharePoint can be made to seamlessly work with documents on those systems, see **Job Aid, 1.3 Configuring SharePoint and ProjectWise DMS Connection**.

5.2 Preparing and Configuring PDF Review Documents

- 5.2.1 The Originator shall configure each pdf for review by embedding the profile's managed statuses into the pdf prior to adding the pdf(s) to the Studio Session as outlined in **Job Aid, 1.0 Preparing and Configuring PDF Review Documents**.

5.3 Creating a Studio Session

- 5.3.1 The Originator shall create and host the Bluebeam Studio Session, publishing the configured original deliverable pdf(s) into the Bluebeam Studio session and inviting attendees to attend the Bluebeam Studio Session as outlined in **Job Aid, 1.1 Creating a Studio Session**. Required naming convention is **[HNTB 5- digit Project Number]-[Project Name]-[Review Milestone]-[Type-Review]-[Review Package]**; i.e. "54321-Alpha Bridge Design-30%-DQC-Segment 1 Structures". The maximum character length for a Session name is 56. In addition to the automated email invitation sent from Studio, a follow up email to the session participants can be sent by the session host to provide details on the review expectations, and to reiterate individuals' roles (i.e. Checker, Backchecker, Updater and Verifier) and responsibilities in the process. An example of a follow up email can be found at **Job Aid, 1.2 Follow Up Email Example**.
- 5.3.2 The Originator shall Publish all "**4.4 Defer Comment**" comments from the QF 04, Comment Resolution Form from **previous** milestones into the current Studio Session, so they can be addressed or noted as resolved during the current session.
- 5.3.3 The Studio Session host shall manage the Bluebeam Studio Session throughout the review process:
- When a file is inadvertently added to a session without the managed statuses embedded or has the incorrect managed statuses added, the files must be removed from the session, correctly configured, and added back into the Studio Session, see **Job Aid, 1.4 Fixing a Session Document to Add or Change Managed Statuses**.
 - Monitoring to assure the 4-phase review process is progressing in accordance with

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 20
Bluebeam QMS Review	Revision Number: 0	Revision Date: 6/19/23	Page 4 of 10
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

this procedure. See **Job Aid, 2.2 Filtering the Markups List** for instructions.

- Providing mentorship and support to session participants as needed.
- Inviting additional Attendees as needed.
- Managing Access and Permissions.
- Adding revised PDFs for verification.
- Reactivating a finished Session when needed, see **Job Aid, 3.2 Reactivating a Studio Session** for instructions.
- Reassigning ownership of a session to another when needed, see **Job Aid, 3.3 Reassigning Ownership of a Studio Session** for instructions.
- Recovering deleted review documents when needed, see **Job Aid, 3.4 Recovering a Deleted Document** for instructions.

5.4 Checking

Once the checker has been informed that the review session is active, the Checker shall join the Bluebeam Studio Session, see **Job Aid, 2.0 Joining into a Studio Session** for instructions, to perform the quality checks/reviews, in accordance with the appropriate QMS procedures QP 06, Discipline QC Check; QP 07, Senior Technical Review; QP 08, Interdisciplinary Review; and QP 10, Constructability Review.

5.4.1 Creating Markups:

The Checkers/Reviewers should document review comments by using the QC Checker toolset included in the "**QP20 BB HNTB QMS Review**" profile to create markups. When the Checker chooses to use a markup tool other than those provided in the profile toolset, they must set the color to red. When conducting QP 06, Discipline QC Check, the Checker may use the "DQC" toolset to mark correct items in yellow. For details on using the markup tools, see **Job Aid, 2.6 Creating Markups**.

Comments shall be detailed enough to facilitate understanding by the Backchecker for response and resolution. Note: Group (Select items and Ctrl+G) comments together if they are intended to be tracked in the markups list as one comment.

If the Checker has no comments, the Checker shall enter a comment that reads "**No Comments**" on the first page of the document to provide evidence of completion of the review. A No Comment: stamp is provided in the Stamps toolset for this purpose. No Status is required to be set for the No Comment markup.

5.4.2 Setting the Status: See, **Job Aid, 2.1 Setting the Status** for instructions.

The Checker must set the status to "**1.2 Preferential/ For Information**" when this is the intended status. All markups without a "**1.2 Preferential/ For Information**" status, will be assumed as "**1.1 Requires Attention**" and must be managed in accordance with this procedure. The Checker may set the status of markups to "**1.1 Requires Attention**" when this is the intended status to serve as a notification to the Backchecker that the markup is ready for backcheck.

- **1.1 Requires Attention** – This markup status is intended to identify markups considered as deficiencies in the deliverable that may require revisions to resolve.
- **1.2 Preferential/ For Information** – This markup status is intended to identify markups that do not require revision but may provide better clarity in the deliverable, or as additional information for the Backchecker to consider.

5.4.3 When conducting the check/review, a toolset is available and may be used to mark correct items in yellow. No Status is required to be set for items highlighted as correct. To verify the status has been set as intended, the Checker may filter the markups list Author column by their name and the Status column by "blank". This will display any markup originated by the Checker that doesn't have a status set. See **Job Aid, 2.2 Filtering the Markups List** for instructions. Bulk markup's status can be set at the same time from the filtered list, see Checker – Bulk Status Setting section in **Job Aid, 2.1 Setting the Status**. If no status is set, it is assumed the markup requires attention.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 20
Bluebeam QMS Review	Revision Number: 0	Revision Date: 6/19/23	Page 5 of 10
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

5.5 Backchecking

The Backchecker shall join the Bluebeam Studio Session, see **Job Aid, 2.0 Joining into a Studio Session** for instructions, and review and respond to **ALL** the Checker's markups.

5.5.1 The Backchecker shall set the 2. Backchecker status for all markups in the markups list, add a Reply or Markup Alert as indicated below.

5.5.2 Setting the Status: See, **Job Aid, 2.1 Setting the Status** for instructions.

When the Backchecking status is set it will serve as the indicator to the Updater that the agreed markup is ready to be updated. Until the 2. Backchecker status is set, the markup is considered pending by the Updater, and no action shall be taken until the Backcheck status is set.

- **2.1 Agree** - This markup status is intended to identify markups for which the Backchecker agrees that the comment made by the Checker should be resolved as noted. Use the Reply feature when necessary to document additional detail that may be required to resolve the markup by the Updater.
- **2.2 Disagree** - This markup status is intended to identify markups in which the Backchecker does not agree with the comment made by the Checker, and therefore no revision should be made. Use the Reply feature to document the rationale for disagreement.
- **2.3 Not At This Stage** - This markup status is intended to identify markups that will be addressed in a subsequent milestone/phase review. These markups will be captured and included in subsequent reviews. Use the Reply feature to document the rationale for deferral and the milestone to which it is to be deferred.
- **2.4 No Action Required** - This markup status is only to be used for a markup with a status of "**1.2 Preferential/ For Information**" that does not require revision. No further status change is required, and the comment is considered closed and verified.

5.5.3 Adding a Reply: See **Job Aid, 2.3 Adding a Reply to a Markup** for instructions. The Backchecker shall add a Reply to **ALL** markups with a status of "**2.2 Disagree**" and "**2.3 Not at This Stage**" and may also add a Reply to markups with a status of "**2.1 Agree**" when additional information is to be provided to the Updater.

5.5.4 Sending a Markup Alert: See **Job Aid, 2.4 Creating a Markup Alert** for instructions. The Backchecker may send an Alert to bring attention to a markup as needed. Additional follow up communications may be required to provide details on the alert.

5.5.5 The Backchecker shall also review all markups with a status of "**3.2 Clarification Required**", which indicates that the Updater needs additional information to resolve the markup. The Backchecker shall respond using the Reply feature to provide clarifying information to the Updater on how to resolve the markup and update the 2. Backchecker status.

- Filter the Status column by "**3.2 Clarification Required**". See **Job Aid, 2.2 Filtering the Markups List** for instructions.
- Review the Reply from the Updater.
- Add a Reply to clarify how to resolve the markup and set the status back to "**2.1 Agree**" to move the markup back into the Updater's court. Replies should be sufficiently detailed to facilitate effective resolution.
- Send a Markup Alert to the Updater.

5.5.6 The Backchecker shall also review the markups with a status of "**4.2 Rejected as Noted**", which indicates that the Verifier rejected the status and reply from the Backchecker and requires a different response to resolve the comment. The Backchecker shall respond to the Verifier using the Reply feature and setting the status accordingly. Replies should be sufficiently detailed to inform Verifier how/why the rejection will be resolved.

- Filter the Status column by "**4.2 Rejected as Noted**". See **Job Aid, 2.2 Filtering the Markups List** for instructions.

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 20
Bluebeam QMS Review	Revision Number: 0	Revision Date: 6/19/23	Page 6 of 10
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

- Review the reply from the Verifier.
- Add a Reply and set the 2. Backchecker status accordingly.
- Send a Markup Alert to the Checker/Verifier.

5.5.7 If disputes cannot be resolved between the Backchecker and the Checker/Verifier, the issue shall be escalated to the PM/DM for resolution and upon resolution, the comment and status shall be updated to reflect discussion, directions and decisions.

5.6 Updating

The Updater shall Join into the Studio Session, see **Job Aid, 2.0 Joining into a Studio Session** for instructions, review **ALL** markups with a "2.1 Agree" status and resolve them in the native file, according to the Backchecker's direction. When necessary, the Updater can request additional information from the Backchecker by setting the status to "3.2 Clarification Required" and shall use the Reply feature to document additional direction requested. The Updater shall resolve any markups with a status of "4.3 Revise as Noted" set by the Verifier to identify markups that weren't resolved in accordance with the Backchecker's direction in the revision.

5.6.1 Filtering the Markups List: See **Job Aid, 2.2 Filtering the Markups List** for instructions. Filter the Status column by "2.1 Agree" in the Markups List to identify all markups that are to be corrected.

5.6.2 Setting the Status: See **Job Aid, 2.1 Setting the Status** for instructions.

The Updater shall set the 3. Updater status to all markups with a "2.1 Agree" status in the markups list after the revision has been completed on the original deliverable in its native format. When the 3. Updater status is set, it will serve as the indicator to the Verifier that the markup is ready to be verified when the updated document is provided. Until the 3. Updater status is set, the markup is considered pending by the Verifier.

- **3.1 Updated** - This markup status is intended to identify markups for which revisions to the original document have been made according to the agreed upon disposition and replies from the Backchecker.
- **3.2 Clarification Required** – This markup status is intended to identify markups for which additional information is required from the Backchecker to revise the original document. The Backchecker shall use the Reply feature to provide the additional information requested and set the status to "2.1 Agree" to put the markup back in the Updater's court. When the additional information is provided by the Backchecker, the Updater shall make the corrections as noted in the Reply and set the status to "3.1 Updated". A Markup Alert can be sent to the Backchecker to expedite the review process.

5.6.3 Adding a Reply: See **Job Aid, 2.3 Adding a Reply to a Markup** for instructions. The Updater shall add a reply to a markup that they set the status to "3.2 Clarification Required" to notify the Backchecker that additional information is needed to resolve the markup.

5.6.4 Sending a Markup Alert: See **Job Aid, 2.4 Creating a Markup Alert** for instructions. The Updater may send an Alert to either the Backchecker or Verifier to expedite the review process.

5.6.5 The Updater shall also resolve any markups where the Verifier sets the status to "4.3 Revise as Noted".

- Filter the Status column by "4.3 Revise as Noted". See **Job Aid, 2.2 Filtering the Markups List** for instructions.
- Review the Reply from the Verifier and make revisions as noted in the native file.
- If input from the Backchecker is required set the Status to "3.2 Clarifications Required" and add a Reply describing the additional information needed to resolve the markup.
- When the revision is completed, set the Status to "3.1 Updated".

5.6.6 The Updater shall provide an updated pdf to the session host to be published into the

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 20
Bluebeam QMS Review	Revision Number: 0	Revision Date: 6/19/23	Page 7 of 10
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

Studio Session for verification by the Verifier.

5.7 Verification

The Verifier shall join the Bluebeam Studio Session, see **Job Aid, 2.0 Joining into a Studio Session** for instructions, and verify and document that markups they originated, or have been designated to verify, have been resolved, unchanged, or deferred as agreed upon within the revised document. To aid in this task, use the Filter function in the Markups List to filter the Author column by YOUR name, and use the Split Screen and View Synchronization features to view and navigate the original and revised document easily. For instructions on using the Split Screen and Synchronizing View features, see **Job Aid, 2.5 Split Screen and Synchronizing Views**.

5.7.1 **Filtering the Markups List:** See **Job Aid, 2.2 Filtering the Markups List** for instructions.

Filter the Status column by **"3.1 Updated"** AND the Author column by the **Checker's name** in the Markups List to identify all markups that the Checker originated that were corrected, and ready for verification.

5.7.2 **Setting the Status:** See, **Job Aid, 2.1 Setting the Status** for instructions. The Verifier shall set the 4. Verifier status and Reply as noted below to ONLY the markups they originated or were designated to verify.

- **4.1 Accepted and Verified** – This markup status is intended to identify markups that have been resolved acceptably when compared to the revised document and no further action is required.
- **4.2 Revise as Noted** – This markup status is intended to identify those markups wherein the update has not been made in accordance with the Backchecker's direction. Reply to the markup with clarifying information on how to resolve the markup. A Markup Alert shall be sent to the Updater to expedite the review process.
- **4.3 Rejected as Noted** – This markup status is intended to identify those markups wherein the Verifier rejects the Backchecker's status of **"2.2 Disagree"** or **"2.3 Not At This Stage"**, or the Updater's status of **"3.1 Updated"** in instances in which the Backchecker's resolution of a **"2.1 Agree"** status does not meet the original intent of the comment. Reply to the markup with the rationale for rejection of the Backchecker's status. A Markup Alert shall be sent to the Backchecker to expedite the review process.
- **4.4 Defer Comment** – This markup status is intended to identify those markups wherein the Backchecker's status is set to **"2.3 Not At This Stage"** and the Checker agrees that the comment can be deferred until the designated milestone.

5.7.3 **Adding a Reply:** See **Job Aid, 2.3 Adding a Reply to a Markup** for instructions. The Verifier shall add a Reply to all markups in which they set the stats to **"4.2 Revise as Noted"** and **"4.3 Rejected as Noted"** to provide the rationale and further direction to the Updater or Backchecker.

5.7.4 **Sending a Markup Alert:** See **Job Aid, 2.4 Creating a Markup Alert** for instructions. The Verifier shall send an Alert to the Updater when the Status is set to **"4.2 Revise as Noted"** and to the Backchecker when the Status is set to **"4.3 Rejected as Noted"** to bring attention to a markup and expedite the review process. Additional follow up communications may be required to provide details on the alert.

5.7.5 The Verifier shall also review the markups with a Backchecker status of **"2.2 Disagree"**, which indicates that the Backchecker does not agree with the markup. The Checker shall respond using the Reply feature, change the status, and may send a Markup Alert to the Backchecker.

- Filter Author column by YOUR name and Status Column by **"2.2 Disagree"**. See **Job Aid, 2.2 Filtering the Markups List** for instructions.
- Review the Reply from the Backchecker.
- If the Verifier doesn't concur with the Backchecker's status, they shall use the Reply feature to note disagreement with the **"2.2 Disagree"** and set the status accordingly

HNTB	Prepared by: Kelly Lumen	Approved by: Lilly Acuña	Document number: QP 20
Bluebeam QMS Review	Revision Number: 0	Revision Date: 6/19/23	Page 8 of 10
Project Name: ATMP Roadway Improvement Project		Project No.: 71473	

to **"4.3 Rejected as Noted"** to move the markup back into the Backchecker's court. Replies should be sufficiently detailed to facilitate effective resolution. Send a Markup Alert to the Backchecker.

- If the Verifier concurs with the Backchecker's status, they shall set the status accordingly to **"4.1 Accepted and Verified"** to confirm the markup will not be addressed.

5.7.6 The Verifier shall also review the markups with a Backchecker status of **"2.3 Not At This Stage"**, which indicates that the Backchecker may agree with the markup but prefers to address in a future milestone. The Verifier shall respond using the Reply feature, change the status, and may send a Markup Alert to the Backchecker.

- Filter Author column by YOUR name and Status Column by **"2.3 Not At This Stage"**. See **Job Aid, 2.2 Filtering the Markups List** for instructions.
- Review the Reply from the Backchecker.
- If the Verifier doesn't concur that the markup should be deferred, they shall use the Reply feature to note disagreement with the **"2.3 Not At This Stage"** and set the status accordingly to **"4.3 Rejected as Noted"** to move the markup back into the Backchecker's court. Replies should be sufficiently detailed to facilitate effective resolution. Send a Markup Alert to the Backchecker.
- If the Verifier agrees that the markup should be deferred, they shall set the status accordingly to **"4.4 Defer Comment"** to confirm delaying resolution until the identified milestone.

5.8 Finishing the Studio Session: See **Job Aid, 3.0 Finishing a Studio Session** for instructions. After all the markups have been verified as agreed upon, the Originator, or designated host, shall "Finish" the Bluebeam Studio Session to download the session documents.

5.9 Generating Markups Summaries: See **Job Aid, 3.1 Generating Markup Summaries** for instructions.

The session host shall create QC Markup Summary reports for each review pdf and if needed complete the Form QF 04, Comment Resolution Form for all markups that have not been resolved during the current review milestone.

5.9.1 QC Markup Summary

The QC Markup Summary report shall be created for and appended to each review document. The combined QC Review Document and the appended QC Markup Summary comprise the QC Record Files for the project.

5.9.2 Deferred Comment Summary

All markups that have a final status when the session is finished of **"4.4 Defer Comment"** shall be documented within the Form QF 04, Comment Resolution Form. A CSV Markups Summary report can be created to assist with completing the Form QF 04, Comment Resolution Form.

5.10 Storing QC Record Files

The Originator, or designee, shall file copies of all Markups and Summary Reports within the project quality record repository in accordance with Procedure QP 03, Control of Project Quality Records.

6.0 QUALITY RECORDS

Enter client deliverables from Work Plan/Scope. For each deliverable, enter the planned or target start and end dates for each review (review periods to include comment resolution and verification). Enter "N/A" in Start Date column for checks/reviews which are not required for a specific deliverable. Reviews to the left of QA Review must be completed and comments resolved prior to QA Review completion. **Note: Discipline QC Check, Visual Check, and QA Review are mandatory for all deliverables, Interdisciplinary Review is also mandatory for all deliverables involving more than one discipline.** Add additional rows as necessary. Please see the Tab entitled "Descriptions of Reviews" for guidance on selecting reviews.

Procedure	Name	Description
-	Field Review	This review is generally performed during design development to assure or confirm assumptions about the actual field condition. May apply in instances where heavy development may cause rapid changes in field conditions.
QP 04	Over the Shoulder Review	This review is generally applied in Design Build or other alternative delivery methods when it is necessary to conduct in between milestone reviews with the client or contractor to review the design approach and document comments or changes for incorporation in the milestone submittal.
QP 06	Discipline QC Check	Mandatory check, applies to all deliverables. Performed within the discipline by a qualified independent party to assure conformance with criteria or requirements, accuracy of mathematical calculations, scope or level of detail associated with milestone submittal and compliance to CADD or other style requirements.
QP 07	Senior Technical Review	This review is generally performed by a high level SME in order to review the approach or concept of a particularly risky or critical deliverable. This review is not applied to customary, routine deliverables
QP 09	Independent Design Check	This check is performed when contractually required, or otherwise deemed necessary, typically on complex structural designs. Involves an independent set of calculations to confirm the design.
QP 08	Interdisciplinary Review	This review is performed by the Task Leads of the various disciplines, and is used to assure alignment and consistency between disciplines and to identify and mitigate interdisciplinary conflicts. Mandatory review when deliverables constitute more than one discipline.
QP 10	Constructability Review	This review is performed by HNTB when part of our scope (typically in design-bid-build) scenarios to assure that the project can be constructed as designed. In alternative delivery projects, this review is performed by the contractor and the HNTB responsibility is limited to resolution of comments.
QP 11	Visual Check	This check is mandatory on all deliverables and is typically performed by the Task Lead of the deliverable. This check is performed on the deliverable in the format in which it will be provided to the client to assure the deliverable is complete, in order, and has been converted properly.
QP 12	QA Review	This review is mandatory on all deliverables and is performed by the PQM to assure that all other required checks/reviews have been performed, comments have been resolved and that records exist providing evidence.
QP 13	Client/Owner Review	This review, conducted by our client/owner is expected to occur on all deliverables upon submittal. Time frames for this review can vary, but consideration shall be given to the impact of delays on our schedule.
QP 13	Third Party Review	This review is only required when our client has agreements with third parties that require them to review deliverables as well as our client, examples are: FHWA, FTA, etc....

<p>9. How is Interdisciplinary Coordination accomplished on the project? Any records maintained?</p> <p>10. How are design changes or decisions communicated to the Project Team?</p>		

Quality Audit Checklist

Project Name: ATMP Roadway Improvement Project

Project No.: 71473

11. What method is used for Interdisciplinary Review?

☐ Bluebeam ☐ Hardcopy CheckPrints
☐ Comment Resolution Forms

Project Quality Records:

12. Has a project quality record repository been established and included in the PQP?

☐ Yes ☐ No ☐ N/A

a. Does it include folders/meta data for storing of Project Quality Records in accordance with the Client Deliverable Quality Matrix?

☐ Yes ☐ No ☐ N/A

b. Is a copy of the approved PQP Approval Form posted in that repository?

☐ Yes ☐ No ☐ N/A

c. Is a copy of the Custom PQP (if applicable) posted in that repository?

☐ Yes ☐ No ☐ N/A

d. Are subconsultant QPs (if applicable) posted in that repository?

☐ Yes ☐ No ☐ N/A

e. Does the project team (including other HNTB offices and subs if applicable) have access to that repository?

☐ Yes ☐ No ☐ N/A

f. Have quality record folders/meta data been established for Design Services During Construction deliverables?

a. Or maintained in Design Logs for DB projects (applicable for Simple RFI, Submittals Reviews, NCRs with no engineering analysis, and Record Drawings

PQP Execution:

13. Are quality check and reviews being conducted in accordance with the Client Deliverable Quality Matrix?

☐ Yes ☐ No ☐ N/A

a. Are records available **in the repository** to demonstrate these check and reviews have occurred?

☐ Yes ☐ No ☐ N/A

i. Including subs if they are following the HNTB PQP?

☐ Yes ☐ No ☐ N/A

b. Have quality check and reviews been conducted in accordance with the dates in the Client Deliverable Quality Matrix? i.e. Have check and review time periods been maintained?

☐ Yes ☐ No ☐ N/A

c. Do calculations include Calculation Cover Sheet, and are calculations organized?

☐ Yes ☐ No ☐ N/A

☐ Yes ☐ No ☐ N/A

Quality Audit Checklist		
Project Name: ATMP Roadway Improvement Project		Project No.: 71473

d. Do records indicate that all required disciplines participated in Interdisciplinary Review?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
e. Are subconsultant certificates of compliance available to indicate they have followed their own QP if applicable?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
f. Has the PQM performed QA Review and generated a Certificate of Compliance, if required, with the PQP for all deliverables?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
g. Do records indicate that Client/Owner/Third Party review comments been resolved and verified?		
14. Have quality checks and reviews been conducted on Design Services During Construction deliverables as required by the Client Deliverable Quality Matrix?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
a. RFI responses	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
b. Construction Submittal review comments	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
c. Design Changes	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
d. NCR responses/analyses	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
e. Record Drawings	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
Continual Improvement Feedback:		
15. Were quality issues encountered on the project? In your opinion, what contributed to those issues?		
16. What challenges did you encounter in executing the PQP?		
17. What went well or was a benefit in executing the PQP?		
18. What would you do differently next time with regard to the quality management process that would result in higher quality deliverables or greater efficiency?

Subconsultant Quality Plan Coversheet (To Be Completed by Subconsultant)		Page 1 of 3
Project Name: ATMP Roadway Improvement Project	Project No.:71473	

The HNTB Quality Management System (QMS) requires that subconsultants either adopt and follow the HNTB Project Quality Plan (PQP) or follow a quality plan of their own. When subconsultants are directed to follow their own quality plan, but do not have a documented quality plan, this cover sheet is provided to document the subconsultants process to address minimum requirements. Once completed and approved, this becomes the subconsultant's quality plan. This form and any attachments shall be submitted to the HNTB Project Quality Manager for review and approval.

Subconsultant Firm:

HNTB		Document number: QF 17
Subconsultant Quality Plan Coversheet (To Be Completed by Subconsultant)		Page 2 of 3
Project Name: ATMP Roadway Improvement Project	Project No.:71473	

Describe the process for training your project team on your quality plan and processes and methods of maintaining records of training. Include a description of how these records will be made available to HNTB upon request.	<input type="checkbox"/>
If the use of inspection, measuring or test equipment (e.g. field or laboratory devices/equipment) is required in your services, describe how those items are calibrated, calibration maintained current, and the maintenance of calibration records. Include a description of how these records will be made available to HNTB upon request.	<input type="checkbox"/>
Describe the process or procedure by which quality control checks or reviews of deliverables are performed to ensure they meet requirements? (i.e. calculations, drawings, specifications, reports, studies, recommendations, etc.). Must include a description of the QC checks, interdisciplinary reviews (if applicable), QA reviews, and any other reviews necessary based on the scope and complexity of the deliverable.	<input type="checkbox"/>
Describe the process by which quality records are maintained. Subconsultant understands that records shall be made available upon request or potentially provided with deliverables if required by the Subconsultant Agreement.	<input type="checkbox"/>

Subconsultants shall submit a certificate of compliance with their deliverables, certifying that those deliverables have been checked/reviewed in accordance with this quality plan.

Audit Scope:

Lead Auditor:

Auditor(s):

Audit Date:

Milestone/Phase:

Audit Objective:

- The purpose of this audit is to assess compliance with the ATMP Roadway Improvement Project quality plan through interviews and the review of quality records.

Audit Scope Details: Through interview and review of a sampling of quality records, an assessment will be made of compliance specifically with the following PQP procedures for the **XX** submittal(s), as documented within the Client Deliverable Quality Matrix.

- List PQP procedures to be audited

Required Audit Participants:

- PM
- PQM
- Task Leads (for Opening Meeting, Closing Meeting and periodically throughout audit to answer questions/provide evidence)
- Subconsultant Task Leads – May need to be available via phone periodically throughout audit to answer questions/provide evidence)
- For DB Projects, OQM, Office Leader, DB DDO, GD DDO, and ODM invited as optional

Auditor(s) will need access to approved PQP, quality records, client satisfaction results etc.

APPENDIX 3 – RESUMES OF QUALITY PERSONNEL

Anthony Son

Proposed Role: QA/QC Manager

Anthony is a key member of the project management team and is responsible for the implementation of site-specific and customer-approved QA/QC management plans on-site. He brings proven experience developing Quality Programs for both the design and construction phases on alternative delivery

projects in Los Angeles, including working with LAWA at LAX. Anthony brings extensive knowledge gained from coordinating with jurisdictional inspectors at LAX for testing and commissioning and will leverage his expertise to coordinate with each AHJ within the City of Angeles for final acceptance of each element.

Work History/Relevant Experience with Similar Projects

City of LA Los Angeles World Airports | LAWA Roadways, Utilities, and Enabling Projects

Los Angeles, CA | Design-Build | \$334M
Quality Manager | 2021 - Present

Skanska is serving as the design-builder for LAWA's RUE projects at LAX. The RUE projects center on restoring and constructing roadways and utilities infrastructure to enable ongoing and future work within LAWA's Landside Access Modernization Program (LAMP). The enabling projects lay the groundwork for high-profile projects such as the automated people mover (APM), Consolidated Rent-a-Car facility (CONRAC) and Intermodal Transportation Facility-West. The RUE contract consists of 16 distinct tasks that involve roadway extensions, utility work and wayfinding signage to help travelers navigate LAX.

Anthony is the Los Angeles-area Quality Manager providing organizational oversight for the Quality Program. He developed the program-wide Quality Assurance Quality Control Plan, Quality Procedures and controls required to ensure compliance with the contract requirements. Anthony provides quality management independent from the RUE project management team performing the work. **Anthony's scope of work for the RUE will complete by 12/01/2022. After that time, he will be 100% dedicated to the ATMP Landside Improvements Project.**

Los Angeles Metro | Westside Subway Extension Phase 1

Los Angeles, CA | Design-Build | \$1.9B
Quality Manager | 2019 - Present

The project uses two slurry pressure balance tunnel boring machines for 3.9 miles of twin-bored tunnels. The three underground stations are approximately 850-1000 feet long. Trackwork includes installation of direct fixation track and two tail tracks at the end of the tunnels for future phases.

Anthony implemented and maintained a quality management system that conformed to the requirements of ANSI/ISO/ASQ Q9001:2008. He reviewed and approved subcontractor and supplier quality programs and document submittals. He performed quality reviews, audits and surveillances of operational activities, and he advised management of deviations from established requirements. Anthony supervised a QC manager, QC engineer and 10 QC inspectors.

Los Angeles Metro | I-405 Sepulveda Pass Widening Improvements Project

Los Angeles, CA | Design-Build | \$1.6B
Lead Quality Control Inspector | 2011 - 2014

The project consisted of a 10-mile HOV lane between the 1-10 and US-101. The project included the removal and replacement of three bridges, the realignment of 27 on- and off-ramps, widening of 13 existing bridges, and construction of 18 miles of soil nail, tie back, cast-in-place reinforced concrete and MSE retaining walls.

Anthony performed the contractor's QC inspections of Metro, Caltrans and City of LA D/B construction of the following: pre-stressed, post-tensioned, reinforced concrete; structural steel highway bridge structures; jointed plain concrete paving; hot mix asphalt paving and overlay; cast-in-place retaining walls; and utility relocations. He reviewed and verified construction of approved work plans.

Los Angeles Metro | Crenshaw / LAX Transit Project

Los Angeles, CA | Design-Build | \$2.1B
Senior Oversight Inspector | 2014 - 2019

This project consisted of 8.5 miles of light-rail line from Exposition and Crenshaw boulevards to the Green Line south of the Los Angeles International Airport. The project consisted of 8 stations, 2 bored tunnels, 3 underground guideways, 5 light rail bridges, and MSE retaining walls.

Anthony performed project oversight inspection for Metro's construction management team on the construction of bridges, at-grade intersection crossings, roadway paving, falsework, MSE retaining walls, underground cut and cover, shoring, piling, street restoration of curbs, gutters, sidewalks, utility relocation of water, gas, power, fiber optics, storm drainage, sewer lines, station mechanical, electrical, plumbing, escalators, elevators, systems, ductbank, communication, train control, track circuit, traction power, grounding, overhead catenary system, and SWPPP and safety.

Los Angeles Metro | Exposition Light Rail Transit Project Phase 1

Los Angeles, CA | \$691M
Quality Control Inspector | 2007 - 2011

This \$640 million project contained 8.6 miles of light rail transportation from the Staples Center to Culver City. Project structures included 9 stations, 2 aerial stations, 4 light rail bridges, 1 LA City bridge, Caltrans bridge retrofit, grade separation trench, and MSE and cast in place retaining walls. Civil improvements included storm drain, sewer line, power, gas and water utility relocation, landscaping, irrigation, and concrete and asphalt paving.

Anthony performed contractor's quality control inspection of Caltrans, LA City and Metro light rail prestressed, post-tensioned, reinforced concrete bridge construction, light rail grade crossings, roadway paving, highway paving, rapid set concrete paving, hot mix asphalt and Portland cement concrete paving MSE retaining walls, and at-grade and aerial stations.

Kelly Lumen, PE

Proposed Role: Design Quality Manager

Kelly's experience includes a range of design, construction and management activities, including design-build delivery and quality management of projects in Los Angeles. Her extensive knowledge in all aspects of design allows

her to be an effective quality manager. She has technical experience in street, storm drain, sewer and water infrastructure design; utility coordination; hydrologic/hydraulic analysis and design; structural design of retaining walls/sound walls; and as construction inspector for concrete reinforced bridges.

Work / Project Experience History

Los Angeles Metro | I-405 Sepulveda Pass Widening
Los Angeles, CA | Design-Build | \$1.6B | Quality Manager | 2011 - 2015

HNTB was the lead designer for this \$1.6B design-build freeway widening project. The project's primary objective was to add a 10-mile HOV lane to the northbound side of I-405 between the I-10 and U.S.101 freeways, completing the last gap of carpool lanes along the entire 72-mile length of I-405. Kelly provided quality assurance management for both design and post design services. Quality management services include reviews for plans, reports and calculations per the project design quality management plan for all disciplines and agencies of the project. Disciplines included roadway and grading; drainage; bridges; walls; transportation management; maintenance of traffic; signing, traffic lighting, and ITS; utilities relocations; planting and irrigation; geotechnical and specifications. Agencies included Caltrans, City of Los Angeles, and County of Los Angeles.

Los Angeles Metro | Southbound I-605/Beverly Boulevard Interchange Improvements Project Report and PS&E
Pico Rivera, CA | Design-Bid-Build | \$35M
Project Quality Manager | 2018 - 2022

This project will improve traffic operations on the southbound ramps while minimizing impacts to right-of-way and ensuring compatibility with the final I-605 corridor improvements. As a key subconsultant to Civil Works, a small, woman-owned business, HNTB is supporting development of the Draft Project Report, Project Report, and Plans, Specifications, and Estimates (PS&E) for this interchange improvement project.

Kelly brought her quality experience to support the small firm as they led this Metro project, demonstrating her ability to guide and train firms in implementing effective quality programs. HNTB worked closely with the prime SBE consultant, Metro, Caltrans District 7, and Gateway Cities Council of Governments to deliver an approved PS&E package within two years.

Brightline West | High Speed Rail Project
Rancho Cucamonga, CA to Las Vegas, NV | Design-Build | \$3B
Quality Manager | 2019 - Ongoing

The project requires redesign of the I-15 Freeway corridor to allow the new high speed rail corridor in the median. Efforts include redesign of freeway segments through Barstow and six interchanges in the corridor. Design included preparation of Geometric Approval drawings for seven different locations. The work involved assessment of the corridor-wide Safety Analysis.

As Quality Manager, Kelly ensures deliverables are compliant with the Quality Plan approved by the Owner. The tight schedule required a deliberately short time frame for quality reviews. Kelly worked with the team to shorten the interdisciplinary review by facilitating IDR meetings to achieve a thorough IDR check with all the disciplines in 1 day, saving at least a week of review time with each submittal.

Caltrans District 12 | Program Management for I-405 (South) Asset Management Project
Orange County, CA | Design-Build | \$150M
Quality Technical Writer | 2021 - Ongoing

This design-build project will extend the life expectancy of pavement, improve safety for all modes of travel as well as maintenance crews, enhance traffic operation, manage congestion, and provide the ability to collect, analyze, and use data for efficient systems performance along the I-405 corridor within the project limits. HNTB is serving as the Program Management consultant.

Kelly is the quality technical writer for all items related to quality in procurement and administration of the design-build contract. She coordinated directly with Caltrans personnel to communicate quality expectations of the DB contractor. She developed an approach to assure adequate quality personnel are assigned on DB projects confirming with Caltrans that the ratio meets their expectations on projects.

Transportation Corridor Agencies | General Engineering Consultant Services, Quality Management
Orange, CA | Design-Build | \$4.4B Program Cost
Quality Manager | 2020 - 2022

TCA leveraged the consultant services to meet the agency's project needs by accessing the nationwide toll, technology, and engineering services of HNTB. Task orders included work related to utility locates, third-party agency and Caltrans project coordination, lane closure public notifications, preliminary cost estimates and geometric design for capital improvement projects, encroachment permit applications and document control services.

Kelly served as the JV's Quality Manager for civil design and project task orders for the TCA. She also acts as TCA's design quality auditor, auditing their consultant projects such as the SR-241/SR-91 Express Lanes Connector. This experience helps her manage design quality with the perspective of a project owner.

Larry Pointe

Proposed Role: Construction Quality Manager

With over 17 years experience providing construction quality management and inspection services, Larry specializes in quality oversight for large-scale (over \$1-billion) alternative delivery projects for roadways, bridges, and light rails. He has a verifiable track record of

developing strong collaborative relationships with key local AHJs including BOE, the City of Los Angeles, and LADBS. His extensive experience inspecting complex design-builds brings assurance that project outcomes will rise to highest level of standards.

Work History/Relevant Experience with Similar Projects

Los Angeles World Airport | LAX Automated People Mover

Los Angeles, CA | P3/DBFOM | \$4.89B | Const. Quality Manager | 2020 - Present

A key part of the \$4.89-billion P3/DBFOM project, this fully automated and driverless system, involving the construction of 2.25 miles of elevated dual lane guideway, will connect LAX travelers and employees to new intermodal transfer facilities, the new consolidated rental car facility, and L.A. Metro. Larry has been instrumental in establishing new highly effective and efficient quality management procedures. He led a full revamp of the materials receiving processes to move the team from closing less than 500 to almost 5,000 materials receiving inspection reports. He established a new collaborative relationship with LADBS and other AHJs, involving on-going regular interface, to facilitate the achievement of CFOs and the closure of nearly 800 permits in under one year - up from less than six prior to his arrival. He established a robust and comprehensive system for tracking and reporting NCRs with thorough root-cause analysis as well actions to prevent future issues. As noted by LAWA personnel in status update meetings, Larry's approach to reporting, investigating, and communicating about these issues has resulted in more transparency, effective resolution, and higher quality outcomes for the project. In addition, Larry also tracked and set up meetings to resolve exposures to the public - bringing the total to less than 10. • *Larry Pointe's scope of work for the APM will be completed by January 2, 2023. After that time he will be 100-percent committed to the ATMP Landside Improvements Project.*

Los Angeles Metro | Purple Line Ext. 3 - Tunnels Project Los Angeles County, CA | Method | \$430M
Project Quality Manager | 2019 - 2020

The Purple Line Extension Tunnel Project, Section 3, will add 2.56 miles of new rail to Metro's Rail system and connect downtown L.A. to the westside. This project includes the construction of a tail shaft, two boring tunnels, and over 14 cross passages along with two new metro stations.

Larry wrote and successfully obtained owner approval for the project's quality plans. He worked through a backward planning process to identify and make sure the proper systems were in place to allow the team to achieve successful future closeout. He went above and beyond to take document control under the

quality department when submittals fell behind. He established a system to prioritize accuracy, compliance, and proper submittal oversight.

Los Angeles Metro | Metro Crenshaw/LAX Transit Project Los Angeles, CA | Design-Build | \$2.1B
Project Quality Manager | 2014 - 2019

The Crenshaw/LAX Transit Connector is an 8.5-mile light rail line that will run along Crenshaw Blvd. and the Harbor Subdivision right-of-way, from Exposition Blvd. to the Metro Green Line.

Larry established invaluable collaboration with AHJs in order to ensure the project in aligned with stakeholder requirements and could proceed in a compliant and expedient manner. He worked closely with the LABOE, establishing weekly meetings with them, and building a strong enough rapport to bring their head inspector on site for walk-throughs. He successfully persuaded the City of L.A. to adopt his tracking system for NCR process. He established new inspection trainings and a reward program that led to improved quality outcomes across construction teams.

Los Angeles Metro | I-405 Sepulveda Pass Improvements Los Angeles County, CA | Design-Build | \$1.003B
Quality Control Manager | 2012 - 2014

A major collaboration between Caltrans and Los Angeles Metro, this project added a 10-mile HOV lane and improved infrastructure including ramps, bridges and sound walls. It involved removing and replacing three bridges, widening 13 existing underpasses and structures, building 140 ADA ramps, and constructing approximately 18 miles of retaining walls and sound walls.

In addition to bridge/structure inspection and MSE investigation, Larry oversaw the resolution of 60 non-compliant ADA ramps that had been previously poured. As a result of the new inspection policies that Larry implemented, along with his robust team training efforts, the non compliance rate dropped from 89-percent to zero non-compliances on almost 150 ramps.

Florida Department of Transportation (FDOT) | SR 200 Duval County, FL | Method | \$35M
Field Quality Manager | 2009 - 2011

This project widened 11 miles of highway, from two to four lanes, and included four bridge replacements, MSE walls, embankment, and asphalt pavement.

As the field quality manager, Larry was responsible for managing and scheduling quality control inspection staff as well as maintaining earthwork and concrete records for FDOT. He was also in charge of performing all inspections for earthwork, drilled shaft placement, and structural steel on drilled shafts, as well as, on bridge decks, caps, columns, and footings. Larry helped avoid costly delays by establishing critical systems that ensure the project was able to pass FDOT's robust QA program requirements which involved randomized testing. He also maintained the FDOT log book in accordance with their regulations.

1. Overview and Purpose

1.1 Purpose

To promote the effective use of Building Information Modeling (BIM) in the project, the Design Build BIM management team has created this BIM Project Execution Plan (BPxP). This plan is intended to supplement the standard LAWA BPxP Template and provides more detail on how BIM will be used by the Design Build team on the project.

The core objective of our BIM approach is to create a digital representation of the Project and to integrate Virtual Design and Construction (VDC) methodologies. The overall goals for incorporating VDC/BIM into the project include:

- Offering stakeholders a holistic view of the project from design to construction
- Producing detailed illustrations and presentations for LAWA authorities and stakeholders.
- Generating precise design and construction contract drawings.
- Facilitating 3D coordination among disciplines, enabling spatial coordination and clash detection.
- ~~Implementing 4D Construction Sequencing, Phasing, and planning logistics for stakeholders.~~
- ~~Advancing 5D Modeling for cost estimation.~~

1.2 Progressive Design Build BIM Approach

Due to the nature of this progressive design build project, BIM model creation and management will be managed by two distinct BIM teams that work collaboratively to leverage BIM from design through construction:

- The Design BIM team, comprised of HNTB and its subconsultants, is responsible for the creation and management of design BIM models and the production of construction contract drawings
- A Construction BIM team, comprised of the Skanska Flatiron Joint Venture (SFJV), and their sub/trade contractors, is responsible for creation and management of the construction BIM models and the production of shop and fabrication drawings.

Throughout this document, sections have been divided where appropriate to make the distinction between Design and Construction BIM modeling and associated management activities.

1.3 BPxP Change Management

This BPxP is a dynamic document, evolving throughout the project's lifespan. Any desired changes to this document should be proposed in writing to the Construction and Design BIM Managers. Changes that do not affect the project's scope or timeline can be integrated directly. However, changes that could alter the scope or schedule require coordination with project management. Both LAWA and design build team must understand and agree upon these changes before their inclusion in the document.

1.3 Data Use, Reuse, Ownership, and Rights of Data

This document does not supersede any commitments established in the primary contract between LAWA and SFJV.

1.3.1 Design Team Models

The Design Team (DT) will supply BIM Model(s) up to the Level of Development (LOD) and scope defined in this document and the Project LOD matrix. Any use of these BIM models beyond the stipulated scope is at the user's own risk. The DT will not incorporate construction changes derived from construction documentation or the construction process into their BIM Model(s). The BIM Model(s) provided by the DT and associated data are for reference purposes only.

1.3.2 Construction Team Models

The CJV is responsible for updating or recreating the BIM model(s) and design data as outlined in the Project LOD Matrix (Appendix A) provided by the DT team for construction, coordination, scheduling, estimating, phasing and close out of the Work. BIM Model(s) and CAD files for documentation will be given to Trade Contractors and Vendors for reference in submittal preparations. Trade contracts are responsible for converting the provided BIM models into their needed format. Trade models must be returned to the CJV in formats approved by the CJV.

1.3.3 Document Precedence

If there's a conflict between the Construction Documents and the BIM, the Construction Documents prevail. 2D Contract Documents always override BIM Model data.

2.0 Project Information

2.1 Project Details

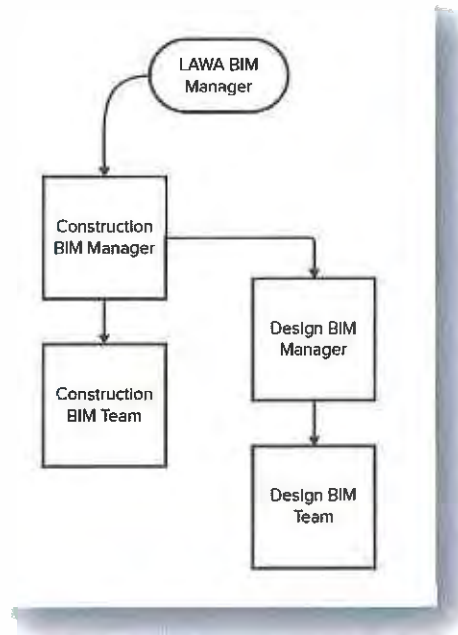

This project focuses on roadway improvements to help reduce airport-related congestion on the local roadway system resulting in back-ups on public streets by redirecting airport traffic from local streets to new dedicated access roadways. A new system of roadways and bridges will be constructed to consolidate traffic away from Sepulveda Boulevard and Century Boulevard, enable construction of future Concourse 0, and provide access to the future Terminal 9.

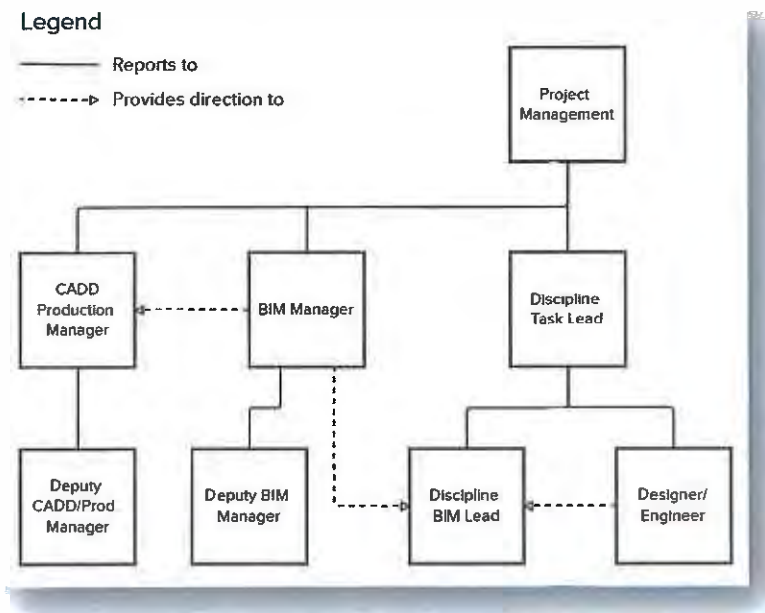

2.2 BIM Staff Organizational Charts

The following organizational charts have been developed to establish a project BIM leadership structure for the design build team as a whole and the distinct design and construction BIM teams.

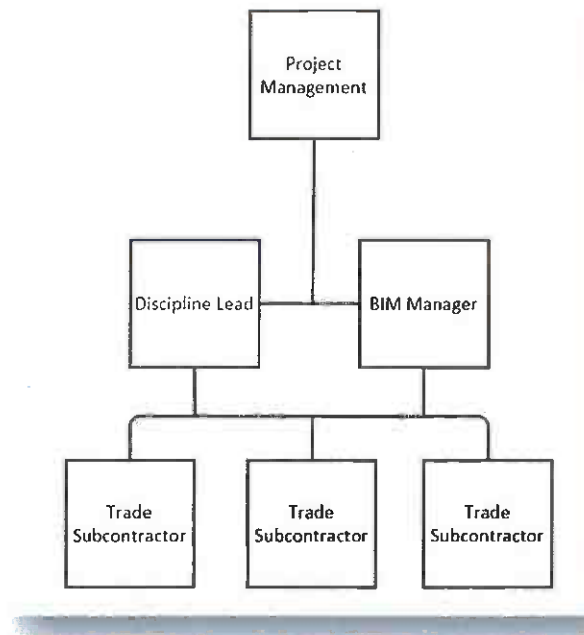

2.2.1 Project BIM Leadership

2.2.2 Design BIM Team

2.2.3 Construction BIM Team

2.3 BIM Staff Directory

The following table lists the contact information of the key BIM staff on the project.

Name	Organization	Role/Title	Email	Phone

2.4 Roles and Responsibilities

2.4.1 Construction BIM Team Key Roles and Responsibilities

The following sections include descriptions of the three key BIM roles on the construction team:

- Construction BIM Manager
- Construction Discipline Lead
- Trade Subcontractor

Construction BIM Manager

The construction BIM Managers role will be in overseeing and directing the implementation of BIM technology and processes after the design is complete. Serving as the point of contact for BIM post-design and ensuring all BIM-related standards are maintained as models progress from design to construction to as built. The BIM manager will maintain the construction model integrity, design intent and standards as it transitions from the design team to the Trade Subcontractors throughout construction.

Key Responsibilities:

- Maintain BIM standards, protocols, automation, and workflows for the project, ensuring consistency and efficiency.
- Lead and mentor Trade Subcontractors and other BIM professionals, fostering a collaborative environment.
- Review and integrate discipline-specific models into a unified Construction model, ensuring interoperability and alignment.
- Provide training and support to the construction team on BIM software and best practices.
- Coordinate with project managers, task leads, and other stakeholders to ensure BIM objectives align with project goals.
- Regularly review and audit BIM models to ensure quality and compliance with project standards.

- Supervise the creation of models pertinent to their discipline, ensuring compliance with project modeling standards and Level of Detail (LOD) criteria.
- Facilitate model coordination with all Trade Subcontractors, addressing and resolving model clashes and any other modeling discrepancies.
- Oversee the development of specific Trade Subcontractor models into as built models.

Construction Discipline Lead

The Construction Discipline Lead is instrumental in ensuring the discipline's design intent is maintained and reflected as an accurate Trade Subcontractor model. Collaborating closely with discipline task leads, engineers, and designers, the construction discipline lead ensures the accuracy and compatibility of the Trade Subcontractor.

Key (BIM) Responsibilities:

- Oversee the creation and submission of 2D shop drawing plans and products.
- Review 2D shop drawing plans before they are submitted for completeness.
- Work with the Construction BIM Manager to coordinate and ensure accurate representation and design requirements are met with the Trade Subcontractor model.
- Attend model coordination meetings with Construction BIM Manager, fellow Construction Discipline Leads and Trade Subcontractors, addressing and resolving model clashes and any other modeling discrepancies.

Trade Subcontractors

The Trade Subcontractor is instrumental in translating the discipline's design intent into an accurate digital model. Collaborating closely with discipline task leads, engineers, and designers, the Trade Subcontractor ensures the accuracy and compatibility of the design model

Key (BIM) Responsibilities:

- Spearhead and supervise the creation of models pertinent to their discipline, ensuring compliance with project modeling standards and Level of Detail (LOD) criteria.
- Develop essential content to accurately represent their discipline's scope, including but not limited to Civil 3D styles & subassemblies, ORD/InRoads templates & feature definitions, Revit Families, etc.
- Attend model coordination meetings with Construction BIM Manager, Construction Discipline Leads and other Trade Subcontractors, addressing and resolving model clashes and any other modeling discrepancies.

2.4.2 Design BIM Team Key Roles and Responsibilities

The following sections include descriptions of the three key BIM roles on the design team:

- Design BIM Manager
- Discipline BIM Lead
- CADD & Production Manager

Design BIM Manager

The BIM Manager plays a pivotal role in overseeing and directing the implementation of BIM technology and processes on the project. Serving as the principal point of contact for all BIM-related activities, they ensure that BIM is optimally utilized to achieve project objectives and maintain a consistent standard.

Key Responsibilities:

- Develop and implement BIM standards, protocols, automation, and workflows for the project, ensuring consistency and efficiency.

- Lead and mentor Discipline BIM Leads (DBLs) and other BIM professionals, fostering a collaborative environment.
- Review and integrate discipline-specific models into a unified project model, ensuring interoperability and alignment.
- Provide training and support to the project teams on BIM software and best practices.
- Coordinate with project managers, task leads, and other stakeholders to ensure BIM objectives align with project goals.
- Regularly review and audit BIM models to ensure quality and compliance with project standards.

Deputy Design BIM Manager

The Deputy Design BIM Manager will support the BIM Manager in the successful implementation and management of BIM technology and processes throughout the project. This role is crucial in ensuring that BIM is leveraged effectively to meet project objectives and maintain high standards. The Deputy will work closely with the BIM Manager and project teams, contributing to the development, execution, and oversight of BIM protocols and practices.

Key Responsibilities:

- **Support BIM Standards Implementation:** Assist in developing, implementing, and maintaining BIM standards, protocols, automation, and workflows, ensuring consistency and efficiency across the project.
- **Collaborative Leadership:** Collaborate with and provide guidance to Discipline BIM Leads (DBLs) and other BIM professionals, fostering a culture of teamwork and continuous improvement.
- **Model Integration:** Work alongside the BIM Manager to review and integrate discipline-specific models into a cohesive project model, ensuring interoperability, accuracy, and alignment with project goals.
- **Training and Development:** Provide training, mentorship, and technical support to project teams, promoting best practices in BIM software and workflows.
- **Coordination with Stakeholders:** Coordinate with project managers, task leads, and other stakeholders to ensure that BIM objectives are fully aligned with the overall project strategy and objectives.
- **Quality Assurance:** Assist in regularly reviewing and auditing BIM models to ensure they meet the project's quality standards and comply with established protocols.

Discipline BIM Lead (DBL)

The Discipline BIM Lead (DBL) is instrumental in translating the discipline's design intent into an accurate digital model. Collaborating closely with discipline task leads, engineers, and designers, the DBL ensures the accuracy and compatibility of the design model.

Key Responsibilities:

- **Spearhead and supervise the creation of models** pertinent to their discipline, ensuring compliance with project modeling standards and Level of Detail (LOD) criteria.
- **Facilitate model coordination** with fellow DBLs, addressing and resolving model clashes and any other modeling discrepancies.
- **Assist the BIM manager** in assimilating the discipline-specific models into the comprehensive federated project model.
- **Develop essential content** to accurately represent their discipline's scope, including but not limited to Civil 3D styles & subassemblies, ORD/InRoads templates & feature definitions, Revit Families, etc.
- **Collaborate with the design Computer-Aided Design and Drafting (CADD) production manager** to ensure the optimal utilization of project models in drawing production.

CADD/Production Manager

The Design CADD & Production Manager is responsible for converting the project BIM models to 2D contract drawings and other graphics. Leading the drawing production process, they ensure that designs are accurately represented, compliant with owner or AHJ presentation requirements, and ready for contractual purposes.

Key Responsibilities:

- Oversee the creation of 2D contract plans derived from comprehensive 3D models and other technical drawings, ensuring they meet owner and/or AHJ CADD standards and presentation requirements.
- Collaborate closely with the BIM Manager and Discipline BIM Leads (DBLs) to ensure seamless integration and accurate representation of BIM model in 2D plans.
- Maintain, develop, and enforce CADD standards and best practices to ensure consistency across all project drawings.
- Provide technical leadership and training to CADD technicians and drafters, ensuring proficiency in software and adherence to project standards.
- Review 2D plans before they are submitted or printed for completeness.
- Coordinate with project managers, contractors, and other stakeholders to clarify, adjust, and finalize design representations in contract plans.

2.5 Meetings and Coordination Procedures

The table below lists the anticipated BIM-specific meetings that will be required during the duration of the project. The table is not exhaustive and additional BIM meetings may be required.

Meeting	Project Stage	Frequency	Participants	Location	Purpose
BIM Requirements Kick-Off	NTP + 14 Days	After first approved task order	SFJV, HNTB, LAWA	IPO	Align on BIM requirements, LAWA input for BxP and proposed exceptions to standards
BIM Execution Plan Workshop	NTP + 30 days	After first approved task order	SFJV, HNTB, LAWA	IPO	BxP presentation and page turn with LAWA
Design BIM Kickoff	NTP + 30 days	After first approved task order	Design Team	Virtual	Present BXP and train team on how to follow project standards and processes
Drawing Production	Design	Weekly	Task Leads, CADD Manager, Discipline BIM Leads and BIM Manager	Virtual	Ongoing status report on drawing production
Design and Construction BIM Management Task Force	Design	Bi-Weekly	Design and Construction BIM Managers	Virtual	Meeting between both construction and design BIM teams for over the shoulder model progression reviews
Design BIM Coordination	Design	Weekly	BIM Manager, Discipline BIM Leads	Virtual	Ongoing BIM status report and 3D design coordination
Spatial Coordination	Schematic Design, Design Development, IFC	As needed per Design Unit	BIM Manager, BIM Leads, Project Management, Task Leads	Virtual	Formal meeting to verify spatial coordination

3.0 BIM/VDC Uses

3.1 Model Definitions

The model definitions herein have been copied directly from the LAWA BPXP template. They have been included for ease of reference.

3.3.1 Design Model

A Model that has reached the stage of completion in 3D that would customarily be expressed by an architect or engineer in two-dimensional construction documents. A Design Model is generally, an assemblage of several Models produced by various disciplines. It must be clear that each party be able to rely on the fact that the model furnished by others (designer, contractor, or trade subcontractor) "match" the 2D contract documents or shop drawings, generated by the model, in their equivalent state of development.

3.3.2 Construction Model

The Construction Model is generated by the Contractor or trade subcontractor. The Construction Model generates the Coordinated Construction and Shop Drawing Level Information. It is imperative that models furnished by others (designer, contractor, or trade subcontractor) "match" the 2D contract documents or shop drawings, generated by the model, in their equivalent state of development.

3.3.3 As-Built Model

Not used on this project.

3.3.4 Reconciled Record Model (RRM)

Not used on this project.

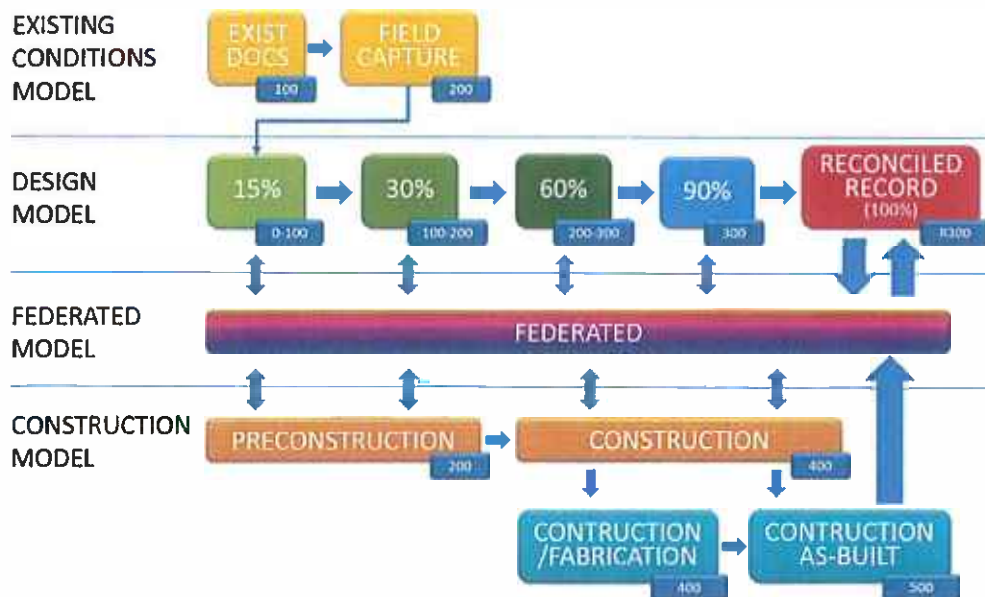

3.3.5 Facilities Model

Not used on this project.

3.3.6 Federated Model (FED)

The FED Model is comprised of all linked, Native Models and is a virtual representation of the entire Project developed to a specified Level of Development. The FED Model shall consist of all discipline Native Models such as Civil, Architectural, Structural, Mechanical, Electrical, Fire Protection, and Special Equipment, depending on the specific scope of the project.

3.3.7 BIM Model Progression Diagram

3.2 Model Use and Responsibility Matrix

The matrix below delineates the BIM/VDC uses for models created during the design phase in contrast to models created during construction. It also defines the team responsible for the creation of said models. This table should be referred to alongside Section 3.3 of the LAWA BPXP Template (Model Definitions), the Project LOD Specification (Appendix A) and Section 5 of this document. Models provided by the DT are intended for CJV's reference purposes only.

BIM Use	Description	Responsible Team	Corresponding BIM Model
Design Phase			
Existing Conditions Modeling	Developing a model of the existing conditions of features impacted by the project using survey data and record drawings	DT	Design Model
Design Authoring	A procedure where software is utilized to create a model that accurately reflects the design intent	DT	Design Model
Drawing Generation	Creation drawings from the model for the purpose communicating design intent and supporting construction activities (i.e. plans).	DT	Design Model
Design Review	Using 3D models as a tool to facilitate design criteria validation and QA/QC	DT	Design Model
3D Design Coordination	A process where software is used to identify spatial inferences by comparing design 3D elements	DT	Design Model

Visualization	Creation or supplementation of a Model to generate visuals, animations, pictures, and schematics.	DT	Enhanced Design Model
Construction Phase			
Shop/fabrication drawings	Construction models are generated by the Contractor or trade subcontractor. The Construction Model generates the Coordinated Construction and Shop Drawing Level Information	SFJV & Trade Contractors	Construction Model
Clash detection/Trade Coordination	The use of 3D models provided by design team and trade contractors to verify fitment and identify conflicts	SFJV	Federated Model
Site utilization and logistics	Develop models to aid in construction planning, traffic management, crane operation sequences, and safety zone delineation	SFJV	Federated Model
As-Built Measurements	The "As-Built Model" is a further development of the "Construction Model" that has been spatially and technically validated in the field. When possible, as-built measurements should be created in their original native format for incorporation back into the design model.	SFJV	As-Built Model
As-Built records	This is the Design Model after being reconciled with the Contractor-provided As-Built Model(s). The RRM is the basis BIM model of the "Record Documents" and is submitted as part of project close-out.	To be determined	Reconciled Record Model

4.0 Model Data Exchange and Collaboration Processes

The following subsections detail how each BIM team will manage their model data and explains the processes used to exchange BIM information between the project BIM teams.

4.1 Design Models

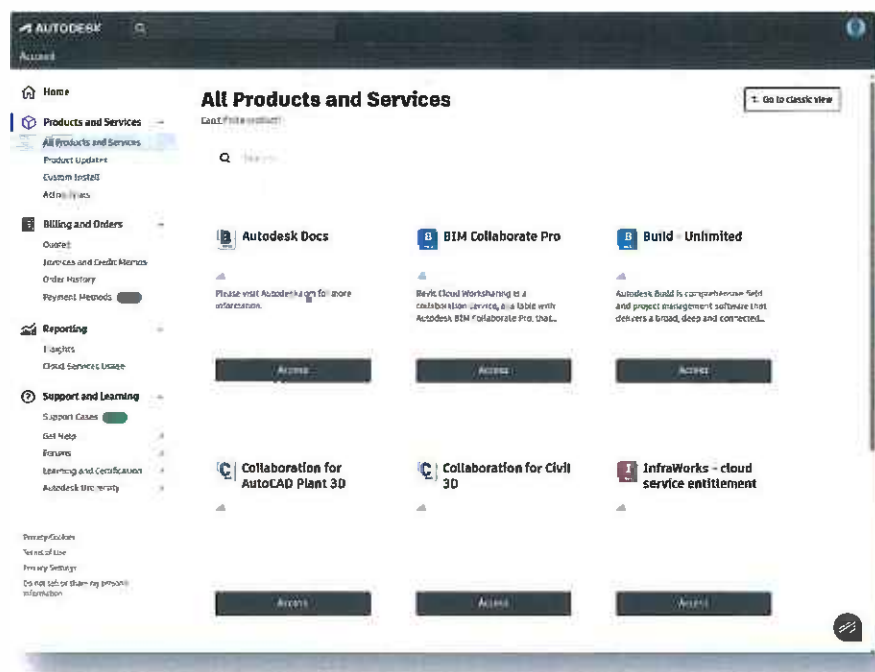

4.1.1 Common Data Environment (CDE)

The storage and collaboration methods for all design models are facilitated through the Autodesk Construction Cloud (ACC), within the project "71472_ATMP" project which is under the ownership and management of HNTB. ACC serves as a hub for the design team to engage and work together throughout the design's evolution. Additionally, ACC offers capabilities like monitoring and web browser-based visualization of model information, along with various other features including clash detection and issue tracking. The use of these features to facilitate design BIM processes are described in the later sections.

Autodesk BIM Collaborate Pro (BCP) serves as the primary collaboration tool for teams participating in the project's design phase. BCP is an additional module of ACC which enables essential work-sharing capabilities in model authoring software for ACC-based datasets. In addition to BCP, the design team is utilizing features from the Autodesk Build (AB) module in ACC for organizing photo data and construction documents. **As such, all members of the design team must ensure they possess the necessary licenses and/or access rights to utilize ACC, AB and BCP.**

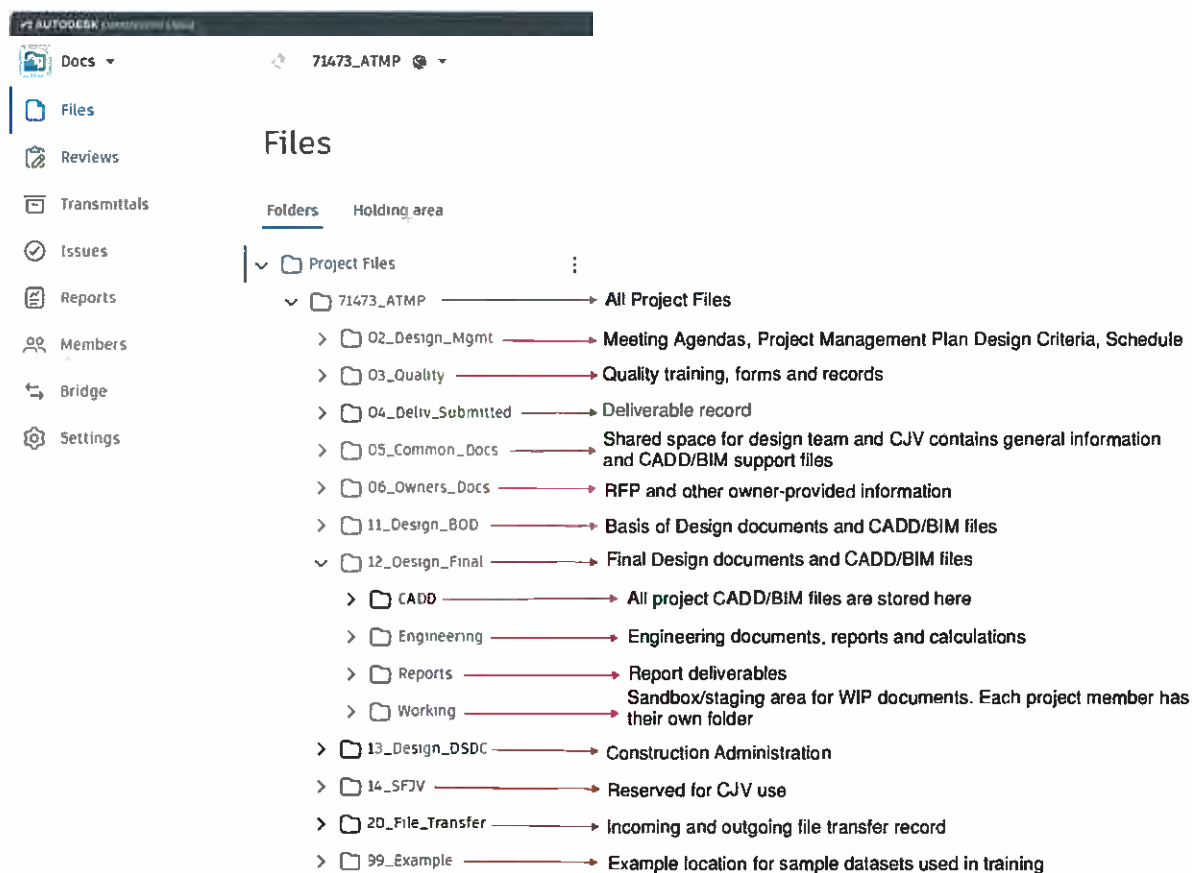

Prior to viewing, opening, or editing any project files hosted on ACC, all design team members must confirm that they:

1. Have installed the current project-approved versions of Civil 3D, InfraWorks and/or Revit depending on their discipline. Refer to Section 6.0 for a list of approved software versions.
2. Are entitled to Autodesk BIM Collaborate Pro and Autodesk Build. This information can be found in the "All Products and Services" page of their user account at manage.autodesk.com. If properly entitled, the account page should appear like this:

3. Have requested access to the "71473_ATMP" project ACC site hosted by the HNTB account. To request access please follow these steps:
 - i. Notify your discipline BIM lead that you require access and provide your name, email address and role on the project.
 - ii. Discipline BIM leads will forward the request to an appropriate project administrator who is responsible for adding users to the project and managing their access. If a user needs restricted or only read-only access, the discipline BIM lead should make note of that when communicating the access request.

The following figure shows the directory structure of the common data environment and a description of each directory. Access these directories may be limited depending on roles and responsibilities. All CADD and BIM data must be stored in the 12 Design Final/CADD folder. Refer to Section 6.0 for a detailed description of the CADD folder's subdirectories.

4.1.2 Model Collaboration and Delivery Procedure

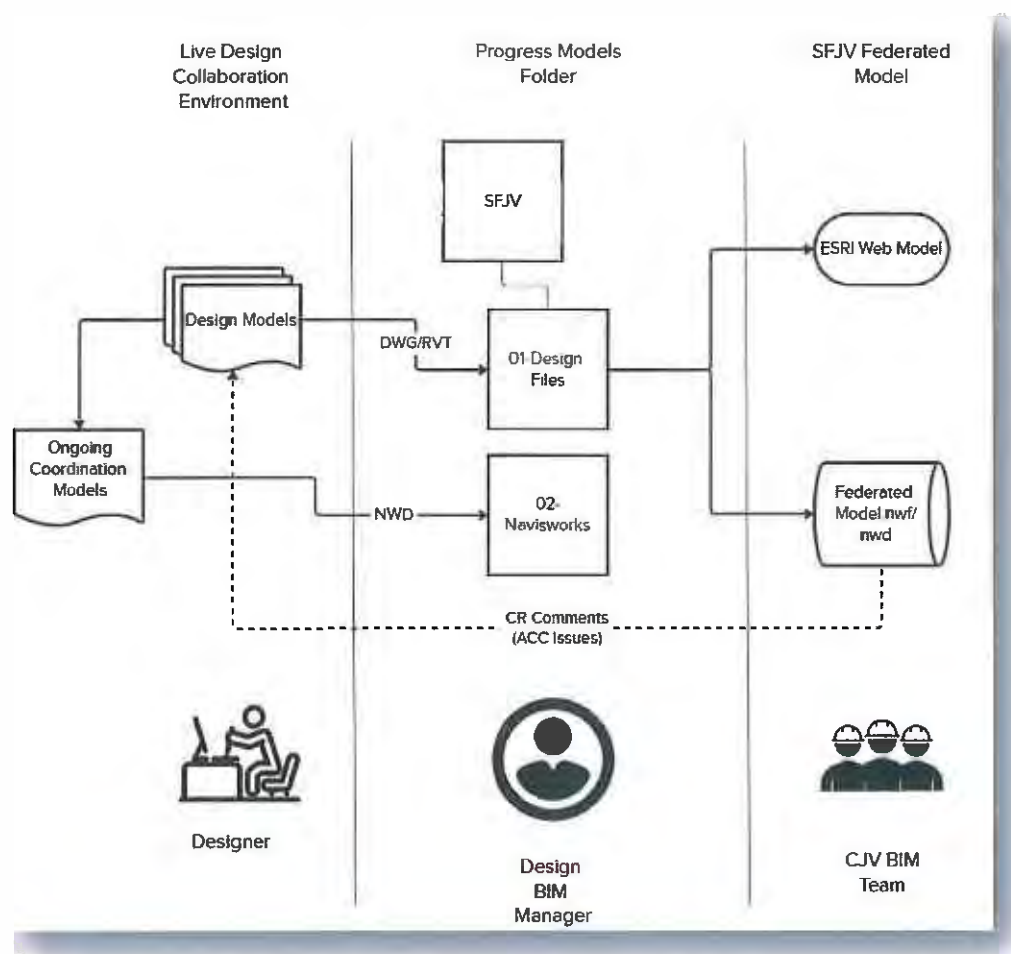

The project's horizontal design predominantly includes roadways, sidewalks, retaining walls, utilities, drainage systems, wayfinding, striping, street lighting, traffic signals, intelligent transportation systems (ITS), and landscaping. The horizontal design models are created and documented using Autodesk Civil 3D. The project's vertical components are primarily bridges (pedestrian and vehicular) and retaining walls which may be modeled using Civil 3D, InfraWorks, Revit, Rhinoceros and/or a combination thereof, and are delivered and documented in a combination of AutoCAD and Revit. All design models are stored and managed in the project's design CDE described above.

To enable real-time coordination between disciplines during the development of the design, all design files in the CDE should be the "live" most current version. Since the versions of the models are always kept up to date on the CDE, there is no upload schedule for files. Working on data offline and then updating a

version on the CDE is prohibited. Work in progress models that are not yet ready for use by the broader project team may be stored in individuals' "Working" folder on the CDE.

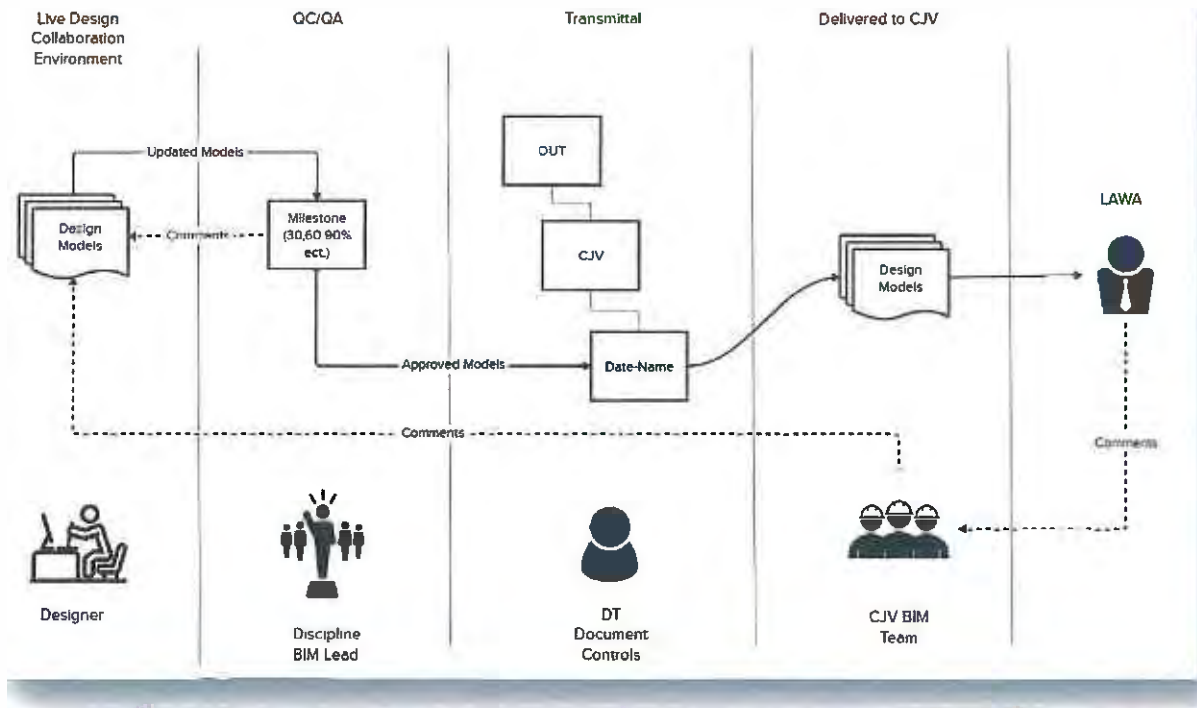

4.1.2.1 Progress Model Delivery

During each design stage (Schematic, Design Development and 90%/IFC) progress versions of the design models are shared with the SFJV BIM team on a bi-weekly basis via the process shown in the flowchart below. The intent of these progress models is to demonstrate progress on the model development and to give the SFJV team an opportunity to review and comment on the models ahead of the milestone model deliverables. These progress models include the native versions of the design models (DWG, RVT), as well as a combined coordination model in Navisworks .NWD format. Progress models are delivered as-is and have not been formally reviewed for quality and coordination. Relationships between these progress models may not always be maintained.

4.1.2.2 Milestone Model Delivery

Design BIM models are checked for quality and coordination. After QC/QA the models are packaged such that their relationships are maintained, and placed in an appropriate transmittal folder in the CDE. The Design Team Document Control team then sends the model transmittal folder to the CJV for review, use as reference in construction modeling, and, ultimately, issuance to the owner (LAWA). If the CJV or owner requests changes or makes comments, the QC/QA process repeats to address, and the live models are retransmitted to the CJV through a new transmittal folder. The diagram below illustrates this process. See Sections 6.0 and 7.0 for a more detailed description of the model QC/QA process.

4.1.3 Coordination with Adjacent Projects

If coordination with an adjacent project requires that design models are transmitted, the process described in the previous section should be followed. Only milestone models shall be transmitted for adjacent project collaboration. SFJV can then transmit the models to the appropriate party accordingly.

4.2 Construction Models

4.2.1 Common Data Environment

Like "4.1.1 Common Data Environment (CDE)" the storage and collaboration methods for all construction models are facilitated through Autodesk Construction Cloud (ACC) except it will be managed by SFJV. This ACC serves as a hub for the construction team to engage and work together with the trade subcontractor models and coordination throughout construction progression into as built.

4.2.2 Model Collaboration and Delivery Procedure

Like "4.1.2 Model Collaboration and Delivery Procedure" construction models will use the same model file formats; Civil 3D, InfraWorks, Revit, Rhinoceros and/or a combination thereof, and are delivered and documented in AutoCAD.

Coordination between disciplines will happen prior to shop drawing submittals. The individual trade models developed by subcontractors are "frozen" (locked as "read-only" in ACC) and the latest versions are copied into a separate QC/QA directory by their respective discipline BIM lead for QC and Trade Coordination. After QC and Trade Coordination comments are made, the models are "unfrozen" by the respective discipline BIM lead so that they may be updated to address the comments. Once the models have cleared QA the latest (updated) live versions are then copied into a transmittal folder, again by the discipline BIM lead. Document control then sends the model and shop drawing transmittal to the DT for review and

approval. If the DT requests changes or makes comments, the QC/QA process repeats to address, and the live models are retransmitted to the DT through a new transmittal folder.

5.0 LOD and Deliverables

5.1 Introduction

During the design and preconstruction stages, models will be created up to the Level of Development (LOD) specified in the Project LOD Matrix (Appendix A). This matrix should be used alongside this document, particularly Sections 3.0, 5.0, and 7.0. The standard baseline for design modeling is at the IFC stage is LOD 300. Any exceptions approved by the project team are detailed in the attached LOD Matrix.

If detailed visualizations of design elements are required for aesthetic evaluations, model development beyond LOD 300 may be necessary. The Design Model isn't meant for such detailed visual reviews and separate exhibits should be created.

Design Models will be passed to trade contractors via the CJV for use as a reference. Trade contractors will then produce construction models according to the Project LOD Matrix. These construction models are used in the creation of essential submittals, including shop and fabrication drawings.

Note: the LOD Matrix and BxP are dynamic documents and will be updated as the project progresses.

5.2 Definitions

The table below lists the fundamental LOD definitions provided by LAWA to be used when specifying element LOD in the project LOD matrix.

LOD	Definition
100	The Model Element may be graphically represented in the Model with a symbol or other generic representation, but does not satisfy the requirements for LOD 200. Information related to the Model Element (i.e. cost per square foot, tonnage of HVAC, etc.) can be derived from other Model Elements.
200	The Model Element is graphically represented within the Model as a generic system, object, or assembly with approximate quantities, size, shape, location, and orientation. Non-graphic information may also be attached to the Model Element.
300	The Model Element is graphically represented within the Model as a specific system, object or assembly in terms of quantity, size, shape, location, and orientation. Non-graphic information, such as parameters, shall also be included in the Model Element.
350	The Model Element is graphically represented within the Model as a specific system, object or assembly in terms of quantity, size, shape, location, orientation, and interfaces with other building systems. Non-graphic information, such as parameters, shall also be included in the Model Element.
400	The Model Element is graphically represented within the Model as a specific system, object or assembly in terms of size, shape, location, quantity, and orientation with detailing, fabrication, assembly, and installation information. Non-graphic information may also be attached to the Model Element. LOD 400 is shop drawing level.

5.3 Model Progression and LOD Matrix

Refer to the Model Progression matrix (Appendix A) for details on model development through the project timeline.

Because this project is not a traditional terminal or airside improvement, a project specific LOD matrix has been developed and has been used in lieu of the standard LAWA LOD Matrix. The project specific matrix includes a more specific breakdown of elements that are found in roadway and bridge construction, which are more applicable for the project.

5.4 Examples

The following examples have been created to demonstrate levels of development for common project elements.

5.4.1 Roadway

ROADWAY LOD EXAMPLES

6.0 Modeling Standards, Protocols, & Governing Software

6.1 General Model Standards

These general model standards apply to all Design and Construction Models.

6.1.1 Model Geolocation and Coordinate system

The project coordinate system(s) are as follows:

Horizontal: CA83-VF

Vertical: NAVD88

Units: US Survey Feet

Geometry in AutoCAD/Civil 3D (.dwg) files must be drawn at their real respective coordinates relative to the project coordinate systems, with the following exceptions:

- Detail drawings
- Sheet border files

Revit (.rvt) models must use shared coordinates for geolocation. Refer to LAWA's [2022 BIM standards, Section 7.2](#) for instructions to geolocate Revit models by acquiring shared coordinates from the LAWA-Provided Revit Templates. All DWG exports from Revit are in units of feet and are relative to the shared coordinate system. The project base point coordinates provided in LAWA's Revit templates are as follow:

E: 6439689.100

N: 1802166.290

Elevation: 105.11

6.1.2 Model Data Conventions

CAD Layer Naming

AutoCAD DWG layer naming on project CAD files is governed by the agency having jurisdiction of parts of the project represented by the CAD files. The table below lists the various AHJ's and their respective layer naming convention.

Agency	Layer Naming Standard
LAWA	National CAD Standards (NCS)
LABOE	National CAD Standards
Caltrans	Custom Caltrans
LADOT	Custom LADOT convention
LABSL	Customer LABSL convention
Utility Owners	Varies

Where an AHJ doesn't provide a standard and/or templates and resources (i.e. utility owners), National CAD Standards layer naming convention is used.

Layer Status Fields

Some AHJ layer naming includes provisions for assigning a layer status or disposition (e.g. existing, proposed). Where an AHJ does not provide provisions, a layer status field is applied. The following table lists approved layer status fields for use on the project which are defined in NCS:

Status	Field	Denotes
--------	-------	---------

Abandoned	-A	Existing facilities to be abandoned as part of the project
Demolished	-D	Existing facilities to be demolished as part of the project
Temporary	-T	Proposed temporary features
Stage & Phase	-#A	Stage and phase of construction (e.g 2B for stage 2, phase B)

Layer status fields are not required but should be used when it is important to make the distinction of an objects disposition. When utilized, the field is added to the end of the layer name. For example, if an existing utility is being demolished the portion being removed should be placed on a new layer with the “-D” status field applied to it.

Original Layer Name: R-UTIL-PIPE

New Layer with Status Field: R-UTIL-PIPE-D

Revit Phasing

Revit elements shall be assigned to the appropriate phase. New phases may be created as needed to accurately organize elements.

6.2 Design Models

6.2.1 Design Governing Software

The following table lists the current list of design software and version approved for use on the project:

Software	Release	Version Number	Notes
Revit	2023	2023.0.11.19	
Civil 3D	2023	2023.3.2	
InfraWorks	2024	2024.1.1.41	
Navisworks	2023	20.2.1393.45	
Rhinoceros	6, 7 & 8	-	
Autodesk Desktop Connector	N/A	Latest	

Updates to the approved project software may take place during the duration of the project. The BIM management team will assess the potential of transitioning to newer software versions if updates make previous versions obsolete or provide improved features beneficial to the project. A software upgrade will be adopted only after the BIM team officially determines that it will add significant value to the project, weighing the associated costs and migration implications.

Software Configuration

Civil 3D Profile

To drive adherence to project standards and consistency in deliverables a project-specific Civil 3D profile has been created. The profile contains project-specific variable settings which can, and occasionally will be updated by BIM management during the project. The profile also autoloads the LISP routines described in the following section.

Instructions for installing this profile can be found here: [ATMP CAD Setup Instructions](#). Use of this profile is mandatory when authoring project files in AutoCAD or Civil 3D. Note that this process can only be completed after access to the project ACC site has been granted.

Project LISP Routines

See table below for a description of the project LISP routines.

Name	Key-In	Description
Acad.lsp	N/A	Runs at program startup and sets variables and support file search paths
Acaddoc.lsp	N/A	Runs when a drawing is created or opened. Sets drawing-specific settings, autoloads lisp tools, and redefines the QSAVE command to include regapp and annotation scale purging
Laylist.lsp	"LAYLIST"	Similar to the in-built "XLIST" command, but this version works on nested XREF layers
PM.lsp	"PM"	Reduces number of clicks when editing multiple polylines
Setstandards.lsp	N/A	Sets project support file search paths to ACC. Is called by Acad.lsp
SWTP.lsp	"SWTP"	Switches between out of the box and project-specific tool palette
TLEN.lsp	"TLEN"	Calculates the total length of selected elements
TROT.lsp	"TROT"	Rotates text to align with line
TW.lsp	"TW"	Rotates view and aligns crosshairs/snapang to the new view rotation.

AutoCAD/Civil3D Tool Palettes

Project-specific tool palettes have been created to streamline access to project and AHJ symbology and annotation. These tool palettes are enabled in the project CAD profile and can be accessed by keying in the "SWTP" command at the Civil 3D command line.

CAD/BIM Support Files

All project CAD/BIM support files are stored in the [05 Common Docs/10 Support](#) folder. These files are critical to the proper function of the software, and they are referenced by both the Project Civil 3D profile and tool palettes. A description of the subdirectories under 10_Support is shown in the table below:

Directory	Description	Example Contents
Documents	AHJ and other agency standards	LAWA BIM 2022 standards, Caltrans PPM and LABOE CAD Standards
Dynamo	Project-Specific dynamo scripts	BOE Construction notes.dyn
Library	Project-specific CAD/BIM content	AutoCAD blocks, Revit Families, ect.
Plotting	AutoCAD Plot Styles and other Printing Configuration files	Project .stb file, .pc3 file for plotters
Profiles	AutoCAD .arg Profiles	Civil 3D 2023 ATMP.arg
Resources	AutoCAD support files	LISP routines, shx files, font mapping, linetypes

Templates	Project-specific drawing and model templates	2023_ATMP_C3D.dwt Blank.dwt
Tool Palettes	AutoCAD tool palette source files	.atc files for tool palettes, image files for tool palette icons

6.2.2 Design CADD/BIM Model Data Structure

File Types

DWG files used on the project fall into one of the following five file type categories:

- Reference
- Model
- Container
- Sheets
- Exhibits

Each type of file has a specific use in the project data structure and drawing production workflow. The following subsections describe each of the file types. Revit (.rvt) files are always Model files.

Reference

Reference files are intended to be used as External References (XREFs) in AutoCAD and Civil 3D. These drawings should only contain basic AutoCAD geometry – **no text or Civil 3D data is allowed**. Examples of reference files include:

- Survey Planimetrics
- Proposed 2D Horizontal Geometry
- 2D Utility Maps
- Right of way and property boundary maps
- Drawing borders and title blocks

Reference files may be overlayed into any of the other project file types. Only attach reference files in Container files.

Model

Model files contain the source information for project models. These files are considered the “working” engineering models where the design is developed, and the graphics contained within are not intended for presentation.

Model files are never XREF'd into other drawings. Instead, data shortcuts should be created to display the information from the model file in base files, (DREF).

Models in Civil 3D include:

- Surfaces
- Alignments & Profiles
- Sample Lines
- Pressure Pipe Networks
- Gravity Pipe Networks
- Corridors
- View Frame Groups

Note: In some circumstances it is appropriate to reference a model file into a sheet file, if that model file's content does not support data shortcuts (i.e. AutoCAD 3D Solids).

Data Shortcuts (DREF)

Model information may be exchanged between model files via data shortcuts. Data shortcuts are maintained in the Data Shortcut Project which is a standalone folder in the project directory structure that is created and managed by Civil 3D. Some examples include:

- Alignment and a Surface model(s) are DREF'd into a Corridor model file for use in the corridor design
- Surface models are DREF'd into a Pipe Network model file for reference when designing the Pipe network

Container Files

Container files are used as a place to host several attached reference files and, in some cases, Civil 3D data from the project models via DREF for presentation in sheet files. Container files can be used to provide a comprehensive reference for data that may be broken into several files due to deliverable packaging requirements.

When Civil 3D data is used in a container file, it should can be stylized and annotated per the project graphic standards. Attached XREFs may be clipped in container files. Container files are XREF'd into sheet files for final annotation and presentation in the contract documents.

Sheets & Exhibits

Sheet and exhibit files overlay reference and base files. Annotation is added to create PDFs. No design data is produced directly in any sheet file. Sheet files may only host Model data via DREFs when approved by the BIM manager. Multiple layout tabs are not allowed – there must be one sheet file dwg for every PDF that is produced.

6.2.3 Directory Structure

All CAD/BIM files are stored under the CADD folder on ACC. The CADD folder has several subdirectories, each intended to contain specific files described in the preceding sections. The following table contain a description of each subdirectory and its intended use.

Directory	Description
_Shortcuts	The _Shortcuts directory is created and managed by Civil 3D. This folder contains XML files which define the Civil 3D data shortcuts for the project. Never manually modify this folder or the files contained within.
Aerial	The Aerial folder is reserved for aerial imagery and associated "sister" files required for correlating the images geographic position. Subdirectories are created to separate aerial images by capture date and/or location
Base	This folder contains Reference and Container files, as described in the previous section. All reference and container files used on the project, regardless of what discipline they support, are stored in this location.
Coordination	The subdirectories in this folder contain coordination files that are referenced by the Model Coordination module in ACC for spatial coordination and clash detection.
Exhibits	This folder contains all non-contract drawing exhibits and graphics. Subfolders may be created to separate exhibit files into different areas, disciplines, ect.
Model	Model files are stored in this directory.
Sheets	The location for all sheet files used on the project. Sub directories are created under this directory for each drawing package, design unit, etc. All sheet files

	included in a package are saved within their respective sub directory, regardless of discipline.
Plots	Sub directories are created underneath the plots folder to mirror those subdirectories present in the sheets folder. When plotting PDFs from sheet files, the resulting PDFs are saved here. When sheets are revised and replotted, they should overwrite the previous version in this directory to create version history In ACC.

6.2.4 File Naming

All BIM files for the project shall use combinations of the following components to form their respective file names.

Naming Components

Abbr. Description

PI	Project Identifier
DD	Discipline Designator
DT	Data type
-X	File type
UD	User defined
.ext	File extension (e.g. .dwg)

Each of these components and their respective approved values are described following subsections.

Project Identifier

The project identifier should be used when it is necessary to make a distinction of what specific part of the project a file is related to. Project identifiers may either be a number, text string, or combination of and must be unique.

The project drawings have been broken into several packages called Design Units (DUs). These design units break up the project plans into packages based on which agency will have jurisdiction of associated review. The Design Unit will be used for the PI after 30% plans have been submitted and construction plans are being generated. For example:

DU01 – Design Unit 01

Use of the project identifier is not required on Model, Container, Coordination or Reference files.

Discipline Designator

Discipline designators are used to identify the primary discipline represented by the data contained in the file. The list below contains approved discipline designators as defined by National CAD standards, V6.

G-	General
GC	General Contractual
GI	General Informational
GJ	User Defined
GK	User Defined
GR	General Resource
A-	Architecture
AD	Architectural Demolition
AE	Architectural Elements
AF	Architectural Finishes
AG	Architectural Graphics
AI	Architectural Interiors
AJ	User Defined

AK User Defined
AS Architectural Site

C- Civil
CD Civil Demolition
CG Civil Grading
CI Civil Improvements
CJ User Defined
CK User Defined
CN Civil Nodes
CP Civil Paving
CS Civil Site
CT Civil Transportation
CU Civil Utilities

L- Landscape
LD Landscape Demolition
LG Landscape Grading
LI Landscape Irrigation
LJ User Defined
LK User Defined
LL Landscape Lighting
LP Landscape Planting
LR Landscape Relocation
LS Landscape Site

R- Resource (Record Drawings)
RA Resource Architectural
RC Resource Civil
RE Resource Electrical
RJ User Defined
RK User Defined
RM Resource Mechanical
RR Resource Real Estate
RS Resource Structural
RU Resource Utilities

S- Structural
SB Structural Substructure
SD Structural Demolition
SF Structural Framing
SW Structural Wall
SJ User Defined
SK User Defined
SS Structural Site

V- Survey / Mapping
VA Survey / Mapping Aerial
VC Survey / Mapping Computed Points
VF Survey / Mapping Field
VI Survey / Mapping Digital
VB Survey / Mapping Boundary

VL	Survey / Mapping Land
VJ	User Defined
VN	Survey / Mapping Node Points
VS	Survey / Mapping Staked Points
VU	Survey / Mapping Combined Utilities

Data Types

Data types are used in conjunction with discipline designators to further define the contents of a file. The list below contains data type abbreviations and their respective definitions that are approved for use on the project.

AL	Alignment
AF	Airfield
AOA	Airport Operations Area
APM	Automated People Mover
AR	Aerial
BA	Barrier
BR	Bridge
BD	Border and/or Titleblock
CM	Communications
CR	Curb Ramp
DR	Drainage
DT	Detail
EL	Electrical
ER	Erosion Control
FD	Foundation
FG	Fine Grading
FO	Fiber Optic
FU	Fuel/Oil
FW	Fire Water
GR	Grading
IT	Intelligent Transportation Systems (ITS)
KM	Key Map
MK	Marking
NG	Natural Gas
LT	Lighting
PV	Pavement
PR	Profile
RD	Roadway
RG	Rough Grading
ROW	Right of way
RW	Retaining Wall
SD	Storm Drain
SN	Sign
ST	Staging, Maintenance of Traffic (MOT)
SP	Site Plan
SS	Sanitary Sewer
TC	Traffic Control
TP	Topography
TS	Traffic Signal
WT	Water
UT	General Utilities

File Type

The File Type component is used to identify a file's intended use as either a *reference*, *model* or *container* file. The three approved file type indicators are as follows:

- C Container
- M Model
- R Reference

User Defined

Some files may use an optional user defined component as part of their name. When warranted, user defined components should supplement the information already defined by the discipline designator and file type. Some examples include:

- Segment/Alignment
- Project Area
- Item Number (e.g. wall number, bridge number)

Reference, Model & Container File Naming

Reference, model, and display file names are comprised of the following components:

Abbr. Description

PI	Project Identifier (Optional)
DD	Discipline Designator
DT	Data Type
FT	File Type
UD	User Defined (Optional)

For example, a Civil (DD = C-) Roadway (DT = RD) reference (FT = -R) User Defined (UD = A for alignment A) dwg file results in the name:

C-RD-R-A.dwg

Or a Structures (DD = S-) retaining wall (RW) model (FT = -M) Revit file of Wall A1 (UD = A1) results in the name:

S-RW-M-A1.rvt

Sheet File Naming

Sheet file names should be comprised of the following components:

Abbr. Description

PI	Project Identifier
DD	Discipline Designator
SN	Sequence Number
###	Drawing number
UD	User Defined

The sequence number is a component unique to sheet files which is used to organize sheets into their respective sheet type. The table below lists approved sequence numbers and their respective types. These sequence numbers have been adapted from NCS v6.

General (Symbols, legend, notes, ect.)	0
Plans (Horizontal Views)	1
Elevations and Profiles	2
Sections and cross sections	3

Enlarged Plans	4
Details	5
Schedules and Diagrams	6

For example, Sheet 1 (### = 01) of a Civil Roadway (DD = CP) layout plan (SN = 1) dwg file for Design Unit 001 (PI = DU001) would result in the name:

DU01-CP1-001.dwg

Exhibit File Naming

Exhibit files are not required to follow a particular naming convention. They do, however, need to be organized into descriptive subdirectories under the CADD > Exhibits folder on ACC.

6.2.5 Model-Based Drawing Production

General Information

1. All files are created with templates provided by the CADD or BIM Manager. If a discipline requires specialized CAD resources, they must be either:
 - i) created by the CADD or BIM Manager
 - ii) reviewed and approved by the CADD or BIM Manager
2. All design information in DWG files must be positioned relative to the project coordinate system in model space, except for detail drawings and sheet borders.
3. All XREFs are always overlaid. Never attach an XREF to any project drawing, with the exception of container files.
4. Civil 3D DREFs may be hosted in model, container, coordination and exhibit files only. Never host DREFs in reference files. DREFs may be hosted in Sheet Files with BIM manager approval.
5. All CAD files must be stored in the CADD directory according to the guidelines contained herein. Do not store CAD or BIM files under any discipline-specific sub folders.
6. File naming must adhere to the standards defined herein. When using user defined file name components, limit the number of characters to a minimum. Use the description field in ACC to add additional details about a file's contents if needed.
7. Discipline BIM leads will assist their teams in following project data structure requirements.
8. Drawing (sheet) lists will be maintained by the CADD manager and discipline task lead and will be kept in the respective Sheets subdirectory.
9. Weekly CADD/BIM Production meetings will be held to report production progress and report any CADD/BIM technical issues.
10. Major design changes will be reported during weekly task lead meetings and via email. Ad-hoc CADD/BIM production meetings may be required in the event of a major design change.
11. Use of the AutoCAD sheet set manager to organize drawing sheets and update title block information is required. Sheet set files (.dst) should only be modified and managed by a single designated person or the project CADD/production manager

Project Templates and Resources

To facilitate modeling and model-based drawing production, project-specific drawing templates and associated AutoCAD & Civil 3D resources have been created for use in Civil 3D. These are not the standard templates provided by LAWA; instead, they have been created to support the graphics standards for the primary agency having jurisdiction (AHJ), the Los Angeles Bureau of Engineering (BOE), who will be primarily reviewing the project drawings.

Caltrans will have jurisdiction over some parts of the project. When Caltrans is the AHJ, standard Caltrans 2020 drawing templates will be used. All drawing templates and required support files are stored on ACC under the 10_Support directory described above.

The Los Angeles Department of Transportation (LADOT) also has jurisdiction on parts of the project. Where plans are prepared for LADOT, the appropriate LADOT templates should be used.

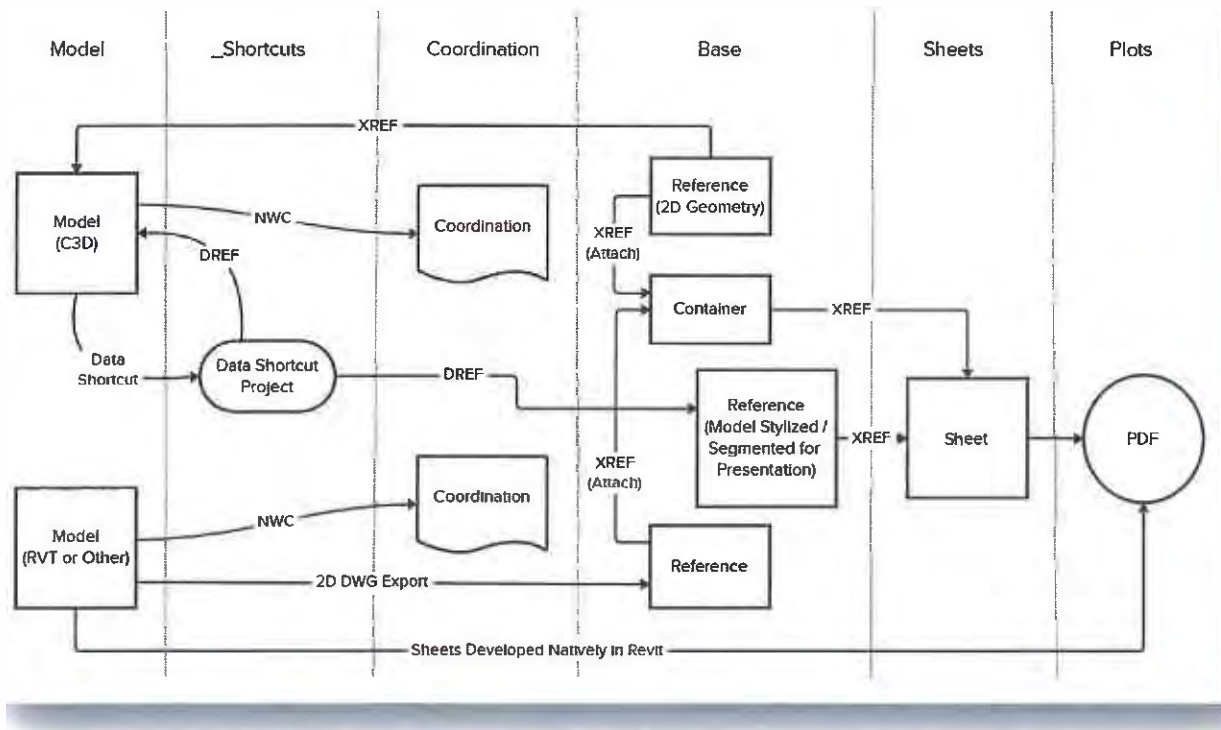

The table below lists the available project template files and their intended use. Note that Civil 3D reference templates are used to control drawing settings, graphic standards and Civil 3D styles. The source reference templates that control each project template are also noted in the table below. Changes to styles must either be made or approved by the project BIM and/or CADD Production Manager.

Template Name	Reference Template	Software	Uses	Notes
2023_ATMP_C3D.dwt	RefTemp-C3D	Civil 3D	Model Files Reference Files	Contains Civil 3D styles and project-approved NCS Layers for Civil/Roadway design.
2023_ATMP_ACAD.dwt	RefTemp-ACAD	AutoCAD or Civil 3D	Reference files Sheet files	Contains basic General layers and is intended to be used to create "light-weight" references with only required layers.
2020_CT_C3D.dwt	RefTemp-CT C3D	Civil 3D	Container files (CT)	Content linked to Caltrans Civil 3D Styles.
Blank.dwt	None	AutoCAD or Civil 3D	Reference Files Exhibits	Contains no resources. Is intended to be linked with a reference template to bring in styles, and layers as needed.
2023_ATMP_STRC.dwt	RefTemp-STRC	AutoCAD or Civil 3D	Reference files	Contains NCS layers for structural design and Civil 3D styles for bridge modeling and drawing production.
2020_CT_STRC.dwt	RefTemp-CT STRC	AutoCAD Or Civil 3D	Reference files	Contains Caltrans layers for structural design
_Geo Template.dwt	N/A	AutoCAD or Civil 3D	Reference Files	LADOT geometric template for signing and striping
_Signal Template.dwt	N/A	AutoCAD or Civil 3D	Reference Files	LADOT Traffic Signal Template
LAWA Revit Template 2023.rte	N/A	Revit 2023	Revit Models	LAWA issued Revit Template which has been upgraded to the 2023 version of Revit
BOE SSM Template.dst	N/A	AutoCAD or Civil 3D	AutoCAD Sheet Set template	Contains custom fields for the project BOE titleblock. Should be used when creating new sheetsets for drawings where BOE is the AHJ
CT SSM Template.dst	N/A	AutoCAD or Civil 3D	AutoCAD Sheet Set template	Contains custom field for use with the Caltrans titleblock for Caltrans AHJ drawing packages.

Cut sheet templates have also been created. These drawings contain viewports and sheet borders that match the standard project sheet-cut layout. These drawings also have common project reference files like topography, roadway planimetrics, ect. pre-loaded and layer managed. When creating a new discipline drawing package, these files should be used as the basis. The CADD manager is responsible for initial cut sheet creation.

Drawing Production Reference Relationship Map

The following graphic illustrates how each project file type should be referenced relative to other file types for model coordination and drawing production. It is imperative that file reference relationships do not deviate from those shown in the graphic. The swim lanes represent directories within the CADD folder and nodes represent file types.

Graphics Standards

For this project will follow a combination of **LABoE**, **LABSL**, and **LADOT** graphic standards in all areas except Sepulveda Blvd. improvements, which will follow **Caltrans** graphic standards.

LABOE CADD Manual: [BOE CADD Manual 210827.pdf \(lacity.gov\)](#)

LADOT Drafting Standards: [LADOT Drafting Manual \(lacity.gov\)](#)

LABSL Plan Review Resources: [Business Permits: LA Bureau of Street Lighting \(lacity.org\)](#)

Caltrans Plans Preparation Manual: [Plans Preparation Manual, last updated April 14, 2023 \(ca.gov\)](#)

Lineweight

Lineweights are set in the layer definitions. With the use of the STB file these definitions are no longer tied to the color of an object within the DWG. Color be changed for additional clarity within the DWG file without affecting the printed outcome. Unless you are the owner/originator of a base file DO NOT change in the original file. Instead make changes to the Xref within a file.

Typical CTB Color (for reference only)	Line Thickness	Plotted Line Width		Use of Line
		mm	in	
N/A	Extra Fine	0.13	0.005	Fine detail which cannot be accomplished using a "fine" line
1	Fine	0.18	0.007	Material indications, surface marks, hatch lines, patterns.
2	Thin	0.25	0.010	Text < 0.10" Dimension lines, leaders, extension lines, break lines, hidden objects, setback lines, minor contours, minor grid lines, architectural backgrounds, schedule/table grid lines.
3	Medium	0.35	0.014	0.10" ≤ Text < 0.20" Object lines, symbols, minor contours, easements, schedule/table grid accent lines.
4	Wide	0.50	0.020	0.20" ≤ Text < 0.50" Titles, major contours, major grid lines, cross sections, property lines, drawing block borders.
5	Extra Wide	0.70	0.028	Text ≥ 0.50" Match lines, large titles, building footprints, title block borders, sheet borders, schedule/table outlines.
6	XX Wide	1.00	0.039	Major title underlining and separating portions of designs.
7	XXX Wide	1.40	0.055	Right of Way, Border sheet outlines and cover sheet line work.
N/A	XXXX Wide	2.00	0.079	Border sheet outlines and cover sheet line work.

The image below shows an example how the various NCS lineweights are plotted.

NCS Name	Lineweight	Plot Preview	Text Preview
"EXTRA FINE"	0.005" (0.13 mm)	_____	
"FINE"	0.007" (0.18 mm)	_____	
"THIN"	0.010" (0.25 mm)	_____	
"MEDIUM"	0.014" (0.35 mm)	_____	
"WIDE"	0.020" (0.50 mm)	_____	
"EXTRA WIDE"	0.028" (0.70 mm)	_____	
"XX WIDE"	0.039" (1.00 mm)	_____	
"XXX WIDE"	0.055" (1.40 mm)	_____	
"XXXX WIDE"	0.079" (2.00 mm)	_____	

0.08" THIN
0.10" MEDIUM
0.20" WIDE
0.50" X WIDE

Proposed features

Proposed features should use the lineweights presented in the table above. However, in some instances where emphasis on certain features is required, proposed lineweights can be increased or reduced.

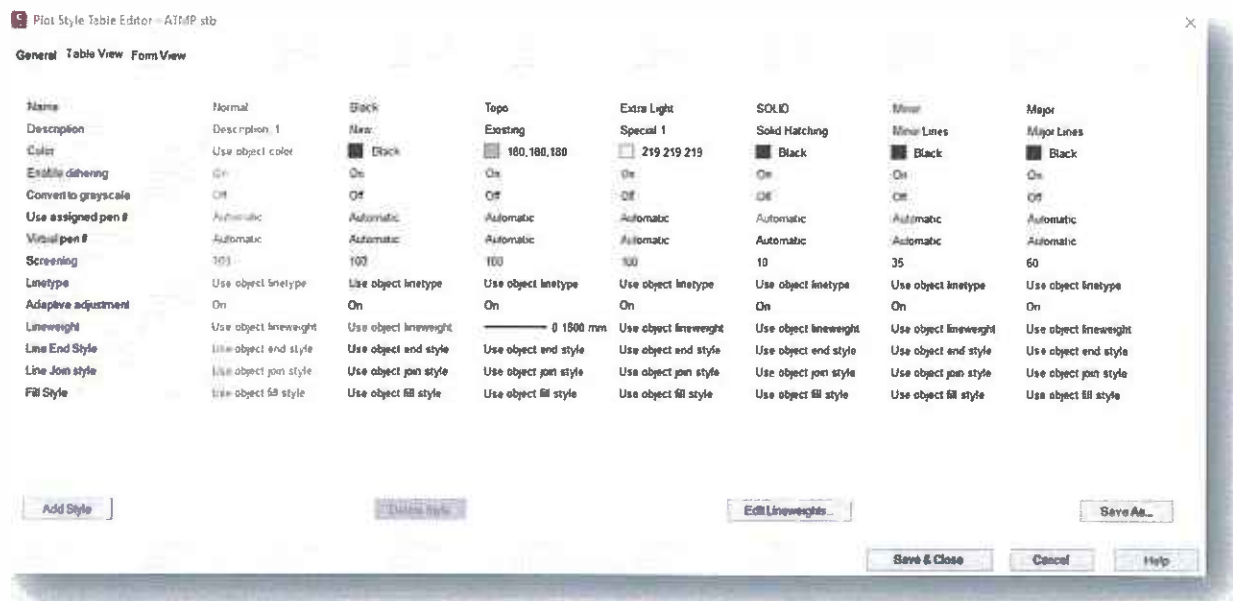

**** Contact the CADD Manager prior to changes to ensure uniformity for the project. ****

Some examples include:

- On a grading sheet, the lineweight of proposed site features could be reduced from the standard "Medium" to "Thin" to emphasize proposed contours and other grading features.
- Select proposed utilities could be reduced from "Medium" to "Thin" to emphasize one proposed utility type on a utility-specific sheet. Additionally, a specific utility could be increased to "Wide" or "Extra Wide" to emphasize.

Screening

Screening is controlled by the Plot Style of the Layer definition. There are seven available styles defined in the STB. Each defining the color and the percent screen of the output.

Color features

Features to be plotted in color will use the "Normal" Plot Style. Line weights as described in the table above.

Proposed features

Proposed features should be printed using the "Black" Plot Style. Line weights as described in the table above.

Existing features

Existing features should be printed using the "Topo" Plot Style. This is a medium screen. Line weights as described in the table above.

Special features

The "Extra Light" and "Solid Hatching" Plot Styles should be used to highlight an area with a fill. These are very light colors and all other Plot Styles will be visible in the fill area.

Minor features

The "Minor Lines" Plot Style should be used for Minor grid lines and Minor contours. It is also used in areas where a light screen is desired, it is lighter than "Topo". Line weights as described in the table above.

Major features

The "Major Lines" Plot Style should be used for Major grid lines and Major contours. It is also used in areas where a dark screen is desired, it is darker than "Topo". Line weights as described in the table above.

Digital & Physical Plotting

All drawings plotted from CAD software should be plotted digitally to full size PDF format. Plan sets shall consist of 22"x34" sheets on the appropriate Project or Caltrans border. If physical plots are desired, full size or half size (11"x17") they should be generated using the PDF files. **** Do not print to 11"x17" PDF files. Do not attempt to produce physical plots directly from CAD software. ****

Use AutoCAD PDF (Smallest file).pc3 for a Printer/plotter and either the ATMP.stb or BW.stb (Caltrans) Plot style table (pen assignment).

6.2.6 Design Model Coordination Process

Model coordination will regularly occur during the design phases of the project. The goals of this coordination are as follows:

- Facilitate interdisciplinary coordination.
- Identify spatial conflicts (i.e. clash detection).
- Review model content for accuracy, LOD progression, and completeness.

Coordination Models

Coordination models are exported as NWC format from the native design file authoring software (e.g. Civil 3D, Revit) and contain clean 3D geometry of the design suitable for viewing in 3D and for spatial coordination and 3D clash detection. Creating these "clean" coordination models is critical so as not to introduce extraneous elements (e.g. construction lines, gridlines, text, 2D linework) into the federated model coordination space. Coordination model exports are saved to the coordination model folder in ACC.

Creating Coordination Models

Autodesk provides a free "Navisworks NWC Export Utility" add-in which enables exporting NWC files directly from various authoring applications. This utility is available for download at the following link:

[Navisworks 3D Viewer | Download Free Navisworks Freedom | Autodesk](#)

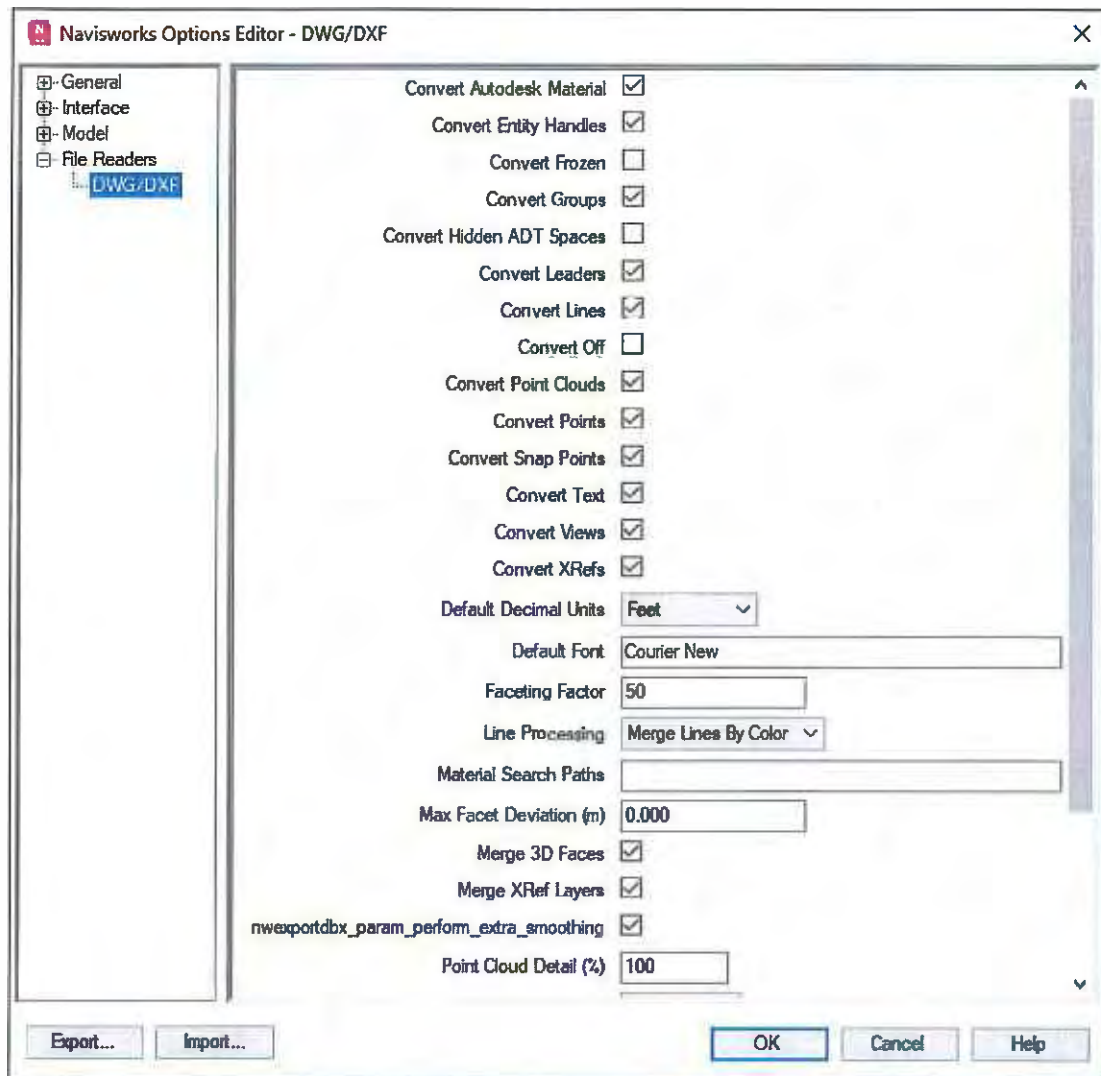

Civil 3D

When creating a coordination model in Civil 3D, care should be taken such that the only 3D elements are included in the NWC export. These include:

- Surfaces
- Alignments with proposed profiles
- Gravity Pipe Networks
- Pressure Pipe Networks
- AutoCAD 3D Solids

Use the [QSELECT](#) and [ISOLATE ELEMENTS](#) commands to filter the elements down to only types shown in the list above are visible, then use the NWCOUT command to create the coordination model export.

Note: Before using the NWCOUT command, use the NWOPT command to set up the export settings. As follows:

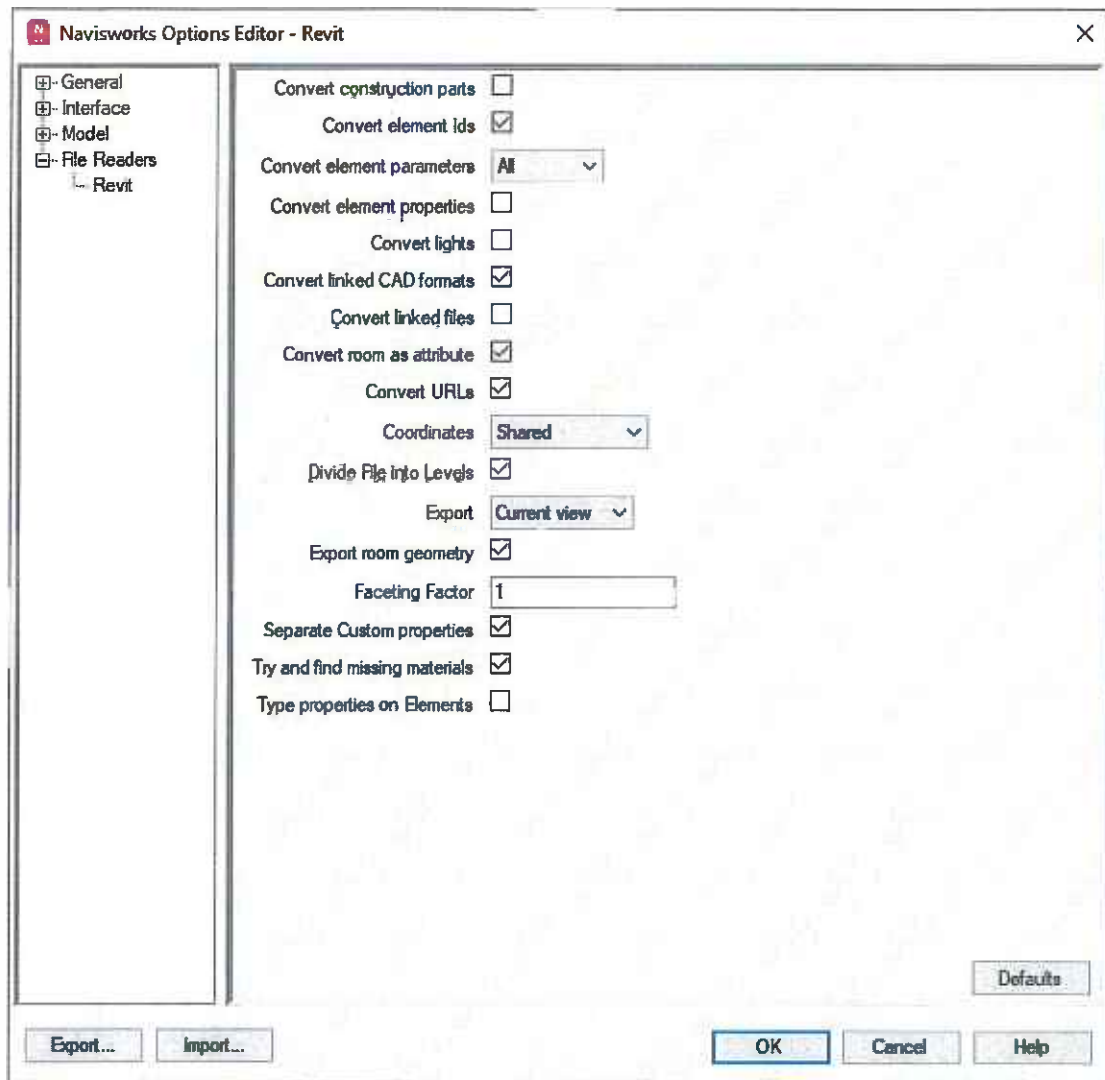

Revit

When creating a coordination model from Revit, follow the guidelines published by Autodesk as the following link:

[Help | Workflow: Using Revit and Navisworks | Autodesk](#)

In Revit, use the following settings for Navisworks exports:

Coordination Model Naming

Coordination models use simple “friendly” names that clearly identify their contents. Existing features are prefixed with “Ex” and proposed models are prefixed with “Pr”. Other models may also be used as reference to provide context, these models are prefixed with “Ref”. General models (e.g. keymaps, right of way, etc.) are prefixed with “Gen”. When multiple design alternatives are being considered, the alternative models use names prefixed with “Alt”. Some examples include:

- Pr Drainage | Proposed Drainage
- Ex Utilities – Water | Existing Utilities Model - Water
- Pr Grading | Proposed Grading Model

Appendix B includes a coordination model matrix with correlates native design files with their respective coordination model “Friendly” names.

Model Coordination in ACC

The model coordination module in ACC has been enabled and configured to provide both an ongoing look at the models both during the development of the design and at major milestone deliverables. ACC Issues are used to identify, and formally track the resolution of all conflicts and coordination issues and form the quality records for the model deliverables. The Model Coordination module in ACC will be the primary tool used to facilitate all design model coordination.

Coordination Spaces

Model coordination in ACC works by designating a particular folder, or several folders, as a "Coordination Space". Models added to these folder(s) are automatically checked for clashes with other models in the folder and made available for viewing and federation in the ACC Model Coordination module.

Ongoing Coordination Space

The ongoing coordination space is used during the entire duration of the design process. When design models are ready for coordination (both during design, and at milestones), they are exported to .NWC format and uploaded (or updated) in the coordination space folder. Automatic clash detection is enabled for the ongoing project coordination space, and several custom views have been created to facilitate reviewing more specific clash cases.

Additional Coordination Spaces

Should the need arise, additional coordination spaces beyond the ongoing coordination space may be created. However, projects in ACC are limited to a maximum of twenty (20) coordination spaces, so creation of new spaces should be considered carefully and approved by the BIM manager.

Conflict Resolution Meetings

Formal conflict resolution meets are scheduled at key points in the design process. These meetings involve all discipline task leads, project management and other key decision makers. During conflict resolution meetings, the ongoing model coordination space is presented by the BIM manager or Deputy BIM Manager, and clashes are checked between each disciplines' models.

ACC Issues

When clashes or other coordination items are identified during the conflict resolution meetings, an ACC Issue is created by the BIM Manager or Deputy BIM Manager. Issues are created as 3D markers and are associated with a specific coordination model. When an issue is created it is tagged with the following information:

- Status ("Open" for new issues)
- Appropriate issue type (Clash, or Coordination)
- Location (Design Unit)
- Comments are added to further explain the issue
- A representative from the discipline in charge of making a change is assigned the issue
- Watchers from other disciplines are also assigned if the issue requires interdisciplinary coordination.

The status of the ACC issue indicates the progression of its resolution. When issues are initially created, they are flagged as "Open". After an issue is resolved, its status is set to "Closed" and the BIM Manager or Deputy BIM manager then verifies that the issue has been addressed. The "Pending" Status is used for issues that require additional information (i.e. Potholes) and is used in cases where issues need to be deferred. At the completion of the IFC stage, all Issues must have their status set to "Closed". See appendix C for more detailed documentation of the ACC issue resolution process.

6.3 Construction Models

Construction Models shall match all requirements of Section 6.0 Modeling Standards, Protocols, & Governing Software. Should any need for deviation be required a formal request shall be submitted to the Construction BIM Manager for approval.

7.0 Modeling Scope, Requirements, Quality Control and Assurance

7.1 Design Models

7.1.2 Accuracy and Tolerances

The completeness of model geometry is a function of the model's LOD. Where the LOD does not dictate that the model be represented as a specific shape, buffer zones should be used to reserve adjacent space. Model geometry should be coordinated so that elements do not overlap or conflict. In designing the model, allowances for construction tolerances should be considered to prevent potential conflicts due to allowable deviations from the plan.

Dimensions displayed on models or CAD drawings must be automatically produced by the modeling or CAD software. These dimensions must not be modified, disassociated or detached. If certain dimensions are not directly displayed, they can be determined by making measurements in the model or CAD drawing. However, when positioning elements during construction, the dimensions explicitly indicated on the Contract Documents must always be prioritized. Using the Design models comes with risks for the builder. It's essential for the builder to ensure the accuracy of dimensions taken from models before building.

7.1.2 Scope and Requirements

Each section below describes the minimum level of detail required in the BIM models at the IFC stage. Model detail will exceed the descriptions below only when necessary to convey design intent. Further model development deemed necessary that was not previously defined will be addressed as identified as required. See also Section 6 and Appendix A for model progression and level of development information.

Existing conditions models will be developed from record drawings and/or through survey data collection by the design team. Existing conditions models will be created by the BIM manager or discipline BIM leads as needed to complete the proposed design and will only include elements directly impacted by the proposed project improvements.

Roadways

- Existing
 - Existing roadways will be modeled using TINN surfaces built from survey data in the form of points and break lines. These surfaces will represent the top of existing roadway surface and surrounding ground.
- Proposed
 - New and reconstructed Roadway models will be created using Civil 3D corridor models which will output the definition required to create a proposed top surface representing the finished grade of the roadway, curbs, gutters, sidewalks and adjacent ground.
 - Roadway baselines will be modeled using Civil 3D Alignments. Proposed profiles will be associated with each alignment.
 - Barriers will be modeled in 3D using Civil 3D corridors.
 - Guardrails will be modeled in 3D using 3D solids

Utilities and Drainage (at grade)

Unless specifically described in another section, the utilities described in this section represent all under or above ground pipes, conduits and/or conductors. This section does not describe utilities and drainage within bridge or other structures.

- Existing
 - Existing surface drainage features including curbs, swales, ditches, open channels and stormwater quality features will be included in the existing ground TINN surface model.
 - Where existing utilities have not been potholed, dipped, or otherwise field verified, they will be modeled with AutoCAD 3D solids which are generated using assumed dimensions and

depths below the existing ground. These utility models will be stored in model files with names prefixed with the letter "R" indicating that they are derived from record information. Record model geometry will be hosted on "R" prefixed layers. If record drawings provide elevations and other specifics for utilities and drainage, they will be modeled using pipe networks with names start with the letter "R-" to indicate that the model was derived from record drawings and assumptions.

- Where existing utilities have been field verified, they will be modeled with Civil 3D Pipe networks. These utility models will be stored in model files with names prefixed with the letter "V" indicating that they are derived from survey information. Field verified utility pipe network names will start with the letter "V" and will be hosted on layers starting with the letter "V".
- Existing overhead utilities will be modeled in 3D using 3D polylines and 3D solids. Existing overhead utilities that are being removed as part of the project will not be modeled.
- Proposed
 - All proposed underground drainage and utilities will be modeled using Civil 3D pipe networks and will include pipe material and diameter information. Proposed pipe network names will begin with "C-" and geometry will be hosted on "C-" prefixed layers.
 - Proposed surface drainage features including curbs, gutters, swales, ditches, open channels and water quality features will be modeled as part of the finished grade top surface
 - Specialized drainage features including, but not limited to, underground detention tanks, trash racks, energy dissipation structures etc. will be modeled with AutoCAD 3D objects.

Structures

- Existing
 - Existing Structures will be modeled in the following instances:
 - They are being modified or retrofitted as part of the project
 - They are being replaced as part of the project (foundations only)
 - They span, or will be spanned by, proposed project features and will remain in-place during construction and after project completion.
 - Existing bridge models will include structure outlines for decks, girders, columns, bent caps, and barriers. Foundations will be modeled by referencing record drawings. Interior diaphragms, voids and shear keys will not be modeled. Pins, post tensioning, reinforcement, embeds, etc. will not be modeled.
 - Existing retaining wall models will capture structure outlines for wall extents. Foundations will be modeled by referencing record drawings. Drains, reinforcement, embeds, etc. will not be modeled.
- Proposed
 - Proposed bridge models will include structure outlines for concrete decks, girders, columns, bent caps, barriers, and foundations Interior diaphragms, voids and shear keys will be modeled. Pins, bearings, post tensioning, reinforcement, embeds, etc. will not be modeled. Chamfers and fillets smaller than 2" will not be modeled.
 - Proposed Retaining wall model will include structure outlines for detailed wall shape, barriers, and foundation. Drains, reinforcement, and embeds will not be modeled.
 - Additional items including but not limited to cable trays, conduits, drainage pipes, camera, ITS equipment shall be modeled as required by the DT for space planning and verification. Only basic size and shape of the components will be modeled. Fasteners, bolt holes and other fabrication details will not be modeled.
 - Penetrations larger than 4" will be modeled.

Landscape Architecture

- Existing
 - Existing Landscape Features including, trees, bushes/shrubs, furniture, sculptures, and water features will be modeled based on survey data as 2D features.
 - Existing landscape grading (mounds, berms, ect.) are included in the existing TINN surface created from survey data.
 - Existing landscape features with foundations that are within the proposed improvement area and are to remain through the duration of the project and post-construction are modeled in 3D.
 - Existing trees that will remain after completion of project that require dedicated root space will be modeled in 3D. The model only needs to include a representation of the required root ball space.
- Proposed
 - Plantings not requiring dedicated root space will be modeled in 2D.
 - Plantings requiring dedicated root space will be modeled in 3D. The model only needs to include a representation of the required root ball space.
 - Features not requiring foundations will be modeled in 2D.
 - Features requiring foundations will be modeled in 3D.
 - Proposed landscape grading will be modeled using TINN surfaces for incorporation into the proposed Site/civil finished ground surface.
 - Proposed irrigation systems will be modeled in 2D except for service connections, which will be modeled in 3D using Civil 3D pipe networks to from the trunk line to the backflow preventer.

Civil/Site

- Existing Site Features
 - Existing site features are modeled using survey data and are represented as 2D symbols in 3D space.
 - Existing site features with foundations that are within the proposed improvement area and are to remain through the duration of the project and post-construction are modeled in 3D.
- Proposed Site Features
 - Features not requiring foundations will be modeled in 2D.
 - Features requiring foundations will be modeled in 3D.
 - An overall combined finished surface TINN will be modeled that includes all proposed grading for roadways, site/civil improvements, landscaping, ect.

Signage, Striping, Traffic Signals, ITS and Lighting

- Existing
 - Existing above ground traffic features are modeled using survey data and are represented as 2D symbols in 3D space.
 - Existing above ground traffic features with foundations that are within the proposed improvement area and will remain in-place both during construction and after project completion are modeled in 3D.
- Proposed
 - Above ground traffic features not requiring foundations are modeled in 2D.
 - Above ground traffic features requiring foundations are modeled in 3D. Including:
 - Signs
 - Light Poles
 - Traffic Signals

- Underground traffic signal control wiring, conduits and associated handholes and pull boxes are modeled in 2D.
- At-grade fiber optic communication lines for traffic and ITS equipment will be modeled using Civil 3D pipe networks. Fiber optic cables located on or within bridge or wall structures will not be modeled.
- Specialized equipment including but not limited to cameras, sensors, conduits ect. shall be modeled as required by the DT for space planning and verification. Only basic size and shape of the components will be modeled. Fasteners, bolt holes, and other fabrication details will not be modeled.

7.1.3 BIM Quality Strategy

Project BIM models will undergo quality control and assurance for both data integrity and design coordination. Data integrity checks will verify that project BIM models have been prepared in accordance with project standards, are used directly in the production of contract documents, and are at the appropriate LOD. Design coordination checks will be performed in addition to traditional contract drawing reviews and will focus on spatial coordination of existing and proposed features. BIM quality processes will not be used in the verification of technical performance and/or adherence to design criteria.

7.1.4 Model Quality Control and Assurance

BIM Data Check

Throughout the design process, Discipline BIM leads will continually monitor BIM models for progress, accuracy, model errors, and BIM standards compliance. These checks should occur regularly as part of the model development process. If the DBL isn't actively working in the BIM model, they should perform this check as a separate task on a weekly basis.

Prior to each design milestone submittal, project BIM data will undergo a formal data check to verify that the BIM model meets the project requirements, is the basis for the contract drawings, and meets the LOD indicated in the progression matrix. Each discipline must review their respective BIM models and will submit a completed BIM data verification checklist (Appendix C) with their models at delivery. This process is managed by the discipline BIM leads for their respective discipline BIM models, and the by BIM manager overall.

Spatial Coordination

BIM models will also be reviewed on an ongoing and milestone basis to verify that the proposed design has been checked for spatial conflicts. Ongoing spatial conflict reviews need not be documented. At milestone submittals a formal model checking process is completed, per the documentation in (Appendix C).

7.2 Construction Models

7.2.1 Accuracy and Tolerances

Construction Models shall match all requirements of Section 7.1.2 above. Should any need for deviation be required a formal request shall be submitted to the Construction BIM Manager for approval.

7.2.2 Scope and Requirements

Construction Models shall, at a minimum, match all requirements of Section 7.2.2 above and in addition all essential details presented on shop drawings shall be included in these models.

Any deviation must be formally requested and approved by the Construction BIM Manager.

7.2.3 BIM Quality Strategy

Construction Models shall match all requirements of Section 7.1.3 above.

7.2.4 Model Quality Control and Assurance

BIM Data Check and Spatial Coordination

Discipline models will be reviewed per specific areas (TBD) and only when all disciplines are complete. This review will check for accuracy, model errors, and BIM standards compliance as well as spatial conflicts. These checks will be documented and must occur prior to shop drawing submittal and will occur as often as required to ensure model compliance. Shop drawings will not be submitted until all compliance and spatial coordination issues are resolved.

Appendix C – Spatial Conflict Resolution Process

Appendix C – Spatial Conflict Resolution Process

1.0 Purpose

To promote the effective use of Building Information Modeling (BIM) in the project, the Design Build BIM management team has created this BIM Model Quality Check (QC) Process Visual Aid. This aid is intended to supplement the standard QC Process and provide details on how the BIM QC Process will be implemented utilizing the tools found in Autodesk Construction Cloud (ACC).

The core objective of this BIM QC process is to identify and resolve spatial coordination issues and clashes among the different disciplines of the Project.

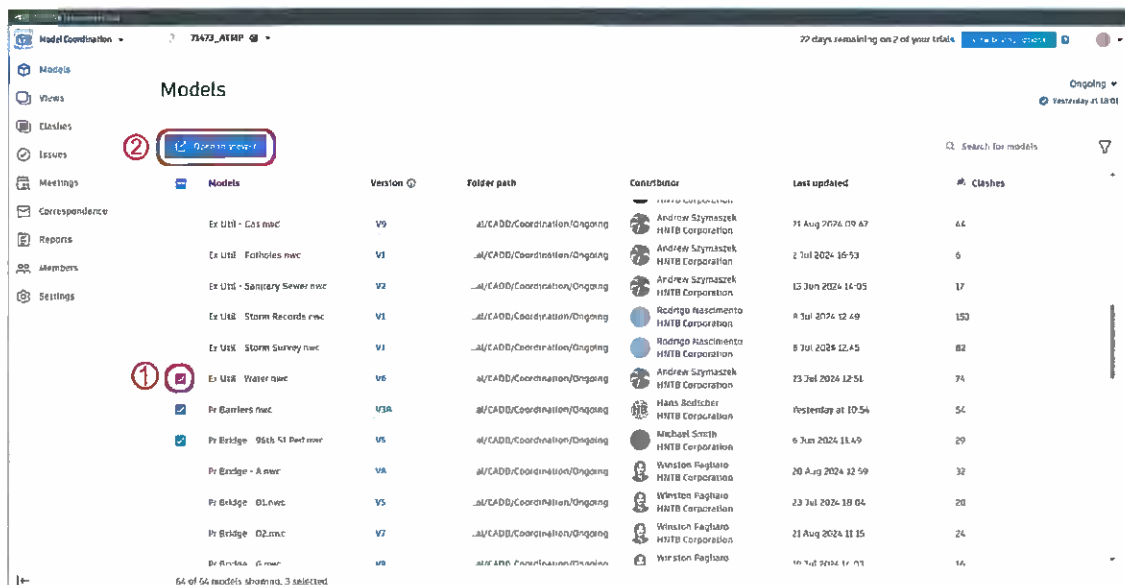

1.1 Model Coordination

This process begins with the models uploaded to ACC from the different disciplines. To access this, enter the drop-down window at the top left of the ACC webpage and select Model Coordination.

1.1.1 Viewing Models

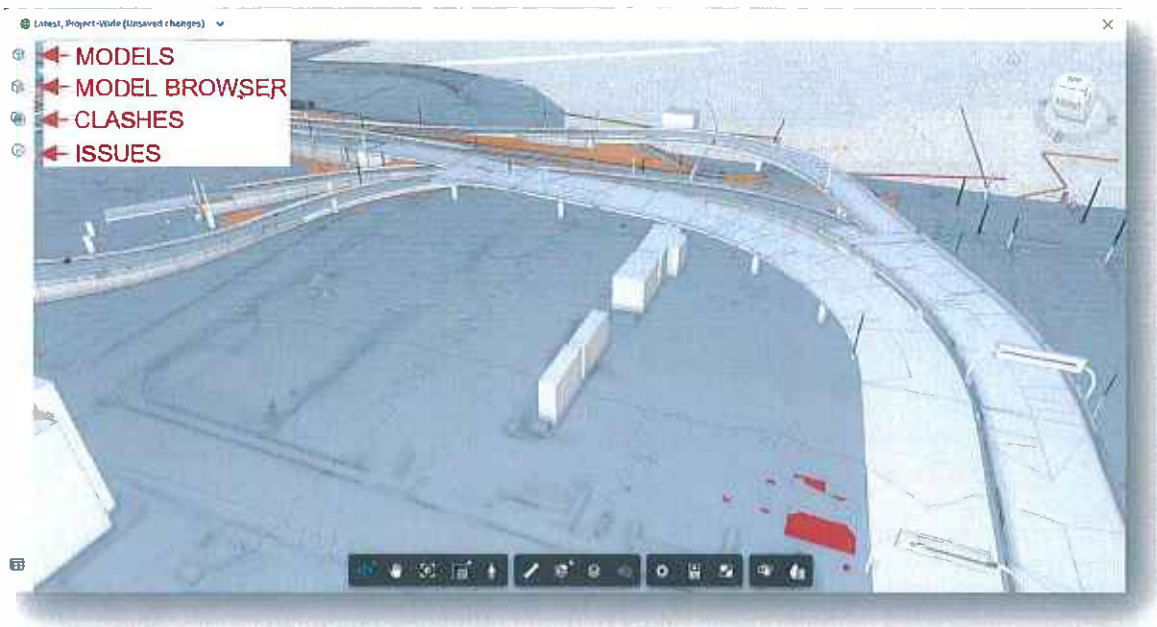

Inside the Model Coordination window, select the models you wish to see by clicking on the checkbox to the left of the Model name. Then select [Open in Viewer] near the top of the page.

After clicking [Open in Viewer], all selected models will load into a 3D Space together. In this view you can rotate, select, hide, and navigate the 3D space to see how everything works together. Navigation tools can be found on the bottom of the screen.

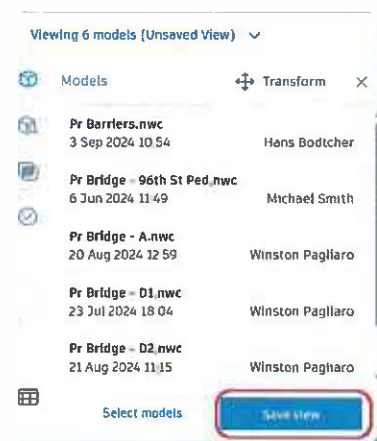

The ribbon on the left side of the screen contains 4 informational menus:

- **Models** – Displays a list of all selected and loaded models.
- **Model Browser** – Allows you to filter which models are currently being shown.
- **Clashes** – Allows you to select any loaded model and will highlight any clashes with other selected models. Clashes can then be assigned as Issues or Non-Issues.
- **Issues** – Displays clashes that have been marked as issues along with their current status and any design information assigned to it.

1.1.2 Saved Views

Instead of needing to reselect each model individually as described in Section 1.1.1, ACC allows you to save your current view with all loaded models for easy access in future sessions. To do this, while in the 3D Space open the Models Menu on the left side of the screen. At the bottom of the menu, click the [Save View] button. This will store your current 3D Space in the Views Menu in the Model Coordination space of ACC. Note; this saved view will appear in the Views Menu for all team members, not only the creator.

2. Clashes and Issues

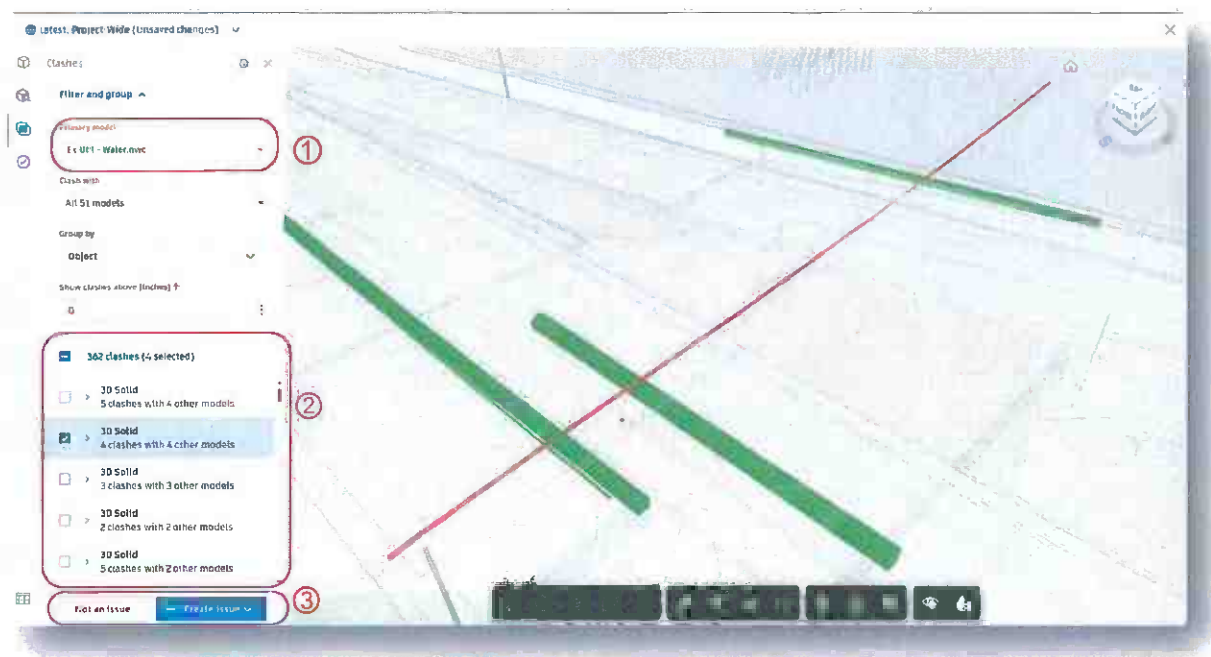

2.0 Clashes

When multiple disciplines are coming together in a small area there is likely to be accidental collisions. This is one of the areas that BIM & VDC shines, it allows us to identify and coordinate a solution between disciplines before issues are discovered on-site, saving time and costs.

To locate possible clashes, select the [Clashes] menu in the location detailed in Section 1.1.1. Inside this menu you will first select a **Primary Model** to compare with other models in the project coordination. After selecting your **Primary Model**, you will see any clashes displayed in the lower part of this menu. Selecting one of these clashes will move your 3D Space view close to the issue area.

- Primary Model object(s) will be highlighted in **Green**.
- Clashing model object(s) will be highlighted in **Red**.
- All other model objects will display transparent grey.

After identifying the clash, use the bottom buttons to either designate it as a non-issue. Or to mark it as an issue and assign it a type from the list that appears.

2.1 Issues

When an issue is created, it will appear in the Issues menu and be assigned a unique number. All Issues will display in the menu on the left side of the screen. Selecting an Issue will adjust the 3D view to display

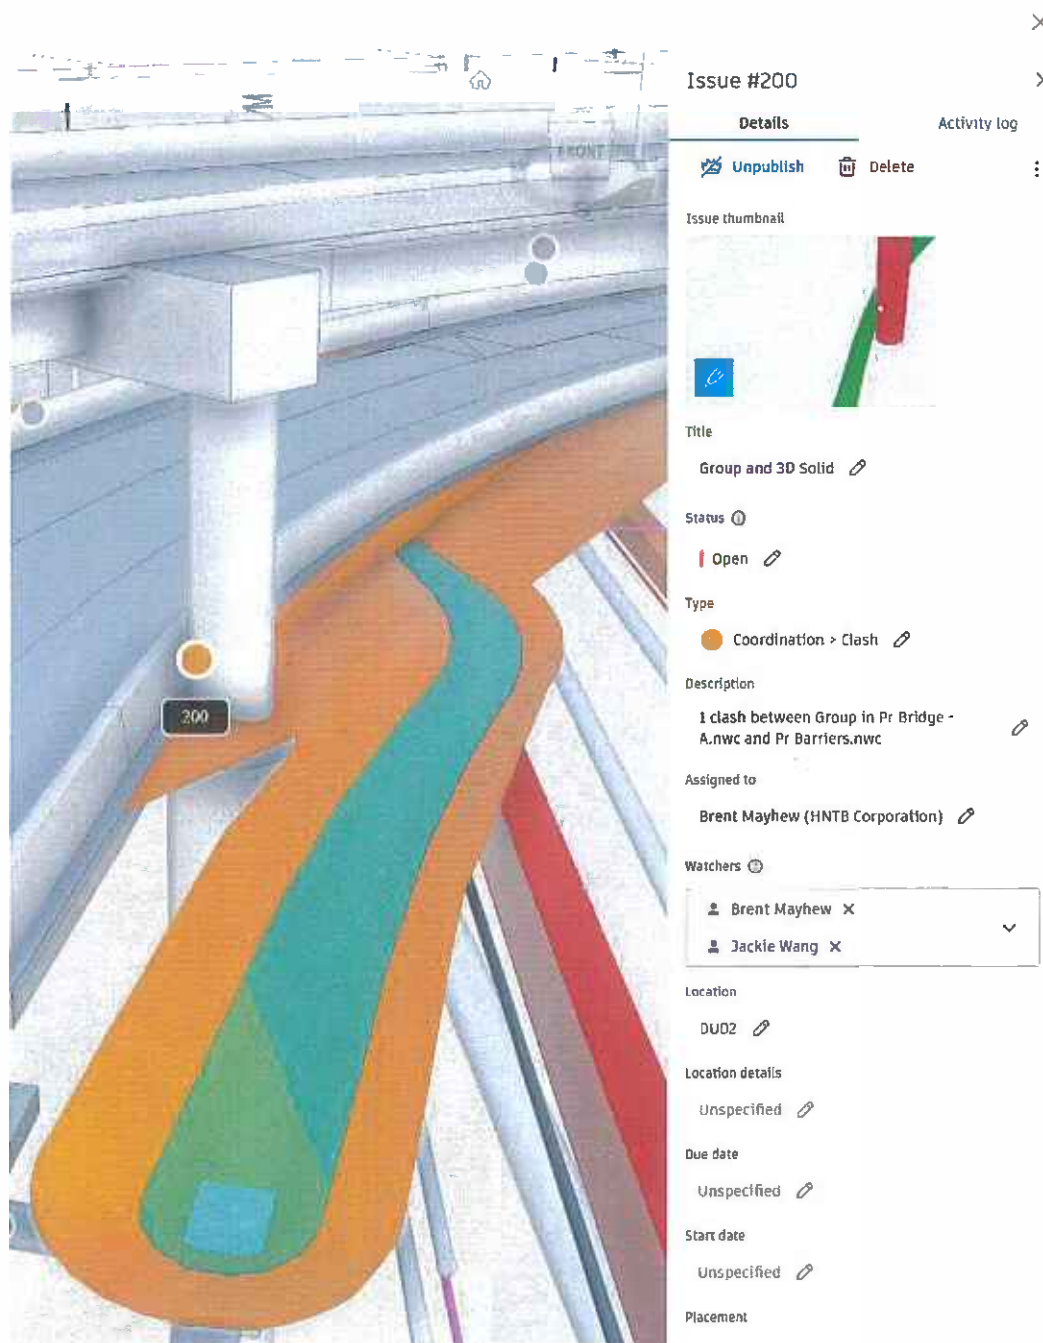

the issue along with opening a details panel on the right side of the screen. The details panel will display information relevant to this issue. Beginning with a thumbnail image from when the issue was created, the current status, and a description.

In the Details panel team members can be assigned issues to designate who is responsible for its resolution. Additionally, team members that should be aware of the issue, but are not expected to contribute to its resolution, should be added as Watchers.

Further down in the Details panel, you can add additional information such as; location, due date, a field for comments, files, and/or images that are relevant to this issue.

Issues View in Model Coordination

Issues Detail Panel

Description of Issue Types

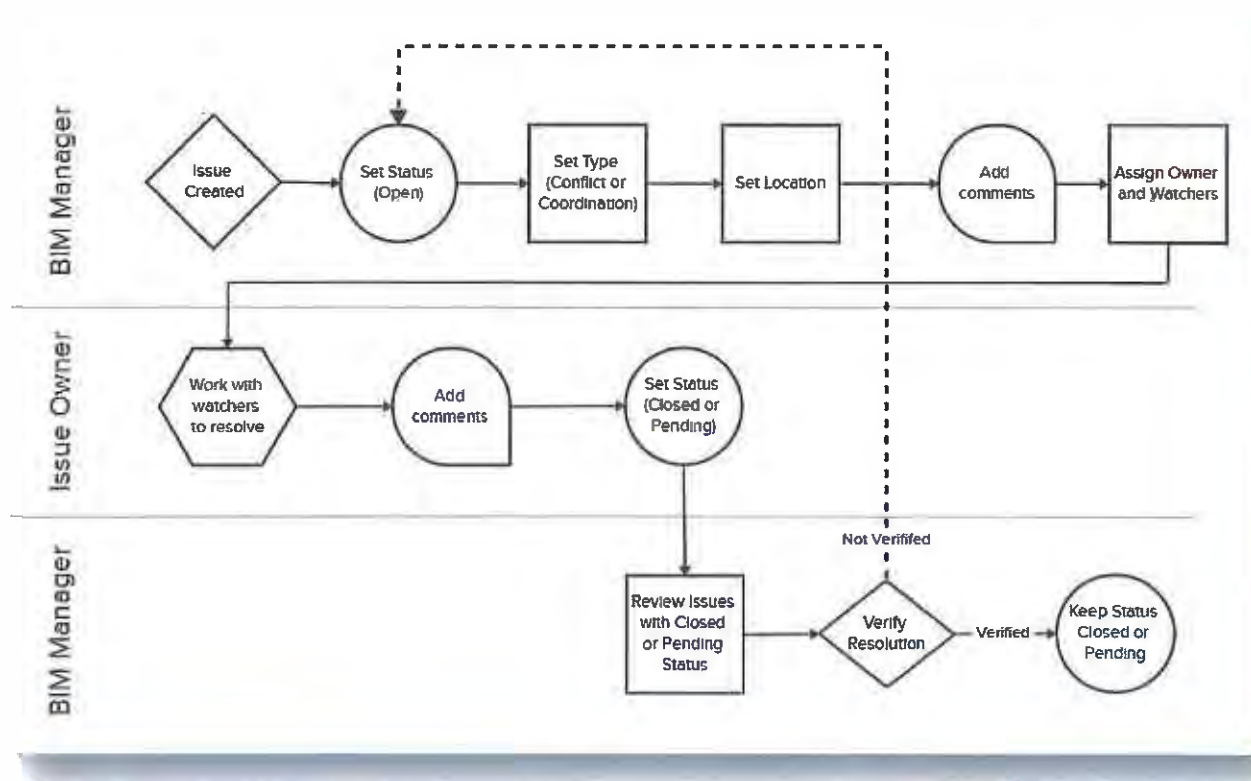

- **Coordination > Clash** – Used when two elements directly intersect with each other, or when two objects do not meet minimum clearance criteria.
- **Coordination > Coordination** – Used when additional coordination is required between models. For example, the top of wall elevation does not match the bridge abutment.

Descriptions of Issue Status:

- **Draft** – Possible issue that may need attention.
- **Open** – Issue that needs to be or are in the process of being resolved.
- **Pending** – Reserved for issues that are unable to be addressed at this time. Either due to lack of information, outside the current scope, etc... This is used when issues need to be deferred for future resolution
- **Closed** – Issue has been resolved.

The following flowchart demonstrates the issue resolution process

Appendix A – Risk Register.....	6

Risk Management Plan

1 Overview

As part of SFJV's management approach, we will develop and apply an expanded Risk Management Manual modeled after the International Tunnel Insurance Group's "Code of Risk Management for Tunnel Works". The objective of the SFJV Risk Management Manual is to provide an instructional reference on how to identify and mitigate risks associated with design, construction, and commissioning.

The overall performance and payment concern of LAWA will be addressed by providing Performance and Payment Bonds. SFJV recommends to LAWA that insurance coverage be managed through either an Owner Controlled Insurance Program (OCIP) or Contractor Controlled Insurance Program (CCIP) as LAWA chooses. All other risks will be identified on a Risk Register and will be further addressed with specific action plans to mitigate the risk.

2 Responsibilities

SFJV has assigned a Risk Manager to identify all risks on the project, organize a Risk Register and develop action plans to mitigate those risks. The Risk Manager reports directly to the Project Manager. The Risk Manager, Project Manager and/or Construction Manager will designate responsibilities to specific risk register items as appropriate.

3 Insurance and Claim Management

If elected by LAWA, SFJV will provide insurance coverage and manage the insurance program through an SFJV Contractor Controlled Insurance Program (CCIP). This program will be expertly organized and managed through Skanska's insurance broker AON. AON's CCIP Manager will report directly to SFJV Risk Manager.

4 Risk Register.

SFJV and LAWA jointly developed a Risk Register early in Phase 1 which we will continue to be developed and maintained throughout the Project duration. The Risk Register clearly identifies Risk scenarios, their potential cause, and potential consequences, allowing for the analysis of the likelihood of occurrence if unmitigated, potential cost impact, and potential schedule impact. Furthermore, the Risk Register documents the action plan's mitigating measures to minimize/eliminate Risk of occurrence and who's the responsible party. The latest risk register is included in appendix A

5 Action Plans

SFJV will develop action plans for specific Risk scenarios as identified in the Risk Register. These action plans will detail the specific Risk, consider all potential consequences of these and provide an examination of possible mitigating measures to minimize/eliminate the risk of occurrence and then implement the best solution to minimize/eliminate that risk of occurrence.

6 Project Risks

SFJV identified the following 22 most likely to occur Risks from the Risk Register as developed to date. The full register is included in Appendix A

ID #	Risk Description/Summary	ID #	Risk Description/Summary
1	AHJs commenting/not accepting Basis of Design and number of AHJ design review iterations could result in late start and finish of Schematic Design phase and delay in progression of design iterations and issuance of permits	27	In cases where overhead lines are intended to remain protected-in-place, they shall be considered in the logistics (crane picks, etc)
2	AHJ challenge in to review individual drainage reports of the ATMP projects without a master hydrology map of flows. This has ties to the entire Program and not just ATMP roadways.	2	The 4'x8' RCB along Century Blvd will be in conflict with proposed structures and will require relocation
3	AHJ challenge in approving traffic indices which will be driving Pavement Design.	32	With the changes in the roadway geometry, the proposed striping for lane transitions may extend outside of the project limits as the striping transitions.
	Traffic throughputs during construction could degrade the level of service, resulting in an increase in number and timing of construction phases/traffic switches and diminished user experience	33	LAWA employs Monotube Cantilevered Sign Structure, as outlined in LADOT's Redbook, for overhead signage differing from Caltrans's Tubular variety. Non-Caltrans standard LAWA Overhead Signage will drive up the cost for specialty fabrication and it will require extensive coordination.
8	Insufficient craft labor resources could result in longer durations to complete schedule activities	34	On Sepulveda, coordination between LADOT Spec and Caltrans Spec regarding the removal and disposal of thermoplastic striping will be required. Caltrans considers existing thermoplastic striping as hazardous material which requires disposal in a specific manner.
11	Existing Utility information not robust or inaccurate data requires a relocation that impedes progress of new facilities	39	Potential for additional Wayfinding locations are added outside of the ATMP project limit

14	Delays in ROW and TCE acquisition, or eviction of Tenants from LAWA property needed for construction could delay the project	47	Failure to achieve Contract Milestones may result in liquidated damages. Specific milestones, listed in GC46, creating this risk are Schedule Deliverables 1a and 1b, Milestone 2, GMP at 60% construction documents, and Milestone 5, Final Completion by June 30, 2028
15	Utility relocations required to be performed by the utility owners, either because they are in franchise right, or that is the standard practice (i.e. SoCalGas) could result in delays to the project	51	There could be a delay in design advancement due to a delay in the selection of architectural treatments for the entire Program by Cultural Affairs & Arts group.
16	We anticipate the risk of pricing volatility and lead-time for materials and industry contracting to be high due to geopolitical tensions, the unknown trajectory of the pandemic, and increased demand from multiple major projects leading up to the Olympics	TBD	The magnitude of this project will require large areas adjacent to the work zones for equipment access, staging of materials, craft employee parking, and logistics facilities. Currently there are not adequate areas designated for site access and logistics. Restricted work areas will decrease efficiency/productivity, and increase cost/durations.
18	Construction activities may cause hazards to pedestrians and bicyclists in the area	TBD	Shared construction work zones between separate Contracts, i.e. Terminal 9, will cause potential for interface impacts.
20	There is a high likelihood of encountering contaminated or hazardous materials on site, and the exact type and quantity have not yet been fully identified. This could present both cost and schedule challenges to the project if encountered.	TBD	Shared construction work zones between separate Contracts, i.e. Concourse 0 will cause potential for interface impacts.

Appendix A – Risk Register

RISK REGISTER				Project Name:	Airfield and Terminal Modernization Program - Roadway Improvement Project (ATMP)										Quantitative Risk Analysis									
Risk Identification				Risk Description					Probability			Cost Impacts - Current Total			Total Time Impact (Non-Critical days)			Critical Path Delays						
Status	Location	Risk Type (Level 1)	Risk Type (Level 2)	Title	Risk Description/Summary	Planned Mitigation and Actions (LAWA)	Risk Manager	Assumptions	Low	High	Average	Low (Cost)	Most Likely (Cost)	High (Cost)	Probable (Cost)	Low (Days)	Most Likely (Days)	High (Days)	Probable (Days)	Is the delay deemed as the critical path?	Bully Rate @95% Conf			
Closed		Design	Requirement	ALL Approvals For BOB	ALL construction activities requiring Review of Design and Construction Documents must be approved by the Airfield and Terminal Modernization Program (ATMP) before construction begins.	Set-up engineering meetings with ATMP to review design documents and construction documents. Obtain approval from ATMP and Project Specific Design Control (PSDC) before construction begins.	LAWA (TBC)	Phase 1 - 1.5m MB, 50% subject to lane closures, 32% gel released = 220000m @ 1100kph @ 120m increase in direct manours 3.60m schedule delay	0%	0%	0%													
Active		Permitting	ABOE	ATMP Drainage Design Approval	ATMP challenge in to review individual drainage reports of the ATMP projects without a master hydrology map of area. This has ties to the entire Program and not just ATMP roadways.	Develop a master hydrology map. SFJV will support with project specific information, but we have to determine the "What" and "Where" of the task.	LAWA (TBC)	ATMP involvement may be required Phase 1 50m direct cost to prepare hydrology report \$24m for 6 months, schedule delay	80%	80%	80%	\$ 13,050,000	\$ 15,500,000	\$ 17,000,000	\$ 9,300,000	164	163	304	170					
Closed		Permitting	LAWA	ATMP Review of Design Approval	ATMP challenge in to review individual drainage reports of the ATMP projects without a master hydrology map of area. This has ties to the entire Program and not just ATMP roadways.	Set-up engineering meetings with ATMP to review design documents and construction documents. Obtain approval from ATMP and Project Specific Design Control (PSDC) before construction begins.	LAWA (TBC)	ATMP involvement may be required Phase 1 50m direct cost to prepare hydrology report \$24m for 6 months, schedule delay	0%	0%	0%													
Closed		Permitting	ABOE	ATMP Review of Design Approval	ATMP challenge in to review individual drainage reports of the ATMP projects without a master hydrology map of area. This has ties to the entire Program and not just ATMP roadways.	Set-up engineering meetings with ATMP to review design documents and construction documents. Obtain approval from ATMP and Project Specific Design Control (PSDC) before construction begins.	LAWA (TBC)	LAWA has agreed with BOE to provide 70.10 260kph and the will be in estimate as now																
Active		Construction	Performance and Reliability	Degraded Traffic Level of Service	Traffic throughput during construction could degrade the level of service, resulting in an increase in number and timing of construction phase/traffic events and decreased user experience.	Minimize lane closures where possible. Coordinate with LAWA for closure during special events, outreach efforts for lane closures.	SFJV (C-4015 H)	Phase 2 1.5m MB, 50% subject to lane closures, 32% gel released = 220000m @ 1100kph @ 120m increase in direct manours 3.60m schedule delay	80%	80%	80%	\$ 8,800,000	\$ 92,800,000	\$ 68,200,000	\$ 24,000,000									
Active		External	COVID-19	Pandemic Restrictions	New COVID-19 variants require on-located LAWA office to close.	Conduct virtual meetings for project coordination. Use PPE to attend in-person meetings and follow social distancing protocols if in-person meetings are needed. SFJV to follow Federal/State/Local Guidelines.	LAWA (TBC)	6 month with 10% inefficiency Phase 1 \$2.4m Phase 2 10% inefficiency for Staff = 1 10% 30% 20% Craft labor inefficiency = \$150		10%	20%	\$ 27,300,000	\$ 30,400,000	\$ 33,440,000	\$ 8,000,000									
Active		Construction	Performance and Reliability	More than Anticipated Restrictive Lane Closure hrs	More than anticipated restrictive lane closure hours as dictated by 3rd Party, AHU (Caterpillar, LADOT, etc.) and LAWA could result in lower productivity than planned.	ATMP buy-in from the jurisdictions and implement accordingly.	SFJV (TBC)	Phase 2 1.5m MB, 50% subject to lane closures, 32% gel released = 220000m @ 1100kph @ 120m increase in direct manours 3.60m schedule delay	30%	70%	80%	\$ 88,800,000	\$ 92,800,000	\$ 68,200,000	\$ 24,000,000									
Active		Construction	Labor Issues	Insufficient Craft Labor Resources	Insufficient craft labor resources could result in longer duration to complete schedule activities.	SFJV will monitor labor conditions, work with unions to expand local hire pool. Potential to offer no-bid scale pay to attract additional workers.	SFJV (TBC)	63hr above scale for all craft 1.5m MB, last \$1m carried in SFJV estimate	20%	80%	50%	\$ 1,150,000	\$ 3,500,000	\$ 1,650,000	\$ 1,700,000									
Active		Construction	Existing Conditions	Offering Site Conditions/Clearing	Geology and buried obstacles create more difficult foundation installation conditions than expected.	Perform adequate borings for geotechnical investigations. Use deep foundation systems where in-situ pile is anticipated. Contractor to notify the owner or owner's field representatives immediately upon discovery and obtain approval to proceed with removals.	SFJV (TBC)	110 shafts @20% chance of obstruction = 22 holes at min. \$200k per shaft at 6m per hole = 6.6m Add-on @ 1m per shaft = 1.1m	30%	40%	30%	\$ 48,300,000	\$ 99,400,000	\$ 55,440,000	\$ 10,100,000									
Active		Utilities	Service Interruptions	Displaced Utility Service Interruptions	Utility activities require shutdown of utilities that affect user experience, operations, and/or emergency services.	CWP's to provide a step-by-step and a checklist on how to verify, abandon, relocate or protect-in-place existing utilities. Plan to outline prerequisite activities including but not limited to utility survey, site party notifications, field verification, permit start, and etc. CWP to also provide an action plan including a list of hot lines (emergency contact numbers) for all utility companies when a strike happens.	SFJV (TBC)	Vertical cable fiber, 3.5m/day 10.0% 8 days to repair = \$12m/min. \$30m consequential damages	50%	50%	50%	\$ 37,800,000	\$ 43,000,000	\$ 46,200,000	\$ 21,000,000									
Active		Utilities	Relocation	Existing Utility Conflicts with Proposed Work	Existing utility information not robust or inaccurate leads requires a relocation that impedes progress of new facilities.	Proactively locate utilities (through electronic detection/spot testing). Contractor to notify the owner immediately upon discovery and commence the dialogue with utility companies.	SFJV (TBC)	Phase 2 16 Unknown relocations @ 12.5m per each, 3 inches TBC	30%	80%	80%	\$ 87,730,000	\$ 97,300,000	\$ 107,250,000	\$ 48,700,000									

RISK REGISTER				Project Name:	Airfield and Terminal Modernization Program - Roadway Improvement Project (ATMP)					Quantitative Risk Analysis												
Risk Identification				Risk Description					Probability			Cost Impacts - Current Total			Total Time Impact (Non-Critical days)				Critical Path Delays			
Status	Location	Risk Type (Level 1)	Risk Type (Level 2)	Title	Risk Description/Summary	Planned Mitigation and Actions (LAWA)	Risk Manager	Assumptions	Low	High	Average	Low (Cost)	Most Likely (Cost)	High (Cost)	Probable (Cost)	Low (Days)	Most Likely (Days)	High (Days)	Probable (Days)	If the delay occurred on the critical path?	Daily Rate (\$/hour)	
Active		Interface	Internal-TB	Schedule Conflict with T3	The CTA outbound departure movements to Baguette and EB Century are on the critical path based on the current phasing plan we have developed. Delays to access required to build these movements could result in increased duration	Facilitate communication with T3 design team to confirm that access will be provided to avoid delays and optimize plans.	LAWA / SFJV (TBD)	Aggregate 5 month delay	26%	45%	36%	\$ 16,890,000	\$ 20,000,000	\$ 22,600,000	\$ 4,000,000							
Active		Construction	Logistics	Part 77 Surface Penetration	Improper preconstruction planning leads to construction equipment penetrating Part 77 Surfaces	Meet with FAA early to discuss and identify any issues through the 7450 permit process as identified in Part 77	SFJV (TBD)		0%	0%	0%	\$ -	\$ -	\$ -	\$ -							
Active		ROW	Acquisition	ROW and TCE Acquisition	Delays in ROW and TCE acquisition, or violation of Tenants from LAWA property needed for construction could delay the project	During preconstruction process SFJV to work with LAWA to identify needed takes/TCEs and develop schedule for timeframes needed for acquisition Extensive coordination with LAWA to complete acquisitions on time. Conduct comprehensive appraisals to account for market conditions to avoid delays in negotiations.	LAWA (TBD)	4 acquisitions Phase 1 \$2.5m/property for eminent domain process Phase 2 3 month delay @ \$4m/month, resequencing/acceleration caused inefficiencies plug \$5m	60%	60%	70%	\$ 24,319,000	\$ 27,000,000	\$ 29,750,000	\$ 18,900,000							
Active		Utilities	Relocation	2nd Party Utility Relocation	Utility relocations required to be performed by the utility owners, either because they are in franchise right, or that is the standard practice (i.e. local laws) could result in delays to the project. Delays may also result from late arrival and/or longer duration to complete the work.	To start the dialogue with the utility companies promptly upon identifying relocations during design. LAWA to apply pressure to encourage cooperation from the 3rd parties. Complete utility agreements prior to construction and meet with utility owners to make sure they understand the construction schedule.	LAWA / SFJV (TBD)	4 month critical path delay	60%	60%	60%	\$ 14,400,000	\$ 18,000,000	\$ 17,600,000	\$ 9,000,000							
Active		Procurement	Market Conditions	Material and Industry Pricing Escalation	We anticipate the risk of pricing volatility and lead-time for materials and industry contracting to be high due to geopolitical tensions, the unknown trajectory of the pandemic, and increased demand from multiple major projects leading up to the Olympics	SFJV will work with LAWA during preconstruction to identify major cost drivers and develop strategies to mitigate escalations LAWA to evaluate if there is any advantage to securing any materials for a separate purchase prior to advance of construction. Should bid long lead items with mitigation plans (e.g. long-lead items).	SFJV (TBD)	3% escalation per year for 4 years on \$1.2b 325*1.35*325*1.03*225 = 1.03*325*1.03*4	60%	100%	80%	\$ 6,422,224	\$ 100,466,138	\$ 110,516,032	\$ 80,375,311							
Active		Construction	Performance and Reliability	Twelve Incident	Work performed under traffic closures increases the likelihood of traffic incidents, that impact public safety and can potentially delay the job due to loss of life of work.	Contractor to obtain concurrence from LADOT and set up traffic closures in accordance with the approved plans. Contractor to QC the closure and take pictures for documentation. Use proactive protection and flaggers where necessary. Plan for emergency response team to be stationed close to the construction site to minimize this risk.	SFJV (TBD)	3 incidents/year, 4 years, average 1 day delay per incident = 20 days @ 11m/day	15%	10%	10%	\$ 3,400,000	\$ 4,500,000	\$ 4,400,000	\$ 400,000							
Active		Construction	Safety	Pedestrian Impacts	Construction activities may cause hazards to pedestrians and bicyclists in the area	Contractor to obtain concurrence from LADOT and set up traffic closures in accordance with the approved plans. Contractor to QC the closure and take pictures for documentation. Implement flaggers where necessary. Provide ADA compliant ramp detour routes where needed.	SFJV (TBD)	3 additional flaggers for 2 years @ \$80/H	60%	60%	60%	\$ 2,396,160	\$ 2,852,400	\$ 2,826,840	\$ 1,597,440							
Active		Construction	Safety	Demolition	Structure demolition operations that will be required to remove existing elements pose major falling and flying object hazards	Implement mitigations including but not limited to construction fence and aerials, nets, scaffolds, etc. Request for closure of sidewalks, traffic control and other public areas where hazard is present. Plan for night time full closure of roadways during demolition to minimize risk if possible.	SFJV (TBD)	3 deductibles @ \$50k each	20%	60%	30%	\$ 800,000	\$ 1,000,000	\$ 1,180,000	\$ 380,000							
Active		Construction	Allowance	Contaminated/hazardous Materials	There is a high likelihood of encountering contaminated or hazardous materials on site, and the exact type and quantity/extent yet to be fully identified. This could present both cost and schedule challenges to the project if encountered.	Perform Site Investigations (SI). Follow up with AIA's to accelerate SI reviews. SFJV will do best effort during site investigations to identify only hazardous materials, notify LAWA (for most cases) with exception to facilities such as Hazardous, etc.	LAWA (TBD)	200 yds per shaft, 10 shafts with hazardous materials \$1000/yd premium paid off of hazardous material additional handling/transport = \$750/yd	40%	100%	70%	\$ 1,150,000	\$ 3,500,000	\$ 3,650,000	\$ 2,450,000							
Active		Construction	Quality	DBE Satisfactory Performance	The likelihood of unsatisfactory performance by the DBEs due to their limited resources and/or experience cannot be disregarded.	Hire DBE firms with demonstrated expertise in performing similar work.	SFJV (TBD)	3 subcontractors @ \$2m premium each	0%	0%	0%	\$ 5,400,000	\$ 6,000,000	\$ 6,800,000	\$ -							
Active		Construction	Requirement	7460 Restriction	High aircraft restrictions may be imposed by FAA/LAWA in respect to maximum vertical clearance resulting in loss of production and efficiency	Coordinate with LAWA/FAA in advance to figure out requirements during construction.	SFJV (TBD)		0%	0%	0%	\$ -	\$ -	\$ -	\$ -							
Active		Utilities	Abandonment/Removal	DWP Water 477 Service Zone Elevation Line	The old line is to be decommissioned. However, if SFJV is asked to abandon or relocate the line there is a high possibility of encountering asbestos.	Plan to utility as-built for more information and verify with DWP/V. Be prepared to obtain environmental permits and to employ a specialized subcontractor to handle the waste. Coordinate with DWP to confirm that the old line can be abandoned.	SFJV (TBD)	\$2m Plug for Asbestos removal	10%	40%	25%	\$ 1,800,000	\$ 2,800,000	\$ 2,700,000	\$ 500,000							

RISK REGISTER				Project Name:	Airfield and Terminal Modernization Program - Roadway Improvement Project (A7MP)				Quantitative Risk Analysis																
Risk Identification				Risk Description					Probability			Cost Impacts - Current Total				RDW/DI		Total Time Impact (Non-Critical days)				RDW/DI		Critical Path Delay

Daily Rate (\$/2000/shift)				
Active		Construction	Logistics	COS (central Outfall Sewer)	The COS trunk line holds vital importance for LASOE. While it might not result in a relocation due to direct conflict with proposed structures, safeguarding measures might be necessary during construction. The passage of cranes and heavy equipment, especially in shoulder areas, could call for engineered protection plans.	Obtain more information on the subjected line (condition, base, material, depth, etc.) and identify areas where heavy construction loads or activities may pose a risk. Coordinate with LASOE on protection requirements. Provide information on surcharge to see if protection is necessary.	SFJV (TBD)		6%	6%	3%	\$ -	\$ -	\$ -	\$ -										
Active		Construction	Logistics	43rd East Airport Sewer Line	30+ years old. May require protection if not planned to be relocated or replaced.	The team should proactively seek to identify such conflict early on during the design phase and plan accordingly. Early dialogue with LASOE is highly encouraged.	SFJV (TBD)		0%	3%	3%	\$ -	\$ -	\$ -	\$ -										
Active		Utilities	Relocation	Fuel Lines	There is a nest of fuel lines in NB Sepulveda and within Century Blvd. Provisions need to be made to relocate, abandon or protect-in-place.	Team to identify criteria for removal or relocation of active and inactive fuel lines. Permit, specialty work, duration and other relevant efforts to be identified. Engage in early conversations with utility companies, CALM, SCC and other LAWA department. Platinate to confirm location of the oil lines. Coordinate with Caltrans/Utility owner to determine if lines can be protected in place if they don't meet the 10' clearance requirement from proposed foundations.	SFJV (TBD)	515k plug cost for relocation and temp bypass	0%	20%	10%	\$ 3,500,000	\$ 15,000,000	\$ -	\$ 16,500,000	\$ 1,500,000									
Active		Construction	Logistics	Overhead Power Lines	In cases where overhead lines are intended to remain protected-in-place, they shall be considered in the logistics (crane paths, etc.)	The team should proactively seek to identify such issues early on during the logistics and phasing efforts following the design. Obtain construction clearances requirements (disturbance-free) from utility owners. Coordinate with utility owners if the power line needs to be de-energized for a short period of time during construction activities like pile driving.	SFJV (TBD)		80%	80%	70%	\$ -	\$ -	\$ -	\$ -										
Active		Utilities	Conflict	Reinforced Concrete Storm Drain Box	The RCB along Century Blvd will be in conflict with proposed structures and will require relocation.	Avoid RCB by designing around the structure. Provide sufficient clearance.	SFJV (TBD)	Project will impact RCB work will be priced in estimate. SFJV work in roadside impacts. Run field until estimate defines scope of work.	100%	100%	100%	\$ -	\$ -	\$ -	\$ -										
Active		Utilities	Conflict	42nd Sanitary Sewer	The 42nd SS along Vicksburg Ave and across Century Blvd is in conflict and may require to be relocated.	Avoid SS line by designing around the line. Provide sufficient clearance.	SFJV (TBD)	Roadsign to move straddle band to avoid sewer line. 50k plug	80%	80%	60%	\$ 4,500,000	\$ 5,000,000	\$ -	\$ 5,500,000	\$ 2,000,000									
Active		Utilities	Conflict	48th LADWP Water Trunkline	The 48th trunkline that runs into 54th along Sepulveda at 18th street is in conflict and may require relocation.	Avoid 48th trunk line by designing around the line. Provide sufficient clearance. Review Caltrans requirements for 100' setback from utility to structures.	SFJV (TBD)	Low probability is conflict due to columns for pedestrian bridge. SFJV design to avoid the water line.	10%	16%	21%	\$ -	\$ -	\$ -	\$ -										
Active		Design	Settlements	Expanded Scope by BOE	Any changes made to any part of an intersection that is under LASOE's jurisdiction will require full upgrade of the entire intersection to current DOT Standard and Design Guideline. Some principle may apply for BOE utilities. Partial relocation or repairs of affected utilities typically calls for a greater scope of work (i.e. you take out a segment of a RCB or VCP SS line you will have to chase it all the way to upstream and downstream manholes).	Coordinate with BOE, as design progresses, on relocation of affected utilities. Inform LAWA on any increased scope items. Review DOT design criteria for temporary works.	SFJV (TBD)	Reopen century to the 40th (+747/53P), then at from jersey to balance (+726/67P) @ 377,280P	80%	78%	63%	\$ 25,194,330	\$ 27,893,790	\$ -	\$ 30,793,070	\$ 17,000,000									
Active		Design	Settlements	Striping	With the changes in the roadway geometry, the proposed striping for lane transitions may extend outside of the project limits as the striping transitions.	Coordinate with AMU's (BOE) on the striping requirements.	SFJV (TBD)	Plug	90%	99%	76%	\$ 450,000	\$ 500,000	\$ -	\$ 550,000	\$ 375,000									
Active		Contractual	Financing/Procure	Signage - Entry Signs	LAWA employs Monocolor Conventional Sign Structures, as outlined in LADOT's Handbook, for overhead signage deriving from Caltrans' Tubular Signage. Non-Caltrans standard LAWA Overhead Signage will drive up the cost for specialty fabrication and it will require extensive coordination.	Coordinate with Caltrans for sign structure standards on Sepulveda Blvd entry. Provide cost differential for LAWA's heavier and potentially procure early to mitigate any schedule issues.	LAWA (TBD)	40% premium on signs \$11.02m from POC Estimate	90%	100%	80%	\$ 4,114,880	\$ 4,571,280	\$ -	\$ 5,028,320	\$ 3,000,000									
Active		Construction	Material Handling	Striping - Thermoplastic	On Sepulveda, coordination between LADOT Spec and Caltrans Spec regarding the removal and disposal of thermoplastic striping will be required. Caltrans considers existing thermoplastic striping as hazardous material which requires disposal in a specific manner.	Use Caltrans Specs for thermoplastic striping disposal. Get LADOT confirmation. LAWA may need to obtain and provide contractor with necessary disposal manifest. Contractor to dispose properly. Review LADOT and Caltrans specs and determine requirement for treatment.	LAWA (TBD)	Determine requirement for treatment, which will be priced into estimate.	90%	100%	80%	\$ -	\$ -	\$ -	\$ -										

RISK REGISTER				Project Name:	Airfield and Terminal Modernization Program - Roadway Improvement Project (ATMP)								Quantitative Risk Analysis

Status	Location	Risk Type (Level 1)	Risk Type (Level 2)	Title	Risk Description/Summary	Planned Mitigation and Actions (LAWA)	Risk Manager	Assumptions	Low	High	Average	Low (Cost)	Med Likely (Cost)	High (Cost)	Probable (Cost)	Low (Days)	Med Likely (Days)	High (Days)	Probable (Days)	Is the delay deemed on the critical path?	Daily Rate (\$/Day/2021)							
Active		Contractual	Financing/Financial	Traffic Signal Existing Equipment	There is a potential requirement that may be imposed by the LADOT to replace/upgrade existing signal equipment.	SFJV/WHITS will perform survey of right of way intersections within project footprint. SFJV will support LAWA as needed for intersections required from LAMP that have not been modernized.	SFJV / LAWA (TBC)	8 Intersections, 32.5m/intersection	80%	50%	80%	\$ 18,000,000	\$ 25,000,000	\$ 22,000,000	\$ 18,000,000													
Closed		Permitting	LADOT	Street Lighting Approval-Level	Proposed street lighting requires level approval of LADOT, which will increase cost of the package.	SFJV/LAWA to identify review for street lighting, push to have LAWA lighting stay within LAWA approved and manageable.					RD/VDI	\$ -	\$ -	\$ -	\$ -													
Active		Design	Setbacks	Street Lighting - BSL High Voltage	BSL High Voltage (Bates circle) (Field Inspector) may direct to upgrade a service that was not required by Design/Permitted Package.	LAWA/SFJV to coordinate with BSL to get circuit diagrams for existing lighting.	SFJV (TBC)	plug 32.5m	50%	50%	50%	\$ 2,250,000	\$ 2,500,000	\$ 2,750,000	\$ 2,250,000													
Active		Permitting	LADCA	Street Lighting - CTA Architectural	LAWA may decide to use CTA Architectural standards that may require additional coordination with structures on the barriers and lighting. (possible since it will be an ASD's Approved equipment list or Carvens Standards.	Coordinate architectural requirements with all AHJ's prior to construction. LAWA/SFJV to coordinate in determining if Cultural Affairs review is necessary. If so involve them early in final design.	LAWA (TBC)	LAWA to make determination on lighting type to be used. Cost to be included in estimate.	50%	50%	50%	\$ -	\$ -	\$ -	\$ -													
Active		Interface	Internal-Wayfinding	LAWA Office Wayfinding	Potential for additional Wayfinding locations are added outside of the ATMP project limit.	Coordinate with LAWA for potential change orders during construction. Roadways team will coordinate with LAWA Wayfinding Team to identify any potential additional needs.	LAWA (TBC)	Double existing estimate for signage.	80%	80%	78%	\$ 11,128,400	\$ 12,348,800	\$ 12,822,800	\$ 9,376,800													
Active		Interface	Internal-CD	CD Coordination	Schedule and Construction coordination between concurrent project through design and construction.	Continue frequent coordination with the CD team to avoid conflicts.	SFJV (TBC)	Eliminate need for delay design.	10%	30%	20%	\$ 1,688,000	\$ 1,200,000	\$ 1,230,000	\$ 940,000													
Active		Construction	Logistics	ADA Buffer Zone	May not be able to meet the 10' buffer zone (ADA requirement) along SB Separation/CD between the edge of the existing roadway and existing retaining wall.	LAWA to explore if waiver from TSA or other governing agency for the 10' buffer zone is needed. Coordination being driven by LAWA / CD Team / DME Team.	LAWA (TBC)	Work to obtain variance or exception.	10%	20%	18%	\$ -	\$ -	\$ -	\$ -													
Active		Construction	Schedule Impact	FPA 2028 / Olympic 2028	Potential Schedule Impact to the construction.	Create construction schedule assuming some downtime in 2028 and 2028.		3 month delay @ 4-m/mo, 2 remobilizations @ 5-m each.	2%	8%	0%	\$ 18,000,000	\$ 30,000,000	\$ 22,000,000	\$ -													
Active		Environmental	Schedule Impact	EIR Impacts	Changes made during design development could trigger amendments or revamp of EIR.	Evaluate changes and coordinate with AHJ's to confirm requirements for revamp. Start the process as soon as possible.		\$2.5m for revamp, assume no schedule impact.	8%	8%	0%	\$ 2,350,000	\$ 2,500,000	\$ 2,750,000	\$ -													
Active		Design	Requirement	Project Specific Design Criteria for LAWA Airport Access Roadways	There is currently no established, clear classification of LAWA Airport Access Roadways and relevant project specific design criteria to support the basic configuration of the BOD roadway geometry.	This is a significant, high priority, early risk. This needs action and monitoring separate from the broad, general AHJ Participation Risk item above. Mitigation needed is continued prioritization of establishing PSDCs for LAWA Airport Access Roadway Classification. Recurring meetings needed with COLA planning, DPM (BOD) unit expectations are clear and documented.	LAWA (TBC)	Redesign from 50% submittal required to 30% of phase 1 and 2 (2'130m) 12 month delay @ 5m/mo				\$ 70,280,000	\$ 78,000,888	\$ 85,800,000	\$ 1,580,000													
Active		Construction	Labor Issues	Labor Strikes	Labor strikes are becoming more common. Current Construction Trade union agreements for Carpenters and Laborers is set to expire in July 2025. These construction trades will comprise a majority of the ATMP craft workforce. Current agreements provide for annual increases in wages and benefits up through that expiration date. If an agreement could be reached a strike is probable. Upon eventual resolution of disputes the ATMP project could sustain impacts including several months of delay and labor rate increases above and beyond anticipated escalations.	Include contingency in both Cost and Schedule for potential impact/delay. Review PJA between LAWA and unions for no-strike clause.	LAWA (TBC)	3 month schedule delay @ 5m/mo	1%	10%	0%	\$ 1,888,000	\$ 12,000,000	\$ 13,200,000	\$ -													
Active		Procurement	Market Conditions	Material Storage	Shortage of key materials (cement, flyash, reinforcing steel, Falcovon steel, lumber, asphalt) etc. could cause delays while finding and implementing alternative sources or substitution with alternative materials.	Establish task group to monitor future market availability and plan work arounds. Also include contingency to cover the risk.	SFJV (TBC)	Material = 11" x 18", 5% additional beyond estimate on 50% of materials.	35%	70%	50%	\$ 7,425,000	\$ 8,250,000	\$ 6,675,000	\$ 4,125,000													
Active		Contractual	Financing/Financial	Liquidated Damages	Failure to achieve Contract Milestones may result in liquidated damages. Specific milestones, listed in CCAL, creating this risk are Schedule Deliverables 1e and 1b, Milestone 2, CMF at 50% construction documents, and Milestone 8, Final Completion by June 30, 2028.	A. Identify the Contract Milestones to reflect the dates in the preliminary schedule. B. Prioritize the program for assessed LD's as a cost of the project. C. Implement immediate coordination efforts for both Procurement and Construction to achieve current Contract Milestones.	LAWA (TBC)	SFJV to submit 30% design and then discuss next steps.	80%	100%	75%	\$ -	\$ -	\$ -	\$ -

Sustainability Plan

1 Overview and Goals

SFJV intends to comply with all sustainability requirements in PR-20, as well as its corporate sustainability programs, and the project sustainability management plan (the draft project sustainability management plan is in Appendix I).

2 Sustainable Project Management

SFJV has worked with LAWA to use LAWA's Prolog Manager system and internally SFJV's Procore management system to eliminate paper for submittals, RFI's, Change Orders, and other project correspondence.

During Construction SFJV will coordinate just-in-time deliveries to the greatest extent possible.

3 Sustainable Construction Activities

Please reference Appendix 17 – Storm Water Pollution Prevention Plan, Appendix 18 – Hazardous Materials Management Plan, Appendix 19 – Environmental Monitoring and Control Plan for details on sustainable practices to be implemented during construction.

4 Cleaning in General

SFJV will keep the site free from accumulations of waste material and will maintain good housekeeping throughout its construction activities. In addition to the individual crews, SFJV has included in its construction estimate a dedicated crew to ensure the site is always maintained and clean.

5 Sustainability Certifications

In accordance with RFI 05 – the project will target to achieve an Envision Certification of Gold or Better. LAWA's PM/CM is leading the Envision Certification process. SFJV/HNTB are supporting LAWA's PM/CM as they develop the certification application. See Appendix 1 for the draft sustainability management plan developed by LAWA's PM/CM – provided for reference only.

Executive Summary

The LAWA Airfield & Terminal Modernization Project (ATMP) project includes access roadway improvements that will reduce airport-related congestion on public streets by moving airport traffic off local streets and onto new dedicated access roadways. These new roadways will enable future construction of Terminal 0 and future access to the new Terminal 9. This project scope does not involve terminal work. The project scope includes construction of new elevated, at-grade, and below-grade roadways, modified intersections, and arrival and departure ramp realignment. It will also be removing several ramps, roadway sections, and bridges.

The main purpose of the project is to enhance the safety and efficiency of ground transportation at LAX by consolidating roadway access to and from the Central Terminal Area (CTA). Separating airport traffic from local traffic would reduce congestion that results in back-ups into the local street network. The project also seeks to reduce queuing on local streets and increase the throughput into and out of CTA by enabling dynamic, demand-based transportation policies and modernizing the transportation technology systems, e.g. GPS, Smart-Parking, Traffic-Monitoring, etc.

The purpose of this Sustainability Management Plan (SMP) is to detail the implementation of sustainability procedures and practices during the design and construction of the project.

The project is being planned, designed, and constructed to align with LAWA's overall commitment to sustainability. Project sustainability goals are aligned with LAWA's sustainability vision.

The project is using the Envision sustainable infrastructure framework to guide and measure sustainability. Envision use is driven by an owner commitment to sustainability, interest in incorporating sustainability into project design and improving overall sustainable performance, and an airport Envision requirement. Envision use facilitates a holistic assessment and integrate best practices that address a broad range of social, economic, and environmental indicators. Envision is an industry-recognized tool that supports more sustainable project planning, design, construction, and operations and maintenance. The project will use the framework to focus on:

- Improving safety for the broader community.
- Reduce light pollution for neighboring communities and businesses.
- Enhance multi-modal connections for airport users and employees.
- Make positive impacts on the local economy including job creation and workforce training.
- Managing stormwater runoff responsibly through Low Impact Design (LID).
- Responsibly managing resources and waste during construction.
- Selecting materials that reduce the level of embodied carbon in the project
- Reduce greenhouse reductions both during construction and in overall operations.
- Improving the community's local mobility.

The 2019 LAWA Sustainability Action Plan also contained the following focus areas for sustainability:

- Energy management, to reduce energy impacts
- Water management leading to efficient operations and to reduce water use
- Air emissions measures that achieve ongoing reduction of air pollutants
- Material resources management to address waste reduction, recycling, and re-use
- Noise management to minimize aircraft noise affecting communities
- Natural resources management with restoration
- Projects and other wildlife conservation programs
- Corporate responsibility to ensure business and workforce inclusion

Key Performance Indicators for these focus areas are outlined in **Table 2**.

The project is being planned, designed and constructed to align with LAWA's overall commitment to sustainability. The project is registered with ISI and is planning for Envision verification using Pathway A. The project team has a target of Envision Gold verification, which requires the project to achieve 40% of applicable points.

FIGURE 1 RECOGNITION LEVELS

FIGURE 2 PATHWAY A

1 Introduction

1.1 Purpose

This Sustainability Management Plan (SMP) is intended to describe the approach that the project team will use to establish sustainability goals and objectives, initiate actions, and review performance related to project sustainability.

Sustainability efforts include guiding the project team to meet sustainability goals and objectives, tracking related performance, collaborating about the Envision process and credits, and coordinating sustainability performance.

The SMP informs and supports the project team in assessing the project's environmental, social and economic aspects, and establishing performance objectives to reduce project's impacts. The plan considers current and future conditions, trends and emerging topics, and opportunities to influence performance beyond the project boundaries.

1.2 Commitment

The project team is committed to leading in sustainability by addressing economic, environmental and social aspects of the Project at each project stage. The goals of the project are to enhance the safety, efficiency, and user experience of ground transportation systems at LAX while modernizing those transportation systems as well.

From their website, LAWA commits to "...setting the global airport standard for customer satisfaction and security, regional economic leadership and organizational performance. Building on our core values, we will engage our employees, tenants, customers, and communities in an effort to continually improve our environmental, economic and social performance."

Our support of sustainability efforts aligns with and reinforces these goals, as well as the project's vision to reduce the negative impacts of airport-related traffic and congestion on local communities.

About LAWA

Los Angeles World Airports (LAWA) is the City of Los Angeles department that owns and operates Los Angeles International (LAX) and Van Nuys (VNY) general aviation airports. Both play an integral role in helping to meet the Southern California regional demand for passenger, cargo and general aviation service. Both airports make a distinct contribution to the strength of the system as it provides a high level of safety, security and service for its customers, communities and stakeholders.

As the aviation authority for the nation's second largest city and hub of one of the world's most populous metropolitan areas, Los Angeles World Airports (LAWA) is faced with the challenges of providing an airport system to serve a major portion of the Southern California market. LAWA has met this challenge, and at no cost to taxpayers.

Sustainability Action Plan Vision

Committed to setting the gold standard in sustainability for the people of Los Angeles and the world.

1.3 Project Description

The project includes access roadway improvements that will reduce airport-related congestion on public streets by moving airport traffic off local streets and onto new dedicated access

roadways. These new roadways will enable future construction of Terminal 0 and future access to the new Terminal 9. The project includes construction of new elevated, at-grade, and below-grade roadways, modified intersections, and arrival and departure ramp realignment. It will also be removing several ramps, roadway sections, and bridges.

1.3.1 Project Components

When planning to verify an Envision project, it is important to clearly define the project boundary and keep it consistent across all credit submittals. This entails fully explaining the elements that are being reported on in a project submission, as well as clarifying if there are elements that are not included that may be referenced in project documents. When a project is submitted for verification, the Envision Sustainability Professional (ENV SP) submits a verification submittal quality assurance checklist confirming that the project boundary has been provided and is consistently applied across credits. A site map must also be provided indicating the boundary and all project elements. The Institute for Sustainable Infrastructure (ISI) does not dictate what project boundaries are appropriate for Envision verification; rather, ISI and its team of verifiers rely on submitting teams to clearly define the boundaries of the project(s) being submitted for verification.

The main components/ Envision boundary for the ATMP are listed and shown in Figure 1 below:

- Sepulveda Blvd from 94th Street intersection to the north tunnel portal
- Century Blvd from Airport Blvd to Sky Way to the north and Terminal 8 to the south
- 94th Street from Sepulveda Blvd to Jetway Blvd (proposed street)
- 96th Street from Sepulveda Blvd to Jetway Blvd
- 98th Street from Sepulveda Blvd to Jetway Blvd
- Sky Way from 96th Street to World Way
- CTA roads from Terminal 1 to the north to Terminal 8 to the south

Figure 3 ATMP Boundaries

A more detailed description of the boundaries and scope is shown in Figure 2 and described below:

Figure 4 Conceptual Site Plan

- **Sepulveda Blvd Modifications:** Sepulveda Blvd will be modified in the northbound direction to allow construction of the Segment NE connection, removal of the existing CTA/Century Blvd ramp connection, and widened in the vicinity of 96th Street to facilitate connection to Segments C, G, E, and F. The southbound direction will be modified to provide access to Segments A and D, removal of the westerly sidewalks and median will be reconfigured for the proposed Segments A, D, I, P, K, and W overcrossing structure bents. A pedestrian bridge over Sepulveda Blvd at Century Blvd will be added.
- **Century Blvd Modifications:** Century Blvd will be modified at the intersection of Jetway Blvd to provide for left turn lanes into the future Terminal 9 roadway by others, and modified approach from Segment P. The northern curb lines and travel way alignment between Jetway Blvd and Vicksburg Ave will be re-configured to fit columns for the Segments A and K overcrossing structures.
- **Proposed Segment A:** New roadway at grade and bridge from just south of the existing Lincoln Blvd/Sepulveda Blvd intersection to provide southbound traffic access to the CTA. This alignment varies from two to three lanes and is grade separated above Sepulveda Blvd, 98th Street, and Century Blvd.
- **Proposed Segment C:** New roadway at grade and bridge from the existing Sepulveda Blvd/96th Street intersection to carry the northbound Sepulveda Blvd traffic to the CTA via merging in Segment A. This alignment is two lanes and is grade separated to cross over Segments F and D.
- **Proposed Segment D:** New roadway at grade and bridge to carry the outbound CTA traffic via Segments K and W to southbound Sepulveda Blvd. This alignment varies from one to three lanes and is grade separated above 98th Street, below Segments C and A, and above Sepulveda Blvd.
- **Proposed Segment E:** Modifications to 96th Street roadway to provides access from the Jetway Blvd/96th Street intersection to northbound Sepulveda Blvd. This alignment is one at-grade lane.
- **Proposed Segment F:** Modifications to 96th Street roadway to provide access from northbound Sepulveda Blvd to the Jetway Blvd/96th Street intersection and ITF West. This alignment varies from one to two at-grade lanes.
- **Proposed Segment G:** New roadway at grade and bridge to provide access for outbound CTA to northbound Sepulveda Blvd via Segment D. This alignment is one lane grade separated over 96th Street (Segments E and F) and the driveway to the LAX City Bus Center.
- **Proposed Segment I:** New roadway at grade and bridge to provide access from westbound Century Blvd to the CTA arrival level by joining to the existing N. World Way. This alignment is two lanes grade separated over Sepulveda Blvd and Segment D.
- **Proposed Segment K:** New roadway at grade and bridge connecting Segment L and Center Way to Segment D, to provide CTA outbound access to both northbound and southbound Sepulveda Blvd. This alignment is three lanes and is grade separated under Segment L, and over Segments N, Sepulveda Blvd and Century Blvd.

- **Modified Segment L:** The existing structure connects CTA departures level to Segment K and provides CTA outbound access to northbound and southbound Sepulveda Blvd will be modified by widening the structure from one to two lanes. This structure crosses over Segments P and K.
- **Modified Segment L1:** The existing structure from Segment L to CTA provides for the departure-to-departure return movement. This alignment remains at one lane and is grade separated over Segment N and may need some modifications due to the proposed widening of Segment L.
- **Proposed Segment M:** New bridge from CTA departures level joining Segment P with final destination of eastbound Century Blvd. This alignment varies from one to two lanes and is grade separated over Segment N and Sepulveda Blvd.
- **Proposed Segment N:** New at grade roadway to provide arrival-to-arrival level return movement to CTA. This alignment is one lane and crosses under Segments L, M, P, K, and L1 bridges.
- **Proposed Segment NE:** New at grade roadway providing direct connection from northbound Sepulveda Blvd to Century Blvd via Segment P. It also provides access to future Terminal 9. This alignment is one lane and crosses under Segment W bridge.
- **Proposed Segment P:** New at grade roadway and bridge from CTA outbound arrivals level to Century Blvd. This alignment varies from three to five lanes and is grade separated crossing under Segment L, and over Segments N and D, and Sepulveda Blvd.
- **Proposed Segment W:** New bridge from CTA departures level to provide access to northbound and southbound Sepulveda Blvd via Segment D. This alignment facilitates a pending connection to Terminal 9 roadways, which will be designed by others. This alignment varies from one to two lanes and is grade separated crossing over Sepulveda Blvd, Segment NE, and Century Blvd.
- **World Way Modifications (Arrivals):** At Sky Way the intersection will be modified to remove the north leg and it will become a T intersection.
- **Existing Roadway Removals:** The project demolishes the following roadways:
 - Ramp from northbound Sepulveda Blvd to CTA
 - Ramp from southbound Sepulveda Blvd to Sky Way
 - 96th Street bridge over Sepulveda Blvd
 - Vicksburg Ave from 96th Street to mid-block to 98th Street
 - Intersection of Center Way, World Way, and outbound road to Century Blvd
 - Road outbound to Century Blvd including bridge over Sepulveda Blvd and two associated loop ramps to Sepulveda Blvd
 - Inbound road from Century Blvd including bridge over Sepulveda Blvd
 - West Century Blvd west of Sepulveda Blvd

Figure 5 Regional Context

Figure 6 Project Site Aerial

2 Roles and Responsibilities

Project Team Organization

"Key Project Team Members" as defined by Envision v3 Credit Amendment #005 are:

1. Owner – Los Angeles World Airports (LAWA)
2. Lead Construction Contractor: Skanska + Flatiron Joint Venture
3. Lead Designer: HNTB (part of SFJV)
4. Lead Permitting: SFJV
5. Program Manager: HDR
6. Envision Lead: HDR

The organizational chart illustrates the project team configuration (Figure X). Table 1 details general responsibilities for each role in relation to sustainability management.

Table 1 - Sustainability Roles and Responsibilities

Name	Project Role	Organization	Sustainability Responsibilities
John Thomas	Program Manager	HDR/LAWA	Documentation/Review
Will Kirby	Lead ENV SP	HDR/LAWA	Envision Lead/Submittals and Process
Jazz Peluchette	ENV SP	HDR/LAWA	Envision Support/Doc. Writing
Chad Tucker	ENV SP	HDR/LAWA	Envision Support/Doc. Writing
Chris Halpin	Project Manager	SFJV	
Peter Weiss	Deputy PM	SFJV	
Richard Hart	Design Manager	SFJV	
Michelle Barton	Sustainability Mgr	LAWA	
[others]			

Figure X. Organizational Chart of Project Team

[JOHN TO PROVIDE]

3 Sustainable Design Practices

3.1 Analysis and Methodology

The SMP builds on LAWA's commitments to sustainability and looks to leverage these activities to incorporate elements within the project that improve sustainable performance.

The SMP references a number of project and related plans, including but not limited to:

- LAWA Sustainability Action Plan (2019)
- Sustainable Airport Planning, Design and Construction Guidelines for Implementation on All Airport Projects (LAWA Guidelines)
- LA 's Green New Deal: Sustainable City Plan (2019)
- LA County, Planning and Land Development Handbook for Low Impact Development (LID) Part B Planning Activities
- LA County, Low Impact Development Standard Manual
- CALGreen – California Green Building Standards Code, 2022
- CEC California Energy Code: 2022 Building Energy Efficiency Standards for Nonresidential Buildings
- Green Streets

Using this information as a foundation, the project team has established project sustainability goals and performance objectives.

3.1.1 LAWA Sustainability Action Plan

LAWA's Sustainability Action Plan (SAP) seeks to move beyond incremental reductions in the magnitude of their environmental footprint toward using data and metric driven strategies to make positive impacts for the future. Though the plan is holistic as it considers financial and social sustainability, the primary focus is the direct environmental impacts LAWA has on the community, including water and energy use reduction, increasing re-use and recycling, minimize noise and emissions, plus workforce inclusion. The 2045 goals of the SAP are below:

- 100% renewable energy use
- No potable water consumed for industrial uses
- Zero carbon emissions for LAWA operations

3.1.2 Envision

The project team is using Envision as a structure for effectively collaborating and communicating around the complex concepts and challenges of sustainability.

Envision is a sustainable infrastructure framework developed through a joint collaboration between the Zofnass Program for Sustainable Infrastructure at the Harvard University Graduate School of Design and ISI. ISI is a not-for-profit education and research organization, dedicated to developing and maintaining a civil infrastructure framework, and was formed by the American Council of Engineering Companies (ACEC), the American Public Works Association (APWA), and the American Society of Civil Engineers (ASCE).

Envision provides a holistic framework for evaluating and rating the community, environmental, and economic benefits of all types and sizes of infrastructure projects, giving recognition to those projects that use transformational, collaborative approaches to assess the sustainability indicators over the course of the project's life cycle. The system has 64 sustainability credits divided into five sections: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Resilience. Envision is similar in structure to the LEED rating system. While LEED evaluates buildings, Envision provides industry-wide sustainability metrics for all infrastructure types.

Any infrastructure project may use Envision as a framework for evaluating sustainability performance. Recognition is sometimes a driver when using the system, but most agencies use Envision due to benefits like:

- Charting a clear sustainability vision for all members of the project team early and often throughout planning, design, construction, and operation.
- Facilitating interdisciplinary and interdepartmental project team coordination, including planning and design charrettes, regular project meetings, documentation, and reviews.
- Raising the bar for sustainability decisions by starting project team dialogue about issues that might not otherwise have been raised.
- Integrating with and supporting organizational sustainability goals.
- Illustrating that the project addresses community concerns.
- Looking at long-term costs and risks.
- Enhancing transparency and credibility of sustainability efforts.
- Providing a quality control system for project decisions.
- Tracking performance and establishing design, construction, and operations metrics.
- Demonstrating commitment to implementing more sustainable infrastructure.

To earn formal recognition from ISI, a project must be officially registered and submitted for verification (and associated fees paid to ISI). To do so, supporting documentation must be submitted electronically to ISI through their online system. ISI then provides the documentation to a trained third-party Verifier who evaluates the information and returns their assessment to ISI for review and authentication (Figure 4).

Figure 7. Envision Process

3.1.2.1 PATHWAYS

Infrastructure projects may seek third-party verification at or after 95% design completion. This means all major design decisions must be made prior to seeking third-party verification and award. There are two verification pathways, Pathway A: Design + Post-Construction and Pathway B: Post-Construction, the steps which are outlined in the graphic at the right.

Figure 8. Envision Pathways

3.1.2.2 RECOGNITION

Envision recognition levels are awarded based on the percent of total applicable points earned. This recognition provides third-party confirmation of a project team's commitment to the environment and community. Higher levels of recognition illustrate greater levels of contribution to environmental, economic, and social aspects of sustainability.

- Verified – 20% or more, but less than 30%
- Silver – 30% or more, but less than 40%
- Gold – 40% or more, but less than 50%
- Platinum – 50% or more

Figure 9. Recognition Levels

3.1.2.3 PRELIMINARY ENVISION ASSESSMENT

Based on multiple discussions with the project team, a preliminary Envision assessment was conducted to examine the project using the Envision sustainable infrastructure framework criteria to identify sustainability priorities and inform future decision-making. The Preliminary Envision Assessment Summary Scorecard is included in Appendix B.

Significant issues identified during the assessment that affect overall project sustainability include:

- Community Involvement and Quality of Life
- Equity and Social Justice Advancement
- Enhancing Public Space
- Stakeholder Buy-in
- Operational and Construction Waste Reduction
- Potable and Non-potable Water Usage During Construction
- Renewable Energy Usage
- Managing Stormwater
- Air Pollutant Emissions Reduction
- Net Embodied Carbon Reduction

An initial Sustainability Management Plan meeting was held on September 18, 2024. Participants performed a SWOT analysis, discussed project sustainability goals, related Sustainability Focus Areas, and Key Performance Indicators (KPI) that outline sustainability considerations during design and construction. Additional meetings were used to refine goals, focus areas, and KPIs.

3.2 SWOT Analysis

The SWOT Analysis discussed strengths, weaknesses, opportunities, and threats recognized in the project's planning stage. This analysis included input from LAWA project team members and design staff. The information was augmented with input from the construction manager when it was brought on board. Table 1. SWOT Analysis illustrates the early examination. Actions resulting from this analysis included further discussions around stakeholder and community engagement, as well as general communications strategies and opportunities for improved procurement processes.

Table 2. SWOT Analysis

Strengths	Weaknesses
<ul style="list-style-type: none"> - Using Progressive Design-Build - Established Sustainability Goals/Plans - Emissions reductions (via design) 	<ul style="list-style-type: none"> - Budget/Schedule constraints - Limited scope opportunities
Opportunities	Threats
<ul style="list-style-type: none"> - Workforce development - Showcase project - Net Embodied Carbon Reduction - 	<ul style="list-style-type: none"> - Weather/major rain events - No reclaimed water offered in the area by LADWP - Equity and Stakeholder buy-in

Figure 10. Key Elements of a Sustainability Framework

3.3 Project Sustainability Goals

- Construction Safety – zero incidents (look into EIR requirements)
- Minimize Noise and Vibration – noise assessment in EIR
 - Construction not louder than current ambient
 - No impact driving
- Reduce light pollution from existing
 - Reduce light pollution at hotels
- Minimize potable water for industrial uses
- Look at waste diversion standard for Green Building code
- To discuss:
 - zero carbon rebar
 - concrete mix design

For reference, the 2019 Sustainability Action Plan Goals by 2045 are also listed below:

- 100% renewable energy use
- No potable water consumed for industrial uses
- Zero carbon emissions for LAWA operations

3.4 Sustainability Focus Areas

The following areas and sustainability strategies were identified during the Envision assessment:

- Reducing construction waste/ increasing construction waste diversion
- Renewable energy for lighting
- Increase mobility/ access to People Mover
- Further community engagement
- Reducing carbon emissions
- Material selection

The following final list was then discussed at the SMP meeting:

- Improving safety for the broader community.
- Reduce light pollution for neighboring communities and businesses.
- Enhance multi-modal connections for airport users and employees.
- Make positive impacts on the local economy including job creation and workforce training.
- Managing stormwater runoff responsibly through Low Impact Design (LID).
- Responsibly managing resources and waste during construction.
- Selecting materials that reduce the level of embodied carbon in the project
- Reduce greenhouse reductions both during construction and in overall operations.
- Improving the community's local mobility through the roads and highway system.

3.5 Key Performance Indicators (KPIs)

Table 2 outlines the KPIs for the sustainability focus areas and how the performance objectives align with community needs and issues.

- **KPIs** are quantifiable measures of performance over time for a specific objective.
- The **KPI Goal** shows a specific objective that the project aims to achieve.
- A Baseline is conventional performance or “business-as-usual” condition to show what the target will be measured against. The Envision Guidance Manual provides several options for identifying acceptable baselines (listed in order of preference):
 - Existing conditions or the existing system(s) being replace.
 - A seriously considered project alternative
 - Industry “standard practice” or existing codes, standards, or regulatory requirements
 - A project of similar scope and size operating within the same geographical area or within a geographical area with similar operating conditions.
- The **Target** is preferably a quantifiable performance level the project is trying to reach, e.g., percent reduction.
- The **Measurement/Mechanism** explains how the baseline and follow-up will be measured to show progress toward the target.

Table 3 Key Performance Indicators Schedule

KPI Goal	Baseline	Target	Measurement / Mechanism	Related Envision v3 Credits
Focus Areas as headings				

KPI Goal	Baseline	Target	Measurement / Mechanism	Related Envision v3 Credits
Support and Enhance the Community				
Engage stakeholders	Industry-required programs for soliciting feedback and communicating project information to the public (Existing codes, standards, or regulatory requirements)	Engage stakeholders by providing information and soliciting and considering feedback in project design. Quarterly meetings by Biosolids advisory group. X Public meetings. Any quantitative metrics here? # of interactions? (LD1.3 Restorative LOA)	Number and type of outreach and community engagement practices. Process for review and consideration of comments. Track website traffic and comment interactions.	QL1.1, QL1.4, QL3.1, QL3.3, LD1.2, LD1.3
Support economic growth				
Minimize construction impacts to surrounding community	Compliance with laws and regulations (Existing codes, standards, or regulatory requirements)	1. Limit working hours more stringently than required by law. 2. Fuel emissions: Specify use of environmentally friendly motors (look at emissions reduction). 3. Lighting: Specify use of focused downlight for early-morning or night work. 4. Limit noise / vibration. 5. Specify truck traffic patterns and logistics. (QL1.6 Conserving LOA)	1. Community feedback during construction; monitoring and response to comments. 2. Monitoring and logging noise and vibration levels. 3. Documentation of work schedule and motor use.	QL1.3, QL1.6, RA2.2

KPI Goal	Baseline	Target	Measurement / Mechanism	Related Envision v3 Credits
Procure local/ regional materials when possible	Materials procured sources/ distance not a consideration during procurement discussion (Existing codes, standards, or regulatory requirements)	At least 90% of soils, aggregate, plants, and other materials through local sources (per Envision v2 credit RA1.4 criteria, Superior LOA).	Regional materials forms and project quantities. Regional materials content calculations.	RA0.0
Procure recycled-content materials	Materials with no recycled content (Existing codes, standards, or regulatory requirements)	At least 25% of recycled materials including materials with recycled content and/or reused existing structures or materials. (RA1.2 Superior LOA)	Recycled materials forms and project quantities. Reuse and recycled content calculations.	RA1.2
Reduce construction waste	No recycling or construction waste diversion (Existing codes, standards, or regulatory requirements)	Reduce construction waste entering landfills by at least 75%. (RA1.4 Superior LOA)	Construction waste management plan and diversion calculations.	RA1.4
Reuse materials and structures on site where possible	No structure reuse; demo existing structures and build new (Existing codes, standards, or regulatory requirements)	Integrate existing structures into project design when practicable. (RA1.2 Superior LOA)	Recycled materials forms and project quantities. Reuse and recycled content calculations.	RA1.2, RA1.4, RA2.2, QL1.6, CR1.2

Metrics related to the Envision levels of achievement (LOA) associated with pursued credits, are also seen as Key performance indicators. Credit levels of achievement are shown on Table 3.

4 Sustainability Approach and Implementation

4.1 Planning

Sustainability was incorporated early into the project planning as there was already a solid foundation from which to build including the City of LA's Green New Deal City pLAn, LAWA's green building standards, and their 2019 Sustainability Action Plan (SAP). As the project progresses through design and construction, discussions will continue to integrate sustainability considerations into decision making. In parallel, the project team will continue to monitor the potential credit levels of achievement and documentation needs should the project decide to submit for verification when design is complete.

4.1.1 LAWA Sustainability Action Plan

LAWA updated their sustainability goals with the 2019 SAP to focus on aspects of sustainability that are of "vital importance to the community, region and future success of LAWA operations."

The plan covers several aspects of LAWA's operations, but some of the more relevant parts of the plan to the ATMP would be:

- Achieve 90% construction waste diversion rate by 2025 and 95% by 2035
- Reduce Vehicle Miles Traveled (VMT) using the LAX Landside Access Modernization Program that supports reoriented infrastructure to reduce traffic in the CTA.

This SAP works to support the City's broader Green New Deal, which was also updated in 2019. Among other targets and goals, the pLAn seeks to increase construction and demolition waste recycling requirements to at least 80% and reducing VMT by 100% by 2050.

4.1.2 Envision

The project is being planned to align with Envision in the event LAWA decides to register the project with ISI for Envision verification in the future. The project team has a target of Envision Gold verification, which requires the project to achieve 40% of applicable points.

Based on results of the preliminary Envision assessment and subsequent discussions, the project identified 57 credits for continued review, as well as two categories under which an innovation credit may be feasible. Based on continuing research and discussions, the project team will narrow the LOA range for each pursued credit as the project progresses. See Table 2 for ranges.

4.1.3 Environmental Impact Report Alignment

To promote collaboration and confirm alignment of the Environmental Impact Report (EIR) and Envision criteria, an evaluation was performed to compare Envision credits and topics being studied as part of the EIR. This information was shared with SFJV to provide an understanding of issues Envision examines and how that compares and contrasts with subjects covered in the EIR. The comparison also will be used to inform documentation efforts in the future, as applicable. Some EIR topics demonstrate a direct comparison to Envision credits and others are a little less straightforward but relate to a similar intent.

4.2 Design

The KPIs were reviewed regularly throughout the design phase. Sustainability design considerations were also a theme during project meetings.

Documentation to support Envision verification began early in the project process. The Project Team integrated sustainability into the project processes to proactively identify opportunities for incremental sustainable improvements and sources of documentation for the verification submittal.

Sustainability requirements and strategies are integrated into designs and specifications per Envision needs and project team agreement. These documents establish Contractor submittal requirements to demonstrate compliance with the sustainability metrics and provide documentation for the post-construction submittal. Sustainability strategies have been evaluated based on overall benefit, life-cycle costs, and compliance with applicable requirements and standards.

4.3 Construction

[TO COMPLETE LATER]

DRAFT
FOR INFORMATION ONLY

4.4 Environmental, Economic, and Social Impacts

The project's environmental, economic, and social impacts have been assessed, including the potential for existing non-sustainable conditions to further deteriorate environmental, economic, or social conditions if left unaddressed. Elements of this assessment were derived from the

- LAWA Sustainability Action Plan (2019)
- LA 's Green New Deal: Sustainable City Plan (2019)
- Sustainable Airport Planning, Design and Construction Guidelines for Implementation on All Airport Projects (LAWA Guidelines)

Table 3 lists project features/components with related sustainability considerations.

Each component is marked with the symbols below to denote if the impacts are:

-  Environmental
-  Economic
-  Social

Table 5 Sustainability Considerations and Impacts

Feature/ Component	Sustainability Consideration(s)	Potential Impacts
General		  
Lighting	- Replace any HPS light bulbs with LEDs	  
Emissions	- Revise lighting circuits to allow expansion of BSL's EV charging program from electroliers on streets adjacent to parallel parking.	  
Construction Best Practices		  
	- Contractor required to conduct rock-crushing operations on -site to reuse waste rock/concrete generated during construction to the maximum extent feasible.	
	- Contractors required to use renewable diesel fuel in off-road equipment and on-site, on-road trucks.	
	- Contractors required to recycle or salvage a minimum of 85 percent of non-hazardous construction and	

	demolition waste generated directly from construction of the ATMP.	
	- Only non-potable water will be used for any landscaping installed by the ATMP.	
	- Contractor required to develop noise control plans for construction noise impacts.	 
	- Contractor required to avoid noise-sensitive times (9:00 p.m. to 7:00 a.m. Monday – Friday; 6:00 p.m. to 8:00 a.m. Saturday; anytime on Sunday or holidays) to implement the noisiest on-site construction activities.	 
	- Contractor required to relocate any stationary source equipment (i.e. generators) whose use is flexible regarding location, at the greatest distance from noise-sensitive land uses.	 
Overpasses and Bridges		
	- Pedestrian bridge over Sepulveda Blvd.	 
Roads		
	- Reducing airport-related traffic back-ups on local streets.	  
Quality Control	- Program Wide Quality Assurance and Quality Control Plan	 
Waste Diversion		
	Relocation of iconic LAX signing and lighted pylons instead of disposing of them.

5.1 Envision Credit Summary

Based on results of discussion during the Envision assessment, the project is pursuing **XX** credits. To support each credit at the targeted level of achievement (LOA), a narrative will be developed to describe how the project meets the evaluation criteria. This is done using ISI-provided credit cover sheets. In addition to the narrative, supporting documentation for each evaluation criteria must be included to enable the Verifier (selected by ISI) to validate the LOA. For Pathway A, this process takes place for the design phase and is submitted after 95% design completion. Credits that will need to be confirmed after construction will be marked as "pending" in the scorecard. For credits marked "pending," narratives and additional supporting documentation will need to be submitted after 95% construction completion.

5.1.1 Envision Package Development

Based on the assessment, subsequent research and discussions, and associated costs, the project team will narrow the LOA range for each pursued credit. The Envision Lead has created a preliminary phasing plan to begin developing credit summaries based on types of documentation available throughout the design process. This allows the credit documentation process to be spread out over a period of time, depending on when the information is available to assist with documentation.

The Envision team will begin to gather documentation needed to complete credit summaries from various sources, including, but not limited to:

- Technical Memos
- Environmental Assessment

- Related plans
- Design documents
- Client policies, practices and standards

The project designated John Thomas as the designated point of contact (POC) for project documentation. This allows those creating credit packages to direct documentation requests to one person knowledgeable about that topic who can collect and provide documentation needed to successfully complete the Envision credit packages. The Envision Lead will organize credit documentation, facilitate quality reviews, and communicate with documentation providers to ensure the process stays on schedule. It is helpful to schedule regular status update calls to convey credit package progress and stay informed on project progress and changes that may affect the Envision documentation.

DRAFT
FOR INFORMATION ONLY

6 Processes and Controls

6.1 Project Management

SFJV has developed a comprehensive Project Management Plan (PMP) that complies with local, state, and federal guidelines and requirements. The PMP defines the vision; implementation strategy; schedule and budget criteria; and the policies, procedures, and standards for the project. The PMP is the master reference document for the team and provides guidance to subconsultants engaged throughout the life of the program, from inception through planning, design, and construction. The PMP provides a level of continuity and standardization to facilitate time and cost-effective communications and decision-making. The PMP serves as a formal process to monitor risks, minimize costs, reduce scope creep, and identify potential schedule impacts.

The PMP includes:

- | | | |
|-----|---|---|
| • X | • | • |
| • X | • | • |
| • X | • | • |
| • X | • | • |
| • | | |

Add relevant information about project processes and information tracking systems, for schedule, resources, budgets, etc..

6.1.1 Quality Assurance

Quality control and quality assurance are outlined as part of the Program Wide Quality Assurance and Quality Control Plan which establishes the administrative and organizational framework for SFJV's quality program during the ATMP Roadway Improvements Project.

Add information about quality assurance as available.

Sustainability and Envision documents are reviewed by multiple members of the Envision team, and project team as needed. Quality Control is conducted consistently with Project Quality Control procedures. Sustainability requirements are included in project plans and specifications as warranted.

6.2 Envision Management

The project team uses a number of tools to manage Envision throughout the process.

Figure 11: Envision Process

Very early in the project, the Envision Lead facilitated a preliminary Envision assessment with the purpose of:

- Providing a preliminary evaluation of which level of achievement each Envision credit could potentially reach based on current plans/design
- Indicated documentation requirements for associated Envision credits and indicate where reference documents may already exist
- Provided high-level input for initial discussion regarding the level of effort required to achieve Envision verification
- Consider a "baseline" verification level for the project, as of now, without making substantial changes to designs or plans.
- Evaluate at a high-level what might be needed to increase the verification level.

DRAFT
FOR INFORMATION ONLY

The assessment phase formed the foundation for all Envision-related activities. Using the Envision Credit Review Workbook, the project team reviews each credit to establish applicability and determine the potential LOA. The workbook is designed to allow the project team to set a “low” LOA as a baseline, considering what is known about the project at the time of the assessment. The project team can also select a “high” level of achievement based on potential opportunities discussed during the assessment. These opportunities can be related to design and construction decisions that haven’t been made, availability of documentation, or stretch goals that the project team will consider as the project moves forward. This assessment represents a preliminary review of Envision for the project, including a review of the project’s sustainable attributes, as well as the potential effort required to earn recognition through the Envision verification process.

The Envision Lead records the outcomes of the preliminary Envision assessment in an Assessment Summary Report, which includes potential improvement areas such as changes to processes, design or scope that will improve project sustainability and offer opportunities for the project to rate more favorably when verified with Envision. The items outlined are not required by Envision but meant to start conversations into the larger perspective of project and community sustainability.

Once the assessment is complete, the Envision team moves to an aligned effort to:

- Coordinate ongoing scope items and the documentation process
- Integrate sustainability and Envision criteria into the project
- Complete credit packages for verification submission

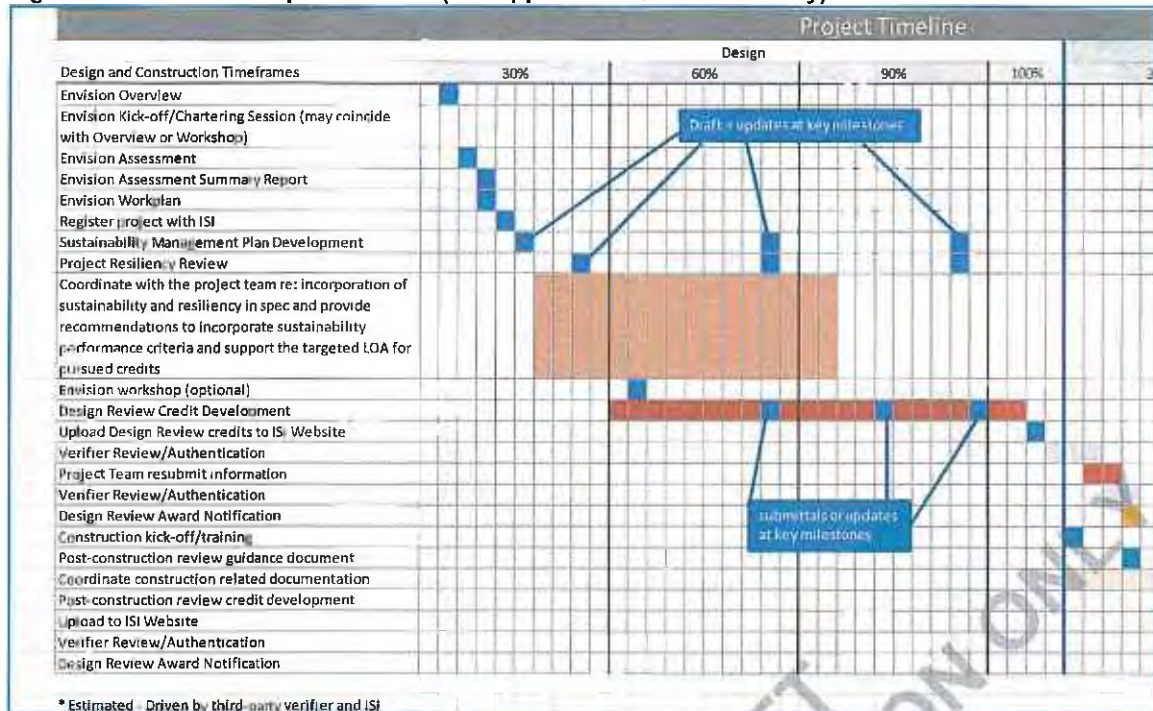

This portion of the process is the core of the Envision effort and progresses through the design phases. Coordination and integration include developing an Envision Workplan, registering the project with ISI, developing a Sustainability Management Plan (SMP), conducting a Resiliency Review Report (RRR) and coordinating with the project team to incorporate of sustainability and resiliency in specifications and provide recommendations to incorporate sustainability performance criteria and support the targeted LOA for pursued credits. An Envision Workshop is conducted with a select group of owner and project team to review and update the preliminary assessment, if the assessment was done very early in the project. The graphic below illustrates

Figure 12: Envision Credit Review Workbook Summary Tab

a typical Envision project timeline and how it integrates with standard design project milestones. Items such as the Envision Credit Review Workbook, SMP, and PRR are updated regularly, but at a minimum around the significant project milestones to make sure they reflect any material changes in the project.

Figure 13: Envision Workplan Timeline (see Appendix B for Full Summary)

Credit packages are created based on a phased credit development schedule. This schedule outlines early development and review for credits that are not applicable or based on planning decisions, mid-project development and review for credits that do not need 95% design drawings and specifications, and later writing, compilation and review for credits that can't be documented until the drawings and specs are near final.

As the design progresses, the project team uses the Envision framework and SMP to make sure that the Project is meeting sustainability goals and striving to not only reduce impacts, but providing environmental, social and economic benefits to the community. Design discussions continue to reference Envision credits that can influence and improve design decisions and project solutions, including and beyond those listed originally outlined in the Assessment Summary Report.

As the project progresses, the Envision Lead organizes credit documentation, facilitates quality reviews, and communicates with documentation providers to ensure the process stays on schedule. Regular status calls are scheduled to convey credit package progress and stay informed on project progress and changes that may affect the Envision documentation.

The Envision Credit Review Workbook is used as a tool throughout the process to document Envision goals/LOAs, track action items, track credit development status, and outline discipline specific requirements.

6.2.1 Project Envision Verification

6.2.1.1 ENVISION PACKAGE DEVELOPMENT

Should LAWA decide to pursue a project verification, a narrative would be developed to describe how the project meets the evaluation criteria. This is done using ISI-provided credit cover sheets. In addition to the narrative, supporting documentation for each evaluation criteria must be included to enable the Verifier (selected by ISI) to validate the LOA. As described in 3.1.2.1 Pathways, documentation for the design phase can be submitted after 95% design completion.

If documenting for verification, the Envision Lead will draft a phasing plan to begin developing credit summaries based on types of documentation available throughout the planning and design process. This enables the credit documentation process to be spread out over a period, depending on when the information is available to assist with documentation.

To prepare for the possibility of documenting for verification, the Sustainability Management Team will gather potential documentation needed to complete credit summaries from various sources, including, but not limited to:

- Technical Memos
- Engineering Reports
- Project-related plans
- Stakeholder Engagement
- Design documents
- LAWA policies, practices, and standards
- Meeting presentations and minutes

The project designated John Thomas as LAWA's Envision Liaison and designated point of contact (POC) for project documentation. This allows a single path of communication for requesting documentation during the collection phase and allows staff creating credit packages to direct documentation requests to one person knowledgeable about that topic who can collect and provide documentation needed to successfully complete the Envision credit packages. The Envision Lead, Will Kirby with HDR, will help to organize credit documentation, facilitate quality reviews, and communicate about required documentation to help the process stay on schedule. The monthly leadership meetings can be used as provide an opportunity for status updates, stay informed on project progress and changes that may affect the Envision documentation, and convey deliverable and credit package progress.

7 Monitoring and Reporting

7.1 Design & Construction

Monitoring and reporting mechanisms are in place to track sustainability progress through design and construction, including:

- **Meetings:** Sustainability/Envision Coordination meetings include providing credit package progress/status updates, reviewing and responding to credit-related questions, providing updates or information on project progress, and/or changes that may impact the Envision documentation effort.
- **Sustainability KPIs** are revisited and monitored periodically through the design process at key design milestones.
- **A plan-do-check-act methodology** has been established to identify priorities, evaluate progress, and make adjustments to improve project sustainability performance. This plan is adaptable and flexible to manage changes in environmental, social, or economic conditions of the project over time.
 - **Plan:** Sustainability actions have been stated within this SMP.
 - **Do:** Ongoing sustainability efforts are reported at Sustainability Coordination and Sustainability Workgroup meetings and incorporated into overall project planning and design.
 - **Check:** project decisions are compared to KPI targets and measurements.
 - **Act:** Tracking and implementation of this SMP will continue through design and construction of all elements. Contractor guidance and required submittals will verify that sustainable performance measures are implemented during construction. Sustainability goals are reiterated to team members through construction plans, job briefings, contractor/subcontractor training, and/or orientation. Relevant KPIs are measured during and/or after construction.

Envision/sustainability requirements are communicated to contractors in the RFPs and specifications. Detailed guidance for integration, monitoring and documentation is included in:

- Contractor Envision Action Plan
- Construction Management Plan Envision Alignment Guidance
- Recycled Materials Forms
- Construction Waste Diversion Forms

Tracking and implementation of the SMP will continue through construction, including.

- Sustainability goals are communicated throughout the team through methods such as construction plans, daily job briefings, subcontractor orientations, or on-site field training sessions.
- Contractor activities and reporting/submittal requirements are incorporated into project documents.
- Project team reviews and documents all construction activities that may affect the projects sustainability elements.

7.2 Operations & Maintenance

The project is being planned, designed and constructed to align with **organization policy**. The project is part of **master plan or regional plan** which has objectives including:

- Green New Deal– pLAn
- LAX Landside Access Modernization Program
- Z

- Sustainability/resiliency incorporated into O&M planning/plan.
- Milestones for reviews
- Variables?

Section 1 SWPPP Requirements

1.1 INTRODUCTION

This Stormwater Pollution Prevention Plan (SWPPP) is designed to comply with California's *General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities* (2022 CGP), State Water Resources Control Board (State Water Board) Order No. 2022-0057-DWQ (NPDES No. CAS000002) for Risk Level 1 Projects (Appendix Q). This SWPPP has been prepared following the 2023 CASQA Traditional SWPPP Template provided in the California Stormwater Quality Association (CASQA) Stormwater Best Management Practice (BMP) Handbook: Construction (CASQA 2023). The SWPPP also includes applicable requirements specified in LAWA Guidance Manual for Construction Stormwater Pollution Prevention – Part 1: Construction Stormwater Pollution Prevention Plan (SWPPP).

In accordance with the 2022 CGP, Section IV.O., this SWPPP is designed to address the following:

- Identification of all pollutants, their sources and control mechanisms, including sources of sediment associated with all construction activities, e.g., sediment, paint, cement, stucco, cleaners and site erosion.
- Pollutant source assessments, including a list of potential pollutant sources and identification of site areas where additional BMPs are necessary to reduce or prevent pollutants in stormwater and authorized non-stormwater discharges, per the minimum requirements defined in the 2022 CGP when developing the pollutant source assessment.
- Description of site-specific BMPs implemented to reduce or eliminate stormwater pollution.
- Where not otherwise required to be under a Regional Water Quality Control Board (Regional Water Board) permit, all non-stormwater discharges are identified and either eliminated, controlled or treated.
- Site BMPs are effective and result in the reduction or elimination of pollutants in stormwater discharges and authorized non-stormwater discharges during construction to the Best Available Technology/Best Control Technology (BAT/BCT) standard.

The Los Angeles International Airport (LAX) is a world-class airport that serves as the primary airport for the greater Los Angeles area. The scope of the project covered under this SWPPP is only the Roadway Improvements portion of the Los Angeles World Airport (LAWA) Airfield and Terminal Modernization Program (ATMP). The project area comprises approximately 52.82 acres, of which nearly all areas will be disturbed. The project is bounded by the existing Sky Way to the west, the future Terminal 9 to the south, future Jetway Boulevard to the east, and 94th Street to the north in Los Angeles, California. The property is owned by LAWA and is being developed by Skanska-Flatiron Joint Venture (SFJV). The project's location is shown in Appendix A.

1.2 PERMIT REGISTRATION DOCUMENTS

Required Permit Registration Documents (PRDs) shall be submitted to the State Water Board via the Stormwater Multiple Application and Report Tracking System (SMARTS) by the LRP or Duly Authorized Representative (DAR). The project-specific PRDs include, as applicable:

1. Notice of Intent (NOI)

2. Risk Type Determination (Construction Site Sediment and Receiving Water Risk Determination)
3. Site Drawings and Maps
4. SWPPP
5. Applicable plans, calculations and other supporting documentation for compliance with the Phase I or Phase II municipal separate storm sewer system (MS4) post-construction requirements or the post-construction standards of the 2022 CGP:
 - a. Attachment or web-source containing the applicable Phase I or Phase II MS4 post construction requirements
 - b. The post-construction plans and calculations submitted to or approved by the applicable Phase I or Phase II MS4
 - c. Post-construction water balance calculation
6. Active Treatment System (ATS) Plan and Passive Treatment Plan, if applicable
7. Dewatering Plan, if applicable
8. Annual Fee per the current 23 California Code of Regulations Chapter 9 fee schedule for National Pollutant Discharge Elimination System (NPDES) stormwater permits
9. Signed Certification Statement (LRP Certification is provided electronically with SMARTS PRD submittal).

Site maps can be found in Appendix A. A copy of the submitted PRDs shall also be kept in Appendix B along with the Waste Discharge Identification (WDID) confirmation.

1.3 SWPPP AVAILABILITY AND IMPLEMENTATION

The SWPPP will be available at the construction site during working hours while construction is occurring and shall be made available upon request by a federal, state, or municipal inspector. A current copy of the SWPPP and any site inspection reports required by the 2022 CGP may be kept in electronic format at the site so long as the information requested by a federal, state, or municipal inspector can be made available during an inspection. All maps are legible and available in hard copy at the site in accordance with 2022 CGP Section IV.O.1.

The SWPPP must be implemented at the appropriate level to protect water quality at all times throughout the life of the project. The SWPPP must remain on the site during construction activities, commencing with the initial mobilization and ending with the termination of coverage under the 2022 CGP.

1.4 SWPPP AMENDMENTS

SWPPP changes or amendments will be uploaded to SMARTS within 30 calendar days. The SWPPP should be revised when:

- There is a 2022 CGP violation (2022 CGP Section VI.Q.1)
- There is a reduction or increase in total disturbed acreage (2022 CGP Section III.F.2. and F.4)

- BMPs are not effective and are not resulting in a reduction or elimination of pollutants in stormwater discharges and authorized non-stormwater discharges (2022 CGP Section VI.Q.1 and Attachment F Section III.C.5)
- There is a change in the project duration that changes the project Risk Level (2022 CGP Section III.F.1)
- Dischargers with projects where all construction activities (including passive treatment, active treatment systems, and/or active equipment) will be suspended for 30 days or more (2022 CGP Section III.G)

Additionally, the SWPPP will be amended when:

- There is a change in construction or operations that may affect the discharge of pollutants to surface waters, groundwater(s), or a municipal separate storm sewer system (MS4) (2022 CGP Section IV.O and VI.Q.1), or when deemed necessary by the QSD.

The QSD has determined that the changes listed in Table 1-1 can be field determined by the QSP. All other changes will be made by the QSD as formal amendments to the SWPPP. The 2022 CGP requires that the QSD revise the SWPPP to address potential problems identified by visual inspections, sampling data, comments from a QSP or their own site observations (2022 CGP Section V.C.2).

The following items shall be included in each amendment:

- Who requested the amendment
- The location of proposed change
- The reason for change
- The original BMP(s) proposed, if any
- The new BMP(s) proposed
- QSD Certification

SWPPP amendments will be logged at the front of the SWPPP and SWPPP Amendment QSD certifications will be located in Appendix C. The SWPPP text will be revised, replaced and/or hand annotated as necessary to properly convey the amendment. SWPPP amendments must be made by a QSD. The following changes have been designated by the QSD as “to be field determined” and constitute minor changes that the QSP may implement based on field conditions.

Table 1-1. List of Changes to be Field Determined

Candidate Changes for Field Location or Determination by QSP¹	Field Located or Field Determined by QSP
Increase quantity of an Erosion or Sediment Control Measure	<i>To be determined by QSP</i>
Relocate/add stockpiles or stored materials	<i>Per site condition and construction schedule; QSP to determine on-site as construction schedule progresses.</i>
Relocate or add toilets	<i>Per site condition and construction schedule; QSP to determine on-site as construction schedule progresses.</i>

Candidate Changes for Field Location or Determination by QSP¹	Field Located or Field Determined by QSP
Relocate vehicle storage and/or fueling locations	<i>Per site condition and construction schedule; QSP to determine on-site as construction schedule progresses.</i>
Relocate areas for waste storage	<i>Per site condition and construction schedule; QSP to determine on-site as construction schedule progresses.</i>
Relocate water storage and/or water transfer location	<i>Contractor and QSP need to coordinate together.</i>
Changes to access points (entrance/exits)	<i>Per site condition and construction schedule; QSP to determine on-site as construction schedule progresses.</i>
Change type or location of Erosion or Sediment Control BMPs	<i>Contractor and QSP need to coordinate together.</i>
Minor changes to schedule or segments	<i>Contractor to provide information to QSP, QSD, and LRP</i>
Changes in construction materials	<i>Contractor and QSP need to coordinate together.</i>
<i>(1) Any field changes not identified for field location or field determination by the QSP must be made as an amendment by the QSD.</i>	

The required standards for amending the SWPPP include:

- Submit sections of the SWPPP that are changed using redline/strikeout format for changing or updating the text, per LAWA requirement.
- When a Change-of-Information (COI) is required (i.e., adding or removing acreage, revising the dates, new ownership, etc.), the information (including) the amendment language) needs to be submitted to LAWA PM for uploading into the SMARTS database and obtaining the LRP certification for submission prior to Board approval. Other amendments that do not trigger a COI, do not require LRP approval.
- Update the amendment log. Place the appropriate notice of approval(s) into Appendix C along with the amendment.
- Each amendment shall be a single line item on the Amendment Log Form. Following the amendment log shall be the information supporting the sections listed in the “brief description of Amendment, include section and page number” column of the log.

1.5 RETENTION OF RECORDS

Paper or electronic records of documents required by this SWPPP shall be retained for a minimum of three years from the date generated or date submitted, whichever is later, for the following items. Additionally, at the completion of the project the SWPPP documents shall be submitted to the LAWA PM for retention.

- SWPPP
- Visual monitoring reports
- Sampling equipment calibration records
- pH and turbidity sampling field sheets
- Analytical laboratory reports

These records shall be available at the site until construction is complete. Records assisting in the determination of compliance with the 2022 CGP will be made available within a reasonable time to the Regional Water Board, State Water Board or U.S. Environmental Protection Agency (EPA) upon request. Requests by the Regional Water Board for retention of records for a period longer than three years shall be adhered to.

1.6 REPORTING

Completed inspection checklists are not required to be submitted to the Regional Water Board. However, completed inspection checklists will be kept with the SWPPP onsite or electronically. The 2022 CGP requires that permittees prepare, certify and electronically submit an Annual Report through SMARTS no later than September 1 of each year. Reporting requirements are identified in 2022 CGP Section IV.P. Annual reports will be filed in SMARTS and in accordance with information required by the online forms. The following information, at a minimum, shall be provided to the LRP's Data Submitter prior to August 15 or prior to filing the NOT, for the annual reporting purposes:

- A digital copy of all required inspection reports including weekly and quarterly inspections, as well as storm inspections (pre-storm, during-storm, post-storm as applicable).
- If any inspections were performed by a person other than the designated QSP, provide a copy of the training log identifying the inspector as properly trained by the QSP.
- If applicable, explanations for any of the following conditions:
 - Any Permit-required inspections that were not performed
 - BMP maintenance/repair or design changes that were not initiated within 72 hours of being identified/reported
 - Non-visible pollutant or non-storm water sampling occurrences (include all laboratory data reports)
- Report of any authorized or unauthorized non-storm water discharge; include date and time of observation.
- By August 1 each year and at project completion, submit to the LAWA PM, a completed hand marked version of the SMARTS Annual Report. Also include digital copies of the summary and evaluation of all sampling and analysis results, original laboratory reports, chain of custody forms, a summary of all corrective actions taken during the compliance year, and identification of any compliance activities or corrective actions that were not implemented.

Planned changes in site construction activities that may result in non-compliance with the 2022 CGP are required to be provided in writing to the Regional Water Board and local stormwater agency prior to changes.

If a 2022 CGP discharge violation occurs, the QSP will immediately notify the LRP. The LRP will include information on the violation with the Annual Report. Corrective measures will be implemented immediately following identification of the discharge or written notice of non-compliance from the Regional Water Board. Discharge and corrective actions must be documented and include the following items:

- The date, time, location, nature of operation and type of unauthorized discharge
- The cause or nature of the notice or order
- The BMPs deployed before the discharge event or prior to receiving notice or order
- Receiving the notice or order, including additional measures installed or planned to reduce or prevent re-occurrence

Results of non-visible pollutant monitoring and corrective actions will be electronically submitted within 30 days after obtaining analytical results or within 10 days if the analytical results demonstrate the exceedance of an applicable Total Maximum Daily Loads (TMDL)-related Numeric Action Level (NAL) or Numeric Effluent Limitation (NEL) or Basin Plan parameter.

A NAL exceedance report will be prepared when requested, in writing, by the Regional Water Board. In the event of a TMDL NEL exceedance, by the end of each reporting year the project will submit and certify, in SMARTS, documentation of the site assessment, SWPPP evaluation and implementation of the corrective actions.

The Regional Water Board will be notified via email 24 hours prior to the beginning of a planned dewatering discharge. In the event of an emergency dewatering, the Regional Water Board and applicable MS4 are to be notified within 24 hours of a discharge occurring. An emergency is defined as the need to protect human life and health or prevent severe property damage. Results of pH and turbidity monitoring will be submitted in the Annual Report.

See Section 7.7 for additional discussion of the reporting requirements.

1.7 CHANGES TO PERMIT COVERAGE

The 2022 CGP allows for the reduction or increase of the total acreage covered under the 2022 CGP when: a portion of the project is complete and/or conditions for termination of coverage have been met; when ownership of a portion of the project is purchased by a different entity; or when new acreage is added to the project.

Modified PRDs will be filed electronically through a Change of Information (COI) within 30 days of a reduction or increase in total disturbed area if a change in permit covered acreage is to be sought. The SWPPP will be modified appropriately and will be logged at the front of the SWPPP. SWPPP Amendment QSD Certification will be located in Appendix C. COIs submitted electronically via SMARTS can be found in Appendix D. COIs will be submitted to the LAWA PM.

1.8 NOTICE OF TERMINATION

A Notice of Termination (NOT) must be submitted electronically by the LRP or DAR via SMARTS to terminate coverage under the 2022 CGP. According to the requirements of 2022 CGP Section III.H.4.h., the following final stabilization method will be used to satisfy final stabilization condition requirements:

- 70 percent final cover method supported by pre- and post- project photographs demonstrating stabilization.
- Revised Universal Soil Loss Equation (RUSLE or RUSLE2) method with computation proof supported by pre- and post- project photographs demonstrating stabilization.
- Custom method for which Regional Water Board approval has been obtained, supported by documentation required by the Regional Water Board and pre- and post- project photographs demonstrating stabilization.

The Regional Water Board will consider a construction site complete when the conditions of the 2022 CGP, Section III.H, have been met. The discharger is required to submit the following in SMARTS:

- NOT SMARTS Form
- QSP-prepared final NOT inspection which includes the QSP name and valid QSP certificate number
- Final site map with photo orientation references
- Photos demonstrating final stabilization and applicable post-construction BMPs and/or low impact development
- A long-term maintenance plan for the post-construction stormwater runoff BMPs and/or low impact development features being implemented

According to the 2022 CGP, the NOT will be automatically approved within 30 calendar days after the date the NOT was submitted, unless, within the 30 calendar days the Regional Water Board notifies the discharger through SMARTS that the NOT has been denied, returned, or accepted for review (2022 CGP Section III.H.7).

Note: If an Annual Report has not been filed in the current reporting year, an Annual Report will need to be submitted prior to the NOT.

Section 2 Project Information

2.1 PROJECT AND SITE DESCRIPTION

2.1.1 Site Description

The ATMP – Roadway Improvements Project is Risk Level 1 that comprises approximately 52.82 acres. This area is roughly estimated from the Google Earth Map and will be updated when more specific information is provided by LAWA or SFJV. It is bounded by the existing Sky Way to the west and Aviation Boulevard to the east. To the north is Westchester Parkway and to the south is the Imperial Highway. Construction work will include the demolition and construction of new driveways, curb cuts, and ramps. Roadway construction and demolition will occur from Sepulveda Boulevard and Century Boulevard leading up to the Central Terminal Area (CTA). The project is located approximately 3.6 miles northwest from Dominguez Channel. The center of the Project site is approximately located at Latitude 33.94720 degrees N and Longitude 118.39623 degrees W.

2.1.2 Existing Conditions

As of the initial date of this SWPPP, the project area is in a highly urbanized area with extensive human disturbance including pavement, tall buildings, roads, parking garages and multi-lane roadways. The proposed roadway improvement locations are primarily covered with impervious surfaces. Numerous, significant utility structures run through the project area including water lines, sewer lines, natural gas lines, fuel lines, electrical lines and private communication lines.

The Project will construct new elevated roadways to direct the inbound and outbound traffic to CTA from Sepulveda Boulevard and Century Boulevard and improves traffic congestion on these major local and regional highways. 96th Street will be modified to receive and send traffic from and to Sepulveda Boulevard via the Sepulveda Blvd/96th Street intersection. The return to departure and arrival access roads will also be reconstructed. Existing inbound and outbound ramps to the CTA along with the 96th Street Bridge over Sepulveda Blvd will be removed.

Environmental concerns include the northwest corner of Century Boulevard and Sepulveda Boulevard. At this location, 13 underground storage tanks were removed from the site under the direction of regulatory agencies. Soil contamination from historic jet fuel operations resulted in detectable concentrations of halogenated VOCs and 1,4 dioxane in the soil. The site is currently being remediated using soil vapor extraction systems.

2.1.3 Existing Drainage

The project area elevation is between approximately 95 to 123 feet above mean sea level (AMSL). The site is geographically located within two Watershed Management Areas (WMA). On the east side of the Sepulveda Boulevard is the Dominguez Channel WMA. The Dominguez Channel leads to Los Angeles Harbor. West of Sepulveda Boulevard is the Santa Monica Bay WMA. Both watersheds are under the jurisdiction of the California Regional Water Quality Control Board, Los Angeles Region, NPDES Permit No. CAS004001 (Order No. R4-2012-0175). The watersheds drain westerly and southeasterly rendering Sepulveda Boulevard as the ridge line between the two watersheds. This indicates that little site flow will be entering our project site. Existing drainage facilities within the project footprint are described below:

- **96th Street Trunkline** – 30" to 42" reinforced concrete pipe (RCP) owned and maintained by the City of Los Angeles
- **98th Street Trunkline** – 42" RCP owned and maintained by the City of Los Angeles
- **West Century Blvd Trunkline** – 6' x 4' reinforced concrete box (PCB) owned and maintained by LAWA. This facility is within the parkway area along Century Blvd between the CTA and Airport Road. It is very shallow (6 inch cover in places) and will create issues with the proposed enabling project along Century Blvd. identified in the Project Requirement.
- **World Way South Trunkline** – Size, material, and is unknown. Ownership of this line is being confirmed but is likely LAWA as it exists within the LAWA roadway.
- **Sky Way** – 11' x 4.5' RCB owned and maintained by LAWA.

The proposed storm drainage improvements of this project will preserve existing facilities to the maximum extent practicable. As such, connections to existing public owned systems are expected throughout the project. In instances where connections are made into an existing system owned and maintained by Los Angeles County Flood Control District (LACFCD), such as the 96th Street Trunkline mentioned above, a permit will be required. LACFCD requires new stormdrain connections to design for an allowable discharge flow rate determined by their agency.

No federally protected wetlands, floodplains, or waters of the United States exist on the project area. Therefore, there would be no effect on wetlands and waters of the United States at these locations and no specific mitigations would be required.

The water quality impairments (303(d) list and TMDLs identified in the 2022 CGP Table H-1) for the receiving waters are identified in Table 2-1.

Table 2-1. Applicable 303(d) List Impairments and TMDLs

Receiving Water	Water Quality Impairment	
	303(d) list	TMDL (2022 CGP Table H-1)
Santa Monica Bay	Dichlorodiphenyltrichloroethane (DDT), Arsenic, Polychlorinated, Biphenyls (PCBs), Mercury, and Trash	DDT, PCBs, and Bacteria
Dominguez Channel	Copper, Bacteria, Lead, Toxicity, and Zinc	Total Copper, Total Lead, and Total Zinc

2.1.4 Geology and Groundwater

The project area is situated in the El Segundo Sand Hills physiographic region of the West Coast Groundwater Basin and is also referred to simply as the West Coast Basin (DWR 1961). The West Coast Basin extends westerly from the Newport-Inglewood fault zone and associated uplifted land surface on the east to Santa Monica Bay on the west, the Palos Verdes Hills and San Pedro Bay on the south and approximately to the Orange County line on the southeast. The El Segundo Sand Hills region is a roughly three- to four-mile-wide strip of land adjacent to the coast extending from Playa Del Rey and Westchester on the north to Palos Verdes Peninsula on the south. The Torrance Plain borders the El Segundo Sand Hills on the East. The site is situated in the northerly portion of the El Segundo Sand Hills physiographic region.

The El Segundo Sand Hills are underlain by deposits of the Older Dune Sand and Lakewood Formation geologic units. According to DWR (1961), the Older Dune Sand has been tilted, weathered, eroded and altered by leaching and cementation processes. Hydrogeologic divisions of the Lakewood Formation from younger to older in the project area include the Semi-perched aquifer, the Bellflower aquiclude and the Gage aquifer. The Semi-perched aquifer and the Bellflower aquiclude are dominated by fine-grained deposits. The underlying Gage aquifer consists mainly of sand and gravel beds with interbeds of silt and clay. In the project area the Older Dune Sand and Semi-perched aquifer may contain local areas of perched groundwater but not of sufficient quantities to be a usable resource. The depth to the top of the Gage aquifer in the project area is variable but is estimated to be on the order of 80 feet below ground surface.

A 2019 groundwater investigation at a nearby site reported depths to groundwater within the Gage aquifer ranging from 90 to 100 feet (Wood, 2019). While depths to groundwater vary with location and time, these data are likely to be fairly representative of conditions at the project location.

2.1.5 Project Description

The ATMP – Roadway Improvements Project will construct new elevated roadways to direct the inbound and outbound traffic to CTA from Sepulveda Boulevard and Century Boulevard and improves traffic congestion on these major local and regional highways. 96th Street will be modified to receive and send traffic from and to Sepulveda Boulevard via Sepulveda Boulevard/96th Street intersection. The return to departure (upper level) and arrival (lower level) access roads will also be reconstructed. Existing inbound and outbound ramps to the CTA along with the 96th Street Bridge over Sepulveda Boulevard will be removed. Upon the completion of the project, the percentage of impervious area will be approximately 98 – 100% since there will be all paved roadways.

The following is a detailed list of the different segments improvements:

- **Proposed Segment A:** New roadway at grade and bridge from just south of the existing Lincoln Blvd/Sepulveda Blvd intersection to provide southbound traffic access to the CTA. This alignment varies from two to three lanes and is grade separated above Sepulveda Blvd, 98th Street, and Century Blvd.
- **Proposed Segment C:** New roadway at grade and bridge from the existing Sepulveda Blvd/96th Street intersection to carry the northbound Sepulveda Blvd traffic to the CTA via merging in Segment A. This alignment is two lanes and is grade separated to cross over Segments F and D.
- **Proposed Segment D:** New roadway at grade and bridge to carry the outbound CTA traffic via Segments K and W to southbound Sepulveda Blvd. This alignment varies from one to three lanes and is grade separated above 98th Street, below Segments C and A, and above Sepulveda Blvd.
- **Proposed Segment E:** Modifications to 96th Street roadway to provides access from the Jetway Blvd/96th Street intersection to northbound Sepulveda Blvd. This alignment is one at-grade lane.
- **Proposed Segment F:** Modifications to 96th Street roadway to provide access from northbound Sepulveda Blvd to the Jetway Blvd/96th Street intersection and ITF West. This alignment varies from one to two at-grade lanes.

- **Proposed Segment G:** New roadway at grade and bridge to provide access for outbound CTA to northbound Sepulveda Blvd via Segment D. This alignment is one lane grade separated over 96th Street (Segments E and F) and the driveway to the LAX City Bus Center.
- **Proposed Segment I:** New roadway at grade and bridge to provide access from westbound Century Blvd to the CTA arrival level by joining to the existing N. World Way. This alignment is two lanes grade separated over Sepulveda Blvd and Segment D.
- **Proposed Segment K:** New roadway at grade and bridge connecting Segment L and Center Way to Segment D, to provide CTA outbound access to both northbound and southbound Sepulveda Blvd. This alignment is three lanes and is grade separated under Segment L, and over Segments N, Sepulveda Blvd and Century Blvd.
- **Modified Segment L:** The existing structure connects CTA departures level to Segment K and provides CTA outbound access to northbound and southbound Sepulveda Blvd will be modified by widening the structure from one to two lanes. This structure crosses over Segments P and K.
- **Modified Segment L1:** The existing structure from Segment L to CTA provides for the departure-to-departure return movement. This alignment remains at one lane and is grade separated over Segment N and may need some modifications due to the proposed widening of Segment L.
- **Proposed Segment M:** New bridge from CTA departures level joining Segment P with final destination of eastbound Century Blvd. This alignment varies from one to two lanes and is grade separated over Segment N and Sepulveda Blvd.
- **Proposed Segment N:** New at grade roadway to provide arrival-to-arrival level return movement to CTA. This alignment is one lane and crosses under Segments L, M, P, K, and L1 bridges.
- **Proposed Segment NE:** New at grade roadway providing direct connection from northbound Sepulveda Blvd to Century Blvd via Segment P. It also provides access to future Terminal 9. This alignment is one lane and crosses under Segment W bridge.
- **Proposed Segment P:** New at grade roadway and bridge from CTA outbound arrivals level to Century Blvd. This alignment varies from three to five lanes and is grade separated crossing under Segment L, and over Segments N and D, and Sepulveda Blvd.
- **Proposed Segment W:** New bridge from CTA departures level to provide access to northbound and southbound Sepulveda Blvd via Segment D. This alignment facilitates a pending connection to Terminal 9 roadways, which will be designed by others. This alignment varies from one to two lanes and is grade separated crossing over Sepulveda Blvd, Segment NE, and Century Blvd.

Project cut and fill grading will occur on approximately 52.82 acres of the project, which comprises approximately 100% percent of the total area. The limits of grading will be provided for the future SWPPP submittal. Locations and types of stockpiles will be identified in a subsequent site logistic plan after the Basis of Design (BOD) preferred alternative is selected. Stockpiles will be planned and managed to comply with environmental requirements and to eliminate/avoid risk to LAWA operations.

SFJV will provide a construction field office in the ATMP staging and laydown area for LAWA's sole use. SFJV will also prefer to have a construction project management field office located within the staging and laydown area site. Field offices and staging/laydown areas for each phase are provided in Appendix R – ATMP Construction Logistics Areas.

2.1.6 Developed Condition

Final site BMPs conditions will consist of the following:

- Re-establish uniform coverage equaling 70% of the pre-construction vegetative conditions; where preconstruction vegetation covers less than 100% of the surface, such as in arid areas, the 70% coverage criteria is adjusted as follows: if the preconstruction vegetation covers 50% of the ground surface, 70% of 50% would require 35% total uniform surface coverage.

For the area of development post-construction drainage will be directed to on-site drains, planter drains, catch basins, and side catch basins will direct through existing storm drain pipe. Ultimately water is discharged into either Santa Monica Bay or the Dominguez Channel. Dominguez Channel Subbasin is governed by the LA County MS4 Permit as run-off is conveyed by City of Los Angeles Department of Sanitation storm drain lines. Completion of the ATMP – Roadway Improvements Project is estimated to result in a slight increase of impervious area.

Table 2-2. Construction Site Estimates

Total Area	52.82 acres
Percent Impervious before Construction	95%
Runoff Coefficient before Construction	0.85 – 0.90
Percent Impervious after Construction	98%
Runoff Coefficient after Construction	0.90 – 0.95

2.2 PERMITS AND GOVERNING DOCUMENTS

In addition to the 2022 CGP, the following documents were considered while preparing this SWPPP:

- Regional Water Board requirements
- Basin Plan requirements
- Contract Documents

2.3 STORMWATER RUN-ON FROM OFF-SITE AREAS

Stormwater run-on from areas adjacent to the construction sites will be mitigated with existing roadway curbs, stormdrain collection systems, parking area drain inlets, or implementation of perimeter berm or barriers. Any stormwater run-on not mitigated by the prior list will be managed with the installation of BMPs. Methods include use of dikes (or berms) and swales.

2.4 FINDINGS OF THE CONSTRUCTION SITE SEDIMENT AND RECEIVING WATER RISK DETERMINATION

A risk level determination has been performed using 2022 CGP Attachment D.1 procedures and the project is classified as Risk Level 1. The copy of the risk level determination submitted on SMARTS with the PRDs is included in Appendix B.

Erosivity (R) values were calculated via the low erosivity calculator at <https://lew.epa.gov/> in accordance with the State Water Board Guidance for multi-year projects at:

https://www.waterboards.ca.gov/water_issues/programs/stormwater/smarts/construction/docs/rfactor_guide.pdf

Tables 2-3 and 2-4 summarize the sediment and receiving water risk factors, respectively.

Table 2-3. Summary of Sediment Risk

RUSLE Factor	Value	Method for Establishing Value
R	149.07	USEPA Rainfall Erosivity Factor Calculator for Small Construction Sites
K	0.20	SWRCB K Factor Map
LS	0.41	LS Factors for Construction Sites – Table from Renard et. al., 1997
Total Predicted Sediment Loss (tons/acre)	12.22	R x K x LS
Overall Sediment Risk Low Sediment Risk < 15 tons / acre Medium Sediment Risk >= 15 and 75 tons / acre High Sediment Risk >= 75 tons / acre		Low

The time dependent R factor was calculated using March 26, 2024 and May 31, 2028 for the dates of initial earth disturbance and final stabilization, respectively. The dates correspond to the estimated start and end of ATMP – Roadway Improvements related construction and demolition work.

Table 2-4. Summary of Receiving Water Risk

Receiving Water	303 (d) – Listed for Sediment Related Pollutant	Beneficial Uses of COLD, SPAWN, and MIGRATORY	TMDL for Sediment Related Pollutant
Dockweiler Beach (Santa Monica Bay)	Arsenic, DDT, Mercury, PCBs, and Trash	Only SPAWN	No
Dominguez Channel	Copper, Indicator Bacteria, Lead, Toxicity, Zinc	No	No
Overall Receiving Water Risk			Low

The narrative effluent limitations require stormwater and authorized non-stormwater discharges to not contain a hazardous substance greater than or equal to reportable quantities established in 40 CFR Sections 117.3 and 302.4. Controls, structures and best management practices shall be implemented to minimize or prevent pollutants in stormwater and authorized non-stormwater

discharges associated with the construction activity. This SWPPP has been prepared to address Risk Level 1 requirements (2022 CGP Attachment D).

Projects that discharge to a water body and/or watershed listed in Table H-2 of 2022 CGP are subject to both the narrative and numeric effluent limitations imposed by the TMDL requirements in Attachment H of 2022 CGP. NEL and NAL applicable to this project are listed in Table 2-5. This SWPPP has been prepared to address the TMDL requirements (2022 CGP Attachment H).

2.5 CONSTRUCTION SCHEDULE

The overall construction schedule, as well as the start and end dates for each element are provided in Appendix E. Stormwater pollution prevention measures shall be implemented throughout the entire duration of the construction activities as prescribed in this SWPPP. The project sediment risk was determined based on construction taking place March 26, 2024 to May 31, 2028. Modification or extension of the schedule (start and end dates) may affect risk level determination and permit requirements. The QSD will be made aware of schedule changes during construction to address potential impact to the SWPPP.

The sequences and durations for progressing construction stages are presented below:

- **Stage 1 – Early Work**
 - 8 months after start of Early Work
- **Stage 2 to 4 – Offline Segment Construction (CTA Inbound from NB and SB Sepulveda Blvd.)**
 - 18 months from end of Stage 1
- **Stage 2 to 4 – Offline Segment Construction (CTA Departures Outbound to T-9 & 96th St.)**
 - Segment D to north of Century Blvd.
 - 31 months from start of Stage 2
 - Segment D superstructure along Jetway Blvd.; Segments W, G, E and F; Sepulveda Blvd. widening; Open traffic to 96th St. from Segments W/D/E/F/G
 - 20 months from end of Stage 1
- **Stage 5 – Major Demolition and Segment Construction**
 - Demolition
 - 2 months after end of Stage 2 opening of traffic to 96th St.
 - Segments P, K, L and N; Segment D from Century Blvd to SB Sepulveda Blvd. gore; Open Segments K and P to traffic with P in interim condition; Open Segments L and N to traffic; Open Segment D on-ramp to SB Sepulveda Blvd.
 - 12 months after end of Stage 5 demolition sequence
- **Stage 6 – Major Demolition & Segment Construction**
 - Demolish existing WWS over Sepulveda Blvd., existing EB Century Blvd. to NB Sepulveda Blvd. loop ramp and existing EB Century Blvd. over Sepulveda Blvd. Construct Segments NE and M
 - 7 months after end of Stage 5

2.6 POTENTIAL CONSTRUCTION ACTIVITY AND POLLUTANT SOURCES

Appendix F includes a list of construction activities and associated materials that are anticipated to be used onsite as well as the pollutant source assessment form that was completed for the project.

These activities and associated materials will or could potentially contribute to pollutants (other than sediment) to stormwater runoff.

The anticipated activities and associated pollutants were used in Section 3 to select the Best Management Practices (BMPs) for the project. Locations of anticipated activities and associated BMPs will be included in the Site Maps.

Additionally, proper measures will be taken to ensure that trench spoils or any other soils disturbed during construction activities that are contaminated are not discharged with stormwater or non-stormwater discharges into storm drains or water bodies (except pursuant to a separate NPDES Permit). If contaminated soils are found onsite and the responsible party cannot be identified or fails to take action, soils will be sampled to determine proper handling and protect public safety. The appropriate local, State and federal agencies along with the appropriate Regional Water Board will be notified when contaminated soils are observed.

The sampling requirements for non-visible pollutants associated with construction activity are provided in Section 7.7.1. For a full and complete list of onsite pollutants, refer to the Safety Data Sheets (SDS) which are retained onsite at the construction trailer.

2.7 TMDL REQUIREMENTS

Based on the project's receiving water and the pollutant source assessment, the following TMDLs are applicable to the project (See 2022 CGP Attachment H).

Table 2-5. Project TMDLs

TMDL	Applicable Water Body/Watershed	Pollutants	Additional TMDL Related NAL or NEL	Compliance Actions
Los Angeles and Long Beach Harbor Waters TMDL	Dominguez Channel	Total Copper	Interim NAL of 0.20751 mg/L	Comply with General Permit and the additional Metals TMDL Requirements in the 2022 CGP Attachment H Section I.G.3
Los Angeles and Long Beach Harbor Waters TMDL	Dominguez Channel	Total Lead	Interim NAL of 0.12288 mg/L	Comply with General Permit and the additional Metals TMDL Requirements in the 2022 CGP Attachment H Section I.G.3
Los Angeles and Long Beach Harbor Waters TMDL	Dominguez Channel	Total Zinc	Interim NAL of 0.89887 mg/L	Comply with General Permit and the additional Metals TMDL Requirements in the 2022 CGP Attachment H Section I.G.3

TMDL	Applicable Water Body/Watershed	Pollutants	Additional TMDL Related NAL or NEL	Compliance Actions
Santa Monica Bay Beaches Bacteria TMDL	Santa Monica Bay Watershed Management Area	Enterococcus, Fecal Coliform, Total Coliform	None	Comply with General Permit and the additional Bacteria TMDL Requirements in the 2022 CGP Attachment H Section I.A
Santa Monica Bay DDTs and PCBs TMDL	Santa Monica Bay	DDT and PCBs	None	Comply with General Permit and the additional Toxics TMDL Requirements in the 2022 CGP Attachment H Section I.G.2

2.8 IDENTIFICATION OF NON-STORMWATER DISCHARGES

Non-stormwater discharges into storm drainage systems or waterways which are not authorized under the 2022 CGP and listed in the SWPPP or authorized under a separate NPDES permit are prohibited.

Non-stormwater discharges that are authorized from the ATMP – Roadway Improvements Project will be managed with the stormwater and non-stormwater BMPs described in Section 3 of this SWPPP and will be minimized under the direction of the QSP. Additionally, the non-stormwater discharges not applicable to this project are still allowable granted they do not contact potential pollutant sources.

Activities at this site that may result in unauthorized non-stormwater discharges include:

- Dust control during clearing, grading and grubbing
- Dust control during excavation, support of excavation, construction and demolition.
- Equipment washing
- Sanitary waste

Steps will be taken, including the implementation of appropriate BMPs, to ensure that unauthorized discharges are eliminated, controlled, disposed or treated onsite. Discharges of construction materials and wastes, such as fuel or paint resulting from dumping, spills or direct contact with stormwater are prohibited.

Treated construction process water, which will include construction impacted stormwater and other non-stormwater, will be discharged to the sanitary sewer system in accordance with an Industrial Wastewater Discharge Permit.

2.9 REQUIRED SITE DRAWINGS AND MAPS INFORMATION

A General Vicinity Map, Site BMP Maps for current construction plan and other 2022 CGP Section IV.O.2.k and l information are provided in Appendix A. The Site Maps will be updated in the future submittals and reflect each applicable phase of development including:

- **Phase 1:** Remove Sky Way access to CTA and LAX-it lot to facilitate Concourse 0 construction
- **Phase 2:** Construct offline alignments to provide access to and from the CTA while keeping traffic in existing locations
- **Phase 3:** Finalize access to CTA via Sepulveda Boulevard
- **Phase 4:** Finalize access to CTA from Sepulveda Boulevard and begin reconstruction of Century Boulevard access to CTA
- **Phase 5:** Construct offline alignments located south of Century Boulevard to provide access to Century Boulevard to and from the CTA
- **Phase 6:** Complete construction to move traffic to final configuration

Section 3 Best Management Practices

3.1 SCHEDULE FOR BMP IMPLEMENTATION

BMPs will be implemented as per the schedule indicated in Table 3.1.

Table 3-1. BMP Implementation Schedule

BMP	Implementation	Duration
Erosion Control		
EC-1 Scheduling	Start of construction	Entirety of project
EC-2 Preservation of Existing Vegetation	Start of construction	Entirety of project
EC-5 Soil Binders	Prior to rain – exposed soil	Entirety of project
EC-7 Geotextiles and Mats	Prior to rain, as needed	Entirety of project
EC-9 Earth Dike/Drainage Swale	Start of construction, as needed	Entirety of project
EC-10 Velocity Dissipation Device	Start of construction, as needed	Entirety of project
Sediment Control		
SE-1 Silt Fence	Start of construction, as needed	Entirety of project
SE-2 Sediment Basin	Prior to initial grading	Entirety of project
SE-5 Fiber Rolls	Start of construction, as needed	Entirety of project
SE-7 Street Sweeping and Vacuuming	Start of construction	Entirety of project
SE-8 Sandbag Barrier	Start of construction, as needed	Entirety of project
SE-10 Storm Drain Inlet Protection	Start of construction	Entirety of project
SE-12 Manufactured Linear Sediment Controls	Start of construction, as needed	Entirety of project
SE-14 Biofilter bags	Start of construction, as needed	Entirety of project
Tracking Control		
TC-1 Stabilized Construction Entrance/Exit	Start of construction	Entirety of project
TC-2 Stabilized Construction Roadway	Start of construction	Entirety of project
TC-3 Entrance Outlet Tire Wash	Start of construction, as needed	Entirety of project
Wind Erosion Control		
WE-1 Wind Erosion Control	Start of construction	Entirety of project
Non-Stormwater Control		
NS-1 Water Conservation Practices	Start of construction, as needed	Entirety of project
NS-2 Dewatering Operation	Prior to discharge	Entirety of project
NS-3 Paving and Grinding Operation	Prior to paving operations	Entirety of project
NS-6 Illicit Connection/Discharge	Start of construction	Entirety of project

BMP	Implementation	Duration
NS-8 Vehicle and Equipment Cleaning	Start of construction	Entirety of project
NS-9 Vehicle and Equipment Fueling	Start of construction	Entirety of project
NS-10 Vehicle and Equipment Maintenance	Start of construction	Entirety of project
NS-12 Concrete Curing	Prior to concrete work	Entirety of project
NS-13 Concrete Finishing	Prior to concrete work	Entirety of project
NS-16 Temporary Batch Plants	Prior to concrete work	Entirety of Project
Waste Management and Material Pollution Control		
WM-1 Material Delivery and Storage	Start of construction	Entirety of project
WM-2 Material Use	Start of construction	Entirety of project
WM-3 Stockpile Management	Start of construction	Entirety of project
WM-4 Spill Prevention and Control	Start of construction	Entirety of project
WM-5 Solid Waste Management	Start of construction	Entirety of project
WM-6 Hazardous Waste Management	When confirmed present	Entirety of project
WM-7 Contaminated Soil Management	When confirmed present	Entirety of project
WM-8 Concrete Waste Management	Start of construction	Entirety of project
WM-9 Sanitary-Septic Waste Management	Start of construction	Entirety of project
WM-10 Liquid Waste Management	Start of construction	Entirety of project

3.2 EROSION AND SEDIMENT CONTROL

Erosion and sediment controls are required by the 2022 CGP to provide effective reduction or elimination of sediment related pollutants in stormwater discharges and authorized non-stormwater discharges from the sites. Additionally, LAWA PR-18 requires that no sediment be discharged to a storm drain system or receiving water. Applicable BMPs are identified in this section for erosion control, sediment control, tracking control, and wind erosion control.

These temporary erosion and sediment control BMPs shall be implemented in conformance with the following guidelines and as outlined in the BMP Fact Sheets provided in Appendix G. If there is a conflict between documents, the Site Map will prevail over narrative in the body of the SWPPP or guidance in the BMP Fact Sheets. Site specific details in the Site Map prevail over standard details included in the Site Map and the SWPPP narrative prevails over guidance in the BMP Fact Sheets.

3.2.1 Erosion Control

Erosion control, also referred to as soil stabilization, consists of source control measures that are designed to prevent soil particles from detaching and becoming transported in stormwater runoff. Erosion control BMPs protect the soil surface by covering and/or binding soil particles.

This construction project will implement the following practices to provide effective temporary and final erosion control during construction:

- Preserve existing vegetation where required and when feasible.
- Control the area of soil-disturbing operations by implementing the identified erosion control BMPs quickly and effectively.
- Control erosion in concentrated flow paths by applying erosion control blankets, erosion control seeding or alternate methods.
- Prior to the completion of construction, apply permanent erosion control to remaining disturbed soil areas.
- Stabilize inactive areas within 14 days of cessation of construction activities or sooner if stipulated by local requirements.

Sufficient erosion control materials shall be maintained onsite to allow implementation in conformance with this SWPPP.

The following erosion control BMP selection table indicates the BMPs that will be implemented to control erosion on the construction site. Erosion control BMP Fact Sheets are provided in Appendix G.

Table 3-2. Temporary Erosion Control CASQA BMP Selections

Fact Sheet	BMP Name	BMP Used		If Not Used, State Reason
		Yes	No	
EC-1	Scheduling	X		
EC-2	Preservation of Existing Vegetation	X		
EC-3	Hydraulic Mulch		X	Other selected BMPs are adequate.
EC-4	Hydroseed		X	Other selected BMPs are adequate.
EC-5	Soil Binders	X		
EC-6	Straw Mulch		X	Other selected BMPs are adequate.
EC-7	Geotextiles and Mats	X		
EC-8	Wood Mulching		X	Other selected BMPs are adequate.
EC-9	Earth Dike and Drainage Swales	X		
EC-10	Velocity Dissipation Devices	X		
EC-11	Slope Drains		X	Other selected BMPs are adequate.
EC-12	Stream Bank Stabilization		X	No stream banks associated with site
EC-14	Compost Blankets		X	Other selected BMPs are adequate.
EC-15	Soil Preparation-Roughening		X	Other selected BMPs are adequate.
EC-16	Non-vegetated Stabilization		X	Other selected BMPs are adequate.
WE-1	Wind Erosion Control	X		

EC-1 Scheduling

BMPs will be systematically deployed as triggered by specific project activities. For instance, upon the initiation of site access, measures such as tracking controls for stabilized construction entrance and exit will be promptly implemented. Subsequent BMPs will be executed in accordance with the prescribed schedule outlined in the table above and further detailed below. The implementation of EC-1, Scheduling BMPs, will be coordinated throughout the project duration, aligning seamlessly with the construction sequence. Adjustments to erosion and sediment controls will be made at locations of soil disturbance changes, ensuring effective management of stormwater runoff along the downgrade perimeter. The project schedule will sequence construction activities with the installation of erosion and sediment control measures appropriate for typical seasonal climate characteristics. Implementation of BMPs will be coordinated with adjacent and subsequent Contractors in accordance with applicable project Contract requirements.

EC-2 Preservation of Existing Vegetation

Vegetation within the construction area that is not designated for clearing and grubbing should be preserved to the greatest extent feasible.

EC-5 Soil Binders

Soil binders will be applied, as needed, to rough-graded soils that will be inactive for a short period of time to temporarily prevent water and wind-induced erosion. Plant-material-based binders are anticipated to be selected due to their higher resistance to leaching characteristics.

EC-7 Geotextiles and Mats

Plastic covers or other Rolled Erosion Control Products (RECPs) will be utilized to protect disturbed soil areas, stockpiles and steep slopes as an alternative to soil binders (EC-5) if rain is predicted.

EC-9 Earth Dike / Drainage Swale

Earth dikes and drainage swales are used to divert off site runoff around the construction site, divert runoff from stabilized areas and disturbed areas, and direct runoff into sediment basins. Temporary earth dikes shall not adversely impact adjacent properties and not be used in areas with slopes steeper than 10%. The flow out of the swale must be directed onto a stabilized area or into a grade stabilization structure. When significant erosion is anticipated, stabilization of a swale shall be achieved through methods such as vegetation, chemical treatment, rock rip-rap, matting, etc.

EC-10 Velocity Dissipation Devices

Outlet protection is a physical device composed of rock, grouted riprap, or concrete rubble, which will be placed at the outlet of the storm drainage ditch to prevent scour of the soil caused by concentrated high velocity flows. When flows are conveyed in open channels such as ditches and swales, the estimated discharge rate shall guide the selection of apron length and rock size. For outlets on slopes steeper than 10%, additional protective measures are recommended.

WE-1 Wind Erosion Control

Reclaimed water shall be applied to disturbed soil areas to prevent or alleviate dust nuisance generated by construction activities. Excessive watering shall be avoided so as not to cause runoff.

3.2.2 Sediment Controls

Sediment controls are temporary or permanent structural measures that are intended to complement the selected erosion control measures and reduce sediment discharges from active construction areas. Sediment controls are designed to intercept and settle out soil particles that have been detached and transported by the force of water.

The following sediment control BMP selection table indicates the BMPs that will be implemented to control sediment on the construction site. Sediment control BMP Fact Sheets are provided in Appendix G.

Table 3-3. Sediment Control CASQA BMP Selections

Fact Sheet	BMP Name	BMP Used		If Not Used, State Reason
		Yes	No	
SE-1	Silt Fence	X		
SE-2	Sediment Basin	X		
SE-3	Sediment Trap		X	SE-2 instead; drainage area >5 acres
SE-4	Check Dams		X	Other selected BMPs are adequate.
SE-5	Fiber Rolls	X		
SE-6	Gravel Bag Berm		X	Other selected BMPs are adequate.
SE-7	Street Sweeping	X		
SE-8	Sandbag Barrier	X		
SE-9	Straw Bale Barrier		X	Other selected BMPs are adequate.
SE-10	Storm Drain Inlet Protection	X		
SE-11	ATS		X	Other selected BMPs are adequate.
SE-12	Manufactured Linear Sediment Controls	X		
SE-13	Compost Sock and Berm		X	Other selected BMPs are adequate.
SE-14	Biofilter Bags	X		
TC-1	Stabilized Construction Entrance / Exit	X		
TC-2	Stabilized Construction Roadway	X		
TC-3	Entrance Outlet Tire Wash	X		

SE-1 Silt Fence

A silt fence comprises a woven geotextile material securely entrenched and affixed to supporting poles, occasionally reinforced by a plastic or wire mesh for additional support. Designed to detain water, the silt fence facilitates the sedimentation of coarse particles behind its structure. It is important to note that silt fences are not designed to retain fine soil particles such as clays or silts.

Silt fences will be placed around stockpiles or along project site boundaries if needed to protect downgradient vicinities from runoff. Silt fences will not be installed anywhere on a project without specific approval from LAWA and shall not be used within the Air Operations Area (AOA).

SE-2 Sediment Basin

A sediment basin is a temporary basin formed by excavation or by constructing an embankment so that sediment-laden runoff is temporarily detained under quiescent conditions, allowing sediment to settle out before the runoff is released. Temporary sediment basins will be implemented to provide stormwater retention and sediment settling to support site preparation and grading.

SE-5 Fiber Rolls

A fiber roll, also recognized as wattles or logs, is composed of materials like straw, coir, curled wood fiber, or other biodegradable elements tightly bound into a tubular structure. This roll is then enveloped by plastic netting, which may be photodegradable, or made from natural fibers such as jute, cotton, or sisal. In addition, there are fiber rolls with gravel cores, featuring embedded ballast materials like gravel or sand to enhance weight when staking is impractical, such as in the context of inlet protection.

For the LAWA ATMP – Roadway Improvements, fiber rolls will be made with natural, fiber-wrapped materials such as burlap or cotton. Monofilament or plastic-wrapped rolls are not allowed. Strategically placed at the toe, on the face of slopes along contours, and at the grade break of exposed slopes, these fiber rolls intercept runoff, diminish flow velocity, facilitate the release of runoff as sheet flow, and effectively remove sediment from the runoff through sedimentation. Obstructions such as rocks greater than 1 inch in diameter will be removed prior to placing the fiber roll. Fiber rolls will be repaired or replaced within 24-hours if damage is discovered.

Fiber rolls will be mainly implemented for project perimeter control, storm drain inlet protection, sediment control at down-slope of exposed soil areas, and stockpiles management. No plastic mesh monofilament wrapped fiber roll is permitted; only natural wrapped fiber rolls such as burlap or cotton will be installed on LAWA property.

SE-7 Street Sweeping

Street sweeping intends to remove sediment from streets and roadways and to clean paved surfaces. Sweeping and vacuuming prevent sediment from the project site from entering storm drains or receiving waters. Potential sediment tracking locations shall be inspected daily. Sufficient self-loading operational vacuum motor sweepers with spray nozzles shall be kept onsite to address dust control and pavement cleaning associated with operations.

SE-8 Sandbag Barrier

A sandbag barrier will be used around temporary stockpiles and spoiled areas, below smaller cleared areas, parallel to roadways, and as sediment traps wherever needed as a linear control measure. Alternatively, fiber rolls may be used where greater flow through or less upgradient water retention is desired. Inspection shall be conducted to assess the integrity of the sandbags on a weekly basis.

SE-10 Storm Drain Inlet Protection

Storm Drain Inlet Protection measures temporarily pond runoff before it enters the storm drain, allowing sediment to settle. Every storm drain inlet receiving runoff from unstabilized or otherwise active work areas shall be protected to prevent sediment-laden stormwater and non-stormwater discharges from entering the stormwater drainage system. Silt fence (SE-1) or other sediment control BMPs could be employed as needed to facilitate storm drain inlet protection.

SE-12 Manufactured Linear Sediment Controls

Manufactured Linear Sediment Controls (MLSC) are pre-manufactured devices that are typically specified and installed for drainage and sediment control on the perimeter of disturbed sites or stockpiles. MLSCs are commonly employed in areas as an alternative to silt fences (SE-1) and fiber rolls (SE-5) for sediment control purposes. They serve to decelerate runoff water, divert drainage, and contain fines and sediment.

SE-14 Biofilter Bags

Biofilter Bags are a multi-purpose sediment control BMP consisting of a plastic mesh bag filled with 100% recycled wood product waste. Biofilter bags are a short-term BMP that can be rapidly deployed, maintained, and replaced. Biofilter bags can be an effective short-term solution to place in developed rills to prevent further erosion until permanent measures can be established.

TC-1 Stabilized Construction Entrance and Exit

Stabilized Construction Entrance and Exit shall be applied to unpaved roads and construction site access points with a notable risk of sediment trackout onto paved roadways. Gravel and tracking plates will be installed to mitigate the tracking of sediment. Local roads adjacent to the site shall be inspected daily. Street sweeping (SE-7) will be scheduled to remove visible accumulated sediment as needed.

TC-2 Stabilize Construction Roadway

Access roads, parking areas, and other on-site construction vehicle roadways will undergo stabilized grading and regular maintenance to prevent erosion, minimize dust emissions, and avoid the tracking of sediment onto paved roads. Vehicles are required to operate at sufficiently low speeds to mitigate dust kick-up.

TC-3 Entrance Outlet Tire Wash

A tire wash will be implemented to minimize trackout of dirt, mud, and sediment from the construction site onto the adjacent public access roads.

3.3 NON-STORMWATER CONTROLS AND WASTE AND MATERIALS MANAGEMENT

3.3.1 Non-stormwater Controls

Non-stormwater discharges into storm drainage systems or waterways, which are authorized under the 2022 CGP, are prohibited. Non-stormwater discharges for which a separate NPDES permit is required by the Regional Water Board are prohibited unless coverage under the separate NPDES permit has been obtained for the discharge. The selection of non-stormwater BMPs is based on the list of construction activities with a potential for non-stormwater discharges identified in Appendix F of this SWPPP.

The following non-stormwater control BMP selection table indicates the BMPs that will be implemented to control sediment on the construction site. Fact Sheets for temporary non-stormwater control BMPs are provided in Appendix G.

Non-stormwater BMPs will be implemented in conformance with the following guidelines and in accordance with the BMP Fact Sheets provided in Appendix G. If there is a conflict between documents, the Site Map will prevail over narrative in the body of the SWPPP or guidance in the BMP Fact Sheets. Site specific details in the Site Map prevail over standard details included in the Site Map. The narrative in the body of the SWPPP prevails over guidance in the BMP Fact Sheets.

Table 3-4. Non-stormwater Control CASQA BMP Selections

Fact Sheet	BMP Name	BMP Used		If Not Used, State Reason
		Yes	No	
NS-1	Water Conservation Practices	X		
NS-2	Dewatering Operation	X		
NS-3	Paving and Grinding Operation	X		
NS-4	Temporary Stream Crossing		X	No stream crossing the project site.
NS-5	Clear Water Diversion		X	No clear water diversion.
NS-6	Illicit Connection/Discharge	X		
NS-7	Potable Water/Irrigation		X	Not anticipated as per project scope.
NS-8	Vehicle and Equipment Cleaning	X		
NS-9	Vehicle and Equipment Fueling	X		
NS-10	Vehicle and Equipment Maintenance	X		
NS-11	Pile Driving Operation		X	Not anticipated as per project scope.
NS-12	Concrete Curing	X		
NS-13	Concrete Finishing	X		
NS-14	Material and Equipment Use Over Water		X	No work over water.
NS-15	Demolition Adjacent to Water		X	No demolition adjacent to water.
NS-16	Temporary Batch Plants	X		

NS-1 Water Conservation Practices

Water Conservation Practices encompass strategic activities employed during the construction phase of a project to utilize water in a manner that prevents erosion and the offsite transport of pollutants. Implementation of these practices can effectively minimize or eliminate non-stormwater discharges.

NS-2 Dewatering Operations

Dewatering Operations will be implemented to manage the discharge of pollutants when non-stormwater and accumulated precipitation (stormwater) must be removed from a work location. Although construction practices and BMPs would minimize the quantity of run-on into the work areas and excavations, rainfall which does not evaporate or percolate into the ground may require dewatering and rainfall which contacts construction contaminants may require to be treated as construction impacted stormwater. In cases where the accumulated stormwater cannot be used for dust control, the stored water will need to be treated prior to discharge to the MS4. The contractor must comply with all the CGP requirements, provisions, limitations, and prohibitions as described in the SWPPP. There may be additional requirements and/or permits from the Regional Water Quality Control Board (RWQCB) and/or the owner of the MS4. There are a variety of methods that the Contractor can use to treat the water prior to discharge. Sediment basin (SE-2) and water treatment system will be implemented as needed at the construction sites to remove potential construction process water contaminants prior to discharge.

NS-3 Paving and Grinding Operation

Paving and Grinding Operations will be implemented to prevent paving and road improvement materials, saw-cuttings and other debris from being discharged off-site. Prior to paving and operations, silt fence (SE-1) or fiber rolls (SE-5) will be installed as identified in the site BMP maps to prevent migration of sediment. Other BMPs such as stockpile management (WM-3), soil waste management (WM-5), and concrete waste management (WM-8) will be incorporated as needed. To prevent discharge of debris into stormwater, manufacturer recommendations will be followed to allow for sufficient curing of material prior to the onset of precipitation. Additionally, grinding operations will budget enough time to clean up prior to the onset of precipitation.

NS-6 Illicit Connection/Discharge

Illicit Connection/Discharge are procedures and practices designed for construction contractors to recognize illicit connections or illegally dumped or discharged materials on a construction site and report incidents. The construction sites shall be inspected regularly for any non-Contractor illegal discharges, illicit connections or illegally dumped materials; discovery of this activity shall be reported to the owner's representative immediately.

NS-8 Vehicle and Equipment Cleaning

Vehicle and Equipment Cleaning procedures and practices eliminate or reduce the discharge of pollutants to stormwater from vehicle and equipment cleaning operations. Procedures and practices include but are not limited to: using offsite facilities; washing in designated, contained areas only; eliminating discharges to the storm drain by infiltrating the wash water; and training employees and subcontractors in proper cleaning procedures.

NS-9 / NS-10 Vehicle and Equipment Fueling / Maintenance

Several types of vehicles and equipment will be used on-site throughout the project, including excavators, cranes, loaders, paving equipment, trucks, trailers, drill rigs, backhoes, forklifts, generators, and compressors. Vehicle and Equipment Fueling/Maintenance will be utilized to prevent discharges of fuel and other vehicle fluids from locations where these activities are designated to occur. Self-propelled vehicles will be fueled off-site or at a paved fueling area; fuel trucks equipped with absorbent spill clean-up materials will be used for all on-site fueling. Waste Management BMPs will be incorporated for minor repairs and maintenance of vehicle and

equipment on-site to prevent illegal discharges of fuel and other vehicle fluids. Drip pans or absorbents will be used for all maintenance involving grease, oil, solvents, or vehicle fluids.

NS-12 / NS-13 Concrete Curing / Finishing

Concrete operations will be conducted for the construction of the portal, station, foundation pads, parking, roadway improvements, retaining walls, etc. Concrete curing procedures will be implemented to proactively prevent the uncontrolled discharge of curing compounds. Conformance with Concrete Finishing protocols will be ensured during the finishing work for the facilities.

NS-16 Temporary Batch Plants

Temporary Batch Plants will be established at the construction sites to facilitate the project concrete, grout, and pavement work. Effective management and utilization of equipment, materials, and waste products originating from temporary batch plant facilities will minimize the discharge of potential pollutants into the storm drain system or watercourses. This approach not only decreases air emissions but also serves to mitigate noise impacts.

3.3.2 Materials Management and Waste Management

Materials management control practices consist of implementing procedural and structural BMPs for handling, storing, and using construction materials to prevent the release of those materials into stormwater discharges. The amount and type of construction materials to be used at the site will depend on the type of construction and the length of the construction period. The materials may be used continuously, such as fuel for vehicles and equipment; or for a discrete period, such as soil binders for temporary stabilization.

Waste management consists of implementing procedural and structural BMPs for handling, storing, and ensuring proper disposal of wastes to prevent the release of those wastes into stormwater discharges.

Materials and waste management pollution control BMPs will be implemented to minimize stormwater contact with construction materials, wastes, and service areas; and to prevent materials and wastes from being discharged off site. The primary mechanisms for stormwater contact that shall be addressed include:

- Direct contact with precipitation, stormwater run-on and runoff
- Direct discharge to stormwater conveyances and receiving waters through spills or dumping
- Extended contact with asphalt, treated wood products, or other leachable materials and wastes.
- Wind dispersion of loose materials

A list of construction activities is provided in Appendix F. Table 3-5 indicates the BMPs that shall be implemented to handle materials and control construction site wastes associated with these construction activities. Fact sheets for Materials and Waste Management BMPs are provided in Appendix G.

Material and waste management BMPs will be implemented in conformance with the following guidelines and in accordance with the BMP Fact Sheets provided in Appendix G. If there is a conflict between documents, the Site Map will prevail over narrative in the body of the SWPPP or

guidance in the BMP Fact Sheets. Site specific details in the Site Map prevail over standard details included in the Site Map and the SWPPP narrative prevails over BMP Fact Sheets guidance.

Table 3-5. Materials and Waste Management CASQA BMP Selections

Fact Sheet	BMP Name	BMP Used		If Not Used, State Reason
		Yes	No	
WM-1	Material Delivery and Storage	X		
WM-2	Material Use	X		
WM-3	Stockpile Management	X		
WM-4	Spill Prevention and Control	X		
WM-5	Solid Waste Management	X		
WM-6	Hazardous Waste Management	X		
WM-7	Contaminated Soil Management	X		
WM-8	Concrete Waste Management	X		
WM-9	Sanitary-Septic Waste Management	X		
WM-10	Liquid Waste Management	X		

WM-1 Material Delivery and Storage

Materials will be delivered and stored in a manner that ensures they will not be discharged to the storm drain system. Chemical liquids will be stored on secondary containment. All materials will be properly stored and covered prior to rain and at the end of each construction day.

WM-2 Material Use

Mitigate the discharge of pollutants into the storm drain system or watercourses resulting from material use by adopting alternative products, minimizing the use of hazardous materials on-site, and providing comprehensive training for employees and subcontractors. Materials will be used in a manner that ensures they will not be exposed to rain or discharged into the stormdrain system. Spills and leaks will be cleaned up immediately.

WM-3 Stockpile Management

Stockpile management procedures and practices are designed to reduce or eliminate air and storm water pollution from stockpiles of soil, soil amendments, sand, paving materials, and pressure treated wood. The stockpiles will be secured with wind erosion control (WE-1) and sediment controls such as silt fences (SE-1), fiber rolls (SE-5), and sandbags (SE-8).

Stockpiles of rock and earth materials that are not actively being used shall be protected with a dust control product such as: water spray (reclaimed water shall be used for dust control), proprietary non-toxic crusting agents, anchored geotextile fabric or tarps, erosion control fabric, seeding, or other methods approved by LAWA. Bituminous prime coat products for dust control are not acceptable.

WM-4 Spill Prevention and Control

To prevent spills and leaks, materials will be stored and handled with proper care. Immediate cleanup measures will be taken if there is a spill or leak. On-site spill kits will be consistently maintained, ensuring they are appropriate for all materials and wastes. Employees and subcontractors will undergo training to adeptly address and clean up spills and leaks. The contractor shall provide a Spill Prevention and Emergency Response Plan in accordance with Permit requirements.

WM-5 Solid Waste Management

The procedures and practices for solid waste management are strategically designed to prevent or minimize the discharge of pollutants into stormwater from solid or construction waste. This involves the establishment of designated waste collection areas and containers, organizing regular disposal processes, and providing training for employees and subcontractors. Stockpile locations require prior approval by LAWA. Stockpiles need to be located such that access by construction vehicles minimize disruption to adjacent public streets consistent with all impact mitigations outlined in the FAA Haul Route Plan.

WM-6 Hazardous Waste Management

Hazardous waste management will be implemented to minimize stormwater contact with hazardous waste materials and to prevent waste discharges. Hazardous waste will be stored in appropriately and clearly labeled containers and segregated from other non-waste materials. Employees and subcontractors shall receive training on hazardous waste storage and disposal procedures. If hazardous waste materials spill, clean up immediately.

WM-7 Contaminated Soil Management

Suspect contaminated soil areas and materials will be properly contained during further characterization. If temporary stockpiling of suspect or confirmed contaminated soils is required, then the piles will be placed on and covered with plastic sheeting or tarps secured with sandbags and bermed with fiber rolls or silt fences to prevent wind erosion and runoff from leaving the area and to minimize exposure of stormwater with potential contaminants. Upon characterization confirmation, all waste will be handled and properly disposed of in accordance with applicable local, state, and federal rules and regulations.

WM-8 Concrete Waste Management

The implementation of concrete waste management is imperative for all activities involving roadway modification, grouting, and concrete work associated with the project. Strict adherence to this protocol ensures that any surplus concrete and concrete washout slurries will prevent from being discharged into the watercourses linked to the construction sites.

WM-9 Sanitary-Septic Waste Management

Effective sanitary and septic waste management is pivotal in preventing the discharge of pollutants into stormwater. This will be achieved through the establishment of convenient and well-maintained facilities, coupled with the organization of regular service and disposal procedures.

WM-10 Liquid Waste Management

Liquid waste management includes procedures and practices to prevent discharge of pollutants to the storm drain system or to watercourses as a result of the creation, collection, and disposal of

non-hazardous liquid wastes. This waste originates from a broad range of sources and can contain a wide spectrum of potential contaminants and will be managed in conjunction with appropriate BMPs such as Vehicle and Equipment Cleaning (NS-8), Spill Prevention and Control (WM-4), Solid Waste Management (WM-5), etc.

3.4 TMDL-RELATED BMPS

Bacteria TMDL BMPs:

- The QSP shall conduct training for construction site staff on routine housekeeping and sanitary waste management of identified sources of bacteria.
- Structural BMPs designed for retention, infiltration, or diversion of stormwater shall be evaluated and implemented when the implemented minimum source control BMPs are inadequate to reduce bacteria loading to receiving waters.

Dichlorodiphenyltrichloroethane (DDT), Polychlorinated Biphenyls (PCB) and Metals TMDL BMPs:

- A Responsible Discharger that identifies on-site sources of metals or toxics in their pollutant source assessment and are assigned a mass-based waste load allocation, shall address the TMDL through the following in addition to complying with the 2022 CGP:
 - a. Comply with the site-specific erosion and sediment control, post-construction, and all other requirements in the 2022 CGP;
 - b. Install erosion and sediment controls that will result in predicted erosion rates that are as protective as pre-construction conditions (e.g., undisturbed vegetation for the area) for each phase of the construction project; and
 - c. Use RUSLE2 modeling to calculate the predicted soil losses and sediment delivery rates when selecting temporary BMPs and controls to be applied during each phase of the project. The RUSLE2 modeling included in Appendix B of this SWPPP shall include:
 - i. Appropriate climatic variables, soil types, and slope topography for the area disturbed; and
 - ii. Calculated soil loss and sediment delivery rates for the selected BMPs and controls equal to, or less than, the soil loss and sediment delivery rates for pre-construction conditions during each phase of the construction project.

If BMPs fail, sampling for non-visible pollutants will be conducted to address the potential discharge of the TMDL specific pollutant as stated in I.G.3.b of the 2022 CGP.

It should be noted that the General Permit may be re-opened prior to March 23, 2032 to revise requirements for TMDLs for lead, copper, and zinc for Los Angeles Harbor. This will be monitored, and concerns will be addressed should they arise.

3.5 POST-CONSTRUCTION STORMWATER MANAGEMENT MEASURES

Post-construction BMPs are permanent measures installed during construction, designed to reduce or eliminate pollutant discharges from the site after construction is completed. The Los Angeles County Flood Control District, the County of Los Angeles, and 84 incorporated cities therein (including the City of Los Angeles and LAX) are jointly covered under a single MS4 permit for the discharge of urban runoff to Waters of the U.S.

This site is subject to the post-construction requirements of an existing NPDES Phase I or Phase II MS4. ☒ Yes ☐ No

The post-construction runoff reduction requirements have been satisfied through the MS4 program; this project is exempt from 2022 CGP Provision IV.N.3. The MS4's post construction requirements and the post-construction plans and calculations submitted to or approved by the MS4 will be uploaded as part of the PRDs as required by 2022 CGP Provision IV.N.2. The approved Long-Term Maintenance Plan will be uploaded with the NOT.

As per 2022 CGP Attachment D.2 Section II.D.2, all dischargers, other than Linear Underground and Overhead Project dischargers, within a Phase I or II municipal separate storm sewer system permitted area, shall upload the following items in SMARTS:

- An attachment or web-source containing the applicable NPDES Phase I or Phase II municipal separate storm sewer system permittee's post-construction requirements; and
- The post-construction plans and calculations submitted to or approved by the applicable NPDES Phase I or Phase II municipal separate storm sewer system permittee.

3.5.1 Initial Site Restoration and Control Practices

No temporary erosion and sediment control BMPs will remain in place on site after final completion of the project. Good Housekeeping Practices (GHPs) will be implemented; GHPs include application of fertilizers and pesticides to landscaped areas in accordance with manufacturer's specifications and a general onsite maintenance and disposal program to keep the sites free of litter and debris. Landscaping activities and site cleanup will be performed as part of site restoration. The following temporary BMPs are anticipated to be implemented as needed during site restoration:

- EC-1, Scheduling
- EC-2, Preservation of Existing Vegetation
- SE-5, Fiber Rolls
- SE-7, Street Sweeping and Vacuuming
- WE-1, Wind Erosion Control
- WM-1, Material Delivery and Storage
- WM-2, Material Use
- WM-3, Stockpile Management
- WM-4, Spill Prevention and Control
- WM-5, Solid Waste Management
- WM-9, Sanitary/Septic Waste Management
- WM-10, Liquid Waste Management

3.5.2 Operation / Maintenance after Project Completion

Upon project completion the sites will include post-construction BMPs. LAWA will ultimately be the responsible party for the long-term maintenance of post-construction BMPs. The construction sites will be in an area subject to a Municipal Separate Storm Sewer (MS4) permit.

Section 4 BMP Inspection and Maintenance

4.1 BMP INSPECTION AND MAINTENANCE

The 2022 CGP requires routine weekly inspections of BMPs, along with inspections before, during, and after qualifying precipitation events. A BMP inspection checklist must be filled out for inspections and maintained on-site with the SWPPP. The inspection checklist must include the necessary information covered in Section 7.6. A blank BMP Inspection Form can be found in Appendix H. Completed forms will be kept in Appendix M.

Maintenance, repair, or design and implementation of new BMPs alternatives will begin within 72 hours of the identification of failures or other shortcomings. Corrections will be completed as soon as possible, prior to the next forecasted precipitation event (2022 CGP Appendix D Section II.J)

The QSP will verify that all BMP maintenance and repairs were appropriately implemented during the next visual inspection following completion.

The QSP may delegate BMP maintenance and repair verification to an appropriately trained QSP Delegate.

Specific details for maintenance, inspection, and repair of Construction Site BMPs can be found in the BMP Fact Sheets in Appendix G.

Section 5 Training

Appendix J identifies the QSPs and QSP Delegates for the project. To promote stormwater management awareness specific for this project, periodic training of job-site personnel will be included as part of routine project meetings (e.g., daily/weekly tailgate safety meetings), or task specific training as needed. Refresher training will be provided as necessary.

The QSP will be responsible for providing this information at the meetings, and subsequently completing the Training Reporting Form shown in Appendix I, which identifies the site-specific stormwater topics covered as well as the names of site personnel who attended the meeting.

The QSP may delegate specific tasks to trained QSP Delegates who have received the following training based on the guidelines developed by the Construction General Permit Training Team.

1. **Foundational training** for all QSP Delegate(s) regarding stormwater compliance roles and responsibilities, forecast information, and documentation and reporting procedures; and
2. **Site-specific training** regarding visual inspections, sampling procedures, and/or SWPPP and BMP implementation activities relevant to the responsibilities assigned to the QSP Delegate(s).

The delegate cannot perform the QSD and QSP inspections required in Section V.C.4 or Section V.D.2, respectively.

Documentation of training activities will be retained in Appendix I.

Section 6 Responsible Parties and Operators

6.1 RESPONSIBLE PARTIES

DAR(s) who are responsible for SWPPP implementation and have authority to sign permit-related documents will be listed in this section.

6.1.1 Qualified SWPPP Developer (QSD)

QSDs identified for the project are included in Appendix J. SWPPP Amendment QSD Certifications are located in Appendix C. The QSD will have primary responsibility for assessing how construction activities will affect sediment transport, erosion, and other discharges of pollutants in stormwater runoff throughout the project. The QSD is required to revise the SWPPP to address potential problems identified by visual inspections, sampling data, comments from a QSP, or their own site observations. The QSD is required to perform the following on-site visual inspections:

- Within 30 days of construction activities commencing on site;
- Within 30 days when a new QSD is assigned to the project;
- Twice annually, once August through October and once January through March;
- Within 14 calendar days after a numeric action level exceedance; and
- Within the time period requested in writing from Regional Water Board staff.

6.1.2 Qualified SWPPP Practitioner (QSP) and QSP Delegate

QSPs and QSP Delegates identified for the project are included in Appendix J. The QSP will have primary responsibility and significant authority for the implementation, maintenance, and inspection/monitoring of SWPPP requirements. The QSP will be always available throughout the duration of the project.

Duties of the QSP for this project include but are not limited to:

- Implementing all elements of the 2022 CGP and SWPPP, including, but not limited to:
 - Performing the following on-site visual inspections:
 - One inspection per calendar month; other weekly inspections in the month can be delegated to a trained QSP Delegate under the specific direction of the QSP.
 - Within 72 hours prior to a forecasted qualifying precipitation event, to inspect any areas of concern and to verify the status of any deficient BMPs, or other identified issues at the site. If extended forecast precipitation data (greater than 72 hours) is available from the *National Weather Service*, then the Pre-Precipitation Event inspection may be done up to 120 hours in advance.
 - Within 14 days after a NAL exceedance, the QSP shall visually inspect the drainage area for exceedance and document any areas of concern.
 - Prior to the submittal for the NOT or COI (for acreage changes) for all or part of the site.

- Ensuring all BMPs are implemented, inspected, and properly maintained;
- Ensuring that the SMARTS generated WDID Number Notification form is posted on-site, in a location viewable by the public or readily available upon request, and the dates are correct and match the dates listed in SMARTS.
- Implementing non-stormwater management, and materials and waste management activities such as: monitoring discharges; general site clean-up; vehicle and equipment cleaning, fueling and maintenance; spill control; ensuring that no materials other than stormwater are discharged in quantities which will have an adverse effect on receiving waters or storm drain system, etc.
- Ensuring elimination of unauthorized discharges.
- The QSP shall be assigned authority by the Contractor to mobilize crews in order to make immediate repairs to the control measures.
- Coordinate with the Contractors to ensure that the necessary corrections/repairs are made immediately and that the project complies with the SWPPP, the 2022 CGP, and approved plans at all times.
- Notifying the LAWA Project Manager or designee, Contractor Project Manager, LRP, or Duly Authorized Representative (DAR) immediately of off-site discharges or other non-compliance events.
- Providing foundation and site-specific training to QSP Delegates and overseeing QSP Delegate work. Tasks that may be delegated to appropriately trained QSP-delegates include:
 - Performing non-stormwater (NSW) and stormwater visual observations and inspections;
 - Performing stormwater sampling and analysis, as required; and
 - Performing routine inspections and observations.

Table 6-1. QSP and QSP Delegate Authorized Inspections

	Weekly BMP and NSW	Pre-QPE	During QPE Visual Inspections	Post-QPE Visual Inspections	Post NAI Exceedance	Monthly BMP and NSW	NOT
QSP	X	X	X	X	X	X	X
QSP Delegate	X		X	X			

QPE = Qualifying Precipitation Event

6.2 CONTRACTOR LIST

The information of initial project contact person is in below:

Skanska-Flatiron a Joint Venture
1995 Agua Mansa Road
Riverside, California 92509
Email: Chris.Halpin@skanska.com

Section 7 Construction Site Monitoring Program

7.1 PURPOSE

The objective of this Construction Site Monitoring Program (CSMP) is to facilitate:

- Site compliance with the 2022 CGP discharge prohibitions and Numeric Action Levels (NALs)
- Site compliance with TMDL NALs and Numeric Effluent Limitations (NELs)
- Determination of whether non-visible pollutants discharge from the construction site occur which cause or contribute to exceedances of water quality objectives
- Determination of whether immediate corrective actions, additional BMP implementation or SWPPP revisions are necessary to reduce pollutants in stormwater discharges and authorized non-stormwater discharge
- Determination of whether BMPs included in the SWPPP are effective in preventing or reducing pollutants in stormwater discharges and authorized non-stormwater discharges

7.2 APPLICABILITY OF PERMIT REQUIREMENTS

This project has been determined to be a Risk Level 1 project. The 2022 CGP identifies the following types of monitoring applicable for Risk Level 1 projects.

Risk Level 1:

- Visual inspection of BMPs
- Visual monitoring of the site related to qualifying precipitation events
- Visual monitoring of the site for non-stormwater discharges
- Sampling and analysis of construction site runoff for non-visible pollutants including TMDL pollutants identified during the pollutant source assessments when applicable
- Sampling and analysis of construction site runoff as required by the Regional Water Board when applicable

7.3 WEATHER AND PRECIPITATION EVENT TRACKING

Visual monitoring and inspection requirements of the 2022 CGP are triggered by a Qualifying Precipitation Event (QPE). The 2022 CGP defines a QPE as any weather pattern that is forecast to have a 50 percent or greater Probability of Precipitation (PoP) and a Quantitative Precipitation Forecast (QPF) of 0.5 inches or more within a 24-hour period. The event begins with the 24-hour period when 0.5 inches has been forecast and continues on subsequent 24-hour periods when 0.25 inches of precipitation or more is forecast.

7.3.1 Weather Tracking

The QSP should consult the National Oceanographic and Atmospheric Administration (NOAA) for the Forecast Weather Table Interface. These forecasts can be obtained at <http://www.weather.gov/>. Weather reports should be printed and maintained with the SWPPP in Appendix L. Record the date and time the forecast was printed.

7.3.2 Rain Gauges

2022 CGP Attachment D Section III.C.5 requires that post-QPE visual inspections shall be conducted using the onsite rain gauge. The QSP shall install a rain gauge on each project site. Locate the gauge in an open area away from obstructions such as trees or overhangs. Mount the gauge on a post at a height of 3 to 5 feet with the gauge extending several inches beyond the post. Make sure that the top of the gauge is level. Make sure the post is not in an area where rainwater can indirectly splash from sheds, equipment, trailers, etc.

The rain gauges shall be read daily during normal site scheduled hours at approximately the same time every day and the date and time of each reading recorded. An example rain gauge log sheet is provided in Appendix N. Retain rain gauge readings in Appendix M.

Follow the rain gauge instructions to obtain accurate measurements; empty and reset the gauge after the measurement has been recorded. The El Segundo Yard AL371 and 83rd Street Yard AL460 rain gauge stations operated by Los Angeles County can be used for comparison purposes.

7.4 MONITORING LOCATIONS

Monitoring locations based on anticipated construction equipment layout, work areas and drainage topography are described in Sections 7.6 and 7.7 and shown on the Site Maps provided in Appendix A. Whenever changes in the construction site might affect the appropriateness of sampling locations, the sampling locations shall be revised accordingly. All such revisions shall be implemented as soon as feasible and the SWPPP updated. Temporary changes that result in a one-time additional sampling location do not require a SWPPP amendment.

7.5 MONITORING EXEMPTIONS

This project is not required to collect samples or conduct visual observations (inspections) under the following conditions (2022 CGP, Attachment D, Section III.B):

- During dangerous weather conditions such as flooding, high winds (>40 miles per hour) and electrical storms
- Times other than the scheduled site business hours
- When the project site is inaccessible to personnel

If monitoring (visual monitoring or sample collection) of the site is unsafe because of the dangerous conditions noted above, then the QSP shall document the conditions for why an exception to performing the monitoring was necessary. The exemption documentation shall be filed in Appendix M and must be included in the Annual Report.

7.6 VISUAL MONITORING

2022 CGP, Attachment D, Section III.B.2 specifies that for inactive projects, dischargers may reduce the visual inspection frequency and suspend sampling required by 2022 CGP Section III.G for TMDL-related pollutants (all Risk Levels) and pH/turbidity (Risk Levels 2 and 3). Dischargers shall provide an explanation in the Annual Report and include supporting information for all missed visual inspections or sampling required by Attachment D.

Visual monitoring includes observations and inspections. Inspections are required to identify and record BMPs that need maintenance to operate effectively, that have failed or that could fail to

operate as intended. Visual observations are required to observe stormwater drainage areas to identify any spills, leaks or uncontrolled pollutant sources.

Table 7-1 identifies the required frequency of visual observations and inspections. Inspections and observations will be conducted at the locations identified in Section 7.6.3. Any QPE inspection can be counted as a weekly visual inspection.

Table 7-1. Summary of Visual Monitoring and Inspections – Risk Level 1

Type of Inspection	Frequency
<i>Routine Inspections¹</i>	
BMP Inspections	Weekly ²
<i>Qualifying Precipitation Event Triggered Inspections</i>	
Site Inspections Prior to a Qualifying Precipitation Event (QPE)	Within 72 hours of a QPE or up to 120 hours prior if supported with forecast ²
BMP Inspections During an Extended QPE	Once every 24-hour period of a QPE ³
Site Inspection Following a QPE	Within 96 hours of a QPE ²
¹ Inspections are required during scheduled site operating hours. ² Most BMPs must be inspected weekly; those identified below must be inspected more frequently. ³ Inspections are required during scheduled site operating hours on days that the forecast predicts at least 0.25 inches of precipitation once the QPE commences.	

7.6.1 Routine Observations and Inspections

Routine site inspections and visual monitoring are necessary to confirm that the project is compliant with the 2022 CGP requirements.

7.6.1.1 Routine BMP Inspections

Inspections of BMPs are conducted to identify and record:

- Appropriate BMPs for stormwater and non-stormwater are being implemented in areas where active construction is occurring (including staging areas).
- Construction materials, including chemicals, are removed from the site or stored in protective storage containers at the end of every construction day.
- Land areas disturbed during construction are returned to pre-construction conditions or an equivalent protection is used at the end of each workday to eliminate or minimize erosion and the possible discharge of sediment or other pollutants during a precipitation event.
- Project excavations are closed, spoils piles are properly protected and road surfaces are cleaned of excavated material.

Inspections will continue until adequate permanent stabilization is established and, in areas where re-vegetation is chosen, until minimum vegetative coverage is established in accordance with 2022 CGP, Section III.H. Inspections may be reduced in inactive construction areas where soil-disturbing activities are completed and final soil stabilization is achieved in accordance with 2022 CGP, Section III.G.

7.6.1.2 Non-Stormwater Discharge Observations

Each drainage area will be inspected for the presence or indications of prior unauthorized and authorized non-stormwater discharges. Inspections will record:

- Identification and elimination of unauthorized non-stormwater discharges
- Pollutant characteristics, e.g., floating/suspended material, sheen, discoloration, turbidity, odor
- Presence or evidence of any authorized or unauthorized non-stormwater discharge
- Source of discharge

7.6.2 Qualifying Precipitation Event Triggered Observations and Inspections

Visual observations of the site and inspections of BMPs are required prior to and after a QPE and every 24-hour period during a QPE.

7.6.2.1 Visual Observations Prior to a Qualifying Precipitation Event

Within 72-hours prior to a QPE or up to 120 hours prior if extended forecast precipitation data is available, a stormwater visual monitoring site inspection will include and record observations of the following:

- All stormwater drainage areas to identify leaks, spills, or uncontrolled pollutant sources and when necessary, implement appropriate corrective actions to control pollutant sources.
- All stormwater storage and containment areas to detect leaks and check for available capacity to prevent overflow.
- Whether all BMPs have been properly implemented per the SWPPP and implement appropriate corrective actions, as necessary.

The QSP must conduct the inspection prior to the QPE - pre-rain BMP inspections and visual monitoring will be triggered by a NOAA forecast that indicates a 50 percent or greater probability of 0.5 inches of precipitation or more in a 24-hour period in the project area.

7.6.2.2 BMP Inspections During a Qualifying Precipitation Event

During an extended QPE, BMP inspections will be conducted at least once every 24 hours. A QPE is extended for each subsequent 24-hour period forecast to have at least 0.25 inches of precipitation. The BMP inspections shall:

- Identify BMPs that require repair or replacement due to damage
- Identify if BMPs were adequately designed, implemented and effective
- Identify supplemental BMPs that need to be implemented and revise the SWPPP accordingly

If the construction site is not accessible during the precipitation event, the visual inspection shall be performed at all relevant outfalls, discharge points, downstream locations. The inspections should record any projected maintenance activities or BMP repairs in this SWPPP and the reason the site was not accessible.

7.6.2.3 Visual Observations Following a Qualifying Precipitation Event

Post-Qualifying Precipitation Event visual inspections shall be conducted within 96 hours after each QPE if 0.5 inches or more precipitation is measured during the duration of the QPE using the onsite rain gauge. The post-Qualifying Precipitation Event site inspection is required to:

- Identify BMPs that require repair or replacement due to damage
- Identify additional BMPs that need to be implemented and revise the SWPPP accordingly
- Identify if BMPs were adequately designed, implemented and effective
- Observe any stormwater storage and containment areas to detect leaks and ensure maintenance of adequate freeboard
- Observe discharge of stored or contained rainwater
- Observe stormwater drainage areas to identify any spills, leaks or uncontrolled pollutant sources

7.6.3 Visual Monitoring Procedures

Visual monitoring and inspections shall be conducted by the QSPs or QSP Delegates. The names, contact numbers and training qualifications of the QSPs or QSP Delegates assigned to conduct visual observations are provided in Appendix J.

Stormwater observations shall be documented on the *Visual Inspection Field Log Sheet* (see Appendix N). BMP inspections shall be documented on the site-specific BMP inspection checklist that, at minimum includes:

- A description of any BMPs evaluated and any deficiencies noted, including those that may have resulted in the release of non-visible pollutants
- A list of BMPs inspected, including erosion controls, sediment controls, chemical and waste controls and non-stormwater controls
- Corrections required, including any necessary changes to the SWPPP and the associated implementation dates
- Inspection date and time of inspection
- Inspector's name, title and certification, if any
- Inspection type (weekly, pre-precipitation, daily precipitation, or post-precipitation event)
- Photographs of areas of concern and the QSP's description of the problem, if any
- Report of the presence of any floating and suspended materials, odors, discolorations, visible sheens and any sources of pollutants in discharges and contained stormwater
- Site information, including stage of construction, activities completed since last inspection and approximate area of the site exposed
- Weather information, including the presence or absence of precipitation, an estimate of the beginning of the Qualifying Precipitation Event, and the amount of precipitation in inches;

The completed inspection reports will be kept in Appendix M. Results of visual monitoring must be summarized and reported in the Annual Report.

7.6.4 Visual Monitoring Follow-Up and Reporting

The QSDs and QSPs are required to do additional onsite visual inspections at intervals that reflect potential changes to the construction site that may occur. The QSP Delegates cannot perform the QSD and QSP inspections required in this section.

The discharger shall ensure that a QSD performs the following onsite visual inspections:

- Within 30 days of construction activities commencing on a site
- Within 30 days of a discharger replacing the QSD
- Twice annually, once August through October and once January through March
- Within 14 calendar days after a numeric action level exceedance
- Within the time period requested in writing from Water Board staff

The discharger shall ensure that a QSP performs the following onsite visual inspections:

- Once every calendar month
- Within 72-hour prior to a Qualifying Precipitation Event or up to 120 hours prior if extended forecast precipitation data is available
- Within 14 days after a numeric action level exceedance the QSP shall visually inspect the drainage area of exceedance and document any areas of concern
- Prior to submittal of General Permit Notice of Termination or Change of Information (for acreage changes) of all or part of a site

These onsite visual inspection requirements are the minimum required and may be increased by the discharger or a QSD during times of high-risk construction activities, excessive site problems, or other conditions that warrant increased oversight by a QSD.

Maintenance, repairs and corrections of deficiencies, including design changes to BMPs, identified by the observations or inspections, including required repairs or maintenance of BMPs, shall be initiated with 72 hours of identification and completed as soon as possible, prior to the next forecasted precipitation event.

When design changes to BMPs are required, the SWPPP shall be amended to reflect the changes. Deficiencies identified in site inspection reports and correction of deficiencies will be tracked on the *Inspection Field Log Sheet* or *BMP Inspection Report* and shall be submitted to the QSP and shall be kept in Appendix M. QSP Delegates shall report issues identified during inspections that require corrective action to the QSP within 24 hours of the observation.

Results of visual monitoring will be summarized and reported in the Annual Report.

7.6.5 Visual Monitoring Locations

The visual inspections and observations identified in Section 7.6.1 and 7.6.2 will be conducted in all areas of active construction. Site Maps provided in Appendix A include the following locations and areas:

- BMP locations
- Drainage areas on the project site and the contractor's yard, staging areas and storage areas

- Stormwater storage or containment areas on the project site from which stormwater will be dewatered
- Site stormwater discharge locations

7.7 WATER QUALITY SAMPLING AND ANALYSIS

The procedures described below will be performed for monitoring of non-visible pollutants in stormwater discharges from the project site in accordance with the Risk Level 1 requirements. Monitoring of pH and turbidity in dewatering discharges is also applicable when dewatering activities are not subject to a separate NPDES permit. All sampling personnel are required to review and thoroughly understand these procedures prior to performing any sampling.

7.7.1 Sampling and Analysis Plan for pH, Turbidity and Non-Visible Pollutants in Stormwater Runoff Discharges

This Sampling and Analysis Plan for Non-Visible Pollutants describes the sampling and analysis strategy and schedule for monitoring non-visible pollutants in stormwater runoff discharges from the project site. Sampling for non-visible pollutants, including those associated with TMDLs will be conducted when visual inspections indicate:

- A breach, leakage, malfunction or spill is observed
- A leak or spill has not been cleaned up prior to the rain event
- Discharge of non-visible pollutants to surface waters or drainage system has occurred or there is a potential for occurring

Sampling for non-visible pollutants will not be conducted if:

- Site inspections reveal zero spill events and proper storage of all construction materials as specified in this SWPPP
- Spills are cleaned up; the contaminated material is isolated; and potential exposure to stormwater runoff has been eliminated prior to discharge

Table 7-2 summarizes the potential non-visible pollutants identified in the pollutant source assessment in Appendix F and the water quality constituent or indicator for that pollutant. Drainage areas where the source is present will be shown on the Site Maps in Appendix A.

Table 7-2. Potential Non-Visible Pollutants and Water Quality Indicator Constituents Based on the Pollutant Source Assessment

Pollutant	Water Quality Indicator or Constituent	Source/Reason from Pollutant Source Assessment	TMDL Pollutant
Asphalt	VOCs	Asphalt Work	No
Acids, Bleaches, Solvents	pH, VOCs	Cleaning	No

Pollutant	Water Quality Indicator or Constituent	Source/Reason from Pollutant Source Assessment	TMDL Pollutant
Metals	Copper, Aluminum, General Minerals	Crushing operations, storage of oxidized metal parts	Yes
Treated wood	Copper, Arsenic, Zinc, Chromium	Shoring	Yes
Insulation materials	Aluminum, Zinc	Insulation	Yes
Hydrocarbons, solids	Hydrocarbons, Suspended Solids	Vehicle use, maintenance	No
Solder, flux and pipe fitting	Copper, Lead, Zinc, Tin	Plumbing	Yes
Existing structures materials	Zinc, VOCs	Removal of existing structures	Yes
Solid Particles	Suspended Solids	Stockpiles	No
Fine solids	Turbidity	Bentonite	No
Hydraulic Oils, Grease	Oil/Grease	Heavy Machinery	No
Petroleum hydrocarbons	Oil/Grease	Lubricants, Grease	No

7.7.1.1 Sampling Schedule

Samples for the potential non-visible pollutants and a sufficiently large, unaffected background sample shall be collected during the first eight hours of discharge from precipitation events that result in a sufficient discharge for sample collection. Samples shall be collected during the site's scheduled hours and shall be collected regardless of the time of year and phase of the construction.

Collection of discharge samples for non-visible pollutant monitoring will be triggered only when any of the following conditions are observed during site inspections conducted prior to or during a precipitation event.

- Materials or wastes containing potential non-visible pollutants are not stored under watertight conditions. Watertight conditions are defined as (1) storage in a watertight container, (2) storage under a watertight roof or within a building, or (3) protected by temporary cover and containment that prevents stormwater contact and runoff from the storage area.

- Materials or wastes containing potential non-visible pollutants are stored under watertight conditions, but (1) a breach, malfunction, leakage, or spill is observed, (2) the leak or spill is not cleaned up prior to the precipitation event, and (3) there is the potential for discharge of non-visible pollutants to surface waters or a stormdrain system.
- A construction activity, including but not limited to those in Section 2.6, with the potential to contribute non-visible pollutants (1) was occurring during or within 24 hours prior to the precipitation event, (2) BMPs were observed to be breached, malfunctioning or improperly implemented, and (3) there is the potential for discharge of non-visible pollutants to surface waters or a stormdrain system.
- Soil amendments that have the potential to change the chemical properties, engineering properties or erosion resistance of the soil have been applied and there is the potential for discharge of non-visible pollutants to surface waters or a stormdrain system.
- Stormwater runoff from an area contaminated by historical usage of the site has been observed combine with stormwater runoff from the site and there is the potential for discharge of non-visible pollutants to surface waters or a stormdrain system.

7.7.1.2 Sampling Locations

Sampling locations are based on proximity to planned non-visible pollutant storage, occurrence or use; accessibility for sampling and personnel safety. Planned non-visible pollutant sampling locations will be shown on the Site Maps in Appendix A.

The following considerations were used to select the planned sampling locations:

- Areas where soil amendments may be applied
- Areas which may potentially be contaminated by historical usage of the site
- Planned material and waste storage areas and areas where non-visible pollutant producing construction activities are planned
- Sample collection of run-ons will not be required for the project site because of the low volumes anticipated and BMPs which would provide a sufficient barrier to run-on.
- The locations selected for uncontaminated background samples will not have come in contact with the operations, activities or areas identified in Section 7.7.1 or with disturbed soil areas

If a stormwater visual monitoring site inspection conducted prior to or during a storm event identifies the presence of a material storage, waste storage or operations area with spills or the potential for the discharge of non-visible pollutants to surface waters or a stormdrain system that is at a location not listed above and has not been identified on the Site Maps, sampling locations will be selected by the QSP using the same rationale as that used to identify planned locations.

Non-visible pollutant sampling locations shall be documented by the QSP on the Pre-Qualifying Precipitation Event inspection form prior to a forecasted Qualifying Precipitation Event and the *Effluent Sampling Field Log Sheet* which are provided in Appendix N.

7.7.1.3 Monitoring Preparation

The QSP shall be responsible for ensuring that qualified sample collection personnel, supplies and field test equipment are available for monitoring non-visible pollutants prior to any sampling event in accordance with the 2022 CGP.

All sampling personnel and alternates will review SWPPP Section 7 and shall be trained by the QSP or QSD. An adequate stock of monitoring supplies and equipment for monitoring non-visible pollutants will be available on the project site prior to a sampling event. Monitoring supplies and equipment will be stored in a cool temperature environment that will not contact rain or direct sunlight. The QSP or QSP Delegates responsible for sampling will be available to collect samples in accordance with the sampling schedule. Supplies maintained at the project site will include, but are not limited to, clean powder-free nitrile gloves, sample collection equipment, coolers, appropriate number and volume of sample bottles, identification labels, re-sealable storage bags, paper towels, personal rain gear, ice, and *Effluent Sampling Field Log Sheets* and Chain of Custody (CoC) forms which are provided in Appendix N.

Table 7-3 in Section 7.7.1.6 lists the field equipment that shall be used by the monitoring personnel for field sample analysis.

If necessary, the QSP or QSP Delegates will provide advance notice to the analytical laboratory to ensure that adequate sample collection personnel and supplies for monitoring non-visible pollutants are available and mobilized to the site in accordance with the sampling schedule.

7.7.1.4 Analytical Constituents

Table 7-2 lists the specific sources and types of potential non-visible pollutants based on the project pollutant source assessment and the water quality indicator constituents for that pollutant. Table 7-4 in Section 7.7.1.6 provides the specific analytical methods for the potential non-visible pollutants. Analytical methods were selected in compliance with U.S. EPA sufficiency sensitive method requirements in 40 Code of Federal Regulations Part 136, as evidenced by the method detection limit and minimum level.

7.7.1.5 Sample Collection

Samples of discharge will be collected at the designated non-visible sampling locations shown on the Site Maps in Appendix A or in the locations determined by observed breaches, malfunctions, leakages, spills, operational areas, soil amendment application areas and historical site usage areas that triggered the sampling event.

Grab samples shall be collected and preserved in accordance with the methods identified in Table 7-4, "Sample Collection, Preservation and Analysis for Monitoring Non-Visible Pollutants" provided in Section 7.7.1.6. Only the QSP or QSP Delegates trained on sample collection identified in Section 7.7.1.3 shall collect samples.

Representative samples shall be taken based on the general strategy and sampling schedule described above. Each sample must be large enough to obtain an accurate analytical result. Sample collection and handling requirements are described in Section 7.7.7.

7.7.1.6 Sample Analysis

For samples collected for field analysis, collection, analysis and equipment calibration will be in accordance with the field instrument manufacturer's specifications. Field Instruments are included in Table 7-3. The instruments will be maintained in accordance with manufacturer's instructions and calibrated before each sampling and analysis event. The manufacturer's instructions for calibration and use will be added to Appendix O. Maintenance and calibration records shall be maintained with the SWPPP.

Table 7-3. Field Instruments

Field Instrument (<i>or equivalent</i>)	Constituent
Hach 2100P Portable Turbidimeter	Turbidity
Hach HI706 Multiparameter Meter	pH, Conductance

The U.S. EPA established testing procedures for the NPDES program under 40 Code of Federal Regulations Part 136 to ensure pollutants are capable of being detected and measured at or below the applicable water quality criteria or permit limits. A value of zero for non-visible pollutant analytical results less than the minimum level will be applied to calculations required by the 2022 CGP as long as Sufficiently Sensitive Test Methods were used. Samples shall be analyzed using the analytical methods identified in Table 7-4. Sample bottles, volumes and preservatives shall be verified with the analytical laboratory prior to sample collection.

Table 7-4. Sample Collection, Preservation and Analysis for Monitoring pH, Turbidity and Non-Visible Pollutants

Constituent	Analytical Method	Minimum Sample Volume	Sample Bottle ¹	Sample Preservation	Maximum Holding Time
Metals	EPA 200.7	500 ml	P, G	HNO ₃ , pH<2, 4°C	180 days
Total Petroleum Hydrocarbons	EPA 1664	1 liter	G	HCl, pH<2, 4°C	14 days
Volatile Organics	EPA 8260	3x40 ml	G, VOA	HCl, pH<2, 4°C	14 days
MBAS	EPA 425.1	500 ml	P, G	Cool	48 hours
pH	Field Test ²	25 ml	P, G	In-situ	Analyze Immediately
Turbidity	EPA 180.1 or field test	100 ml	P, G	Cool	48 hours

Notes: (1) P = Polyethylene; G = Glass

(2) Delivery time exceeds holding time for laboratory analysis

(3) Analytical laboratories may use the term Reporting Level in lieu of Minimum Level

7.7.1.7 Data Evaluation and Reporting

The QSP shall complete an evaluation of the water quality sample analytical results based on a comparison of the results to the unaffected sample and to the TMDL NAL and NELs.

Runoff/downgradient results shall be compared with the associated upgradient/unaffected results and any associated run-on results. Should the runoff/downgradient sample show an increased level of the tested analyte relative to the unaffected background sample, which cannot be explained by run-on results, the BMPs, site conditions and surrounding influences shall be assessed to determine the probable cause for the increase.

As determined by the site and data evaluation, appropriate BMPs shall be repaired or modified to mitigate discharges of non-visible pollutant concentrations. Any revisions to the BMPs shall be recorded as an amendment to the SWPPP.

Analytical results of non-visible pollutant monitoring shall be submitted to SMARTS within 30 days of obtaining the analytical results. Results demonstrating an exceedance of an applicable TMDL-related NAL or NEL or Basin Plan parameter shall be submitted to SMARTS within 30 days of obtaining the analytical results.

The 2022 CGP prohibits stormwater discharges that contain hazardous substances greater than or equal to reportable quantities established in 40 CFR §§ 117.3 and 302.4. The results of any non-stormwater discharge results that indicate the presence of a hazardous substance greater than established reportable quantities shall be immediately reported to the RWQCB and other agencies as required by 40 CFR §§ 117.3 and 302.4.

The QSP shall compare the runoff sample results to the applicable TMDL NALs and NELs in 2022 CGP Attachment H Table H-2 to determine whether the TMDL NALs and NELs have been exceeded, see Table 7-5.

Table 7-5. TMDL NAL and NEL Exceedances

Standard	Exceedance Evaluation
TMDL NAL	An exceedance occurs on the second, and each subsequent, analytical result for samples taken from any and all discharge locations within the same drainage area, during the same reporting year and taken in accordance with Attachment D Section III.D.3, that is above the concentration set forth in an applicable NAL.
TMDL NEL	An exceedance occurs on the second, and each subsequent, analytical result for samples taken from any and all discharge locations within the same drainage area, during the same reporting year and taken in accordance with Attachment D Section III.D.3, that is above the concentration set forth in an applicable NEL.

If the TMDL NAL or NEL is exceeded, the QSP shall immediately investigate the cause of the exceedance and identify corrective actions. The LRP or DAR shall electronically report all analytical results to the State Water Board by the through SMARTS within 30 days of receiving the results. Exceedances of TMDL NALs and NELs shall be electronically reported to the State Water Board by the LRP or DAR through SMARTS within 10 days of receiving the results.

If requested by the Regional Water Board in writing, a TMDL NAL Exceedance report will be submitted within 30 days of the request. All dischargers shall retain a copy of the report for a minimum of three years after the date the exceedance report is certified and submitted. The TMDL NAL Exceedance Report must contain the following information:

- Analytical methods, method reporting units, and Method Detection Limits of each parameter

- Date, place, time of sampling, visual observation and/or measurements, including precipitation
- Description of the current BMPs associated with the sample that exceeded the TMDL NAL, a description of each corrective action taken including photographs and date of implementation.

In the event of a TMDL NEL exceedance, by the end of each reporting year, project shall implement all of the following water quality based corrective actions:

- Conduct a site assessment to identify pollutant sources within the site that are associated with construction activity and whether the BMPs described in the SWPPP have been properly implemented
- Evaluate the SWPPP and its implementation to determine whether additional BMPs or SWPPP implementation measures are necessary to reduce or prevent pollutants in all regulated discharges to comply applicable NELs
- Certify and submit through SMARTS a report of the above site assessment and SWPPP evaluation that:
 - Additional BMPs or SWPPP implementation measures have been identified and included in the SWPPP, or
 - No additional BMPs or SWPPP implementation measures are required to reduce or prevent pollutants in all regulated discharges to comply with applicable NELs.

The Regional Water Board or its delegate may require revisions of the discharger's water quality-based corrective actions and/or request additional supporting documentation.

7.7.2 Sampling and Analysis Plan for pH and Turbidity in Receiving Water

This project is not subject to Receiving Water Monitoring Triggers because it does not have a direct discharge to the receiving water.

7.7.3 Sampling and Analysis Plan for Dewatering Discharges

Per 2022 CGP Attachment J Section A.1, dischargers with dewatering activities subject to a separate NPDES permit are not subject to the provisions in Attachment J. Other dewatering activities planned for this project will be conducted and monitored according to the requirements of the 2022 CGP Attachment J.

This Sampling and Analysis Plan for dewatering discharge describes the sampling and analysis strategy and schedule for monitoring dewatering discharges in accordance with the requirements of the 2022 CGP.

7.7.3.1 Sample Schedule

Sampling of dewatering discharges will be conducted within the first hour of the commencement of discharge and daily each day that the discharge continues.

7.7.3.2 Sample Locations

Sampling locations are based on the planned dewatering locations. If unplanned dewatering is required, sampling locations will be selected by the QSP using the same rationale as that used to

identify planned locations. Dewatering sampling locations shall be documented by the QSP on the *Effluent Sampling Field Log Sheet* provided in Appendix N.

7.7.3.3 Monitoring Preparation

Monitoring preparation will be performed as described above in Section 7.7.1.3.

7.7.3.4 Sample Collection and Field Analysis

Dewatering samples shall be collected at the designated sampling locations. Turbidity and pH samples shall be analyzed immediately by using field equipment. Each sample must instantaneously comply with the numerical action levels for pH (within 6.5 - 8.5 standard pH units) and turbidity (250 nephelometric turbidity units). Sample collection and handling requirements are described in Section 7.7.6.

7.7.3.5 Data Evaluation and Reporting

At least 24 hours prior to the beginning of a dewatering discharge, the discharger shall notify the Regional Water Board via email of the anticipated dewatering discharge. If the discharge is necessary to protect human life and health or prevent severe property damage and cannot be ceased, the discharger shall notify the corresponding Regional Water Board and the applicable municipal separate storm sewer system within 24 hours.

The QSD shall update the site-specific SWPPP onsite at least 24 hours prior to the beginning of a dewatering discharge and upload the amended SWPPP to SMARTS within 14 days with current information required in below:

- A site map depicting the dewatering activity discharge area locations.
- Cleaning and maintenance plan for all dewatering devices and filter media when the pressure equals or exceeds the manufacturer's specifications (if applicable)
- Onsite BMPs that are selected and implemented:
 - To prevent the dewatering discharge from contacting construction materials or equipment
 - That do not use waters of the United States as part of the treatment area, at all areas or points where dewatering is discharged and
 - To decelerate the velocity of dewatering discharge, e.g., sediment traps, riprap and grouted riprap at outlets
- Site-specific dewatering sampling protocols used to comply with requirements in Section B.1

Dewatering discharges exceeding the numeric action levels for pH and turbidity shall immediately cease until the dewatering discharge complies with the requirements in 2022 CGP Attachment J Section B.1. The discharger shall enter results of all NAL, e.g., turbidity and pH, exceedances through SMARTS within 10 days of the field measurements demonstrating the exceedance. The QSD shall revise the SWPPP to incorporate immediate corrective actions to prevent further exceedances of the NALs for pH and turbidity within 10 days of the exceedance.

The 2022 CGP prohibits non-stormwater discharges that contain hazardous substances greater than or equal to reportable quantities established in 40 CFR §§ 117.3 and 302.4, unless a separate NPDES permit has been issued to regulate those discharges. The results of any discharge results

that indicate the presence of a hazardous substance greater than established reportable quantities shall be immediately reported to the RWQCB and other agencies as required by 40 CFR §§ 117.3 and 302.4.

7.7.4 Sampling and Analysis Plan for Other Regional Water Board Required Pollutants

The Regional Water Board has not specified monitoring for additional pollutants.

7.7.5 Training of Sampling Personnel

QSP Delegates assigned to conduct sampling shall be trained by the QSP to collect, maintain and ship samples in accordance with the 2022 CGP Sample Collection and Handling Instructions and supplemental information as needed. Training records of designated contractor sampling personnel are provided in Appendix I.

7.7.6 Sample Collection and Handling

7.7.6.1 Sample Collection

Samples of discharge will be collected at the designated sampling locations shown on the Site Maps (Appendix A) and listed in the preceding sections. Samples shall be collected, maintained and shipped in accordance with the 2022 CGP Sample Collection and Handling Instructions.

Grab samples shall be collected and preserved in accordance with the methods identified in the Table 7-4 “Sample Collection, Preservation and Analysis for Monitoring Non-Visible Pollutants,” provided in Section 7.7.1.6.

Only personnel trained in proper water quality sampling will collect samples. Samples will be collected by placing a lab-provided primary sample container directly into the up-gradient or down-gradient stream of water and allocate the composite sample into lab-provided sample bottles specific for each analysis. Samples collected for volatile organic compounds (VOC) analysis will be collected directly into lab-provided containers specific for VOC analysis to prevent aeration of the sample.

To maintain sample integrity and to prevent cross-contamination, sampling collection personnel shall follow the protocols below:

- Allocate the samples to the analytical laboratory-provided or specified containers immediately after collection and place the containers in an ice chest containing ice or dry ice
 - Use of any other type of containers could cause sample contamination and may result in NAL or NEL exceedances
- Avoid allowing rainwater to drip from rain gear or other surfaces into sample bottles
- Change gloves between sampling locations and whenever something not known to be clean has been touched
- Decontaminate sampling equipment, i.e., bucket, tubing, prior to sample collection
 - Use a trisodium phosphate (TSP) soapy water wash, distilled water rinse and final rinse with distilled water

- Dispose of wash-rinse water appropriately, i.e., do not discharge to stormdrain or receiving water
- Do not decontaminate laboratory provided sample containers
- Discard sample bottles or lids that dropped onto the ground prior to sample collection
- Do not breathe, sneeze, or cough in the direction of an open sample container
- Do not contaminate the inside of the sample bottle by allowing contact with any material other than the water sample
- Do not eat or drink during sample collection
- Do not leave the cooler lid open once samples are placed inside
- Do not park vehicles in the immediate sample collection area (even non-running vehicles)
- Do not smoke during sampling events
- Do not touch the exposed end of a sampling tube
- Ensure that the composite collection container is thoroughly rinsed if collecting the up-stream sample after the down-stream sample
- Minimize the exposure of the samples to direct sunlight, as sunlight may cause biochemical transformation of the sample to take place
- Never sample near a running vehicle
- Wear clean, powder-free nitrile gloves when collecting samples

The most important aspect of grab sampling is to collect a sample that represents the entire runoff stream. Typically, samples are collected by dipping the collection container in the runoff flow paths and streams as noted below.

- Avoid collecting samples from ponded, sluggish or stagnant water.
- Avoid collecting samples directly downstream from a bridge as the samples can be affected by the bridge structure or runoff from the road surface.
- For small streams and flow paths, simply dip the bottle facing upstream until full.
- For large streams that can be safely accessed, collect a sample in the middle of the flow stream by directly dipping the mouth of the bottle making sure that the opening of the bottle is facing upstream to avoid any contamination by the sampler.
- For larger streams that cannot be safely waded, pole-samplers may be needed to safely access the representative flow.

Depending upon the specific analytical test, some containers may contain preservatives. These containers should **never** be dipped into the stream but filled indirectly from collection container.

7.7.6.2 Sample Handling

Turbidity and pH measurements must be conducted immediately. Do not store turbidity or pH samples for later measurement.

Samples for laboratory analysis must be handled as follows. Immediately following sample collection:

- Cap sample containers
- Complete sample container labels
- Place sealed containers in a re-sealable storage bag
- Place sample containers into an ice-chilled cooler
- Document sample information on the *Effluent Sampling Field Log Sheet* (Appendix N)
- Complete the CoC

All samples for laboratory analysis must be maintained between 0-6 degrees Celsius during delivery to the laboratory. Samples must be kept on ice or refrigerated from sample collection through delivery to the laboratory. Place samples to be shipped inside coolers with ice. Ensure that the sample bottles are well packaged to prevent breakage and the cooler lids are secure.

Ship samples that will be laboratory analyzed to the analytical laboratory right away. Hold times are measured from the time the sample is collected to the time the sample is analyzed. The 2022 CGP requires that samples be received by the analytical laboratory within 48 hours of the physical sampling unless required sooner by the analytical laboratory to meet all hold times.

7.7.6.3 Sample Documentation Procedures

All original data documented on sample bottle identification labels, *Effluent Sampling Field Log Sheet* (Appendix N) and CoCs will be recorded using waterproof ink. These will be considered accountable documents and any errors shall be corrected by lining through the error and entering the correct information. The erroneous information will not be obliterated. All corrections will be initialed and dated.

Duplicate samples shall be identified consistent with the numbering system for other samples to prevent the laboratory from identifying duplicate samples. Duplicate samples shall be identified in the *Effluent Sampling Field Log Sheet*.

Sample documentation procedures include the following:

Sample Bottle Identification Labels: Sampling personnel will attach an identification label to each sample bottle. Sample identification shall uniquely identify each sample location. These location identifiers should be listed in the tables in the SWPPP.

Field Log Sheets: Sampling personnel shall complete the *Effluent Sampling Field Log Sheet* (Appendix N) for each sampling event, as appropriate.

Chain of Custody: Sampling personnel shall complete the CoC for each sampling event for which samples are collected for laboratory analysis. The sampler will sign the CoC when the samples are turned over to the testing laboratory or courier.

7.8 ATS, PTS AND WATERSHED MONITORING

If an Active Treatment System (ATS) is required to achieve compliance with the applicable 2022 CGP wastewater discharge requirements, a project specific Sampling and Analysis Plan for an ATS will be prepared and provided in Appendix P.

The LAWA ATMP Project is not participating in a watershed monitoring option.

7.9 QUALITY ASSURANCE AND QUALITY CONTROL

An effective Quality Assurance and Quality Control (QA/QC) plan shall be implemented as part of the CSMP to ensure that analytical data can be used with confidence. QA/QC procedures to be initiated include the following:

- CoCs
- QA/QC Samples
- Clean sampling techniques
- Data verification
- Field logs

Each of these procedures is discussed in more detail in the following sections.

7.9.1 Training of Sampling Personnel

Sampling personnel shall be trained to collect, maintain and ship samples in accordance with the Surface Water Ambient Monitoring program (SWAMP) 2022 Quality Assurance Program Plan (QAPrP). All sampling personnel shall be familiar with the procedures described above in Sections 7.7.1 and 7.7.7. Training records of sampling personnel are provided in Appendix I.

7.9.2 Field Logs

The purpose of field logs is to record sampling information and field observations during monitoring that may explain any uncharacteristic analytical results. Field log information will include sample date/time, personnel, container identification numbers and types of samples collected. Field observations should be noted in the field log for any abnormalities at the sampling location (color, odor, BMPs, etc.). Field measurements for pH and turbidity should also be recorded in the field log. A Visual Inspection Field Log and an Effluent Sampling Field Log Sheet are included in Appendix N.

7.9.3 Clean Sampling Techniques

Clean sampling techniques involve the use of certified clean containers for sample collection and clean powder-free nitrile gloves during sample collection and handling. Adoption of the sampling procedures in Section 7.7.6 will minimize the chance of field contamination and questionable data results.

7.9.4 Chain of Custody

The sample CoC provided by the analytical laboratory will be used to track the samples from collection through analysis to ensure the validity of the sample. Sample CoC procedures include the following:

- Prompt sample delivery to the analytical laboratory
- Proper labeling of samples
- Use of CoC forms for all samples

Analytical laboratories usually provide CoC forms to be filled out for sample containers.

7.9.5 QA/QC Samples

QA/QC samples provide an indication of the accuracy and precision of the sample collection; sample handling; field measurements; and analytical laboratory methods. The following types of QA/QC will be conducted for this project:

- Field Duplicates at a frequency of 5 percent or 1 duplicate minimum per sampling event (Required for all sampling plans with field measurements or laboratory analysis)
- Equipment Blanks are only needed if the equipment used to collect samples could add the pollutants to sample
- Field Blanks only required if the sampling method calls for them
- Travel Blanks required for sampling plans that include VOC laboratory analysis

7.9.5.1 Field Duplicates

Field duplicates provide verification of laboratory or field analysis and sample collection. Duplicate samples will be collected, handled and analyzed using the same protocols as primary samples. The sample location where field duplicates are collected shall be randomly selected from the discharge locations. Duplicate samples shall be collected immediately after the primary sample has been collected. Duplicate samples must be collected in the same manner and as close in time as possible to the original sample. Duplicate samples shall not influence any evaluations or conclusions.

7.9.5.2 Equipment Blanks

Equipment blanks provide verification that equipment has not introduced a pollutant into the sample. Equipment blanks are typically collected when:

- Equipment that has been cleaned after use at a contaminated site
- Equipment that is not dedicated for surface water sampling is used
- New equipment is used
- Whenever a new lot of filters is used when sampling metals

7.9.5.3 Field Blanks

Field blanks assess potential sample contamination levels that occur during field sampling activities. Deionized water field blanks are taken to the field, transferred to the appropriate container and treated the same as the corresponding sample type during the sampling event.

7.9.5.4 Travel Blanks

Travel blanks assess the potential for cross-contamination of volatile constituents between sample containers during shipment from the field to the laboratory. Deionized water blanks are taken along for the trip and held unopened in the same cooler with the VOC samples.

7.9.6 Data Verification

After results are received from the analytical laboratory, the QSP or QSP Delegate shall verify the data to ensure that it is complete, accurate and the appropriate QA/QC requirements were met. Data must be verified as soon as the data reports are received. Data verification shall include:

- Check the CoC and laboratory reports.

Make sure all requested analyses were performed and all samples are accounted for in the reports.

- Check laboratory reports to make sure hold times were met and that the reporting levels meet or are lower than the reporting levels agreed to in the contract.
- Check data for outlier values and follow up with the laboratory.

Occasionally typographical errors, unit reporting errors, or incomplete results are reported and should be easily detected. These errors need to be identified, clarified and corrected quickly by the laboratory. The QSP or QSP Delegate should note data that is an order of magnitude or more different than similar locations or is inconsistent with previous data from the same location.

- Check laboratory QA/QC results.

U.S.EPA establishes QA/QC checks and acceptable criteria for laboratory analyses. These data are typically reported along with the sample results. The QSP or QSP Delegate shall evaluate the reported QA/QC data to check for contamination (method, field, and equipment blanks), precision (laboratory matrix spike duplicates) and accuracy (matrix spikes and laboratory control samples). When QA/QC checks are outside acceptable ranges, the laboratory must flag the data and explain the potential impact to the sample results.

- Check the data set for outlier values and, accordingly, confirm results and re-analyze samples where appropriate.

Sample re-analysis should only be undertaken when it appears that some part of the QA/QC resulted in a value out of the accepted range. Sample results may not be discounted unless the analytical laboratory identifies the required QA/QC criteria were not met and confirms this in writing.

Field data including inspections and observations must be verified as soon as the field logs are received, typically at the end of the sampling event. Field data verification shall include:

- Check field logs to verify all required measurements are complete and documented
- Check reported values that appear atypical or inconsistent; follow-up immediately to identify potential reporting or equipment problems, if appropriate, recalibrate equipment after sampling
- Review notations of any errors and actions taken to correct the equipment or recording errors.
- Review observations noted on the field logs
- Verify equipment calibrations

7.10 RECORD RETENTION

All records of stormwater monitoring information and copies of reports, including Annual Reports, must be retained for a period of at least three years from date of submittal or longer if required by the Regional Water Board.

Results of visual monitoring, field measurements and laboratory analytical reports must be kept in the SWPPP along with CoCs and other documentation related to the monitoring.

Records are to be kept onsite while construction is ongoing. Records to be retained include:

- NAL Exceedance Reports
- NEL water quality based corrective action reports
- QA/QC records and results
- TMDL-specific pollutant analytical results and other specific records required by TMDLs
- Calibration records
- Date and approximate time of field measurements and laboratory analyses;
- Date, place and time of inspections, sampling, visual observations and/or measurements, including precipitation
- Dewatering exception notifications to the Regional Water Board and local stormwater agency
- Dewatering notifications to the Regional Water Board
- Names of the individuals who performed inspections, sampling, visual observations and/or field measurements
- Names of the individuals who performed laboratory analyses
- Rain gauge readings from site inspections
- Records of any corrective actions and follow-up activities that resulted from analytical results, visual observations or inspections
- Summary of all analytical results, method detection limits, reporting limits and analytical techniques or methods used
- Visual observation and sample collection exemption records

Subject: LAWA Airfield and Terminal Modernization Program (ATMP)
Roadway Improvements
Sediment and Receiving Water Risk Determination

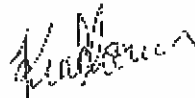

Dear Sir/Madam,

Kroner Environmental Services, Inc. (KES) has performed this Sediment Risk and Receiving Water Risk determination for the LAWA Airfield and Terminal Modernization Program (ATMP) – Roadway Improvements to address current project conditions. The risk determination calculations have been performed using the methodology provided in Attachment D.1 of National Pollutant Discharge Elimination System Construction General Permit CAS000002, State Water Resources Control Board Order 2022-0057-DWQ. The calculations provide the basis for establishing a Combined Project Risk Level designation, site monitoring requirements and effluent standards.

This evaluation assumes that an earthmoving start date of March 26, 2024 corresponding to the planned design schedule for early work package in the ATMP Roadway Improvements Proof of Concept Report. The estimated end date is May 31, 2028 corresponding to the project completion. Upon consideration of each of the two watersheds and associated work areas, our evaluation indicates that the project is a Combined Risk Level 1 as described in the attached Combined Risk Level Determination.

If you have any questions regarding the risk determination, please contact us at (310) 474-1500.

Sincerely,
KRONER ENVIRONMENTAL SERVICES, INC.

Kurt A. Kroner, QSD
Vice President

Enclosed:
Combined Risk Level Determination
Exhibits A thru E

**LOS ANGELES WORLD AIRPORTS
AIRFIELD AND TERMINAL MODERNIZATION PROGRAM
ROADWAY IMPROVEMENTS
COMBINED RISK LEVEL DETERMINATION – JULY 2024**

The Los Angeles World Airports (LAWA) Airfield and Terminal Modernization Program (ATMP) consists of airfield improvements that would enhance operational management and safety within the north airfield, new terminal facilities to upgrade passenger processing capabilities and enhance the passenger experience, and an improved system of roadways to better access the Central Terminal Area (CTA) and new facilities while reducing congestion. The Project covered under this risk assessment to be only the Roadway Improvements at Los Angeles International Airport (LAX) of the ATMP. The other elements of the ATMP will have their own risk assessments.

The Project focuses on roadway improvements to help reduce airport-related congestion on the local roadway system resulting in back-ups on public streets by redirecting airport traffic from local streets to new dedicated access roadways. A new system of roadways and bridges will be constructed to consolidate traffic away from Sepulveda Boulevard and Century Boulevard, enable construction of Concourse 0, and provide access to the new Terminal 9.

The Project areas are within Santa Monica Bay and Dominguez Channel watersheds. Details of site perimeters and stormwater pollution controls are provided in Appendix A of the Stormwater Pollution Prevention Plan and disturbed project areas will be detailed in the Project Registration Documents. This evaluation finds that the Project is Risk Level 1.

This evaluation is prepared by Kroner Environmental Services (KES) as part of the Permit Registration Documentation process for enrollment under National Pollutant Discharge Elimination System Construction General Permit CAS000002, State Water Resources Control Board Order 2022-0057-DWQ.

Sediment Risk

The Sediment Risk factor is the product of rainfall erosivity (R), soil erodibility (K), and length-slope (LS), i.e. Sediment Risk Factor = (R)(K)(LS).

Rainfall Erosivity. The R factor is an estimate of erosivity potential which depends on the duration of earth disturbance work and whether that work occurs during the wet weather season. March 26, 2024 and May 31, 2028 were used for the start of earth disturbance and end date (project completion) in determining the R factor. The U.S. EPA Rainfall Erosivity Factor Calculator found on the U.S. EPA website enables users to enter the start and end dates and locations of the project sites to obtain R factors. For projects with earth disturbance longer than one year, the online calculator requires first obtaining an annual R factor and then a second R factor for the remaining duration of construction that is less than one year.

All the work areas in each of the watersheds are found to have the same annual and partial year R factors. A total project R factor of 149.07 results from multiplying 36.53 per year by 4 years (March 26, 2024 to March 25, 2028) and then adding 2.95 (March 26, 2028 to May 31, 2028), i.e., $36.53 \times 4 + 2.95 = 149.07$ (see Exhibit A).

Erodibility. The K factor is an indicator as to amount of erodibility that is associated with project soil conditions. Soils containing higher concentrations of sand and clay have a lower potential for erodibility. The K factor map provided by the SWRCB website under Construction Stormwater

General Permits – Guidance indicates that all the Project work areas are in a region having coarse-textured soils, such as sandy soils, i.e., $K=0.20$ (see Exhibit B). The K value is low because of high infiltration resulting in low runoff, although these particles are easily detached.

Length-Slope. The LS factor accounts for site topography using pre-construction hillslope-length/gradient factors. The Roadway Improvements area is relatively flat based on street elevations. The slope is estimated to be 1.3 to 1.7% on average over the maximum length of the work area as listed below. The corresponding LS Factor is determined using the “*LS Factors for Construction Sites - Table from Renard et. al., 1997*”. The slope may be recalculated as needed as the elevation data, Project Definition Drawings and Geotechnical Baseline Reports are developed. The LS factor for the ATMP Roadway Improvements Project area is found to be approximately 0.41 (see Exhibit C).

LS Factor

Location	Length (ft)	% Slope	LS Factor
Roadway Improvements	3,200	1.3 – 1.7%	0.41

Results and Discussion. Based on the product of the R, K and LS factors, the watershed erosion estimate for the project is determined to be 12.22 tons/acre (see Exhibit D). The SWRCB designates projects with an erosion estimate of less than 15 tons/acre to be Low Sediment Risk.

The potential for erosivity and sediment production is low because there are high infiltration soils in work areas. The estimated erosion quantity is higher than what would be encountered because most of the work areas have staggered initial and final earth disturbance dates. The earliest disturbance date and project completion/final stabilization dates were used to simplify the evaluation and to account for possible changes in the actual construction schedule.

Receiving Water Risk

Receiving Water Risk is based on whether the project drains to a sediment impaired water body or watershed referred to 2020 – 2022 California Integrated Report (Clean Water Act Section 303(d) – 305(b) Report); has a U.S. EPA Total Maximum Daily Load implementation plan for sediment; or has beneficial uses of COLD, SPAWN and MIGRATORY.

Project discharge will drain to Santa Monica Bay and Dominguez Channel from different sites. Table 2-1 (*Beneficial Uses of Inland Surface Waters*) of the Water Quality Control Plan for Los Angeles Basin lists that Dominguez Channel has no beneficial uses of COLD, SPAWN and MIGRATORY. Since Water Quality Control Plan doesn't include the beneficial uses of Santa Monica Bay, Dockweiler Beach located between LAX and Santa Monica Bay is used for assessment. Table 2-3 (*Beneficial Uses of Coastal Features*) shows that Dockweiler Beach only has a potential beneficial use of SPAWN but without any beneficial uses of COLD and MIGRATORY. Tables and project drainage areas are shown in Exhibit E.

Receiving waters and 2020-2022 California Integrated Report 303(d)-listed impairments are listed below.

Project Drainage Areas	Receiving Waters	303(d) Listed Impairments
<ul style="list-style-type: none"> Argo Drain Subbasin Imperial Drain Subbasin 	Santa Monica Bay	Arsenic, DDT, Mercury, PCBs, Trash

Project Drainage Areas	Receiving Waters	303(d) Listed Impairments
<ul style="list-style-type: none">Dominguez Channel Subbasin	Dominguez Channel	Copper, Indicator Bacteria, Lead, Toxicity, Zinc

There are no discharges from project work areas to a 303(d)-listed water body impaired by sediment. Therefore, Receiving Water Risk is Low.

Combined Risk Type

KES finds that the project would be considered a Combined Risk Level 1 subject to the Risk Level 1 requirements for effluent standards and construction site monitoring as described in NPDES General Permit 2022-0057-DWQ. The results of the Combined Risk Level determination are worksheets attached in Exhibit E.

Exhibit A
US EPA R Factor Worksheet

National Pollutant Discharge Elimination System (NPDES)

Rainfall Erosivity Factor Calculator for Small Construction Sites

EPA's stormwater regulations allow NPDES permitting authorities to waive NPDES permitting requirements for stormwater discharges from small construction sites if:

- the construction site disturbs less than five acres, and
- the rainfall erosivity factor ("R" in the revised universal soil loss equation, or RUSLE) value is less than five during the period of construction activity.

If your small construction project is located in an area where EPA is the permitting authority and your R factor is less than five, you qualify for a low erosivity waiver (LEW) from NPDES stormwater permitting. If your small construction project does not qualify for a waiver, then NPDES stormwater permit coverage is required. Follow the steps below to calculate your R-Factor.

LEW certifications are submitted through the NPDES eReporting Tool or "CGP-Net". Several states that are authorized to implement the NPDES permitting program also accept LEWs. Check with your state NPDES permitting authority for more information.

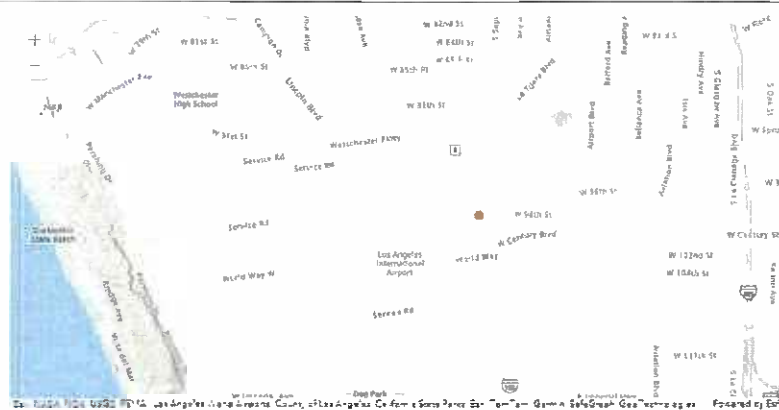

- Submit your LEW through EPA's eReporting Tool
- List of states, Indian country, and territories where EPA is the permitting authority (pdf)
- Construction Rainfall Erosivity Waiver Fact Sheet
- Small Construction Waivers and Instructions (pdf)

The R-factor calculation can also be integrated directly into custom applications using the R-Factor web service.

For questions or comments, email EPA's CGP staff at cgp@epa.gov.

- 1 Select the estimated start and end dates of construction by clicking the boxes and using the dropdown calendar.

The period of construction activity begins at initial earth disturbance and ends with final stabilization.

3 Click the "Calculate R Factor" button below to calculate an R Factor for your small construction project.

Calculate R Factor

Facility Information

Start Date: 03/26/2024

Latitude: 33.9472

End Date: 03/25/2025

Longitude: -118.3979

Calculation Results

Rainfall erosivity factor (R Factor) = **36.53**

A rainfall erosivity factor of 5.0 or greater has been calculated for your site's period of construction.

You do NOT qualify for a waiver from NPDES permitting requirements and must seek Construction General Permit (CGP) coverage. If you are located in an area where EPA is the permitting authority (pdf), you must submit a Notice of Intent (NOI) through the NPDES eReporting Tool (NeT). Otherwise, you must seek coverage under your state's CGP.

Facility Information

Start Date: 03/26/2028

Latitude: 33.9472

End Date: 05/31/2028

Longitude: -118.3979

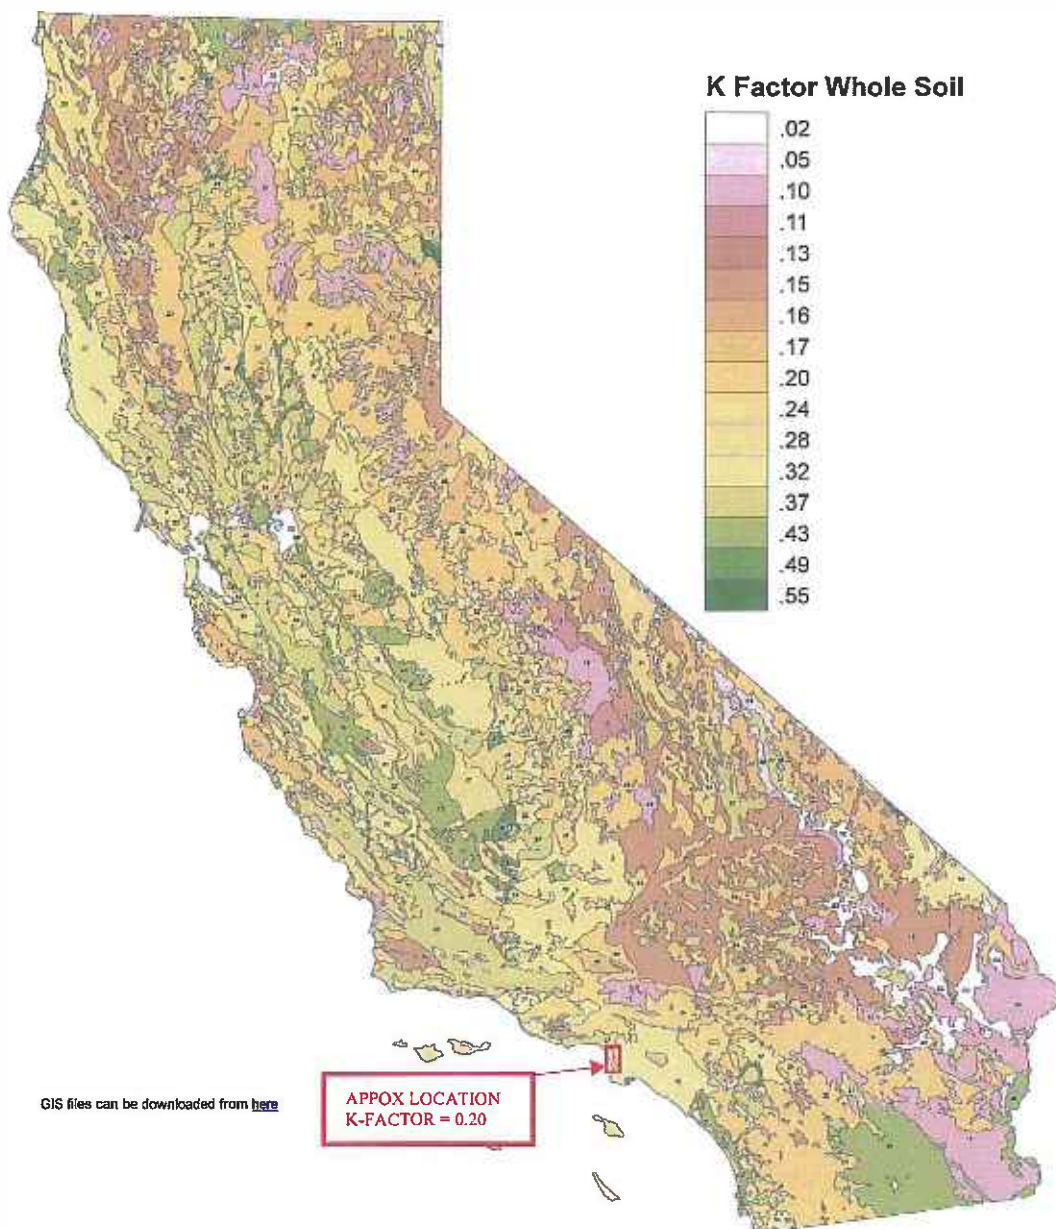

Calculation Results

Rainfall erosivity factor (R Factor) = **2.95**

$$\text{R Factor Calculation: } (36.53 \times 4) + 2.95 = 149.07$$

Exhibit D
Watershed Erosion Estimate

	A	B	C
1	Sediment Risk Factor Worksheet		Entry
2	A) R Factor		
3	Analyses of data indicated that when factors other than rainfall are held constant, soil loss is directly proportional to a rainfall factor composed of total storm kinetic energy (E) times the maximum 30-min intensity (I30) (Wischmeier and Smith, 1958). The numerical value of R is the average annual sum of EI30 for storm events during a rainfall record of at least 22 years. "Isoerodent" maps were developed based on R values calculated for more than 1000 locations in the Western U.S. Refer to the link below to determine the R factor for the project site.		
4	http://cfpub.epa.gov/npdes/stormwater/LEW/lewCalculator.cfm		
5	R Factor Value		149.07
6	B) K Factor (weighted average, by area, for all site soils)		
7	The soil-erodibility factor K represents: (1) susceptibility of soil or surface material to erosion, (2) transportability of the sediment, and (3) the amount and rate of runoff given a particular rainfall input, as measured under a standard condition. Fine-textured soils that are high in clay have low K values (about 0.05 to 0.15) because the particles are resistant to detachment. Coarse-textured soils, such as sandy soils, also have low K values (about 0.05 to 0.2) because of high infiltration resulting in low runoff even though these particles are easily detached. Medium-textured soils, such as a silt loam, have moderate K values (about 0.25 to 0.45) because they are moderately susceptible to particle detachment and they produce runoff at moderate rates. Soils having a high silt content are especially susceptible to erosion and have high K values, which can exceed 0.45 and can be as large as 0.65. Silt-size particles are easily detached and tend to crust, producing high rates and large volumes of runoff. Use Site-specific data must be submitted.		
8	Site-specific K factor guidance		
9	K Factor Value		0.20
10	C) LS Factor (weighted average, by area, for all slopes)		
11	The effect of topography on erosion is accounted for by the LS factor, which combines the effects of a hillslope-length factor, L, and a hillslope-gradient factor, S. Generally speaking, as hillslope length and/or hillslope gradient increase, soil loss increases. As hillslope length increases, total soil loss and soil loss per unit area increase due to the progressive accumulation of runoff in the downslope direction. As the hillslope gradient increases, the velocity and erosivity of runoff increases. Use the LS table located in separate tab of this spreadsheet to determine LS factors. Estimate the weighted LS for the site prior to construction.		
12	LS Table		
13	LS Factor Value		0.41
14			
15	Watershed Erosion Estimate (=R_xK_xLS) in tons/acre		12.22374
16	Site Sediment Risk Factor		Low
17	Low Sediment Risk: < 15 tons/acre		
18	Medium Sediment Risk: ≥15 and <75 tons/acre		
19	High Sediment Risk: ≥ 75 tons/acre

^a: Nearshore Zone is defined as the zone bounded by the shoreline and a line 1000 feet from the shoreline or the 30-foot depth contours, whichever is further from the shoreline.

a: Waterbodies are listed multiple times if they cross hydrologic area or subarea boundaries. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.

b: Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.

c: Coastal waterbodies which are also listed in Inland Surface Waters Table (2-1) or in Wetlands Table (2-4).

e: One or more rare species utilizes all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting.

f: Aquatic organisms utilize all bays, estuaries, lagoons, and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas which are heavily influenced by freshwater inputs.

o: Marine habitats of the Channel Islands and Mugu Lagoon serve as pinniped haul-out areas for one or more species (i.e., sea lions).

w: These areas are engineered channels. All references to Tidal Prisms in Regional Board documents are functionally equivalent to estuaries.

as: Most frequently used grunion spawning beaches. Other beaches may be used as well.

at: Areas of Special Biological Significance or ecological reserves.

Step 2 – Receiving Water Risk Worksheet

Receiving water risk is based on whether a project drains to a water body or watershed that is sediment-sensitive. If the answer to either question below is “yes”, the project is considered a **high** receiving water risk. If the answer to both questions below is “no”, the project is considered a **low** receiving water risk.

- No 1. Does the disturbed area discharge (either directly or indirectly) to a 303(d)-listed water body impaired by sediment? For help with identifying impaired water bodies, please refer to the [2020 – 2022 California Integrated Report \(Clean Water Act Section 303\(d\) - 305\(b\) Report\)](https://www.waterboards.ca.gov/water_issues/programs/water_quality_assessment/2020_2022_integrated_report.html) (https://www.waterboards.ca.gov/water_issues/programs/water_quality_assessment/2020_2022_integrated_report.html).

OR

- No 2. Does the disturbed area discharge (either directly or indirectly) to a water body with designated beneficial uses of COLD, SPAWN, and MIGRATORY? For help with identifying designated beneficial uses, please refer to the appropriate Regional Water Quality Control Board Basin Plan below.

(https://www.waterboards.ca.gov/santaana/water_issues/programs/basin_plan/index.html)

3 The Central Valley Basin Plan lists the COLD beneficial use designation as part of the SPAWN and MIGRATORY beneficial uses. Waterbodies will be considered high-risk receiving waters if listed as SPAWN (COLD) and MIGRATORY (COLD).

Region 9 – San Diego Basin Plan

(https://www.waterboards.ca.gov/sandiego/water_issues/programs/basin_plan/index.html)

Sediment-Sensitive Watershed GIS Map Method

State Water Board staff has prepared a [High-Risk Receiving Watershed Map tool](https://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/constpermits/guidance/receivingwaterrisk.pdf) (https://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/constpermits/guidance/receivingwaterrisk.pdf) to assist dischargers with determining site-specific receiving water risk. Additionally, SMARTS is equipped with an auto-populate feature that can determine the receiving water risk based on the project latitude and longitude coordinates. Projects located in the watersheds highlighted in red are considered high-risk. Please note that the map option may not reflect the correct receiving watershed, lacking site-specific drainage information.

The discharger is responsible for identifying the appropriate receiving water. If the project does not discharge to the watershed as depicted on the High-Risk Receiving Watershed Map, please contact the appropriate Regional Water Quality Control Board.

Site-Specific Receiving Water Risk (High or Low) = _____

Step 3 – Combined Risk Level Matrix

The below matrix is used to determine the combined Risk Level of the project, factoring in both sediment risk and receiving water risk.

		Sediment Risk		
		Low	Medium	High
Receiving Water Risk	Low	Level 1	Level 2	
	High	Level 2		Level 3

Combined Risk Level (1, 2, or 3) = _____ 1 _____

Appendix D Submitted Changes of Information

Log of Updated PRDs

The 2022 CGP allows for the reduction or increase of the total acreage when a portion of the project is complete and/or conditions for termination of coverage have been met; when ownership of a portion of the project is purchased by a different entity; or when new acreage is added to the project.

A Change of Information (COI) shall be filed electronically within the timeframe shown in the table below. The SWPPP shall be modified appropriately, with revisions and amendments recorded in the SWPPP Amendment Log at the front of the SWPPP. COIs submitted electronically via SMARTS can be found in this Appendix.

Reason for Filing COI	Timeline for Filing COI
Reduction or increase in total disturbed area	Within 30 days of the reduction or increase
Updating site specific BMPs	Within 14 days of design change
Change construction start or end date	At least 14 days prior to the date to be changed
Post-construction plans updated or approved by the municipal stormwater permittee	Within 14 days of approval

This appendix includes all of the following updated PRDs (check all that apply):

- ☐ Change of Information;
- ☐ Revise Site Drawings and Maps;
- ☐ Revise Risk Assessment;
- ☐ New landowner's information (name, address, phone number, email address); and
- ☐ New signed certification statement.

Appendix G CASQA Stormwater BMP Handbook: Construction Fact Sheets

Description and Purpose

Scheduling is the development of a written plan that includes sequencing of construction activities and the implementation of BMPs such as erosion control and sediment control while taking local climate (rainfall, wind, etc.) into consideration. The purpose is to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking, and to perform the construction activities and control practices in accordance with the planned schedule.

Suitable Applications

Proper sequencing of construction activities to reduce erosion potential should be incorporated into the schedule of every construction project especially during rainy season. Use of other, more costly yet less effective, erosion and sediment control BMPs may often be reduced through proper construction sequencing.

Limitations

- Environmental constraints such as nesting season prohibitions reduce the full capabilities of this BMP.

Implementation

- Avoid rainy periods. Schedule major grading operations during dry months when practical. Allow enough time before rainfall begins to stabilize the soil with vegetation or physical means or to install sediment trapping devices.
- Plan the project and develop a schedule showing each phase of construction. Clearly show how the rainy season relates

to soil disturbing and re-stabilization activities. Incorporate the construction schedule into the SWPPP.

- Include on the schedule, details on the rainy season implementation and deployment of:
 - Erosion control BMPs
 - Sediment control BMPs
 - Tracking control BMPs
 - Wind erosion control BMPs
 - Non-stormwater BMPs
 - Waste management and materials pollution control BMPs
- Include dates for activities that may require non-stormwater discharges such as dewatering, sawcutting, grinding, drilling, boring, crushing, blasting, painting, hydro-demolition, mortar mixing, pavement cleaning, etc.
- Work out the sequencing and timetable for the start and completion of each item such as site clearing and grubbing, grading, excavation, paving, foundation pouring utilities installation, etc., to minimize the active construction area during the rainy season.
 - Sequence trenching activities so that most open portions are closed before new trenching begins.
 - Incorporate staged seeding and re-vegetation of graded slopes as work progresses.
 - Schedule establishment of permanent vegetation during appropriate planting time for specified vegetation.
- Non-active areas should be stabilized as soon as practical after the cessation of soil disturbing activities or one day prior to the onset of precipitation.
- Monitor the weather forecast for rainfall.
- When rainfall is predicted, adjust the construction schedule to allow the implementation of soil stabilization and sediment treatment controls on all disturbed areas prior to the onset of rain.
- Be prepared year-round to deploy erosion control and sediment control BMPs. Erosion may be caused during dry seasons by un-seasonal rainfall, wind, and vehicle tracking. Keep the site stabilized year-round and retain and maintain rainy season sediment trapping devices in operational condition.
- Apply permanent erosion control to areas deemed substantially complete during the project's defined seeding window.
- Avoid soil disturbance during periods with high wind velocities.

Costs

Construction scheduling to reduce erosion may increase other construction costs due to reduced economies of scale in performing site grading. The cost effectiveness of scheduling techniques

should be compared with the other less effective erosion and sedimentation controls to achieve a cost-effective balance.

Inspection and Maintenance

- Verify that work is progressing in accordance with the schedule. If progress deviates, take corrective actions.
- Amend the schedule when changes are warranted.
- Amend the schedule prior to the rainy season to show updated information on the deployment and implementation of construction site BMPs.

Preservation of Existing Vegetation EC-2

Description and Purpose

Carefully planned preservation of existing vegetation minimizes the potential of removing or injuring existing trees, vines, shrubs, and grasses that protect soil from erosion.

Suitable Applications

Preservation of existing vegetation is suitable for use on most projects. Large project sites often provide the greatest opportunity for use of this BMP. Suitable applications include the following:

- Areas within the site where no construction activity occurs or occurs at a later date. This BMP is especially suitable to multi year projects where grading can be phased.
- Areas where natural vegetation exists and is designated for preservation. Such areas often include steep slopes, watercourse, and building sites in wooded areas.
- Areas where local, state, and federal government require preservation, such as vernal pools, wetlands, marshes, certain oak trees, etc. These areas are usually designated on the plans, or in the specifications, permits, or environmental documents.
- Where vegetation designated for ultimate removal can be temporarily preserved and be utilized for erosion control and sediment control.
- Protecting existing vegetation buffers and swales.

Preservation of Existing Vegetation EC-2

Limitations

- Requires forward planning by the owner/developer, contractor, and design staff.
- Limited opportunities for use when project plans do not incorporate existing vegetation into the site design.
- For sites with diverse topography, it is often difficult and expensive to save existing trees while grading the site satisfactory for the planned development.

Implementation

The best way to prevent erosion is to not disturb the land. In order to reduce the impacts of new development and redevelopment, projects may be designed to avoid disturbing land in sensitive areas of the site (e.g., natural watercourses, steep slopes), and to incorporate unique or desirable existing vegetation into the site's landscaping plan. Clearly marking and leaving a buffer area around these unique areas during construction will help to preserve these areas as well as take advantage of natural erosion prevention and sediment trapping.

Existing vegetation to be preserved on the site must be protected from mechanical and other injury while the land is being developed. The purpose of protecting existing vegetation is to ensure the survival of desirable vegetation for shade, beautification, and erosion control. Mature vegetation has extensive root systems that help to hold soil in place, thus reducing erosion. In addition, vegetation helps keep soil from drying rapidly and becoming susceptible to erosion. To effectively save existing vegetation, no disturbances of any kind should be allowed within a defined area around the vegetation. For trees, no construction activity should occur within the drip line of the tree.

Timing

- Provide for preservation of existing vegetation prior to the commencement of clearing and grubbing operations or other soil disturbing activities in areas where no construction activity is planned or will occur at a later date.

Design and Layout

- Mark areas to be preserved with temporary fencing. Include sufficient setback to protect roots.
 - Orange colored plastic mesh fencing works well.
 - Use appropriate fence posts and adequate post spacing and depth to completely support the fence in an upright position.
- Locate temporary roadways, stockpiles, and layout areas to avoid stands of trees, shrubs, and grass.
- Consider the impact of grade changes to existing vegetation and the root zone.
- Maintain existing irrigation systems where feasible. Temporary irrigation may be required.
- Instruct employees and subcontractors to honor protective devices. Prohibit heavy equipment, vehicular traffic, or storage of construction materials within the protected area.

Preservation of Existing Vegetation EC-2

- Consider pruning or mowing vegetation instead of removing it to allow for regrowth.
- If possible, retain vegetation buffer around the site and adjacent waterways.

Costs

There is little cost associated with preserving existing vegetation if properly planned during the project design, and these costs may be offset by aesthetic benefits that enhance property values. During construction, the cost for preserving existing vegetation will likely be less than the cost of applying erosion and sediment controls to the disturbed area. Replacing vegetation inadvertently destroyed during construction can be extremely expensive, sometimes in excess of \$10,000 per tree.

Inspection and Maintenance

During construction, the limits of disturbance should remain clearly marked at all times. Irrigation or maintenance of existing vegetation should be described in the landscaping plan. If damage to protected trees still occurs, maintenance guidelines described below should be followed:

- Verify that protective measures remain in place. Restore damaged protection measures immediately.
- Serious tree injuries shall be attended to by an arborist.
- Damage to the crown, trunk, or root system of a retained tree shall be repaired immediately.
- Trench as far from tree trunks as possible, usually outside of the tree drip line or canopy. Curve trenches around trees to avoid large roots or root concentrations. If roots are encountered, consider tunneling under them. When trenching or tunneling near or under trees to be retained, place tunnels at least 18 in. below the ground surface, and not below the tree center to minimize impact on the roots.
- Do not leave tree roots exposed to air. Cover exposed roots with soil as soon as possible. If soil covering is not practical, protect exposed roots with wet burlap or peat moss until the tunnel or trench is ready for backfill.
- Cleanly remove the ends of damaged roots with a smooth cut.
- Fill trenches and tunnels as soon as possible. Careful filling and tamping will eliminate air spaces in the soil, which can damage roots.
- If bark damage occurs, cut back all loosened bark into the undamaged area, with the cut tapered at the top and bottom and drainage provided at the base of the wood. Limit cutting the undamaged area as much as possible.
- Aerate soil that has been compacted over a tree's root zone by punching holes 12 in. deep with an iron bar and moving the bar back and forth until the soil is loosened. Place holes 18 in. apart throughout the area of compacted soil under the tree crown.
- Fertilization:

Preservation of Existing Vegetation EC-2

- Fertilize trees in the late fall or early spring. Although to note, many native species do not require fertilization.
- Apply fertilizer to the soil over the feeder roots and in accordance with label instructions, but never closer than 3 ft to the trunk. Increase the fertilized area by one-fourth of the crown area for conifers that have extended root systems.
- Retain protective measures until all other construction activity is complete to avoid damage during site cleanup and stabilization.

Description and Purpose

Soil binding consists of application and maintenance of a soil stabilizer to exposed soil surfaces. Soil binders are materials applied to the soil surface to temporarily prevent water and wind induced erosion of exposed soils on construction sites.

Suitable Applications

Soil binders are typically applied to disturbed areas requiring temporary protection. Because soil binders, when used as a stand-alone practice, can often be incorporated into the soil, they are a good alternative to mulches in areas where grading activities will soon resume. Soil binders are commonly used in the following areas:

- Rough graded soils that will be inactive for a short period of time.
- Soil stockpiles.
- Temporary haul roads prior to placement of crushed rock.
- Compacted soil road base.
- Construction staging, materials storage, and layout areas.
- Slopes and areas requiring stabilization prior to rain.
- Disturbed areas subject to high winds.

Potential Alternatives

- EC-3 Hydraulic Mulch
- EC-4 Hydroseeding
- EC-6 Straw Mulch
- EC-7 Geotextiles and Mats
- EC-8 Wood Mulching

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

- Soil binders are temporary in nature and may need reapplication.
- Soil binders require a minimum curing time until fully effective, as prescribed by the manufacturer. Curing time may be 24 hours or longer. Soil binders may need reapplication after a storm event.
- Soil binders will generally experience spot failures during heavy rainfall events. If runoff penetrates the soil at the top of a slope treated with a soil binder, it is likely that the runoff will undercut the stabilized soil layer and discharge at a point further down slope.
- Plant-material-based soil binders do not generally hold up to pedestrian or vehicular traffic across treated areas as well as polymeric emulsion blends or cementitious-based binders.
- Soil binders may not sufficiently penetrate compacted soils.
- Some soil binders are soil texture specific in terms of their effectiveness. For example, polyacrylamides (PAMs) work very well on silt and clayey soils but their performance decreases dramatically in sandy soils.
- Some soil binders may not perform well with low relative humidity. Under rainy conditions, some agents may become slippery or leach out of the soil.
- Soil binders may not cure if low temperatures occur within 24 hours of application.
- The water quality impacts of some chemical soil binders are relatively unknown, and some may have water quality impacts due to their chemical makeup. Additionally, these chemicals may require non-visible pollutant monitoring. Products should be evaluated for project-specific implementation by the SWPPP Preparer. Refer to the product Material Safety Data Sheet for chemical properties.

Implementation

General Considerations

- Soil binders should conform to local municipality specifications and requirements.
- Site soil types will dictate appropriate soil binders to be used.
- A soil binder must be environmentally benign (non-toxic to plant and animal life), easy to apply, easy to maintain, economical, and should not stain paved or painted surfaces. Soil binders should not pollute stormwater when cured. Obtain a Safety Data Sheet (SDS) from the manufacturer to ensure non-toxicity (note however, the SDS may not include ecological information).
- Stormwater runoff from PAM treated soils should pass through one of the following sediment control BMP prior to discharging to surface waters.
 - When the total drainage area is greater than or equal to 5 acres, PAM treated areas should drain to a sediment basin.

- Areas less than 5 acres should drain to sediment control BMPs, such as a sediment trap, or a series of check dams. The total number of check dams used should be maximized to achieve the greatest amount of settlement of sediment prior to discharging from the site. Each check dam should be spaced evenly in the drainage channel through which stormwater flows are discharged off site.
- Performance of soil binders depends on temperature, humidity, and traffic across treated areas.
- Avoid over spray onto roads, sidewalks, drainage channels, existing vegetation, etc.
- Some soil binders are designed for application to roads.
- Additional guidance on the comparison and selection of temporary slope stabilization methods is provided in Appendix F of the Handbook.

Selecting a Soil Binder

Properties of common soil binders used for erosion control are provided on Table 1 at the end of this Fact Sheet. Use Table 1 to select an appropriate soil binder. Refer to WE-1, Wind Erosion Control, for dust control soil binders.

Factors to consider when selecting a soil binder include the following:

- Suitability to situation - Consider where the soil binder will be applied, if it needs a high resistance to leaching or abrasion, and whether it needs to be compatible with any existing vegetation. Determine the length of time soil stabilization will be needed, and if the soil binder will be placed in an area where it will degrade rapidly. In general, slope steepness is not a discriminating factor for the listed soil binders.
- Soil types and surface materials - Fines and moisture content are key properties of surface materials. Consider a soil binder's ability to penetrate, likelihood of leaching, and ability to form a surface crust on the surface materials.
- Frequency of application - The frequency of application is related to the functional longevity of the binder, which can be affected by subgrade conditions, surface type, climate, and maintenance schedule.
- Frequent applications could lead to high costs. Application frequency may be minimized if the soil binder has good penetration, low evaporation, and good longevity. Consider also that frequent application will require frequent equipment clean up.

Plant-Material-Based (Short Lived, <6 months) Binders

Guar: Guar is a non-toxic, biodegradable, natural galactomannan-based hydrocolloid treated with dispersant agents for easy field mixing. It should be mixed with water at the rate of 11 to 15 lb per 1,000 gallons. Recommended minimum application rates are as follows:

Application Rates for Guar Soil Stabilizer

Slope (H:V):	Flat	4:1	3:1	2:1	1:1
lb/acre:	40	45	50	60	70

Psyllium: Psyllium is composed of the finely ground muciloid coating of plantago seeds that is applied as a dry powder or in a wet slurry to the surface of the soil. It dries to form a firm but rewettable membrane that binds soil particles together but permits germination and growth of seed. Psyllium requires 12 to 18 hours drying time. Application rates should be from 80 to 200 lb/acre, with enough water in solution to allow for a uniform slurry flow.

Starch: Starch is non-ionic, cold water soluble (pre-gelatinized) granular cornstarch. The material is mixed with water and applied at the rate of 150 lb/acre. Approximate drying time is 9 to 12 hours.

Plant-Material-Based (Long Lived, 6-12 months) Binders

Pitch and Rosin Emulsion: Generally, a non-ionic pitch and rosin emulsion has a minimum solids content of 48%. The rosin should be a minimum of 26% of the total solids content. The soil stabilizer should be non-corrosive, water dilutable emulsion that upon application cures to a water insoluble binding and cementing agent. For soil erosion control applications, the emulsion is diluted and should be applied as follows:

- For clayey soil: 5 parts water to 1-part emulsion
- For sandy soil: 10 parts water to 1-part emulsion

Application can be by water truck or hydraulic seeder with the emulsion and product mixture applied at the rate specified by the manufacturer.

Polymeric Emulsion Blend Binders

Acrylic Copolymers and Polymers: Polymeric soil stabilizers should consist of a liquid or solid polymer or copolymer with an acrylic base that contains a minimum of 55% solids. The polymeric compound should be handled and mixed in a manner that will not cause foaming or should contain an anti-foaming agent. The polymeric emulsion should not exceed its shelf life or expiration date; manufacturers should provide the expiration date. Polymeric soil stabilizer should be readily miscible in water, non-injurious to seed or animal life, non-flammable, should provide surface soil stabilization for various soil types without totally inhibiting water infiltration, and should not re-emulsify when cured. The applied compound typically requires 12 to 24 hours drying time. Liquid copolymer should be diluted at a rate of 10 parts water to 1-part polymer and the mixture applied to soil at a rate of 1,175 gallons/acre.

Liquid Polymers of Methacrylates and Acrylates: This material consists of a tackifier/sealer that is a liquid polymer of methacrylates and acrylates. It is an aqueous 100% acrylic emulsion blend of 40% solids by volume that is free from styrene, acetate, vinyl, ethoxylated surfactants or silicates. For soil stabilization applications, it is diluted with water in accordance with the manufacturer's recommendations and applied with a hydraulic seeder at the rate of 20 gallons/acre. Drying time is 12 to 18 hours after application.

Copolymers of Sodium Acrylates and Acrylamides: These materials are non-toxic, dry powders that are copolymers of sodium acrylate and acrylamide. They are mixed with water and applied to the soil surface for erosion control at rates that are determined by slope gradient:

Slope Gradient (H:V)	lb/acre
Flat to 5:1	3.0 – 5.0
5:1 to 3:1	5.0 – 10.0
2:1 to 1:1	10.0 – 20.0

Poly-Acrylamide (PAM) and Copolymer of Acrylamide: Linear copolymer polyacrylamide for use as a soil binder is packaged as a dry flowable solid, as a liquid. Refer to the manufacturer's recommendation for dilution and application rates as they vary based on liquid or dry form, site conditions and climate.

- Limitations specific to PAM are as follows:
 - Do not use PAM on a slope that flows into a water body without passing through a sediment trap or sediment basin.
 - The specific PAM copolymer formulation must be anionic. Cationic PAM should not be used in any application because of known aquatic toxicity problems. Only the highest drinking water grade PAM, certified for compliance with ANSI/NSF Standard 60 for drinking water treatment, should be used for soil applications.
 - PAM designated for erosion and sediment control should be "water soluble" or "linear" or "non-cross linked".
 - PAM should not be used as a stand-alone BMP to protect against water-based erosion. When combined with mulch, its effectiveness increases dramatically.

Hydro-Colloid Polymers: Hydro-Colloid Polymers are various combinations of dry flowable poly-acrylamides, copolymers and hydro-colloid polymers that are mixed with water and applied to the soil surface at rates of 55 to 60 lb/acre. Drying times are 0 to 4 hours.

Cementitious-Based Binders

Gypsum: This is a formulated gypsum-based product that readily mixes with water and mulch to form a thin protective crust on the soil surface. It is composed of high purity gypsum that is ground, calcined and processed into calcium sulfate hemihydrate with a minimum purity of 86%. It is mixed in a hydraulic seeder and applied at rates 4,000 to 12,000 lb/acre. Drying time is 4 to 8 hours.

Applying Soil Binders

After selecting an appropriate soil binder, the untreated soil surface must be prepared before applying the soil binder. The untreated soil surface must contain sufficient moisture to assist the agent in achieving uniform distribution. In general, the following steps should be followed:

- Follow manufacturer's written recommendations for application rates, pre-wetting of application area, and cleaning of equipment after use.
- Prior to application, roughen embankment and fill areas.
- Consider the drying time for the selected soil binder and apply with sufficient time before anticipated rainfall. Soil binders should not be applied during or immediately before rainfall.
- Avoid over spray onto roads, sidewalks, drainage channels, sound walls, existing vegetation, etc.

- Soil binders should not be applied to frozen soil, areas with standing water, under freezing or rainy conditions, or when the temperature is below 40°F during the curing period.
- More than one treatment is often necessary, although the second treatment may be diluted or have a lower application rate.
- Generally, soil binders require a minimum curing time of 24 hours before they are fully effective. Refer to manufacturer's instructions for specific cure time.
- For liquid agents:
 - Crown or slope ground to avoid ponding.
 - Uniformly pre-wet ground at 0.03 to 0.3 gal/yd² or according to manufacturer's recommendations.
 - Apply solution under pressure. Overlap solution 6 to 12 in.
 - Allow treated area to cure for the time recommended by the manufacturer; typically, at least 24 hours.
 - Apply second treatment before first treatment becomes ineffective, using 50% application rate.
 - In low humidities, reactivate chemicals by re-wetting with water at 0.1 to 0.2 gal/yd².

Costs

Costs vary according to the soil stabilizer selected for implementation. The following are approximate installed costs:

Soil Binder	Cost per Acre
Plant-Material-Based (Short Lived) Binders	\$900-\$1,200
Plant-Material-Based (Long Lived) Binders	\$1,500-\$1,900
Polymeric Emulsion Blend Binders	\$900-\$1,900
Cementitious-Based Binders	\$1,000-\$1,500

Source: Cost information received from individual product manufacturers solicited by Geosyntec Consultants (2004). Adjusted for inflation (2016 dollars) by Tetra Tech Inc.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Areas where erosion is evident should be repaired and BMPs re-applied as soon as possible. Care should be exercised to minimize the damage to protected areas while making repairs, as any area damaged will require re-application of BMPs.

- Reapply the selected soil binder as needed to maintain effectiveness.

Table 1 Properties of Soil Binders for Erosion Control				
Evaluation Criteria	Binder Type			
	Plant Material Based (Short Lived)	Plant Material Based (Long Lived)	Polymeric Emulsion Blends	Cementitious-Based Binders
Relative Cost	Low	Moderate to High	Low to High	Low to Moderate
Resistance to Leaching	High	High	Low to Moderate	Moderate
Resistance to Abrasion	Moderate	Low	Moderate to High	Moderate to High
Longevity	Short to Medium	Medium	Medium to Long	Medium
Minimum Curing Time before Rain	9 to 18 hours	19 to 24 hours	0 to 24 hours	4 to 8 hours
Compatibility with Existing Vegetation	Good	Poor	Poor	Poor

Description and Purpose

Rolled Erosion Control Products (RECPs), also known as erosion control matting or blankets, can be made of natural or synthetic materials or a combination of the two. RECPs are used to cover the soil surface to reduce erosion from rainfall impact, hold soil in place, and absorb and hold moisture near the soil surface. Additionally, RECPs may be used to stabilize soils until vegetation is established or to reinforce non-woody surface vegetation.

Suitable Applications

RECPs are typically applied on slopes where erosion hazard is high, and vegetation will be slow to establish. Matting is also used on stream banks, swales and other drainage channels where moving water at velocities between 3 ft/s and 6 ft/s are likely to cause scour and wash out new vegetation and in areas where the soil surface is disturbed and where existing vegetation has been removed. RECPs may also be used when seeding cannot occur (e.g., late season construction and/or the arrival of an early rain season). RECPs should be considered when the soils are fine grained and potentially erosive. RECPs should be considered in the following situations:

- Steep slopes, generally steeper than 3:1 (H:V).
- Long slopes.
- Slopes where the erosion potential is high.
- Slopes and disturbed soils where mulch must be anchored.

Potential Alternatives

- EC-3 Hydraulic Mulch
- EC-4 Hydroseeding

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Disturbed areas where temporary cover is needed, or plants are slow to establish or will not establish.
- Channels with flows exceeding 3.3 ft/s.
- Channels to be vegetated.
- Stockpiles.
- Slopes adjacent to water bodies.

Limitations

- RECP installed costs are generally higher than other erosion control BMPs, limiting their use to areas where other BMPs are ineffective (e.g., channels, steep slopes).
- RECPs may delay seed germination, due to reduction in soil temperature and/or sunlight.
- RECPs are generally not suitable for excessively rocky sites or areas where the final vegetation will be mowed (since staples and netting can catch in mowers). If a staple or pin cannot be driven into the soil because the underlying soil is too hard or rocky, then an alternative BMP should be selected.
- If used for temporary erosion control, RECPs should be removed and disposed of prior to application of permanent soil stabilization measures.
- The use of plastic sheeting should be limited to covering stockpiles or very small graded areas for short periods of time (such as through one imminent storm event) until other measures, such as seeding and mulching, may be installed.
 - Plastic sheeting is easily vandalized, easily torn, photodegradable, and must be disposed of at a landfill.
 - Plastic sheeting results in 100% runoff, which may cause serious erosion problems in the areas receiving the increased flow.
- According to the State Water Board's *CGP Review, Issue #2*, only RECPs that either do not contain plastic netting or contain netting manufactured from 100% biodegradable non-plastic materials, such as jute, sisal, or coir fiber should be used due to plastic pollution and wildlife concerns. If a plastic-netted product is used for temporary stabilization, it must be promptly removed when no longer needed and removed or replaced with non-plastic netted RECPs for final stabilization.
- RECPs may have limitations based on soil type, slope gradient, or channel flow rate; consult the manufacturer for proper selection.
- Not suitable for areas that have foot traffic (tripping hazard) – e.g., pad areas around buildings under construction.
- RECPs that incorporate a plastic netting (e.g. straw blanket typically uses a plastic netting to hold the straw in place) may not be suitable near known wildlife habitat. Wildlife can become trapped in the plastic netting. As per State Water Board guidance, RECPs that

contain plastic netting are discouraged for temporary controls and are not acceptable alternatives for permanent controls. RECPs that do not contain plastic netting or contain netting manufactured from 100% biodegradable non-plastic materials such as jute, sisal, or coir fiber should be used.

- RECPs may have limitations in extremely windy climates; they are susceptible to wind damage and displacement. However, when RECPs are properly trenched at the top and bottom and stapled in accordance with the manufacturer's recommendations, problems with wind can be minimized.

Implementation

Material Selection

- Natural RECPs have been found to be effective where re-vegetation will be provided by re-seeding. The choice of material should be based on the size of area, side slopes, surface conditions such as hardness, moisture, weed growth, and availability of materials.
- Additional guidance on the comparison and selection of temporary slope stabilization methods is provided in Appendix F of the Handbook.
- The following natural and synthetic RECPs are commonly used:

Geotextiles

- Material can be a woven or a non-woven polypropylene fabric with minimum thickness of 0.06 in., minimum width of 12 ft and should have minimum tensile strength of 150 lbs (warp), 80 lbs (fill) in conformance with the requirements in ASTM Designation: D 4632. The permittivity of the fabric should be approximately 0.07 sec^{-1} in conformance with the requirements in ASTM Designation: D4491. The fabric should have an ultraviolet (UV) stability of 70 percent in conformance with the requirements in ASTM designation: D4355. Geotextile blankets must be secured in place with wire staples or sandbags and by keying into tops of slopes to prevent infiltration of surface waters under geotextile. Staples should be made of minimum 11-gauge steel wire and should be U-shaped with 8 in. legs and 2 in. crown.
- Geotextiles may be reused if they are suitable for the use intended.

Plastic Covers

- Generally plastic sheeting should only be used as stockpile covering or for very small graded areas for short periods of time (such as through one imminent storm event). If plastic sheeting must be used, choose a plastic that will withstand photo degradation.
- Plastic sheeting should have a minimum thickness of 6 mils and must be keyed in at the top of slope (when used as a temporary slope protection) and firmly held in place with sandbags or other weights placed no more than 10 ft apart. Seams are typically taped or weighted down their entire length, and there should be at least a 12 in. to 24 in. overlap of all seams. Edges should be embedded a minimum of 6 in. in soil (when used as a temporary slope protection).
- All sheeting must be inspected periodically after installation and after significant rainstorms to check for erosion, undermining, and anchorage failure. Any failures must be repaired

immediately. If washout or breakages occur, the material should be re-installed after repairing the damage to the slope.

Erosion Control Blankets/Mats

- Biodegradable RECPs are typically composed of jute fibers, curled wood fibers, straw, coconut fiber, or a combination of these materials. In order for an RECP to be considered 100% biodegradable, the netting, sewing or adhesive system that holds the biodegradable mulch fibers together must also be biodegradable. See typical installation details at the end of this fact sheet.
- **Jute** is a natural fiber that is made into a yarn that is loosely woven into a biodegradable mesh. The performance of jute as a stand-alone RECP is low. Most other RECPs outperform jute as a temporary erosion control product and therefore jute is not commonly used. It is designed to be used in conjunction with vegetation. The material is supplied in rolled strips, which should be secured to the soil with U-shaped staples or stakes in accordance with manufacturers' recommendations.
- **Excelsior** (curled wood fiber) blanket material should consist of machine produced mats of curled wood excelsior with 80 percent of the fiber 6 in. or longer. The excelsior blanket should be of consistent thickness. The wood fiber must be evenly distributed over the entire area of the blanket. The top surface of the blanket should be covered with a photodegradable extruded plastic mesh. The blanket should be smolder resistant without the use of chemical additives and should be non-toxic and non-injurious to plant and animal life. Excelsior blankets should be furnished in rolled strips, a minimum of 48 in. wide, and should have an average weight of 0.8 lb/yd², ± 10 percent, at the time of manufacture. Excelsior blankets must be secured in place with wire staples. Staples should be made of minimum 11-gauge steel wire and should be U-shaped with 8 in. legs and 2 in. crown.
- **Straw blanket** should be machine produced mats of straw with a lightweight biodegradable netting top layer. The straw should be attached to the netting with biodegradable thread or glue strips. The straw blanket should be of consistent thickness. The straw should be evenly distributed over the entire area of the blanket. Straw blanket should be furnished in rolled strips a minimum of 6.5 ft wide, a minimum of 80 ft long and a minimum of 0.5 lb/yd². Straw blankets must be secured in place with wire staples. Staples should be made of minimum 11-gauge steel wire and should be U-shaped with 8 in. legs and 2 in. crown.
- **Wood fiber blanket** is composed of biodegradable fiber mulch with extruded plastic netting held together with adhesives. The material is designed to enhance re-vegetation. The material is furnished in rolled strips, which must be secured to the ground with U-shaped staples or stakes in accordance with manufacturers' recommendations.
- **Coconut fiber blanket** should be a machine produced mat of 100 percent coconut fiber with biodegradable netting on the top and bottom. The coconut fiber should be attached to the netting with biodegradable thread or glue strips. The coconut fiber blanket should be of consistent thickness. The coconut fiber should be evenly distributed over the entire area of the blanket. Coconut fiber blanket should be furnished in rolled strips with a minimum of 6.5 ft wide, a minimum of 80 ft. long and a minimum of 0.5

lb/yd². Coconut fiber blankets must be secured in place with wire staples. Staples should be made of minimum 11-gauge steel wire and should be U-shaped with 8 in. legs and 2 in. crown.

- **Coconut fiber mesh** is a thin permeable membrane made from coconut or corn fiber that is spun into a yarn and woven into a biodegradable mat. It is designed to be used in conjunction with vegetation and typically has longevity of several years. The material is supplied in rolled strips, which must be secured to the soil with U-shaped staples or stakes in accordance with manufacturers' recommendations.
- **Straw coconut fiber blanket** should be machine produced mats of 70 percent straw and 30 percent coconut fiber with a biodegradable netting top layer and a biodegradable bottom net. The straw and coconut fiber should be attached to the netting with biodegradable thread or glue strips. The straw coconut fiber blanket should be of consistent thickness. The straw and coconut fiber should be evenly distributed over the entire area of the blanket. Straw coconut fiber blanket should be furnished in rolled strips a minimum of 6.5 ft wide, a minimum of 80 ft long and a minimum of 0.5 lb/yd². Straw coconut fiber blankets must be secured in place with wire staples. Staples should be made of minimum 11-gauge steel wire and should be U-shaped with 8 in. legs and 2 in. crown.
- Non-biodegradable RECPs are typically composed of polypropylene, polyethylene, nylon or other synthetic fibers. In some cases, a combination of biodegradable and synthetic fibers is used to construct the RECP. Netting used to hold these fibers together is typically non-biodegradable as well. Only biodegradable RECPs can remain on a site applying for a Notice of Termination due to plastic pollution and wild life concerns (State Waterboard, 2016). RECPs containing plastic that are used on a site must be disposed of for final stabilization.
- **Plastic netting** is a lightweight biaxially oriented netting designed for securing loose mulches like straw or paper to soil surfaces to establish vegetation. The netting is photodegradable. The netting is supplied in rolled strips, which must be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.
- **Plastic mesh** is an open weave geotextile that is composed of an extruded synthetic fiber woven into a mesh with an opening size of less than ¼ in. It is used with re-vegetation or may be used to secure loose fiber such as straw to the ground. The material is supplied in rolled strips, which must be secured to the soil with U-shaped staples or stakes in accordance with manufacturers' recommendations.
- **Synthetic fiber with netting** is a mat that is composed of durable synthetic fibers treated to resist chemicals and ultraviolet light. The mat is a dense, three-dimensional mesh of synthetic (typically polyolefin) fibers stitched between two polypropylene nets. The mats are designed to be re-vegetated and provide a permanent composite system of soil, roots, and geomatrix. The material is furnished in rolled strips, which must be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.
- **Bonded synthetic fibers** consist of a three-dimensional geometric nylon (or other synthetic) matting. Typically, it has more than 90 percent open area, which facilitates

root growth. It's tough root reinforcing system anchors vegetation and protects against hydraulic lift and shear forces created by high volume discharges. It can be installed over prepared soil, followed by seeding into the mat. Once vegetated, it becomes an invisible composite system of soil, roots, and geomatrix. The material is furnished in rolled strips that must be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.

- **Combination synthetic and biodegradable RECPs** consist of biodegradable fibers, such as wood fiber or coconut fiber, with a heavy polypropylene net stitched to the top and a high strength continuous filament geomatrix or net stitched to the bottom. The material is designed to enhance re-vegetation. The material is furnished in rolled strips, which must be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.

Site Preparation

- Proper soil preparation is essential to ensure complete contact of the RECP with the soil. Soil Roughening is not recommended in areas where RECPs will be installed.
- Grade and shape the area of installation.
- Remove all rocks, clods, vegetation or other obstructions so that the installed blankets or mats will have complete, direct contact with the soil.
- Prepare seedbed by loosening 2 to 3 in. of topsoil.

Seeding/Planting

Seed the area before blanket installation for erosion control and re-vegetation. Seeding after mat installation is often specified for turf reinforcement application. When seeding prior to blanket installation, all areas disturbed during blanket installation must be re-seeded. Where soil filling is specified for turf reinforcement mats (TRMs), seed the matting and the entire disturbed area after installation and prior to filling the mat with soil.

Fertilize and seed in accordance with seeding specifications or other types of landscaping plans. The protective matting can be laid over areas where grass has been planted and the seedlings have emerged. Where vines or other ground covers are to be planted, lay the protective matting first and then plant through matting according to design of planting.

Check Slots

Check slots shall be installed as required by the manufacturer.

Laying and Securing Matting

- Before laying the matting, all check slots should be installed and the seedbed should be friable, made free from clods, rocks, and roots. The surface should be compacted and finished according to the requirements of the manufacturer's recommendations.
- Mechanical or manual lay down equipment should be capable of handling full rolls of fabric and laying the fabric smoothly without wrinkles or folds. The equipment should meet the fabric manufacturer's recommendations or equivalent standards.

Anchoring

- U-shaped wire staples, metal geotextile stake pins, or triangular wooden stakes can be used to anchor mats and blankets to the ground surface.
- Wire staples should be made of minimum 11-gauge steel wire and should be U-shaped with 8 in. legs and 2 in. crown.
- Metal stake pins should be 0.188 in. diameter steel with a 1.5 in. steel washer at the head of the pin, and 8 in. in length.
- Wire staples and metal stakes should be driven flush to the soil surface.

Installation on Slopes

Installation should be in accordance with the manufacturer's recommendations. In general, these will be as follows:

- Begin at the top of the slope and anchor the blanket in a 6 in. deep by 6 in. wide trench. Backfill trench and tamp earth firmly.
- Unroll blanket down slope in the direction of water flow.
- Overlap the edges of adjacent parallel rolls 2 to 3 in. and staple every 3 ft (or greater, per manufacturer's specifications).
- When blankets must be spliced, place blankets end over end (shingle style) with 6 in. overlap. Staple through overlapped area, approximately 12 in. apart.
- Lay blankets loosely and maintain direct contact with the soil. Do not stretch.
- Staple blankets sufficiently to anchor blanket and maintain contact with the soil. Staples should be placed down the center and staggered with the staples placed along the edges. Steep slopes, 1:1 (H:V) to 2:1 (H:V), require a minimum of 2 staples/yd². Moderate slopes, 2:1 (H:V) to 3:1 (H:V), require a minimum of 1 ½ staples/yd². Check manufacturer's specifications to determine if a higher density staple pattern is required.

Installation in Channels

Installation should be in accordance with the manufacturer's recommendations. In general, these will be as follows:

- Dig initial anchor trench 12 in. deep and 6 in. wide across the channel at the lower end of the project area.
- Excavate intermittent check slots, 6 in. deep and 6 in. wide across the channel at 25 to 30 ft intervals along the channels.
- Cut longitudinal channel anchor trenches 4 in. deep and 4 in. wide along each side of the installation to bury edges of matting, whenever possible extend matting 2 to 3 in. above the crest of the channel side slopes.

- Beginning at the downstream end and in the center of the channel, place the initial end of the first roll in the anchor trench and secure with fastening devices at 12 in. intervals. Note: matting will initially be upside down in anchor trench.
- In the same manner, position adjacent rolls in anchor trench, overlapping the preceding roll a minimum of 3 in.
- Secure these initial ends of mats with anchors at 12 in. intervals, backfill and compact soil.
- Unroll center strip of matting upstream. Stop at next check slot or terminal anchor trench. Unroll adjacent mats upstream in similar fashion, maintaining a 3 in. overlap.
- Fold and secure all rolls of matting snugly into all transverse check slots. Lay mat in the bottom of the slot then fold back against itself. Anchor through both layers of mat at 12 in. intervals, then backfill and compact soil. Continue rolling all mat widths upstream to the next check slot or terminal anchor trench.
- Alternate method for non-critical installations: Place two rows of anchors on 6 in. centers at 25 to 30 ft. intervals in lieu of excavated check slots.
- Staple shingled lap spliced ends a minimum of 12 in. apart on 12 in. intervals.
- Place edges of outside mats in previously excavated longitudinal slots; anchor using prescribed staple pattern, backfill, and compact soil.
- Anchor, fill, and compact upstream end of mat in a 12 in. by 6 in. terminal trench.
- Secure mat to ground surface using U-shaped wire staples, geotextile pins, or wooden stakes.
- Seed and fill turf reinforcement matting with soil, if specified.

Soil Filling (if specified for turf reinforcement mat (TRM))

Installation should be in accordance with the manufacturer's recommendations. Typical installation guidelines are as follows:

- After seeding, spread and lightly rake $\frac{1}{2}$ - $\frac{3}{4}$ inches of fine topsoil into the TRM apertures to completely fill TRM thickness. Use backside of rake or other flat implement.
- Alternatively, if allowed by product specifications, spread topsoil using lightweight loader, backhoe, or other power equipment. Avoid sharp turns with equipment.
- Always consult the manufacturer's recommendations for installation.
- Do not drive tracked or heavy equipment over mat.
- Avoid any traffic over matting if loose or wet soil conditions exist.
- Use shovels, rakes, or brooms for fine grading and touch up.
- Smooth out soil filling just exposing top netting of mat.

Temporary Soil Stabilization Removal

- Temporary soil stabilization removed from the site of the work must be disposed of if necessary.

Costs

Installed costs can be relatively high compared to other BMPs. Approximate costs for installed materials are shown below:

Rolled Erosion Control Products		Installed Cost per Acre
Biodegradable	Jute Mesh	\$7,700-\$9,000
	Curled Wood Fiber	\$10,200-\$13,400
	Straw	\$10,200-\$13,400
	Wood Fiber	\$10,200-\$13,400
	Coconut Fiber	\$16,600-\$18,000
	Coconut Fiber Mesh	\$38,400-\$42,200
	Straw Coconut Fiber	\$12,800-\$15,400
Non-Biodegradable	Plastic Netting	\$2,600-\$2,800
	Plastic Mesh	\$3,800-\$4,500
	Synthetic Fiber with Netting	\$43,500-\$51,200
	Bonded Synthetic Fibers	\$57,600-\$70,400
	Combination with Biodegradable	\$38,400-\$46,100

Source: Cost information received from individual product manufacturers solicited by Geosyntec Consultants (2004). Adjusted for inflation (2016 dollars) by Tetra Tech, Inc.

Inspection and Maintenance

- RECPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Areas where erosion is evident shall be repaired and BMPs reapplied as soon as possible. Care should be exercised to minimize the damage to protected areas while making repairs, as any area damaged will require reapplication of BMPs.
- If washout or breakage occurs, re-install the material after repairing the damage to the slope or channel.
- Make sure matting is uniformly in contact with the soil.
- Check that all the lap joints are secure.
- Check that staples are flush with the ground.

TYPICAL INSTALLATION DETAIL

Description and Purpose

An earth dike is a temporary berm or ridge of compacted soil used to divert runoff or channel water to a desired location. A drainage swale is a shaped and sloped depression in the soil surface used to convey runoff to a desired location. Earth dikes and drainage swales are used to divert off site runoff around the construction site, divert runoff from stabilized areas and disturbed areas, and direct runoff into sediment basins or traps.

Suitable Applications

Earth dikes and drainage swales are suitable for use, individually or together, where runoff needs to be diverted from one area and conveyed to another.

- Earth dikes and drainage swales may be used:
 - To convey surface runoff down sloping land
 - To intercept and divert runoff to avoid sheet flow over sloped surfaces
 - To divert and direct runoff towards a stabilized watercourse, drainage pipe or channel
 - To intercept runoff from paved surfaces
 - To intercept and divert run-on
 - Below steep grades where runoff begins to concentrate

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Along roadways and facility improvements subject to flood drainage
- At the top of slopes to divert runoff from adjacent or undisturbed slopes
- At bottom and mid slope locations to intercept sheet flow and convey concentrated flows
- Divert sediment laden runoff into sediment basins or traps

Limitations

Dikes should not be used for drainage areas greater than 10 acres or along slopes greater than 10 percent. For larger areas more permanent drainage structures should be built. All drainage structures should be built in compliance with local municipal requirements.

- Earth dikes may create more disturbed area on site and become barriers to construction equipment.
- Earth dikes must be stabilized immediately, which adds cost and maintenance concerns.
- Diverted stormwater may cause downstream flood damage.
- Dikes should not be constructed of soils that may be easily eroded.
- Regrading the site to remove the dike may add additional cost.
- Temporary drains and swales or any other diversion of runoff should not adversely impact upstream or downstream properties.
- Temporary drains and swales must conform to local floodplain management requirements.
- Earth dikes/drainage swales are not suitable as sediment trapping devices.
- It may be necessary to use other soil stabilization and sediment controls such as check dams, plastics, and blankets, to prevent scour and erosion in newly graded dikes, swales, and ditches.
- Sediment accumulation, scour depressions, and/or persistent non-stormwater discharges can result in areas of standing water suitable for mosquito production in drainage swales.

Implementation

The temporary earth dike is a berm or ridge of compacted soil, located in such a manner as to divert stormwater to a sediment trapping device or a stabilized outlet, thereby reducing the potential for erosion and offsite sedimentation. Earth dikes can also be used to divert runoff from off site and from undisturbed areas away from disturbed areas and to divert sheet flows away from unprotected slopes.

An earth dike does not itself control erosion or remove sediment from runoff. A dike prevents erosion by directing runoff to an erosion control device such as a sediment trap or directing runoff away from an erodible area. Temporary diversion dikes should not adversely impact adjacent properties and must conform to local floodplain management regulations and should not be used in areas with slopes steeper than 10%.

Slopes that are formed during cut and fill operations should be protected from erosion by runoff. A combination of a temporary drainage swale and an earth dike at the top of a slope can divert runoff to a location where it can be brought to the bottom of the slope (see EC-11, Slope Drains). A combination dike and swale is easily constructed by a single pass of a bulldozer or grader and compacted by a second pass of the tracks or wheels over the ridge. Diversion structures should be installed when the site is initially graded and remain in place until post construction BMPs are installed and the slopes are stabilized.

Diversion practices concentrate surface runoff, increasing its velocity and erosive force. Thus, the flow out of the drain or swale must be directed onto a stabilized area or into a grade stabilization structure. If significant erosion will occur, a swale should be stabilized using vegetation, chemical treatment, rock rip-rap, matting, or other physical means of stabilization. Any drain or swale that conveys sediment laden runoff must be diverted into a sediment basin or trap before it is discharged from the site.

General

- Care must be applied to correctly size and locate earth dikes, drainage swales. Excessively steep, unlined dikes, and swales are subject to erosion and gully formation.
- Conveyances should be stabilized.
- Use a lined ditch for high flow velocities.
- Select flow velocity based on careful evaluation of the risks due to erosion of the measure, soil types, overtopping, flow backups, washout, and drainage flow patterns for each project site.
- Compact any fills to prevent unequal settlement.
- Do not divert runoff onto other property without securing written authorization from the property owner.
- When possible, install and utilize permanent dikes, swales, and ditches early in the construction process.
- Provide stabilized outlets.

Earth Dikes

Temporary earth dikes are a practical, inexpensive BMP used to divert stormwater runoff. Temporary diversion dikes should be installed in the following manner:

- All dikes should be compacted by earth moving equipment.
- All dikes should have positive drainage to an outlet.
- All dikes should have 2:1 or flatter side slopes, 18 in. minimum height, and a minimum top width of 24 in. Wide top widths and flat slopes are usually needed at crossings for construction traffic.

- May be covered with hydro mulch, hydroseed, wood mulch, compost blanket, or RECP for stabilization.
- The outlet from the earth dike must function with a minimum of erosion. Runoff should be conveyed to a sediment trapping device such as a Sediment Trap (SE-3) or Sediment Basin (SE-2) when either the dike channel or the drainage area above the dike are not adequately stabilized.
- Temporary stabilization may be achieved using seed and mulching for slopes less than 5% and either rip-rap or sod for slopes in excess of 5%. In either case, stabilization of the earth dike should be completed immediately after construction or prior to the first rain.
- If riprap is used to stabilize the channel formed along the toe of the dike, the following typical specifications apply:

Channel Grade	Riprap Stabilization
0.5-1.0%	4 in. Rock
1.1-2.0%	6 in. Rock
2.1-4.0%	8 in. Rock
4.1-5.0%	8 in. -12 in. Riprap

- The stone riprap, recycled concrete, etc. used for stabilization should be pressed into the soil with construction equipment.
- Filter cloth may be used to cover dikes in use for long periods.
- Construction activity on the earth dike should be kept to a minimum.

Drainage Swales

Drainage swales are only effective if they are properly installed. Swales are more effective than dikes because they tend to be more stable. The combination of a swale with a dike on the downhill side is the most cost-effective diversion.

Standard engineering design criteria for small open channel and closed conveyance systems should be used (see the local drainage design manual). Unless local drainage design criteria state otherwise, drainage swales should be designed as follows:

- No more than 5 acres may drain to a temporary drainage swale.
- Place drainage swales above or below, not on, a cut or fill slope.
- Swale bottom width should be at least 2 ft.
- Depth of the swale should be at least 18 in.
- Side slopes should be 2:1 or flatter.
- Drainage or swales should be laid at a grade of at least 1 %, but not more than 15 %.

- The swale must not be overtopped by the peak discharge from a 10-year storm, irrespective of the design criteria stated above.
- Remove all trees, stumps, obstructions, and other objectionable material from the swale when it is built.
- Compact any fill material along the path of the swale.
- Stabilize all swales immediately. Seed and mulch swales at a slope of less than 5 % and use rip-rap or sod for swales with a slope between 5 and 15 %. For temporary swales, geotextiles and mats (EC-7) may provide immediate stabilization.
- Irrigation may be required to establish sufficient vegetation to prevent erosion.
- Do not operate construction vehicles across a swale unless a stabilized crossing is provided.
- Permanent drainage facilities must be designed by a professional engineer (see the local drainage design criteria for proper design).
- At a minimum, the drainage swale should conform to predevelopment drainage patterns and capacities.
- Construct the drainage swale with a positive grade to a stabilized outlet.
- Provide erosion protection or energy dissipation measures if the flow out of the drainage swale can reach an erosive velocity.

Costs

- Cost ranges from \$19 to \$70 per ft. for both earthwork and stabilization and depends on availability of material, site location, and access (Adjusted for inflation (2016 dollars) by Tetra Tech, Inc.).
- Small dikes: \$3 - \$8/linear ft.; Large dikes: \$3/yd³ (Adjusted for inflation (2016 dollars) by Tetra Tech, Inc.).
- The cost of a drainage swale increases with drainage area and slope. Typical swales for controlling internal erosion are inexpensive, as they are quickly formed during routine earthwork.

Inspection and Maintenance

- Inspect BMPs prior to forecast rain, daily during extended rain events, after rain events, weekly during the rainy season, and at two-week intervals during the non-rainy season.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Inspect ditches and berms for washouts. Replace lost riprap, damaged linings or soil stabilizers as needed.

- Inspect channel linings, embankments, and beds of ditches and berms for erosion and accumulation of debris and sediment. Remove debris and sediment and repair linings and embankments as needed.
- Temporary conveyances should be completely removed as soon as the surrounding drainage area has been stabilized or at the completion of construction

Description and Purpose

Outlet protection is a physical device composed of rock, grouted riprap, or concrete rubble, which is placed at the outlet of a pipe or channel to prevent scour of the soil caused by concentrated, high velocity flows.

Suitable Applications

Whenever discharge velocities and energies at the outlets of culverts, conduits, or channels are sufficient to erode the next downstream reach. This includes temporary diversion structures to divert runoff during construction.

- These devices may be used at the following locations:
 - Outlets of pipes, drains, culverts, slope drains, diversion ditches, swales, conduits, or channels.
 - Outlets located at the bottom of mild to steep slopes.
 - Discharge outlets that carry continuous flows of water.
 - Outlets subject to short, intense flows of water, such as flash floods.
 - Points where lined conveyances discharge to unlined conveyances

Limitations

- Large storms or high flows can wash away the rock outlet protection and leave the area susceptible to erosion.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Sediment captured by the rock outlet protection may be difficult to remove without removing the rock.
- Outlet protection may negatively impact the channel habitat.
- Grouted riprap may break up in areas of freeze and thaw.
- If there is not adequate drainage, and water builds up behind grouted riprap, it may cause the grouted riprap to break up due to the resulting hydrostatic pressure.
- Sediment accumulation, scour depressions, and/or persistent non-stormwater discharges can result in areas of standing water suitable for mosquito production in velocity dissipation devices.

Implementation

General

Outlet protection is needed where discharge velocities and energies at the outlets of culverts, conduits or channels are sufficient to erode the immediate downstream reach. This practice protects the outlet from developing small eroded pools (plunge pools) and protects against gully erosion resulting from scouring at a culvert mouth.

Design and Layout

As with most channel design projects, depth of flow, roughness, gradient, side slopes, discharge rate, and velocity should be considered in the outlet design. Compliance to local and state regulations should also be considered while working in environmentally sensitive streambeds. General recommendations for rock size and length of outlet protection mat are shown in the rock outlet protection figure in this BMP and should be considered minimums. The apron length and rock size gradation are determined using a combination of the discharge pipe diameter and estimate discharge rate: Select the longest apron length and largest rock size suggested by the pipe size and discharge rate. Where flows are conveyed in open channels such as ditches and swales, use the estimated discharge rate for selecting the apron length and rock size. Flows should be same as the culvert or channel design flow but never the less than the peak 5-year flow for temporary structures planned for one rainy season, or the 10-year peak flow for temporary structures planned for two or three rainy seasons.

- There are many types of energy dissipaters, with rock being the one that is represented in the attached figure.
- Best results are obtained when sound, durable, and angular rock is used.
- Install riprap, grouted riprap, or concrete apron at selected outlet. Riprap aprons are best suited for temporary use during construction. Grouted or wired tied rock riprap can minimize maintenance requirements.
- Rock outlet protection is usually less expensive and easier to install than concrete aprons or energy dissipaters. It also serves to trap sediment and reduce flow velocities.
- Carefully place riprap to avoid damaging the filter fabric.

- Stone 4 in. to 6 in. may be carefully dumped onto filter fabric from a height not to exceed 12 in.
 - Stone 8 in. to 12 in. must be hand placed onto filter fabric, or the filter fabric may be covered with 4 in. of gravel and the 8 in. to 12 in. rock may be dumped from a height not to exceed 16 in.
 - Stone greater than 12 in. shall only be dumped onto filter fabric protected with a layer of gravel with a thickness equal to one half the D_{50} rock size, and the dump height limited to twice the depth of the gravel protection layer thickness.
- For proper operation of apron: Align apron with receiving stream and keep straight throughout its length. If a curve is needed to fit site conditions, place it in upper section of apron.
 - Outlets on slopes steeper than 10 percent should have additional protection.

Costs

Costs are low if material is readily available. If material is imported, costs will be higher. Average installed cost is \$250 per device.

Inspection and Maintenance

- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subjected to non-stormwater discharges daily while non-stormwater discharges occur. Minimize areas of standing water by removing sediment blockages and filling scour depressions.
- Inspect apron for displacement of the riprap and damage to the underlying fabric. Repair fabric and replace riprap that has washed away. If riprap continues to wash away, consider using larger material.
- Inspect for scour beneath the riprap and around the outlet. Repair damage to slopes or underlying filter fabric immediately.
- Temporary devices should be completely removed as soon as the surrounding drainage area has been stabilized or at the completion of construction.

Description and Purpose

A silt fence is made of a woven geotextile that has been entrenched, attached to supporting poles, and sometimes backed by a plastic or wire mesh for support. The silt fence detains water, promoting sedimentation of coarse sediment behind the fence. Silt fence does not retain soil fine particles like clays or silts.

Suitable Applications

Silt fences are suitable for perimeter control, placed below areas where sheet flows discharge from the site. They could also be used as interior controls below disturbed areas where runoff may occur in the form of sheet and rill erosion and around inlets within disturbed areas (Storm Drain Inlet Protection, SE-10). Silt fences should not be used in locations where the flow is concentrated. Silt fences should always be used in combination with erosion controls. Suitable applications include:

- At perimeter of a project (although they should not be installed up and down slopes).
- Below the toe or down slope of exposed and erodible slopes.
- Along streams and channels.
- Around temporary spoil areas and stockpiles.
- Around inlets.
- Below other small cleared areas.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

- Do not use in streams, channels, drain inlets, or anywhere flow is concentrated.
- Do not use in locations where ponded water may cause a flooding hazard.
- Do not use silt fence to divert water flows or place across any contour line.
- Improperly installed fences are subject to failure from undercutting, overtopping, or collapsing.
- Must be trenched and keyed in.
- According to the State Water Board's *CGP Review, Issue #2* (2014), silt fences reinforced with metal or plastic mesh should be avoided due to plastic pollution and wildlife concerns.
- Not intended for use as a substitute for Fiber Rolls (SE-5), when fiber rolls are being used as a slope interruption device.
- Do not use on slopes subject to creeping, slumping, or landslides.

Implementation

General

A silt fence is a temporary sediment barrier consisting of woven geotextile stretched across and attached to supporting posts, trenched-in, and, depending upon the strength of fabric used, supported with plastic or wire mesh fence. Silt fences trap coarse sediment by intercepting and detaining sediment-laden runoff from disturbed areas in order to promote sedimentation behind the fence.

The following layout and installation guidance can improve performance and should be followed:

- Silt fence should be used in combination with erosion controls up-slope in order to provide the most effective sediment control.
- Silt fence alone is not effective at reducing turbidity. (Barrett and Malina, 2004)
- Designers should consider diverting sediment laden water to a temporary sediment basin or trap. (EPA, 2012)
- Use principally in areas where sheet flow occurs.
- Install along a level contour, so water does not pond more than 1.5 ft. at any point along the silt fence.
- Provide sufficient room for runoff to pond behind the fence and to allow sediment removal equipment to pass between the silt fence and toes of slopes or other obstructions. About 1200 ft.² of ponding area should be provided for every acre draining to the fence.
- Efficiency of silt fences is primarily dependent on the detention time of the runoff behind the control. (Barrett and Malina, 2004)

- The drainage area above any fence should not exceed a quarter of an acre. (Rule of Thumb-100-feet of silt fence per 10,000 ft.² of disturbed area.) (EPA, 2012)
- The maximum length of slope draining to any point along the silt fence should be 100 ft. per ft of silt fence.
- Turn the ends of the filter fence uphill to prevent stormwater from flowing around the fence.
- Leave an undisturbed or stabilized area immediately down slope from the fence where feasible.
- Silt fences should remain in place until the disturbed area draining to the silt fence is permanently stabilized, after which, the silt fence fabric and posts should be removed and properly disposed.
- J-hooks, which have ends turning up the slope to break up long runs of fence and provide multiple storage areas that work like mini-retention areas, may be used to increase the effectiveness of silt fence.
- Be aware of local regulations regarding the type and installation requirements of silt fence, which may differ from those presented in this fact sheet.

Design and Layout

In areas where high winds are anticipated the fence should be supported by a plastic or wire mesh. The geotextile fabric of the silt fence should contain ultraviolet inhibitors and stabilizers to provide longevity equivalent to the project life or replacement schedule.

- Layout in accordance with the attached figures.
- For slopes that contain a high number of rocks or large dirt clods that tend to dislodge, it may be necessary to protect silt fence from rocks (e.g., rockfall netting) ensure the integrity of the silt fence installation.

Standard vs. Heavy Duty Silt Fence

Standard Silt Fence

- Generally applicable in cases where the area draining to fence produces moderate sediment loads.

Heavy Duty Silt Fence

- Heavy duty silt fence usually has 1 or more of the following characteristics, not possessed by standard silt fence.
 - Fabric is reinforced with wire backing or additional support.
 - Posts are spaced closer than pre-manufactured, standard silt fence products.
- Use is generally limited to areas affected by high winds.
- Area draining to fence produces moderate sediment loads.

Materials

Standard Silt Fence

- Silt fence material should be woven geotextile with a minimum width of 36 in. The fabric should conform to the requirements in ASTM designation D6461.

- Wooden stakes should be commercial quality lumber of the size and shape shown on the plans. Each stake should be free from decay, splits or cracks longer than the thickness of the stake or other defects that would weaken the stakes and cause the stakes to be structurally unsuitable.
- Staples used to fasten the fence fabric to the stakes should be not less than 1.75 in. long and should be fabricated from 15-gauge or heavier wire. The wire used to fasten the tops of the stakes together when joining two sections of fence should be 9 gauge or heavier wire. Galvanizing of the fastening wire will not be required.

Heavy-Duty Silt Fence

- Some silt fence has a wire backing to provide additional support, and there are products that may use prefabricated plastic holders for the silt fence and use metal posts instead of wood stakes.

Installation Guidelines – Traditional Method

Silt fences are to be constructed on a level contour. Sufficient area should exist behind the fence for ponding to occur without flooding or overtopping the fence.

- A trench should be excavated approximately 6 in. wide and 6 in. deep along the line of the proposed silt fence (trenches should not be excavated wider or deeper than necessary for proper silt fence installation).
- Bottom of the silt fence should be keyed-in a minimum of 12 in.
- Posts should be spaced a maximum of 6 ft. apart and driven securely into the ground a minimum of 18 in. or 12 in. below the bottom of the trench.
- When standard strength geotextile is used, a plastic or wire mesh support fence should be fastened securely to the upslope side of posts using heavy-duty wire staples at least 1 in. long. The mesh should extend into the trench.
- When extra-strength geotextile and closer post spacing are used, the mesh support fence may be eliminated.
- Woven geotextile should be purchased in a long roll, then cut to the length of the barrier. When joints are necessary, geotextile should be spliced together only at a support post, with a minimum 6 in. overlap and both ends securely fastened to the post.
- The trench should be backfilled with native material and compacted.
- Construct the length of each reach so that the change in base elevation along the reach does not exceed $\frac{1}{3}$ the height of the barrier; in no case should the reach exceed 500 ft.
- Cross barriers should be a minimum of $\frac{1}{3}$ and a maximum of $\frac{1}{2}$ the height of the linear barrier.
- See typical installation details at the end of this fact sheet.

Installation Guidelines - Static Slicing Method

- Static Slicing is defined as insertion of a narrow blade pulled behind a tractor, similar to a plow blade, at least 10 in. into the soil while at the same time pulling silt geotextile fabric into the ground through the opening created by the blade to the depth of the blade. Once the geotextile is installed, the soil is compacted using tractor tires.
- This method will not work with pre-fabricated, wire backed silt fence.
- Benefits:
 - Ease of installation (most often done with a 2-person crew).
 - Minimal soil disturbance.
 - Better level of compaction along fence, less susceptible to undercutting
 - Uniform installation.
- Limitations:
 - Does not work in shallow or rocky soils.
 - Complete removal of geotextile material after use is difficult.
 - Be cautious when digging near potential underground utilities.

Costs

- It should be noted that costs vary greatly across regions due to available supplies and labor costs.
- Average annual cost for installation using the traditional silt fence installation method (assumes 6 month useful life) is \$7 per linear foot based on vendor research. Range of cost is \$3.50 - \$9.10 per linear foot.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Repair undercut silt fences.
- Repair or replace split, torn, slumping, or weathered fabric. The lifespan of silt fence fabric is generally 5 to 8 months.
- Silt fences that are damaged and become unsuitable for the intended purpose should be removed from the site of work, disposed, and replaced with new silt fence barriers.
- Sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches 1/3 of the barrier height.

- Silt fences should be left in place until the upgradient area is permanently stabilized. Until then, the silt fence should be inspected and maintained regularly.
- Remove silt fence when upgradient areas are stabilized. Fill and compact post holes and anchor trench, remove sediment accumulation, grade fence alignment to blend with adjacent ground, and stabilize disturbed area.

NOTES

1. Construct the length of each reach so that the change in base elevation along the reach does not exceed 1/3 the height of the linear barrier; in no case shall the reach length exceed 500'.
2. The last 5'-0" of fence shall be turned up slope.
3. Stake dimensions are nominal.
4. Dimension may vary to fit field condition.
5. Stakes shall be spaced at 8'-0" maximum and shall be positioned on downstream side of fence.
6. Stakes to overlap and hence fabric to fold around each stake one full turn. Secure fabric to stake with 4 staples.
7. Stakes shall be driven tightly together to prevent potential flow-through of sediment at joint. The tops of the stakes shall be secured with wire.
8. For end stake, fence fabric shall be folded around two stakes one full turn and secured with 4 staples.
9. Minimum 4 staples per stake. Dimensions shown are typical.
10. Cross barriers shall be a minimum of 1/3 and a maximum of 1/2 the height of the linear barrier.
11. Maintenance openings shall be constructed in a manner to ensure sediment remains behind silt fence.
12. Joining sections shall not be placed at sump locations.
13. Sandbag rows and layers shall be offset to eliminate gaps.
14. Add 3-4 bags to cross barrier on downgradient side of silt fence as needed to prevent bypass or undermining and as allowable based on site limits of disturbance.

CROSS BARRIER DETAIL

SECTION C-C

J-HOOK

J-HOOK

Description and Purpose

A sediment basin is a temporary basin formed by excavation or by constructing an embankment so that sediment-laden runoff is temporarily detained under quiescent conditions, allowing sediment to settle out before the runoff is released.

Sediment basin design guidance presented in this fact sheet is intended to provide options, methods, and techniques to optimize temporary sediment basin performance and basin sediment removal. Basin design guidance provided in this fact sheet is not intended to guarantee basin effluent compliance with numeric discharge limits (numeric action levels or numeric effluent limits for turbidity). Compliance with discharge limits requires a thoughtful approach to comprehensive BMP planning, implementation, and maintenance. Therefore, optimally designed and maintained sediment basins should be used in conjunction with a comprehensive system of BMPs that includes:

- Diverting runoff from undisturbed areas away from the basin
- Erosion control practices to minimize disturbed areas on-site and to provide temporary stabilization and interim sediment controls (e.g., stockpile perimeter control, check dams, perimeter controls around individual lots) to reduce the basin's influent sediment concentration.

At some sites, sediment basin design enhancements may be required to adequately remove sediment. Traditional

Potential Alternatives

SE-3 Sediment Trap (for smaller areas)

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

(a.k.a. “physical”) enhancements such as alternative outlet configurations or flow deflection baffles increase detention time and other techniques such as outlet skimmers preferentially drain flows with lower sediment concentrations. These “physical” enhancement techniques are described in this fact sheet. To further enhance sediment removal particularly at sites with fine soils or turbidity sensitive receiving waters, some projects may need to consider implementing Active Treatment Systems (ATS) whereby coagulants and flocculants are used to enhance settling and removal of suspended sediments. Guidance on implementing ATS is provided in SE-11.

Suitable Applications

Sediment basins may be suitable for use on larger projects with sufficient space for constructing the basin. Sediment basins should be considered for use:

- Where sediment-laden water may enter the drainage system or watercourses
- On construction projects with disturbed areas during the rainy season
- At the outlet of disturbed watersheds between 5 acres and 75 acres and evaluated on a site by site basis
- Where post construction detention basins are required
- In association with dikes, temporary channels, and pipes used to convey runoff from disturbed areas

Limitations

Sediment basins must be installed only within the property limits and where failure of the structure will not result in loss of life, damage to homes or buildings, or interruption of use or service of public roads or utilities. In addition, sediment basins are attractive to children and can be very dangerous. Local ordinances regarding health and safety must be adhered to. If fencing of the basin is required, the type of fence and its location should be shown in the SWPPP and in the construction specifications.

- As a general guideline, sediment basins are suitable for drainage areas of 5 acres or more, but not appropriate for drainage areas greater than 75 acres. However, the tributary area should be evaluated on a site by site basis.
- Sediment basins may become an “attractive nuisance” and care must be taken to adhere to all safety practices. If safety is a concern, basin may require protective fencing.
- Sediment basins designed according to this fact sheet are only effective in removing sediment down to about the silt size fraction. Sediment-laden runoff with smaller size fractions (fine silt and clay) may not be adequately treated unless chemical (or other appropriate method) treatment is used in addition to the sediment basin.
- Basins with a height of 25 ft or more or an impounding capacity of 50 ac-ft or more must obtain approval from California Department of Water Resources Division of Safety of Dams (<http://www.water.ca.gov/damsafety/>).

- Water that stands in sediment basins longer than 96 hours may become a source of mosquitoes (and midges), particularly along perimeter edges, in shallow zones, in scour or below-grade pools, around inlet pipes, along low-flow channels, and among protected habitats created by emergent or floating vegetation (e.g. cattails, water hyacinth), algal mats, riprap, etc.
- Basins require large surface areas to permit settling of sediment. Size may be limited by the available area.

Implementation

General

A sediment basin is a controlled stormwater release structure formed by excavation or by construction of an embankment of compacted soil across a drainage way, or other suitable location. It is intended to trap sediment before it leaves the construction site. The basin is a temporary measure expected to be used during active construction in most cases and is to be maintained until the site area is permanently protected against erosion or a permanent detention basin is constructed.

Sediment basins are suitable for nearly all types of construction projects. Whenever possible, construct the sediment basins before clearing and grading work begins. Basins should be located at the stormwater outlet from the site but not in any natural or undisturbed stream. A typical application would include temporary dikes, pipes, and/or channels to convey runoff to the basin inlet.

Many development projects in California are required by local ordinances to provide a stormwater detention basin for post-construction flood control, desilting, or stormwater pollution control. A temporary sediment basin may be constructed by rough grading the post-construction control basins early in the project.

Sediment basins if properly designed and maintained can trap a significant amount of the sediment that flows into them. However, traditional basins do not remove all inflowing sediment. Therefore, they should be used in conjunction with erosion control practices such as temporary seeding, mulching, diversion dikes, etc., to reduce the amount of sediment flowing into the basin.

Planning

To improve the effectiveness of the basin, it should be located to intercept runoff from the largest possible amount of disturbed area. Locations best suited for a sediment basin are generally in lower elevation areas of the site (or basin tributary area) where site drainage would not require significant diversion or other means to direct water to the basin but outside jurisdictional waterways. However, as necessary, drainage into the basin can be improved by the use of earth dikes and drainage swales (see BMP EC-9). The basin should not be located where its failure would result in the loss of life or interruption of the use or service of public utilities or roads.

Construct before clearing and grading work begins when feasible.

- Do not locate the basin in a jurisdictional stream.

- Basin sites should be located where failure of the structure will not cause loss of life, damage to homes or buildings, or interruption of use or service of public roads or utilities.
- Basins with a height of 25 ft or more or an impounding capacity of 50 ac-ft must obtain approval from the Division of Dam Safety. Local dam safety requirements may be more stringent.
- Limit the contributing area to the sediment basin to only the runoff from the disturbed soil areas. Use temporary concentrated flow conveyance controls to divert runoff from undisturbed areas away from the sediment basin.
- The basin should be located: (1) by excavating a suitable area or where a low embankment can be constructed across a swale, (2) where post-construction (permanent) detention basins will be constructed, and (3) where the basins can be maintained on a year-round basis to provide access for maintenance, including sediment removal and sediment stockpiling in a protected area, and to maintain the basin to provide the required capacity.

Design

When designing a sediment basin, designers should evaluate the site constraints that could affect the efficiency of the BMP. Some of these constraints include: the relationship between basin capacity, anticipated sediment load, and freeboard, available footprint for the basin, maintenance frequency and access, and hydraulic capacity and efficiency of the temporary outlet infrastructure. Sediment basins should be designed to maximize sediment removal and to consider sediment load retained by the basin as it affects basin performance.

Three Basin Design Options (Part A) are presented below along with a Typical Sediment/Detention Basin Design Methodology (Part B). Regardless of the design option that is selected, designers also need to evaluate the sediment basin capacity with respect to sediment accumulation (See “*Step 3. Evaluate the Capacity of the Sediment Basin*”) and should incorporate approaches identified in “*Step 4. Other Design Considerations*” to enhance basin performance.

A) Basin Design Options:

Option 1:

Design sediment basin(s) using the standard equation:

$$A_s = \frac{1.2Q}{V_s} \quad (\text{Eq. 1})$$

Where:

A_s = Minimum surface area for trapping soil particles of a certain size

V_s = Settling velocity of the design particle size chosen ($V_s = 0.00028$ ft/s for a design particle size of 0.01 mm at 68°F)

1.2 = Factor of safety recommended by USEPA to account for the reduction in basin efficiency caused due to turbulence and other non ideal conditions.

$$Q = CIA \quad (\text{Eq. 2})$$

Where

Q = Peak basin influent flow rate measured in cubic feet per second (ft³/s)

C = Runoff coefficient (unitless)

I = Peak rainfall intensity for the 10-year, 6-hour rain event (in/hr)

A = Area draining into the sediment basin in acres

The design particle size should be the smallest soil grain size determined by wet sieve analysis, or the fine silt sized (0.01 mm [or 0.0004 in.]) particle, and the Vs used should be 100 percent of the calculated settling velocity.

This sizing basin method is dependent on the outlet structure design or the total basin length with an appropriate outlet. If the designer chooses to utilize the outlet structure to control the flow duration in the basin, the basin length (distance between the inlet and the outlet) should be a minimum of twice the basin width; the depth should not be less than 3 ft nor greater than 5 ft for safety reasons and for maximum efficiency (2 ft of sediment storage, 2 ft of capacity). If the designer chooses to utilize the basin length (with appropriate basin outlet) to control the flow duration in the basin, the basin length (distance between the inlet and the outlet) should be a specifically designed to capture 100% of the design particle size; the depth should not be less than 3 ft nor greater than 5 ft for safety reasons and for maximum efficiency (2 ft of sediment storage, 2 ft of capacity).

Basin design guidance provided herein assumes standard water properties (e.g., estimated average water temperature, kinematic viscosity, etc.) as a basis of the design. Designers can use an alternative design (Option 3) with site specific water properties as long as the design is as protective as Option 1.

The design guidance uses the peak influent flow rate to size sediment basins. Designers can use an alternative design (Option 3) with site specific average flow rates as long as the design is as protective as Option 1.

The basin should be located on the site where it can be maintained on a year-round basis and should be maintained on a schedule to retain the 2 ft of capacity.

Option 2:

Design pursuant to local ordinance for sediment basin design and maintenance, provided that the design efficiency is as protective or more protective of water quality than Option 1.

Option 3:

The use of an equivalent surface area design or equation provided that the design efficiency is as protective or more protective of water quality than Option 1.

B) Typical Sediment/Detention Basin Design Methodology:

Design of a sediment basin requires the designer to have an understanding of the site constraints, knowledge of the local soil (e.g., particle size distribution of potentially contributing soils), drainage area of the basin, and local hydrology. Designers should not assume that a sediment basin for location A is applicable to location B. Therefore, designers can use this factsheet as guidance but will need to apply professional judgment and knowledge of the site to design an effective and efficient sediment basin. The following provides a general overview of typical design methodologies:

Step 1. Hydrologic Design

- Evaluate the site constraints and assess the drainage area for the sediment basin. Designers should consider on- and off-site flows as well as changes in the drainage area associated with site construction/disturbance. To minimize additional construction during the course of the project, the designer should consider identifying the maximum drainage area when calculating the basin dimensions.
- If a local hydrology manual is not available, it is recommended to follow standard rational method procedures to estimate the flow rate. The references section of this factsheet provides a reference to standard hydrology textbooks that can provide standard methodologies. If local rainfall depths are not available, values can be obtained from standard precipitation frequency maps from NOAA (downloaded from <http://www.wrcc.dri.edu/pcpnfreq.html>).

Step 2. Hydraulic Design

- Calculate the surface area required for the sediment basin using Equation 1. In which the flow rate is estimated for a 10-yr 6-hr event using rational method procedure listed in local hydrology manual and V_s is estimated using Stokes Law presented in Equation 3.

$$V_s = 2.81d^2 \quad (\text{Eq.3})$$

Where

V_s = Settling velocity in feet per second at 68°F

d = diameter of sediment particle in millimeters (smallest soil grain size determined by wet sieve analysis or fine silt (0.01 mm [or 0.0004 in.]))

- In general, the basin outlet design requires an iterative trial and error approach that considered the maximum water surface elevation, the elevation versus volume (stage-storage) relationship, the elevation versus basin outflow (a.k.a.-discharge) relationship, and the estimated inflow hydrograph. To adequately design the basins to settle sediment, the outlet configuration and associated outflow rates can be estimated by numerous methodologies. The following provides some guidance for design the basin outlet:
 - An outlet should have more than one orifice.
 - An outlet design typically utilizes multiple horizontal rows of orifices (approximately 3 or more) with at least 2 orifices per row (see Figures 1 and 2 at the end of this fact sheet).

- Orifices can vary in shape.
- Select the appropriate orifice diameter and number of perforations per row with the objective of minimizing the number of rows while maximizing the detention time.
- The diameter of each orifice is typically a maximum of 3-4 inches and a minimum of 0.25-0.5 inches.
- If a rectangular orifice is used, it is recommended to have minimum height of 0.5 inches and a maximum height of 6 inches.
- Rows are typically spaced at three times the diameter center to center vertically with a minimum distance of approximately 4 inches on center and a maximum distance of 1 foot on center.
- To estimate the outflow rate, each row is calculated separately based on the flow through a single orifice then multiplied by the number of orifices in the row. This step is repeated for each of the rows. Once all of the orifices are estimated, the total outflow rate versus elevation (stage-discharge curve) is developed to evaluate the detention time within the basin.
- Flow through a single orifice can be estimated using an Equation 4:

$$Q = BC' A(2gH)^{0.5} \quad (\text{Eq.4})$$

Where

Q = Outflow rate in ft³/s

C' = Orifice coefficient (unitless)

A = Area of the orifice (ft²)

g = acceleration due to gravity (ft³/s)

H = Head above the orifice (ft)

B = Anticipated Blockage or clogging factor (unitless), It is dependent on anticipated sediment and debris load, trash rack configuration etc, so the value is dependent on design engineer's professional judgment and/or local requirements (B is never greater than 1 and a value of 0.5 is generally used)

- Care must be taken in the selection of orifice coefficient ("C'"); 0.60 is most often recommended and used. However, based on actual tests, Young and Graziano (1989), "Outlet Hydraulics of Extended Detention Facilities for Northern Virginia Planning District Commission", recommends the following:
 - C' = 0.66 for thin materials; where the thickness is equal to or less than the orifice diameter, or
 - C' = 0.80 when the material is thicker than the orifice diameter
- If different sizes of orifices are used along the riser then they have to be sized such that not more than 50 percent of the design storm event drains in one-third of the drawdown time (to provide adequate settling time for events smaller than the design storm event)

and the entire volume drains within 96 hours or as regulated by the local vector control agency. If a basin fails to drain within 96 hours, the basin must be pumped dry.

- Because basins are not maintained for infiltration, water loss by infiltration should be disregarded when designing the hydraulic capacity of the outlet structure.
- **Floating Outlet Skimmer:** The floating skimmer (see Figure 3 at the end of this fact sheet is an alternative outlet configuration (patented) that drains water from upper portion of the water column. This configuration has been used for temporary and permanent basins and can improve basin performance by eliminating bottom orifices which have the potential of discharging solids. Some design considerations for this alternative outlet device includes the addition of a sand filter or perforated under drain at the low point in the basin and near the floating skimmer. These secondary drains allow the basin to fully drain. More detailed guidelines for sizing the skimmer can be downloaded from <http://www.fairclothskimmer.com/>.
- **Hold and Release Valve:** An ideal sediment/detention basin would hold all flows to the design storm level for sufficient time to settle solids, and then slowly release the storm water. Implementing a reliable valve system for releasing detention basins is critical to eliminate the potential for flooding in such a system. Some variations of hold and release valves include manual valves, bladder devices or electrically operated valves. When a precipitation event is forecast, the valve would be close for the duration of the storm and appropriate settling time. When the settling duration is met (approximately 24 or 48 hours), the valve would be opened and allow the stormwater to be released at a rate that does not resuspend settled solids and in a non-erosive manner. If this type of system is used the valve should be designed to empty the entire basin within 96 hours or as stipulated by local vector control regulations.

Step 3. Evaluate the Capacity of the Sediment Basin

- Typically, sediment basins do not perform as designed when they are not properly maintained or the sediment yield to the basin is larger than expected. As part of a good sediment basin design, designers should consider maintenance cycles, estimated soil loss and/or sediment yield, and basin sediment storage volume. The two equations below can be used to quantify the amount of soil entering the basin.
- The Revised Universal Soil Loss Equation (RUSLE, Eq.5) can be used to estimate annual soil loss and the Modified Universal Soil Equation (MUSLE, Eq.6) can be used to estimate sediment yield from a single storm event.

$$A = R \times K \times LS \times C \times P \quad (\text{Eq.5})$$

$$Y = 95(Q \times q_p)^{0.56} \times K \times LS \times C \times P \quad (\text{Eq.6})$$

Where:

A = annual soil loss, tons/acre-year

R = rainfall erosion index, in 100 ft. Tons/acre.in/hr.

K = soil erodibility factor, tons/acre per unit of R

LS = slope length and steepness factor (unitless)

C = vegetative cover factor (unitless)

P = erosion control practice factor (unitless)

Y = single storm sediment yield in tons

Q = runoff volume in acre-feet

q_p = peak flow in cfs

- Detailed descriptions and methodologies for estimating the soil loss can be obtained from standard hydrology text books (See References section).
- Determination of the appropriate equation should consider construction duration and local environmental factors (soils, hydrology, etc.). For example, if a basin is planned for a project duration of 1 year and the designer specifies one maintenance cycle, RUSLE could be used to estimate the soil loss and thereby the designer could indicate that the sediment storage volume would be half of the soil loss value estimated. As an example, for use of MUSLE, a project may have a short construction duration thereby requiring fewer maintenance cycles and a reduced sediment storage volume. MUSLE would be used to estimate the anticipated soil loss based on a specific storm event to evaluate the sediment storage volume and appropriate maintenance frequency.
- The soil loss estimates are an essential step in the design, and it is essential that the designer provide construction contractors with enough information to understand maintenance frequency and/or depths within the basin that would trigger maintenance. Providing maintenance methods, frequency and specification should be included in design bid documents such as the SWPPP Site Map.
- Once the designer has quantified the amount of soil entering the basin, the depth required for sediment storage can be determined by dividing the estimated sediment loss by the surface area of the basin.

Step 4. Other Design Considerations

- Consider designing the volume of the settling zone for the total storm volume associated with the 2-year event or other appropriate design storms specified by the local agency. This volume can be used as a guide for sizing the basin without iterative routing calculations. The depth of the settling zone can be estimated by dividing the estimated 2-yr storm volume by the surface area of the basin.
- The basin volume consists of two zones:
 - A sediment storage zone at least 1 ft deep.
 - A settling zone at least 2 ft deep.

- The basin depth must be no less than 3 ft (not including freeboard).
- Proper hydraulic design of the outlet is critical to achieving the desired performance of the basin. The outlet should be designed to drain the basin within 24 to 96 hours (also referred to as “drawdown time”). The 24-hour limit is specified to provide adequate settling time; the 96-hour limit is specified to mitigate vector control concerns.
- Confirmation of the basin performance can be evaluated by routing the design storm (10-yr 6-hr, or as directed by local regulations) through the basin based on the basin volume (stage-storage curve) and the outlet design (stage-discharge curve based on the orifice configuration or equivalent outlet design).
- Sediment basins, regardless of size and storage volume, should include features to accommodate overflow or bypass flows that exceed the design storm event.
 - Include an emergency spillway to accommodate flows not carried by the principal spillway. The spillway should consist of an open channel (earthen or vegetated) over undisturbed material (not fill) or constructed of a non-erodible riprap (or equivalent protection) on fill slopes.
 - The spillway control section, which is a level portion of the spillway channel at the highest elevation in the channel, should be a minimum of 20 ft in length.
- Rock, vegetation or appropriate erosion control should be used to protect the basin inlet, outlet, and slopes against erosion.
- The total depth of the sediment basin should include the depth required for sediment storage, depth required for settling zone and freeboard of at least 1 foot or as regulated by local flood control agency for a flood event specified by the local agency.
- The basin alignment should be designed such that the length of the basin is more than twice the width of the basin; the length should be determined by measuring the distance between the inlet and the outlet. If the site topography does not allow for this configuration baffles should be installed so that the ratio is satisfied. If a basin has more than one inflow point, any inflow point that conveys more than 30 percent of the total peak inflow rate has to meet the required length to width ratio.
- An alternative basin sizing method proposed by Fifield (2004) can be consulted to estimate an alternative length to width ratio and basin configuration. These methods can be considered as part of Option 3 which allows for alternative designs that are protective or more protective of water quality.
- Baffles (see Figure 4 at the end of this fact sheet) can be considered at project sites where the existing topography or site constraints limit the length to width ratio. Baffles should be constructed of earthen berms or other structural material within the basin to divert flow in the basin, thus increasing the effective flow length from the basin inlet to the outlet riser. Baffles also reduce the change of short circuiting and allows for settling throughout the basin.

- Baffles are typically constructed from the invert of the basin to the crest of the emergency spillway (i.e., design event flows are meant to flow around the baffles and flows greater than the design event would flow over the baffles to the emergency spillway).
- Use of other materials for construction of basin baffles (such as silt fence) may not be appropriate based on the material specifications and will require frequent maintenance (maintain after every storm event). Maintenance may not be feasible when required due to flooded conditions resulting from frequent (i.e., back to back) storm events. Use of alternative baffle materials should not deviate from the intended purpose of the material, as described by the manufacturer.
- Sediment basins are best used in conjunction with erosion controls.
- Basins with an impounding levee greater than 4.5 ft tall, measured from the lowest point to the impounding area to the highest point of the levee, and basins capable of impounding more than 35,000 ft³, should be designed by a Registered Civil Engineer. The design should include maintenance requirements, including sediment and vegetation removal, to ensure continuous function of the basin outlet and bypass structures.
- A forebay, constructed upstream of the basin, may be provided to remove debris and larger particles.
- The outflow from the sediment basin should be provided with velocity dissipation devices (see BMP EC-10) to prevent erosion and scouring of the embankment and channel.
- The principal outlet should consist of a corrugated metal, high density polyethylene (HDPE), or reinforced concrete riser pipe with dewatering holes and an anti-vortex device and trash rack attached to the top of the riser, to prevent floating debris from flowing out of the basin or obstructing the system. This principal structure should be designed to accommodate the inflow design storm.
- A rock pile or rock-filled gabions can serve as alternatives to the debris screen, although the designer should be aware of the potential for extra maintenance involved should the pore spaces in the rock pile clog.
- The outlet structure should be placed on a firm, smooth foundation with the base securely anchored with concrete or other means to prevent floatation.
- Attach riser pipe (watertight connection) to a horizontal pipe (barrel). Provide anti-seep collars on the barrel.
- Cleanout level should be clearly marked on the riser pipe.

Installation

- Securely anchor and install an anti-seep collar on the outlet pipe/riser and provide an emergency spillway for passing major floods (see local flood control agency).
- Areas under embankments must be cleared and stripped of vegetation.

- Chain link fencing should be provided around each sediment basin to prevent unauthorized entry to the basin or if safety is a concern.

Costs

The cost of a sediment basin is highly variable and is dependent of the site configuration. To decrease basin construction costs, designers should consider using existing site features such as berms or depressed area to site the sediment basin. Designers should also consider potential savings associated with designing the basin to minimize the number of maintenance cycles and siting the basin in a location where a permanent BMP (e.g., extended detention basin) is required for the project site.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level and as required by local requirements. It is recommended that at a minimum, basins be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Examine basin banks for seepage and structural soundness.
- Check inlet and outlet structures and spillway for any damage or obstructions. Repair damage and remove obstructions as needed.
- Check inlet and outlet area for erosion and stabilize if required.
- Check fencing for damage and repair as needed.
- Sediment that accumulates in the basin must be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when sediment accumulation reaches one-half the designated sediment storage volume. Sediment removed during maintenance should be managed properly. The sediment should be appropriately evaluated and used or disposed of accordingly. Options include: incorporating sediment into earthwork on the site (only if there is no risk that sediment is contaminated); or off-site export/disposal at an appropriate location (e.g., sediment characterization and disposal to an appropriate landfill).
- Remove standing water from basin within 96 hours after accumulation.
- If the basin does not drain adequately (e.g., due to storms that are more frequent or larger than the design storm or other unforeseen site conditions), dewatering should be conducted in accordance with appropriate dewatering BMPs (see NS-2) and in accordance with local permits as applicable.
- To minimize vector production:
 - Remove accumulation of live and dead floating vegetation in basins during every inspection.
 - Remove excessive emergent and perimeter vegetation as needed or as advised by local or state vector control agencies.

Description and Purpose

A fiber roll (also known as wattles or logs) consists of straw, coir, curled wood fiber, or other biodegradable materials bound into a tight tubular roll wrapped by plastic netting, which can be photodegradable, or natural fiber, such as jute, cotton, or sisal. Additionally, gravel core fiber rolls are available, which contain an imbedded ballast material such as gravel or sand for additional weight when staking the rolls are not feasible (such as use as inlet protection). When fiber rolls are placed at the toe and on the face of slopes along the contours, they intercept runoff, reduce its flow velocity, release the runoff as sheet flow, and provide removal of sediment from the runoff (through sedimentation). By interrupting the length of a slope, fiber rolls can also reduce sheet and rill erosion until vegetation is established.

Suitable Applications

Fiber rolls may be suitable:

- Along the toe, top, face, and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.
- At the end of a downward slope where it transitions to a steeper slope.
- Along the perimeter of a project.
- As check dams in unlined ditches with minimal grade.
- Down-slope of exposed soil areas.

- SE-14 Biofilter Bags

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- At operational storm drains as a form of inlet protection.
- Around temporary stockpiles.

Limitations

- Fiber rolls should be used in conjunction with erosion control, such as hydroseed, RECPs, etc.
- Only biodegradable fiber rolls containing no plastic can remain on a site applying for a Notice of Termination due to plastic pollution and wildlife concerns (State Water Board, 2016). Fiber rolls containing plastic that are used on a site must be disposed of for final stabilization.
- Fiber rolls are not effective unless trenched in and staked. If not properly staked and trenched in, fiber rolls will not work as intended and could be transported by high flows.
- Not intended for use in high flow situations (i.e., for concentrated flows).
- Difficult to move once saturated.
- Fiber rolls have a limited sediment capture zone.
- Fiber rolls should not be used on slopes subject to creep, slumping, or landslide.
- Rolls typically function for 12-24 months, depending upon local conditions and roll material.

Implementation

Fiber Roll Materials

- Fiber rolls should be prefabricated.
- Fiber rolls may come manufactured containing polyacrylamide (PAM), a flocculating agent within the roll. Fiber rolls impregnated with PAM provide additional sediment removal capabilities and should be used in areas with fine, clayey or silty soils to provide additional sediment removal capabilities. Monitoring may be required for these installations.
- Fiber rolls are made from weed-free rice straw, flax, curled wood fiber, or coir bound into a tight tubular roll by netting or natural fiber (see *Limitations* above regarding plastic netting).
- Typical fiber rolls vary in diameter from 6 in. to 20 in. Larger diameter rolls are available as well. The larger the roll, the higher the sediment retention capacity.
- Typical fiber rolls lengths are 4, 10, 20 and 25 ft., although other lengths are likely available.

Installation

- Locate fiber rolls on level contours spaced as follows:
 - Slope inclination of 4:1 (H:V) or flatter: Fiber rolls should be placed at a maximum interval of 20 ft.

- Slope inclination between 4:1 and 2:1 (H:V): Fiber Rolls should be placed at a maximum interval of 15 ft. (a closer spacing is more effective).
- Slope inclination 2:1 (H:V) or greater: Fiber Rolls should be placed at a maximum interval of 10 ft. (a closer spacing is more effective).
- Prepare the slope before beginning installation.
- Dig small trenches across the slope on the contour. The trench depth should be $\frac{1}{4}$ to $\frac{1}{3}$ of the thickness of the roll, and the width should equal the roll diameter, in order to provide area to backfill the trench.
- It is critical that rolls are installed perpendicular to water movement, and parallel to the slope contour.
- Start building trenches and installing rolls from the bottom of the slope and work up.
- It is recommended that pilot holes be driven through the fiber roll. Use a straight bar to drive holes through the roll and into the soil for the wooden stakes.
- Turn the ends of the fiber roll up slope to prevent runoff from going around the roll.
- Stake fiber rolls into the trench.
 - Drive stakes at the end of each fiber roll and spaced 4 ft maximum on center.
 - Use wood stakes with a nominal classification of 0.75 by 0.75 in. and minimum length of 24 in.
- If more than one fiber roll is placed in a row, the rolls should be overlapped, not abutted.
- See typical fiber roll installation details at the end of this fact sheet.

Removal

- Fiber rolls can be left in place or removed depending on the type of fiber roll and application (temporary vs. permanent installation). Fiber rolls encased with plastic netting or containing any plastic material will need to be removed from the site for final stabilization. Fiber rolls used in a permanent application are to be encased with a non-plastic material and are left in place. Removal of a fiber roll used in a permanent application can result in greater disturbance; therefore, during the BMP planning phase, the areas where fiber rolls will be used on final slopes, only fiber rolls wrapped in non-plastic material should be selected.
- Temporary installations should only be removed when up gradient areas are stabilized per General Permit requirements, and/or pollutant sources no longer present a hazard. But they should also be removed before vegetation becomes too mature so that the removal process does not disturb more soil and vegetation than is necessary.

Costs

Material costs for straw fiber rolls range from \$26 - \$38 per 25-ft. roll¹ and curled wood fiber rolls range from \$30 - \$40 per roll².

Material costs for PAM impregnated fiber rolls range between \$9.00-\$12.00 per linear foot, based upon vendor research¹.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Repair or replace split, torn, unraveling, or slumping fiber rolls.
- If the fiber roll is used as a sediment capture device, or as an erosion control device to maintain sheet flows, sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when sediment accumulation reaches one-third the designated sediment storage depth.
- If fiber rolls are used for erosion control, such as in a check dam, sediment removal should not be required as long as the system continues to control the grade. Sediment control BMPs will likely be required in conjunction with this type of application.
- Repair any rills or gullies promptly.

TYPICAL FIBER ROLL INSTALLATION

N.T.S.

ENTRENCHMENT DETAIL

N.T.S.

Description and Purpose

Street sweeping and vacuuming includes use of self-propelled and walk-behind equipment to remove sediment from streets and roadways and to clean paved surfaces in preparation for final paving. Sweeping and vacuuming prevents sediment from the project site from entering storm drains or receiving waters.

Suitable Applications

Sweeping and vacuuming are suitable anywhere sediment is tracked from the project site onto public or private paved streets and roads, typically at points of egress. Sweeping and vacuuming are also applicable during preparation of paved surfaces for final paving.

Limitations

- Sweeping and vacuuming may not be effective when sediment is wet or when tracked soil is caked (caked soil may need to be scraped loose).
- Sweeping may be less effective for fine particle soils (i.e., clay).

Implementation

- Controlling the number of points where vehicles can leave the site will allow sweeping and vacuuming efforts to be focused and perhaps save money.
- Inspect potential sediment tracking locations daily.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Visible sediment tracking should be swept or vacuumed on a daily basis.
- Do not use kick brooms or sweeper attachments. These tend to spread the dirt rather than remove it.
- If not mixed with debris or trash, consider incorporating the removed sediment back into the project

Costs

Rental rates for self-propelled sweepers vary depending on hopper size and duration of rental. Expect rental rates from \$ 650/day to \$2,500/day¹, plus operator costs. Hourly production rates vary with the amount of area to be swept and amount of sediment. Match the hopper size to the area and expect sediment load to minimize time spent dumping.

Inspection and Maintenance

- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- When actively in use, points of ingress and egress must be inspected daily.
- When tracked or spilled sediment is observed outside the construction limits, it must be removed at least daily. More frequent removal, even continuous removal, may be required in some jurisdictions.
- Be careful not to sweep up any unknown substance or any object that may be potentially hazardous.
- Adjust brooms frequently; maximize efficiency of sweeping operations.
- After sweeping is finished, properly dispose of sweeper wastes at an approved dumpsite.

Description and Purpose

A sandbag barrier is a series of sand-filled bags placed on a level contour to intercept or to divert sheet flows. Sandbag barriers placed on a level contour pond sheet flow runoff, allowing sediment to settle out.

Suitable Applications

Sandbag barriers may be a suitable control measure for the applications described below. It is important to consider that sand bags are less porous than gravel bags and ponding or flooding can occur behind the barrier. Also, sand is easily transported by runoff if bags are damaged or ruptured. The SWPPP Preparer should select the location of a sandbag barrier with respect to the potential for flooding, damage, and the ability to maintain the BMP.

- As a linear sediment control measure:
 - Below the toe of slopes and erodible slopes.
 - As sediment traps at culvert/pipe outlets.
 - Below other small cleared areas.
 - Along the perimeter of a site.
 - Down slope of exposed soil areas.
 - Around temporary stockpiles and spoil areas.
 - Parallel to a roadway to keep sediment off paved areas.
 - Along streams and channels.

Targeted Constituents

Sediment	<input checked="" type="checkbox"/>
Nutrients	
Trash	
Metals	
Bacteria	
Oil and Grease	
Organics	

Potential Alternatives

- SE-1 Silt Fence
- SE-5 Fiber Rolls
- SE-6 Gravel Bag Berm
- SE-12 Manufactured Linear Sediment Controls
- SE-14 Biofilter Bags

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- As linear erosion control measure:
 - Along the face and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.
 - At the top of slopes to divert runoff away from disturbed slopes.
 - As check dams across mildly sloped construction roads.

Limitations

- It is necessary to limit the drainage area upstream of the barrier to 5 acres.
- Sandbags are not intended to be used as filtration devices.
- Easily damaged by construction equipment.
- Degraded sandbags may rupture when removed, spilling sand.
- Installation can be labor intensive.
- Durability of sandbags is somewhat limited, and bags will need to be replaced when there are signs of damage or wear.
- Burlap should not be used for sandbags.

Implementation

General

A sandbag barrier consists of a row of sand-filled bags placed on a level contour. When appropriately placed, a sandbag barrier intercepts and slows sheet flow runoff, causing temporary ponding. The temporary ponding allows sediment to settle. Sand-filled bags have limited porosity, which is further limited as the fine sand tends to quickly plug with sediment, limiting or completely blocking the rate of flow through the barrier. If a porous barrier is desired, consider SE-1, Silt Fence, SE-5, Fiber Rolls, SE-6, Gravel Bag Berms or SE-14, Biofilter Bags. Sandbag barriers also interrupt the slope length and thereby reduce erosion by reducing the tendency of sheet flows to concentrate into rivulets which erode rills, and ultimately gullies, into disturbed, sloped soils. Sandbag barriers are similar to gravel bag berms, but less porous. Generally, sandbag barriers should be used in conjunction with temporary soil stabilization controls up slope to provide effective erosion and sediment control.

Design and Layout

- Locate sandbag barriers on a level contour.
- When used for slope interruption, the following slope/sheet flow length combinations apply:
 - Slope inclination of 4:1 (H:V) or flatter: Sandbags should be placed at a maximum interval of 20 ft, with the first row near the slope toe.
 - Slope inclination between 4:1 and 2:1 (H:V): Sandbags should be placed at a maximum interval of 15 ft. (a closer spacing is more effective), with the first row near the slope toe.

- Slope inclination 2:1 (H:V) or greater: Sandbags should be placed at a maximum interval of 10 ft. (a closer spacing is more effective), with the first row near the slope toe.
- Turn the ends of the sandbag barrier up slope to prevent runoff from going around the barrier.
- Allow sufficient space up slope from the barrier to allow ponding, and to provide room for sediment storage.
- For installation near the toe of the slope, sand bag barriers should be set back from the slope toe to facilitate cleaning. Where specific site conditions do not allow for a set-back, the sand bag barrier may be constructed on the toe of the slope. To prevent flows behind the barrier, bags can be placed perpendicular to a berm to serve as cross barriers.
- Drainage area should not exceed 5 acres.
- Butt ends of bags tightly.
- Overlap butt joints of row beneath with each successive row.
- Use a pyramid approach when stacking bags.
- In non-traffic areas
 - Height = 18 in. maximum
 - Top width = 24 in. minimum for three or more-layer construction
 - Side slope = 2:1 (H:V) or flatter
- In construction traffic areas
 - Height = 12 in. maximum
 - Top width = 24 in. minimum for three or more-layer construction.
 - Side slopes = 2:1 (H:V) or flatter.
- See typical sandbag barrier installation details at the end of this fact sheet.

Materials

- **Sandbag Material:** Sandbag should be woven polypropylene, polyethylene or polyamide fabric, minimum unit weight of 4 ounces/yd², Mullen burst strength exceeding 300 lb/in² in conformance with the requirements in ASTM designation D3786, and ultraviolet stability exceeding 70% in conformance with the requirements in ASTM designation D4355. Use of burlap is not an acceptable substitute, as sand can more easily mobilize out of burlap.
- **Sandbag Size:** Each sand-filled bag should have a length of 18 in., width of 12 in., thickness of 3 in., and mass of approximately 33 lbs. Bag dimensions are nominal and may vary based on locally available materials.

- **Fill Material:** All sandbag fill material should be non-cohesive, Class 3 (Caltrans Standard Specification, Section 25) or similar permeable material free from clay and deleterious material, such as recycled concrete or asphalt.

Costs

Empty sandbags cost \$0.25 - \$0.75. Average cost of fill material is \$8 per yd³. Additional labor is required to fill the bags. Pre-filled sandbags are more expensive at \$1.50 - \$2.00 per bag. These costs are based upon vendor research.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Sandbags exposed to sunlight will need to be replaced every two to three months due to degradation of the bags.
- Reshape or replace sandbags as needed.
- Repair washouts or other damage as needed.
- Sediment that accumulates behind the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.
- Remove sandbags when no longer needed and recycle sand fill whenever possible and properly dispose of bag material. Remove sediment accumulation, and clean, re-grade, and stabilize the area.

SANDBAG BARRIER

NOTES

1. Construct the length of each reach so that the change in base elevation along the reach does not exceed $1/2$ the height of the linear barrier. In no case shall the reach length exceed 500'.
2. Place sandbags tightly.
3. Dimension may vary to fit field condition.
4. Sandbag barrier shall be a minimum of 3 bags high.
5. The end of the barrier shall be turned up slope.
6. Cross barriers shall be a min of $1/2$ and a max of $2/3$ the height of the linear barrier.
7. Sandbag rows and layers shall be staggered to eliminate gaps.

Sandbag Barrier

SE-8

Description and Purpose

Storm drain inlet protection consists of a sediment filter or an impounding area in, around or upstream of a storm drain, drop inlet, or curb inlet. Storm drain inlet protection measures temporarily pond runoff before it enters the storm drain, allowing sediment to settle. Some filter configurations also remove sediment by filtering, but usually the ponding action results in the greatest sediment reduction. Temporary geotextile storm drain inserts attach underneath storm drain grates to capture and filter storm water.

Suitable Applications

- Every storm drain inlet receiving runoff from unstabilized or otherwise active work areas should be protected. Inlet protection should be used in conjunction with other erosion and sediment controls to prevent sediment-laden stormwater and non-stormwater discharges from entering the storm drain system.

Limitations

- Drainage area should not exceed 1 acre.
- In general straw bales should not be used as inlet protection.
- Requires an adequate area for water to pond without encroaching into portions of the roadway subject to traffic.
- Sediment removal may be inadequate to prevent sediment discharges in high flow conditions or if runoff is heavily sediment laden. If high flow conditions are expected, use

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

other onsite sediment trapping techniques in conjunction with inlet protection.

- Frequent maintenance is required.
- Limit drainage area to 1 acre maximum. For drainage areas larger than 1 acre, runoff should be routed to a sediment-trapping device designed for larger flows. See BMPs SE-2, Sediment Basin, and SE-3, Sediment Traps.
- Excavated drop inlet sediment traps are appropriate where relatively heavy flows are expected, and overflow capability is needed.

Implementation

General

Inlet control measures presented in this handbook should not be used for inlets draining more than one acre. Runoff from larger disturbed areas should be first routed through SE-2, Sediment Basin or SE-3, Sediment Trap and/or used in conjunction with other drainage control, erosion control, and sediment control BMPs to protect the site. Different types of inlet protection are appropriate for different applications depending on site conditions and the type of inlet. Alternative methods are available in addition to the methods described/shown herein such as prefabricated inlet insert devices, or gutter protection devices.

Design and Layout

Identify existing and planned storm drain inlets that have the potential to receive sediment-laden surface runoff. Determine if storm drain inlet protection is needed and which method to use.

- The key to successful and safe use of storm drain inlet protection devices is to know where runoff that is directed toward the inlet to be protected will pond or be diverted as a result of installing the protection device.
 - Determine the acceptable location and extent of ponding in the vicinity of the drain inlet. The acceptable location and extent of ponding will influence the type and design of the storm drain inlet protection device.
 - Determine the extent of potential runoff diversion caused by the storm drain inlet protection device. Runoff ponded by inlet protection devices may flow around the device and towards the next downstream inlet. In some cases, this is acceptable; in other cases, serious erosion or downstream property damage can be caused by these diversions. The possibility of runoff diversions will influence whether or not storm drain inlet protection is suitable; and, if suitable, the type and design of the device.
- The location and extent of ponding, and the extent of diversion, can usually be controlled through appropriate placement of the inlet protection device. In some cases, moving the inlet protection device a short distance upstream of the actual inlet can provide more efficient sediment control, limit ponding to desired areas, and prevent or control diversions.
- Seven types of inlet protection are presented below. However, it is recognized that other effective methods and proprietary devices exist and may be selected.

- Silt Fence: Appropriate for drainage basins with less than a 5% slope, sheet flows, and flows under 0.5 cfs.
 - Excavated Drop Inlet Sediment Trap: An excavated area around the inlet to trap sediment (SE-3).
 - Gravel bag barrier: Used to create a small sediment trap upstream of inlets on sloped, paved streets. Appropriate for sheet flow or when concentrated flow may exceed 0.5 cfs, and where overtopping is required to prevent flooding.
 - Block and Gravel Filter: Appropriate for flows greater than 0.5 cfs.
 - Temporary Geotextile Storm drain Inserts: Different products provide different features. Refer to manufacturer details for targeted pollutants and additional features.
 - Biofilter Bag Barrier: Used to create a small retention area upstream of inlets and can be located on pavement or soil. Biofilter bags slowly filter runoff allowing sediment to settle out. Appropriate for flows under 0.5 cfs.
 - Compost Socks: Allow filtered run-off to pass through the compost while retaining sediment and potentially other pollutants (SE-13). Appropriate for flows under 1.0 cfs.
- Select the appropriate type of inlet protection and design as referred to or as described in this fact sheet.
 - Provide area around the inlet for water to pond without flooding structures and property.
 - Grates and spaces around all inlets should be sealed to prevent seepage of sediment-laden water.
 - Excavate sediment sumps (where needed) 1 to 2 ft with 2:1 side slopes around the inlet.

Installation

- **DI Protection Type 1 - Silt Fence** - Similar to constructing a silt fence; see BMP SE-1, Silt Fence. Do not place fabric underneath the inlet grate since the collected sediment may fall into the drain inlet when the fabric is removed or replaced and water flow through the grate will be blocked resulting in flooding. See typical Type 1 installation details at the end of this fact sheet.
 1. Excavate a trench approximately 6 in. wide and 6 in. deep along the line of the silt fence inlet protection device.
 2. Place 2 in. by 2 in. wooden stakes around the perimeter of the inlet a maximum of 3 ft apart and drive them at least 18 in. into the ground or 12 in. below the bottom of the trench. The stakes should be at least 48 in.
 3. Lay fabric along bottom of trench, up side of trench, and then up stakes. See SE-1, Silt Fence, for details. The maximum silt fence height around the inlet is 24 in.
 4. Staple the filter fabric (for materials and specifications, see SE-1, Silt Fence) to wooden stakes. Use heavy-duty wire staples at least 1 in. in length.

5. Backfill the trench with gravel or compacted earth all the way around.
- **DI Protection Type 2 - Excavated Drop Inlet Sediment Trap** - Install filter fabric fence in accordance with DI Protection Type 1. Size excavated trap to provide a minimum storage capacity calculated at the rate 67 yd³/acre of drainage area. See typical Type 2 installation details at the end of this fact sheet.
 - **DI Protection Type 3 - Gravel bag** - Flow from a severe storm should not overtop the curb. In areas of high clay and silts, use filter fabric and gravel as additional filter media. Construct gravel bags in accordance with SE-6, Gravel Bag Berm. Gravel bags should be used due to their high permeability. See typical Type 3 installation details at the end of this fact sheet.
 1. Construct on gently sloping street.
 2. Leave room upstream of barrier for water to pond and sediment to settle.
 3. Place several layers of gravel bags – overlapping the bags and packing them tightly together.
 4. Leave gap of one bag on the top row to serve as a spillway. Flow from a severe storm (e.g., 10-year storm) should not overtop the curb.
 - **DI Protection Type 4 – Block and Gravel Filter** - Block and gravel filters are suitable for curb inlets commonly used in residential, commercial, and industrial construction. See typical Type 4 installation details at the end of this fact sheet.
 1. Place hardware cloth or comparable wire mesh with 0.5 in. openings over the drop inlet so that the wire extends a minimum of 1 ft beyond each side of the inlet structure. If more than one strip is necessary, overlap the strips. Place woven geotextile over the wire mesh.
 2. Place concrete blocks lengthwise on their sides in a single row around the perimeter of the inlet, so that the open ends face outward, not upward. The ends of adjacent blocks should abut. The height of the barrier can be varied, depending on design needs, by stacking combinations of blocks that are 4 in., 8 in., and 12 in. wide. The row of blocks should be at least 12 in. but no greater than 24 in. high.
 3. Place wire mesh over the outside vertical face (open end) of the concrete blocks to prevent stone from being washed through the blocks. Use hardware cloth or comparable wire mesh with 0.5 in. opening.
 4. Pile washed stone against the wire mesh to the top of the blocks. Use 0.75 to 3 in.
 - **DI Protection Type 5 – Temporary Geotextile Insert (proprietary)** – Many types of temporary inserts are available. Most inserts fit underneath the grate of a drop inlet or inside of a curb inlet and are fastened to the outside of the grate or curb. These inserts are removable, and many can be cleaned and reused. Installation of these inserts differs between manufacturers. Please refer to manufacturer instruction for installation of proprietary devices.

- **DI Protection Type 6 - Biofilter bags** – Biofilter bags may be used as a substitute for gravel bags in low-flow situations. Biofilter bags should conform to specifications detailed in SE-14, Biofilter bags.
 1. Construct in a gently sloping area.
 2. Biofilter bags should be placed around inlets to intercept runoff flows.
 3. All bag joints should overlap by 6 in.
 4. Leave room upstream for water to pond and for sediment to settle out.
 5. Stake bags to the ground as described in the following detail. Stakes may be omitted if bags are placed on a paved surface.
- **DI Protection Type 7 – Compost Socks** – A compost sock can be assembled on site by filling a mesh sock (e.g., with a pneumatic blower). Compost socks do not require special trenching compared to other sediment control methods (e.g., silt fence). Compost socks should conform to specification detailed in SE-13, Compost Socks and Berms.

Costs

- Average annual cost for installation and maintenance of DI Type 1-4 and 6 (one-year useful life) is \$200 per inlet.
- Temporary geotextile inserts are proprietary, and cost varies by region. These inserts can often be reused and may have greater than 1 year of use if maintained and kept undamaged. Average cost per insert ranges from \$50-75 plus installation, but costs can exceed \$100. This cost does not include maintenance.
- See SE-13 for Compost Sock cost information.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Silt Fences. If the fabric becomes clogged, torn, or degrades, it should be replaced. Make sure the stakes are securely driven in the ground and are in good shape (i.e., not bent, cracked, or splintered, and are reasonably perpendicular to the ground). Replace damaged stakes. At a minimum, remove the sediment behind the fabric fence when accumulation reaches one-third the height of the fence or barrier height.
- Gravel Filters. If the gravel becomes clogged with sediment, it should be carefully removed from the inlet and either cleaned or replaced. Since cleaning gravel at a construction site may be difficult, consider using the sediment-laden stone as fill material and put fresh stone around the inlet. Inspect bags for holes, gashes, and snags, and replace bags as needed. Check gravel bags for proper arrangement and displacement.

- Sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.
- Inspect and maintain temporary geotextile insert devices according to manufacturer's specifications.
- Remove storm drain inlet protection once the drainage area is stabilized.
 - Clean and regrade area around the inlet and clean the inside of the storm drain inlet, as it should be free of sediment and debris at the time of final inspection.

SECTION A-A

PLAN

DI PROTECTION TYPE 1
NOT TO SCALE

NOTES:

1. For use in areas where grading has been completed and final soil stabilization and seeding are pending.
2. Not applicable in paved areas.
3. Not applicable with concentrated flows.

Section A-A

DI PROTECTION TYPE 2
NOT TO SCALE

Notes

1. For use in cleared and grubbed and in graded areas.
2. Shape basin so that longest inflow area faces longest length of trap.
3. For concentrated flows, shape basin in 2:1 ratio with length oriented towards direction of flow.

TYPICAL PROTECTION FOR INLET ON SUMP

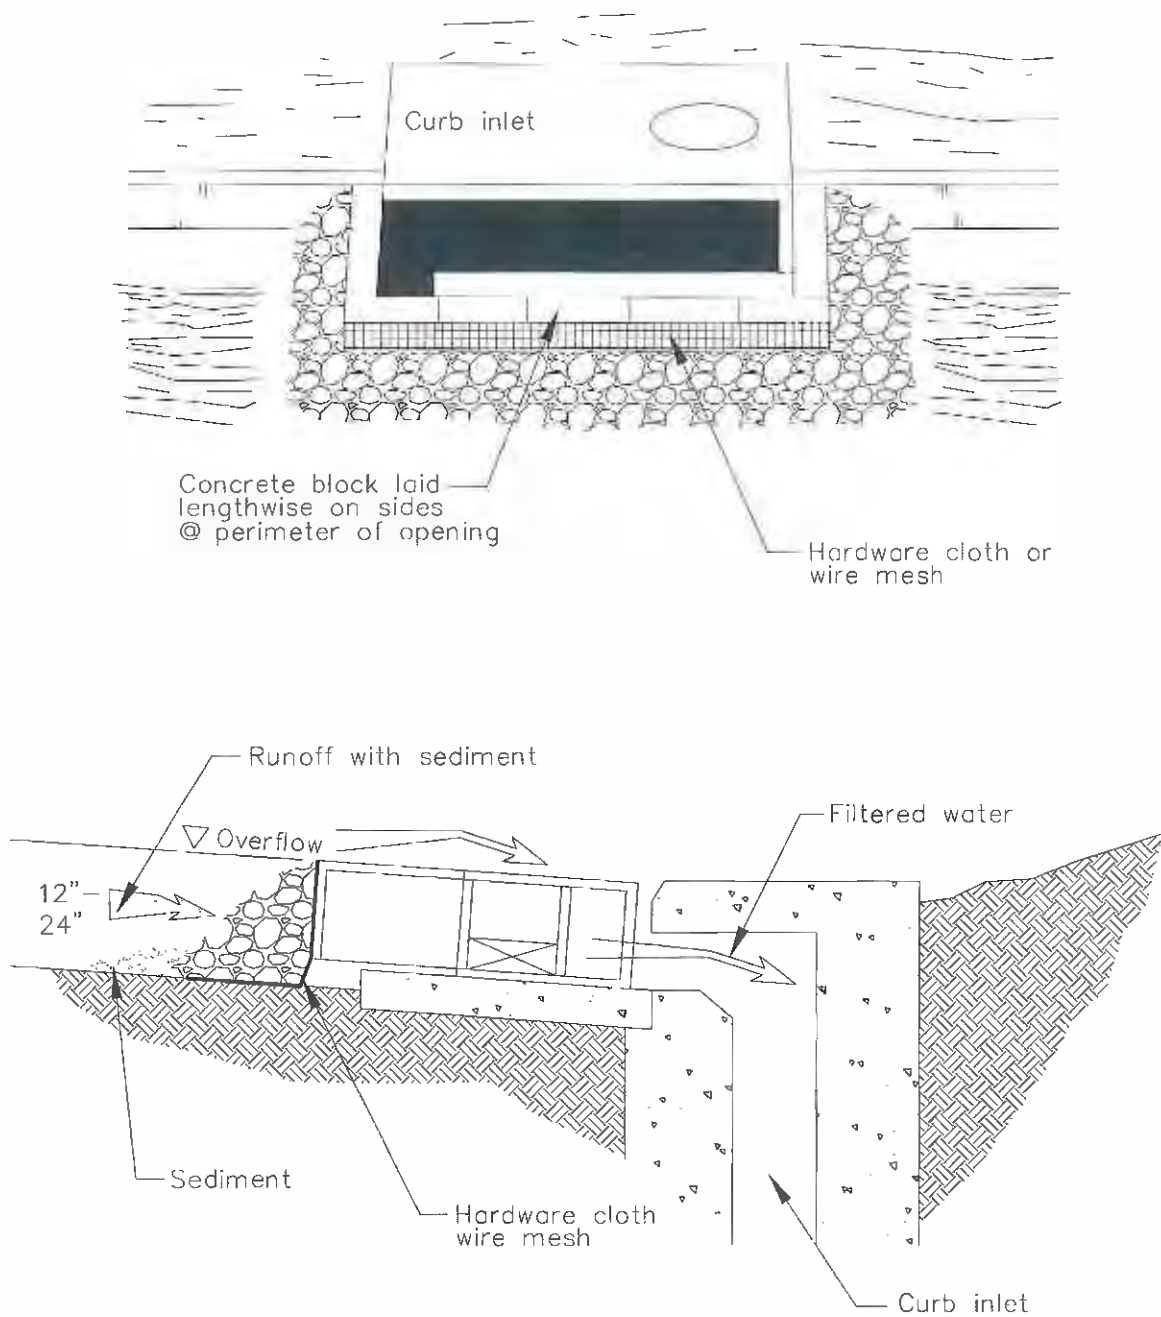

TYPICAL PROTECTION FOR INLET ON GRADE

NOTES:

1. Intended for short-term use.
2. Use to inhibit non-storm water flow.
3. Allow for proper maintenance and cleanup.
4. Bags must be removed after adjacent operation is completed.
5. Not applicable in areas with high silts and clays without filter fabric.
6. Protection can be effective even if it is not immediately adjacent to the inlet provided that the inlet is protected from potential sources of pollution.

DI PROTECTION TYPE 3
NOT TO SCALE

DI PROTECTION – TYPE 4

Description and Purpose

Active Treatment Systems (ATS) reduce turbidity of construction site runoff by introducing chemicals to stormwater through direct dosing or an electrical current to enhance flocculation, coagulation, and settling of the suspended sediment. Coagulants and flocculants are used to enhance settling and removal of suspended sediments and generally include inorganic salts and polymers (USACE, 2001). The increased flocculation aids in sedimentation and ability to remove fine suspended sediments, thus reducing stormwater runoff turbidity and improving water quality.

Suitable Applications

ATS can reliably provide exceptional reductions of turbidity and associated pollutants and should be considered where turbid discharges to sediment and turbidity sensitive waters cannot be avoided using traditional BMPs. Additionally, it may be appropriate to use an ATS when site constraints inhibit the ability to construct a correctly sized sediment basin, when clay and/or highly erosive soils are present, or when the site has very steep or long slope lengths.

Limitations

Dischargers choosing to utilize chemical treatment in an ATS must follow all guidelines of the Construction General Permit Attachment F – Active Treatment System Requirements. General limitations are as follows:

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Numeric Effluent Limit (NEL) for all discharges (10 NTU daily flow-weighted average)
- Limited availability of chemical residual testing procedures that meet permit requirements for flow-through treatment
- Specific field and classroom ATS training required to operate equipment
- Batch treatment requires extensive toxicity testing of effluent
- Batch treatment requires large footprint to accommodate treatment cells
- Requires additional filtration to remove residual floc and treatment chemicals prior to discharge
- Petroleum based polymers should not be used
- Requires site-specific design and equipment
- Limited discharge rates depending on receiving water body
- Labor intensive operation and maintenance
- ATS costs are higher on a unit basis for smaller sites that would be expected to have a lower volume of treated runoff
- ATS costs are seasonably variable due to increases or decreases in rainfall volumes

Implementation

Turbidity is difficult to control once fine particles are suspended in stormwater runoff from a construction site. Sedimentation ponds are effective at removing larger particulate matter by gravity settling but are ineffective at removing smaller particulates such as clay and fine silt. Sediment ponds are typically designed to remove sediment no smaller than medium silt (0.02 mm). ATS may be used to reduce the turbidity of stormwater runoff. With an ATS, very high turbidities can be reduced to levels comparable to what is found in streams during dry weather.

Criteria for ATS Product Use

Chemically treated stormwater discharged from construction sites must be non-toxic to aquatic organisms. The following protocol should be used to evaluate chemicals proposed for stormwater treatment at construction sites. Authorization to use a chemical in the field based on this protocol does not relieve the applicant from responsibility for meeting all discharge and receiving water criteria applicable to a site.

- An ATS Plan, which includes an Operation and Maintenance component, a Monitoring, Sampling and Reporting component, a Health and Safety component, and a Spill Prevention component must be prepared and submitted to the Regional Water Quality Control Board (RWQCB).

- Treatment chemicals should be approved by EPA for potable water use or otherwise be demonstrated to be protective of human health and the environment. Chemical residual or whole effluent toxicity testing is required.
- Prior to field use of chemical treatment, jar tests are to be conducted to demonstrate that turbidity reduction necessary to meet the NELs and receiving water criteria can be achieved. Test conditions, including but not limited to raw water quality and jar test procedures, should be indicative of field conditions. Although these small-scale tests cannot be expected to reproduce performance under field conditions, they are indicative of treatment capability. A minimum of six site-specific jar tests must be conducted per chemical.
- The proposed maximum dosage should be at least a factor of five lower than the no observed effects concentration (NOEC).
- Effluent discharge from an ATS to a receiving water is conditional upon the favorable results of full-scale whole effluent bioassay/toxicity testing for batch treatment systems and upon chemical residuals testing for flow-through systems.
- Contact the RWQCB for a list of treatment chemicals that may be pre-approved for use.

Active Treatment System Design Considerations

The design and operation of an ATS should take into consideration the factors that determine optimum, cost-effective performance. While site characteristics will influence system design, it is important to recognize the following overriding considerations:

- The right chemical must be used at the right dosage. A dosage that is either too low or too high will not produce the lowest turbidity. There is an optimum dosage rate. This is a situation where the adage “adding more is always better” is not the case.
- The coagulant must be mixed rapidly into the water to insure proper dispersion.
- The mixing system for batch treatment must be sized to provide adequate mixing for the design storage volume. Lack of adequate mixing during the flocculation phase results in flocs that are too small and/or insufficiently dense. Too much mixing can rapidly destroy floc as it is formed.
- Care must be taken in the design of the withdrawal system to minimize outflow velocities and to prevent floc discharge. The discharge should be directed through a filtration system such as sand, bag, or cartridge filter that would catch any unintended floc discharge.
- ATS is also regulated for pH of the discharge. A pH-adjusting chemical should be added into the treated water to control pH if the selected coagulant requires alteration of the pH of the discharge outside of the acceptable range.

Active Treatment System Design

ATS can be designed as batch treatment systems using either ponds or portable trailer-mounted tanks, or as flow-through systems using any number of proprietary designed systems.

Figure has been adapted from Port of Seattle response to Washington Dept. of Ecology Action Order 2948

Batch Treatment

Batch Treatment systems consist of the stormwater collection system (either temporary diversion or the permanent site drainage system); a sediment basin, trap or holding tanks; pumps; a chemical feed system; treatment cells; and, interconnecting piping.

Batch treatment systems should use a minimum of two lined treatment cells. Multiple treatment cells allow for clarification of treated water while other cells are being filled or emptied. Treatment cells may be basins, traps, or tanks. Portable tanks may also be suitable for some sites.

The following equipment should be located in a secured, covered location:

- The chemical injector
- Secondary containment for acid, caustic, buffering compound, and treatment chemical
- Emergency shower and eyewash
- Monitoring equipment which consists of a pH meter and a turbidimeter (if not already within the instrumentation panel of the chemical injector)

Flow-through Treatment

At a minimum, a flow-through ATS system consists of the stormwater collection system (either temporary diversion or the permanent site drainage system), an untreated stormwater storage pond or holding tank, and a chemically enhanced filtration system.

Stormwater is collected at interception point(s) on the site and is diverted by gravity or by pumping to an untreated stormwater storage pond or other untreated stormwater holding area.

The stormwater is stored until treatment occurs. It is important that the holding pond be large enough to provide adequate storage.

Stormwater is then pumped from the untreated stormwater storage pond to the chemically enhanced filtration system where polymer is added. Adjustments to pII may be necessary before chemical addition. The filtration system continually monitors the stormwater for turbidity and pH. If the discharge water is out of the acceptable turbidity or pH range, the water is recycled to the untreated stormwater pond (or holding tank) where it can be retreated. Flow through systems must ensure that:

- Cumulative flow volume shall be recorded daily. The data recording system shall have the capacity to record a minimum of seven days of continuous data.
- Instrumentation systems are interfaced with system control to provide auto shutoff or recirculation in the event that effluent measurements exceed turbidity or pH.
- Upon system upset, power failure, or other catastrophic event, the ATS will default to a recirculation mode or safe shut down.
- The instrumentation system provides a method for controlling coagulant dose, to prevent potential overdosing.

Sizing Criteria

An ATS shall be designed and approved by a Certified Professional in Erosion and Sediment Control (CPESC), a Certified Professional in Storm Water Quality (CPSWQ); a California registered civil engineer; or any other California registered engineer.

ATS must be designed to capture and treat (within 72 hours) runoff from the 10-year 24-hour storm event. The runoff volume of the watershed area to be treated from this size storm event is required to be calculated using the Rational Method with a runoff coefficient of 1.

If sediment basins are used to capture flow-through or batch treatment, see SE-2, Sediment Basin, for design criteria. Bypass should be provided around the ATS to accommodate extreme storm events. Primary settling should be encouraged in the sediment basin/storage pond. A forebay with access for maintenance may be beneficial.

The permissible discharge rate governed by potential downstream effect should be used to calculate the recommended size of the treatment cells. Local requirements related to Phase I or Phase II NPDES permit thresholds should be considered in developing maximum discharge rates the ATS Plan.

Costs

Costs for ATS may be significant due to equipment rental requirements and cost of chemicals. ATS cost is lower on a treated unit-basis for large construction sites with large volumes of runoff.

Inspection and Maintenance

ATS must be operated and maintained by individuals with experience in their use and trained in accordance with training requirements below. ATS should be monitored continuously while in

use. A designated responsible person shall be on site daily at all times during treatment operations. Daily on-site visual monitoring of the system for proper performance shall be conducted and recorded in the project data log. The name, phone number, and training documentation of the person responsible for system operation and monitoring shall be included in the project data log.

The following monitoring requirements and results should be recorded in the data log:

Operational and Compliance Monitoring

- Effluent flow rate and volume shall be continuously monitored and recorded at 15- minute or less intervals.
- Influent and effluent pH must be continuously monitored and recorded at 15-minute or less intervals.
- Influent and effluent turbidity (expressed in NTU) must be continuously monitored and recorded at 15-minute or less intervals.
- The type and amount of chemical used for pH adjustment, if any, shall be monitored and recorded.
- Dose rate of chemical used in the ATS system (expressed in mg/L) shall be monitored and reported 15-minutes after startup and every 8 hours of operation.
- Laboratory duplicates – monthly laboratory duplicates for residual coagulant analysis must be performed and records shall be maintained onsite.
- Effluent shall be monitored and recorded for residual chemical/additive levels.
- If a residual chemical/additive test does not exist and the ATS is operating in a batch treatment mode of operation refer to the toxicity monitoring requirements below.

Toxicity Monitoring

Batch Treatment

Toxicity testing for systems operated in batch treatment mode should be made in accordance with the following:

- Acute toxicity testing on effluent samples representing effluent from each batch prior to discharge shall be undertaken. All bioassays shall be sent to a laboratory certified by the Department of Health Services (DHIS) Environmental Laboratory Accreditation Program (ELAP). The required field of testing number for Whole Effluent Toxicity (WET) testing is E113.
- Acute toxicity tests shall be conducted with the following species and protocols. The methods to be used in the acute toxicity testing shall be those outlined for a 96-hour acute test in “Methods for Measuring the Acute Toxicity of Effluents and Receiving Water to Freshwater and Marine Organisms, USEPA-841-R-02-012” for Fathead minnow, *Pimephales promelas*. Rainbow trout, *Oncorhynchus mykiss*, may be used as a substitute for fathead minnow.

All toxicity tests shall meet quality assurance criteria and test acceptability criteria in the most recent versions of the EPA test method for WET testing.

Flow-through Treatment

Toxicity testing for systems operated in flow-through treatment mode should be made in accordance with the following:

- A residual chemical test method shall be used that has a method detection limit (MDL) of 10% or less than the maximum allowable threshold concentration (MATC) for the specific coagulant in use and for the most sensitive species of the chemical used. The MATC is equal to the geometric mean of the No Observed Effect Concentration (NOEC) and Lowest Observed Effect Concentration (LOEC) Acute and Chronic toxicity results for most sensitive species determined for the specific coagulant.
- The residual chemical test method shall produce a result within one hour of sampling.
- A California State certified laboratory shall validate the selected residual chemical test. Specifically, the lab will review the test protocol, test parameters, and the detection limit of the coagulant. The discharger shall electronically submit this documentation as part of the ATS Plan.

Numeric Effluent Limit (NEL) Compliance:

All chemically treated stormwater must be sampled and tested for compliance with pH and turbidity limits. These limits have been established by the Construction General Permit. Sampling and testing for other pollutants may also be necessary at some sites. Turbidity limits have been set as 10 NTU as a daily flow-weighted average or 20 NTU from a single sample. pH must be within the range of 6.0 to 9.0 standard units. It is often possible to discharge treated stormwater that has a lower turbidity than the receiving water and that matches the pH.

Treated stormwater samples and measurements should be taken from the discharge pipe or another location representative of the nature of the treated stormwater discharge. Samples used for determining compliance with the water quality standards in the receiving water should not be taken from the treatment pond prior to decanting. Compliance with the water quality standards is determined in the receiving water.

Operator Training:

Operators shall have training specific to using an ATS and liquid coagulants for stormwater discharges in California. The training shall be in the form of a formal class with a certificate and requirements for testing and certificate renewal. Training shall include a minimum of eight hours classroom and 32 hours field training.

Standard BMPs:

Erosion and sediment control BMPs should be implemented throughout the site to prevent erosion and discharge of sediment to the ATS. Some types of chemical coagulation and flocculation are only achievable in water below a certain turbidity; therefore, minimizing the amount of sediment reaching the system will increase the likelihood of meeting effluent limits and will potentially lower costs of chemical dosing.

Sediment Removal and Disposal

- Sediment shall be removed from the storage or treatment cells as necessary to ensure that the cells maintain their required water storage (i.e., volume) capability.
- Handling and disposal of all solids generated during ATS operations shall be done in accordance with all local, state, and federal laws and regulations.
- If sediment is determined to be non-toxic, it may be incorporated into the site away from drainages.

Manufactured Linear Sediment Controls (MLSC)

SE-12

Description and Purpose

Manufactured linear sediment controls (MLSC) are pre-manufactured devices that are typically specified and installed for drainage and sediment control on the perimeter of disturbed sites or stockpiles and as check dams within channels. Typically, MLSCs can be reused.

This fact sheet is intended to provide guidance on BMP selection and implementation of proprietary or vendor-supplied products, for sediment control. Products should be evaluated for project-specific implementation and used if determined to be appropriate by the SWPPP Preparer.

Suitable Applications

MLSCs are generally used in areas as a substitute for fiber rolls and silt fences in sediment control applications to slow down runoff water, divert drainage or contain fines and sediment. MLSCs are a linear control and application suitability varies based on the specific product type. They may be suitable:

- On paved surfaces for perimeter protection.
- As check structures in channels.
- Along the perimeter of disturbed sites in lieu of silt fence.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Manufactured Linear Sediment Controls (MLSC)

SE-12

- At operational storm drains as a form of inlet protection.
- Around temporary stockpiles or material/equipment storage areas.
- At the interface between graveled driveways and pavement.
- Along the toe of exposed and erodible slopes.

Limitations

- Limitations vary by product. Product manufacturer's printed product use instructions should be reviewed by the SWPPP Preparer to determine the project-specific applicability of MLSCs.

Implementation

General

When appropriately placed, MLSCs intercept and slow sheet flow runoff, causing temporary ponding. The temporary ponding provides quiescent conditions allowing sediment to settle. The device is porous, which allows the ponded runoff to flow slowly through the device, releasing the runoff as sheet flows. Generally, MLSCs should be used in conjunction with temporary soil stabilization controls up-slope to provide an effective combination of erosion and sediment control.

Design and Layout

- MLSCs used on soil should be trenched or attached to the ground per manufacturer specifications in a manner that precludes runoff or ponded water from flowing around or under the device.
- MLSCs designed for use on asphalt or concrete may be attached using a variety of methods, including nailing the device to the pavement, or using a high strength adhesive.
- Follow manufacturer written specifications when installing MLSCs.
- Allow sufficient space up-slope from the silt dike to allow ponding, and to provide room for sediment storage.
- For installation near the toe of the slope, MLSCs should be set back 3 feet from the slope toe to facilitate cleaning. Where site conditions do not allow set back, the sediment control may be constructed on the toe of the slope. To prevent flows behind the barrier, sand or gravel bags can be placed perpendicular and between the sediment control and slope to serve as a barrier to parallel flow.
- Drainage area should not exceed 5 acres.

Materials

- Several manufactured products are available. The following search terms or combination of terms can be used with an internet search engine to find manufactured linear sediment controls:

Manufactured Linear Sediment Controls (MLSC)

SE-12

- “silt barrier”
- “reusable silt fence”
- “silt fence alternative” or
- “perimeter sediment control”

Costs

Manufacturers should be contacted directly for current pricing.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Reshape or replace sections of damaged MLSCs as needed.
- Repair washouts or other damage as needed.
- Sediment that accumulates behind the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.
- Remove MLSCs when no longer needed. Remove sediment accumulation and clean, re-grade, and stabilize the area. Removed sediment should be incorporated in the project or disposed of properly.

Description and Purpose

Biofilter bags, or bio-bags, are a multi-purpose sediment control BMP consisting of a plastic mesh bag filled with 100% recycled wood product waste. Biofilter bags come in a variety of sizes (30" x 18" and 30" x 9" being common) and generally have between 1-2 cubic yards of recycled wood waste (or wood chips). Biofilter bags work by detaining flow and allowing a slow rate of discharge through the wood media. This action removes suspended sediment through gravity settling of the detained water and filtration within the bag.

Suitable Applications

Biofilter bags are a short-term BMP that can be rapidly deployed, maintained, and replaced. Biofilter bags can be an effective short-term solution to place in developed rills to prevent further erosion until permanent measures can be established. Suitable short-term applications include:

- As a linear sediment control measure:
 - Below the toe of slopes and erodible slopes
 - Below other small cleared areas
 - Along the perimeter of a site (with low-expected flow)
 - Down slope of exposed soil areas
 - Around temporary stockpiles and spoil areas
 - Parallel to a roadway to keep sediment off paved areas

Potential Alternatives

- SE-1 Silt Fence
- SE-4 Check Dams
- SE-5 Fiber Roll
- SE-6 Gravel Bag Berm
- SE-8 Sandbag Barrier
- SE-10 Storm Drain Inlet Protection

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Along streams and channels
- As linear erosion control measure:
 - Along the face and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow
 - At the top of slopes to divert runoff away from disturbed slopes
 - As check dams across mildly sloped construction roads
- Inlet Protection (See SE-10)
- Supplement to silt fences or other sediment control devices

Limitations

- Short life-span (maximum usefulness of 2-3 months and should be replaced more frequently if needed); regular maintenance and replacement required to ensure effectiveness. Bags will rapidly fill with sediment and reduce permeability.
- Easily damaged by construction vehicles.
- If not properly staked, will fail on slope applications.
- If improperly installed can allow undercutting or side-cutting flow.
- Not effective where water velocities or volumes are high.
- Potentially buoyant and easily displaced if not properly installed.

Implementation

General

Biofilter bags are a relatively low cost temporary BMP that are easily deployed and have a simple installation that can be performed by hand. Without proper installation, however, biofilter bags can fail due to their light weight, potential displacement, and multiple joint locations. One of the benefits of utilizing biofilter bags is that the media (wood-product) can be recycled or used onsite when no longer needed (where acceptable).

Design and Layout – Linear control

- Locate biofilter bags on level contours.
 - Slopes between 20:1 and 4:1 (H:V): Biofilter bags should be placed at a maximum interval of 20 ft, with the first row near the slope toe.
 - Slopes between 4:1 and 2:1 (H:V): Biofilter bags should be placed at a maximum interval of 15 ft, with the first row near the slope toe.
 - Slopes 2:1 (H:V) or steeper: Biofilter bags should be placed at a maximum interval of 10 ft., with the first row placed the slope toe.

- Turn the ends of the biofilter bag barriers up slope to prevent runoff from going around the berm.
- Allow sufficient space up slope from the biofilter bag berm to allow ponding, and to provide room for sediment storage.
- Stake biofilter bags into a 1 to 2 in. deep trench with a width equal to the bag.
 - Drive one stake at each end of the bag.
 - Use wood stakes with a nominal classification of 0.75 by 0.75 in. and minimum length of 24 in.
- Biofilter bags should be overlapped (6 in.), not abutted.

Costs

Pre-filled biofilter bags cost approximately \$3.20-\$4.50 per bag, dependent upon size (Adjusted for inflation, 2016 dollars, by Tetra Tech, Inc.).

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Biofilter bags exposed to sunlight will need to be replaced every two to three months due to degrading of the bags.
- Reshape or replace biofilter bags as needed.
- Repair washouts or other damage as needed.
- Sediment that is retained by the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.
- Remove biofilter bag berms when no longer needed. Remove sediment accumulation and clean, re-grade, and stabilize the area. Biofilter media may be used on-site, if allowed.

Description and Purpose

A stabilized construction access is defined by a point of entrance/exit to a construction site that is stabilized to reduce the tracking of mud and dirt onto public roads by construction vehicles.

Suitable Applications

Use at construction sites:

- Where dirt or mud can be tracked onto public roads.
- Adjacent to water bodies.
- Where poor soils are encountered.
- Where dust is a problem during dry weather conditions.

Limitations

- Entrances and exits require periodic top dressing with additional stones.
- This BMP should be used in conjunction with street sweeping on adjacent public right of way.
- Entrances and exits should be constructed on level ground only.
- Stabilized construction entrances are rather expensive to construct and when a wash rack is included, a sediment trap of some kind must also be provided to collect wash water runoff.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Stabilized Construction Entrance/Exit TC-1

Implementation

General

A stabilized construction entrance is a pad of aggregate underlain with filter cloth located at any point where traffic will be entering or leaving a construction site to or from a public right of way, street, alley, sidewalk, or parking area. The purpose of a stabilized construction entrance is to reduce or eliminate the tracking of sediment onto public rights of way or streets. Reducing tracking of sediments and other pollutants onto paved roads helps prevent deposition of sediments into local storm drains and production of airborne dust.

Where traffic will be entering or leaving the construction site, a stabilized construction entrance should be used. NPDES permits require that appropriate measures be implemented to prevent tracking of sediments onto paved roadways, where a significant source of sediments is derived from mud and dirt carried out from unpaved roads and construction sites.

Stabilized construction entrances are moderately effective in removing sediment from equipment leaving a construction site. The entrance should be built on level ground. Advantages of the Stabilized Construction Entrance/Exit is that it does remove some sediment from equipment and serves to channel construction traffic in and out of the site at specified locations. Efficiency is greatly increased when a washing rack is included as part of a stabilized construction entrance/exit.

Design and Layout

- Construct on level ground where possible.
- Select 3 to 6 in. diameter stones.
- Use minimum depth of stones of 12 in. or as recommended by soils engineer.
- Construct length of 50 ft or maximum site will allow, and 10 ft minimum width or to accommodate traffic.
- Rumble racks constructed of steel panels with ridges and installed in the stabilized entrance/exit will help remove additional sediment and to keep adjacent streets clean.
- Provide ample turning radii as part of the entrance.
- Limit the points of entrance/exit to the construction site.
- Limit speed of vehicles to control dust.
- Properly grade each construction entrance/exit to prevent runoff from leaving the construction site.
- Route runoff from stabilized entrances/exits through a sediment trapping device before discharge.
- Design stabilized entrance/exit to support heaviest vehicles and equipment that will use it.

Stabilized Construction Entrance/Exit TC-1

- Select construction access stabilization (aggregate, asphaltic concrete, concrete) based on longevity, required performance, and site conditions. Do not use asphalt concrete (AC) grindings for stabilized construction access/roadway.
- If aggregate is selected, place crushed aggregate over geotextile fabric to at least 12 in. depth, or place aggregate to a depth recommended by a geotechnical engineer. A crushed aggregate greater than 3 in. but smaller than 6 in. should be used.
- Designate combination or single purpose entrances and exits to the construction site.
- Require that all employees, subcontractors, and suppliers utilize the stabilized construction access.
- Implement SE-7, Street Sweeping and Vacuuming, as needed.
- All exit locations intended to be used for more than a two-week period should have stabilized construction entrance/exit BMPs.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMPs are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect local roads adjacent to the site daily. Sweep or vacuum to remove visible accumulated sediment.
- Remove aggregate, separate and dispose of sediment if construction entrance/exit is clogged with sediment.
- Keep all temporary roadway ditches clear.
- Check for damage and repair as needed.
- Replace gravel material when surface voids are visible.
- Remove all sediment deposited on paved roadways within 24 hours.
- Remove gravel and filter fabric at completion of construction

Costs

Average annual cost for installation and maintenance may vary from \$1,500 to \$6,100 each, averaging \$3,100 per entrance. Costs will increase with addition of washing rack and sediment trap. With wash rack, costs range from \$1,500 - \$7,700 each, averaging \$4,600 per entrance (All costs adjusted for inflation, 2016 dollars, by Tetra Tech Inc.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Access roads, subdivision roads, parking areas, and other onsite vehicle transportation routes should be stabilized immediately after grading, and frequently maintained to prevent erosion and control dust.

Suitable Applications

This BMP should be applied for the following conditions:

- Temporary Construction Traffic:
 - Phased construction projects and offsite road access
 - Construction during wet weather
- Construction roadways and detour roads:
 - Where mud tracking is a problem during wet weather
 - Where dust is a problem during dry weather
 - Adjacent to water bodies
 - Where poor soils are encountered

Limitations

- The roadway must be removed or paved when construction is complete.

- Certain chemical stabilization methods may cause stormwater or soil pollution and should not be used. See WE-1, Wind Erosion Control.
- Management of construction traffic is subject to air quality control measures. Contact the local air quality management agency.
- Materials will likely need to be removed prior to final project grading and stabilization.
- Use of this BMP may not be applicable to very short duration projects.

Implementation

General

Areas that are graded for construction vehicle transport and parking purposes are especially susceptible to erosion and dust. The exposed soil surface is continually disturbed, leaving no opportunity for vegetative stabilization. Such areas also tend to collect and transport runoff waters along their surfaces. During wet weather, they often become muddy quagmires that generate significant quantities of sediment that may pollute nearby streams or be transported offsite on the wheels of construction vehicles. Dirt roads can become so unstable during wet weather that they are virtually unusable.

Efficient construction road stabilization not only reduces onsite erosion but also can significantly speed onsite work, avoid instances of immobilized machinery and delivery vehicles, and generally improve site efficiency and working conditions during adverse weather.

Installation/Application Criteria

Permanent roads and parking areas should be paved as soon as possible after grading. As an alternative where construction will be phased, the early application of gravel or chemical stabilization may solve potential erosion and stability problems. Temporary gravel roadway should be considered during the rainy season and on slopes greater than 5%.

Temporary roads should follow the contour of the natural terrain to the maximum extent possible. Slope should not exceed 15%. Roadways should be carefully graded to drain transversely. Provide drainage swales on each side of the roadway in the case of a crowned section or one side in the case of a super elevated section. Simple gravel berms without a trench can also be used.

Installed inlets should be protected to prevent sediment laden water from entering the storm sewer system (SE-10, Storm Drain Inlet Protection). In addition, the following criteria should be considered.

- Road should follow topographic contours to reduce erosion of the roadway.
- The roadway slope should not exceed 15%.
- Chemical stabilizers or water are usually required on gravel or dirt roads to prevent dust (WE-1, Wind Erosion Control).
- Properly grade roadway to prevent runoff from leaving the construction site.
- Design stabilized access to support heaviest vehicles and equipment that will use it.

- Stabilize roadway using aggregate, asphalt concrete, or concrete based on longevity, required performance, and site conditions. The use of cold mix asphalt or asphalt concrete (AC) grindings for stabilized construction roadway is not allowed.
- Coordinate materials with those used for stabilized construction entrance/exit points.
- If aggregate is selected, place crushed aggregate over geotextile fabric to at least 12 in. depth. A crushed aggregate greater than 3 in. but smaller than 6 in. should be used.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Keep all temporary roadway ditches clear.
- When no longer required, remove stabilized construction roadway and re-grade and repair slopes.
- Periodically apply additional aggregate on gravel roads.
- Active dirt construction roads are commonly watered three or more times per day during the dry season.

Costs

Gravel construction roads are moderately expensive, but cost is often balanced by reductions in construction delay. No additional costs for dust control on construction roads should be required above that needed to meet local air quality requirements.

TC-1 Stabilized Construction Entrance/Exit

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

A tire wash is an area located at stabilized construction access points to remove sediment from tires and undercarriages and to prevent sediment from being transported onto public roadways.

Suitable Applications

Tire washes may be used on construction sites where dirt and mud tracking onto public roads by construction vehicles may occur.

Limitations

- The tire wash requires a supply of wash water.
- A turnout or doublewide exit is required to avoid having entering vehicles drive through the wash area.
- Do not use where wet tire trucks leaving the site leave the road dangerously slick.

Implementation

- Incorporate with a stabilized construction entrance/exit. See TC-1, Stabilized Construction Entrance/Exit.
- Construct on level ground when possible, on a pad of coarse aggregate greater than 3 in. but smaller than 6 in. A geotextile fabric should be placed below the aggregate.
- Wash rack should be designed and constructed/manufactured for anticipated traffic loads.

- Provide a drainage ditch that will convey the runoff from the wash area to a sediment trapping device. The drainage ditch should be of sufficient grade, width, and depth to carry the wash runoff.
- Use hoses with automatic shutoff nozzles to prevent hoses from being left on.
- Require that all employees, subcontractors, and others that leave the site with mud caked tires and undercarriages to use the wash facility.
- Implement SC-7, Street Sweeping and Vacuuming, as needed.

Costs

Costs are low for installation of wash rack.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.
- Remove accumulated sediment in wash rack and/or sediment trap to maintain system performance.
- Inspect routinely for damage and repair as needed.

Non-Stormwater Management and Material Management BMPs

4.1 Non-Stormwater Management BMPs

The [discharge](#) of materials other than [stormwater](#) and authorized [non-stormwater discharges](#) is prohibited by NPDES regulations as well as other local codes and ordinances. It is recognized that certain authorized non-stormwater discharges may be necessary for the completion of construction projects. Such discharges include, but are not limited to, irrigation of vegetative [erosion control](#) measures, and pipe flushing and testing.

Non-stormwater management [BMPs](#) are [source control BMPs](#) that prevent pollution by limiting or reducing potential [pollutants](#) at their source or eliminating off-site discharge. These practices involve day-to-day operations of the construction site and are usually under the control of the contractor. These BMPs are also referred to as “good housekeeping practices,” which involve keeping a clean, orderly construction site.

Non-stormwater management BMPs also include procedures and practices designed to minimize or eliminate the discharge of pollutants from vehicle and equipment cleaning, fueling, and maintenance operations to stormwater drainage systems or to watercourses.

Table 4-1 of this handbook lists the non-stormwater management BMPs. All these BMPs must be implemented depending on the conditions and applicability of deployment described as part of the BMP. The key to implementing these BMPs is to maintain a clean site and keep water, runoff, and run-on away from potential pollutants, including bare soil. In general, conduct construction activities so that: potential pollutants are not discharged directly to drainage systems; generation of potential pollutants is limited; and pollutants that are generated are contained and cleaned up immediately and are therefore not available for later discharge. These BMPs are fundamental to water quality protection and all sites must implement non-stormwater BMPs appropriate for the construction activities being performed.

Table 4-1 Non-Stormwater Management BMPs

BMP#	BMP Name

NS-15	Demolition Adjacent to Water ^{1, 2}
NS-16	Temporary Batch Plants ^{1, 3}
1) BMP fact sheet updated in 2009 2) BMP fact sheet updated in 2011 3) BMP fact sheet updated in 2012	

It is recommended that owners and contractors be vigilant regarding implementation of these BMPs, including making their implementation a condition of continued employment, and part of all prime and subcontract agreements. By doing so, the chance of inadvertent violation by an uncaring individual can be prevented, potentially saving thousands of dollars in fines and project delays. Also, if procedures are not properly implemented and/or if BMPs are compromised then the discharge may be subject to additional sampling and analysis requirements for non-visible pollutants contained in the [General Permit](#). (See Section 2.5.4.2. of this handbook)

4.2 Waste Management and Materials Pollution Control BMPs

[Waste management](#) and materials pollution control BMPs, like non-stormwater management BMPs, are source control BMPs that prevent pollution by limiting or reducing potential pollutants at their source before they come in contact with stormwater. These BMPs also involve day-to-day operations of the construction site, and are under the control of the contractor, and are additional “good housekeeping practices,” which involve keeping a clean, orderly construction site. These BMPs are fundamental to water quality protection and all sites must implement waste management and/or materials pollution control non-stormwater BMPs appropriate for the construction activities being performed.

Waste management consists of implementing procedural and structural BMPs for handling, storing, and disposing of wastes generated by a construction project to prevent the release of waste materials into stormwater runoff or discharges through proper management of the following types of wastes:

- Solid
- Sanitary
- Concrete
- Hazardous
- Equipment-related wastes

Materials pollution control (also called materials handling) consists of implementing procedural and structural BMPs in the handling of, storing, and the using of construction materials. The BMPs are intended to prevent the release of pollutants during stormwater and non-stormwater

Table 4-2 Waste Management and Materials Pollution Control BMPs

BMP#	BMP Name

discharges. The objective is to prevent or reduce the opportunity for contamination of stormwater runoff from construction materials by covering and/or providing secondary containment of storage areas and/or by taking adequate precautions when handling materials. These controls must be implemented for all applicable activities, material usage, and site conditions. The discharge of construction materials or wastes from a site is prohibited.

Table 4-2 of this handbook lists the waste management and materials pollution control BMPs. It is important to note that these BMPs should be implemented depending on the conditions/applicability of deployment described as part of the BMP.

4.3 Fact Sheet Format

A BMP fact sheet is a short document that presents detailed information about a particular BMP. Typically, each fact sheet contains the information outlined in Figure 4-1 of this handbook. Completed fact sheets for each of the above activities are provided in Section 4.4 of this handbook.

The fact sheets also contain side bar presentations with information on BMP categories, targeted constituents, removal effectiveness, and potential alternatives.

Example Fact Sheet

4.4 BMP Fact Sheets

BMP fact sheets for non-stormwater management and waste management and materials pollution control follow. The BMP fact sheets are individually page numbered and are suitable for inclusions in SWPPPs. Copies of the fact sheets can be individually downloaded from the CASQA Online BMP Handbook at <http://www.casqa.org>.

BMP fact sheets are guidance and intended to provide a range of information about the BMPs. The BMP fact sheets should not be interpreted as General Permit requirements. CASQA recognizes that there may be alternative public domain and/or proprietary practices performing similar function. Alternative products should be evaluated for project-specific implementation and used if determined to be appropriate by the QSD. Fact sheets do not address site-specific implementation application needs and modifications. The QSD should provide site specific implementation requirements in the SWPPP.

Description and Purpose

Wind erosion or dust control consists of applying water or other chemical dust suppressants as necessary to prevent or alleviate dust nuisance generated by construction activities. Covering small stockpiles or areas is an alternative to applying water or other dust palliatives.

California's Mediterranean climate, with a short "wet" season and a typically long, hot "dry" season, allows the soils to thoroughly dry out. During the dry season, construction activities are at their peak, and disturbed and exposed areas are increasingly subject to wind erosion, sediment tracking, and dust generated by construction equipment. Site conditions and climate can make dust control more of an erosion problem than water-based erosion. Additionally, many local agencies, including Air Quality Management Districts, require dust control and/or dust control permits in order to comply with local nuisance laws, opacity laws (visibility impairment) and the requirements of the Clean Air Act. Wind erosion control is required to be implemented at all construction sites greater than 1 acre by the General Permit.

Suitable Applications

Most BMPs that provide protection against water-based erosion will also protect against wind-based erosion and dust control requirements required by other agencies will generally meet wind erosion control requirements for water quality protection. Wind erosion control BMPs are suitable during the following construction activities:

- Construction vehicle traffic on unpaved roads
- Drilling and blasting activities
- Soils and debris storage piles
- Batch drop from front-end loaders
- Areas with unstabilized soil
- Final grading/site stabilization

Limitations

- Watering prevents dust only for a short period (generally less than a few hours) and should be applied daily (or more often) to be effective.
- Over watering may cause erosion and track-out.
- Oil or oil-treated subgrade should not be used for dust control because the oil may migrate into drainageways and/or seep into the soil.
- Chemical dust suppression agents may have potential environmental impacts. Selected chemical dust control agents should be environmentally benign.
- Effectiveness of controls depends on soil, temperature, humidity, wind velocity and traffic.
- Chemical dust suppression agents should not be used within 100 feet of wetlands or water bodies.
- Chemically treated subgrades may make the soil water repellant, interfering with long-term infiltration and the vegetation/re-vegetation of the site. Some chemical dust suppressants may be subject to freezing and may contain solvents and should be handled properly.
- In compacted areas, watering and other liquid dust control measures may wash sediment or other constituents into the drainage system.
- If the soil surface has minimal natural moisture, the affected area may need to be pre-wetted so that chemical dust control agents can uniformly penetrate the soil surface.

Implementation

Dust Control Practices

Dust control BMPs generally stabilize exposed surfaces and minimize activities that suspend or track dust particles. The following table presents dust control practices that can be applied to varying site conditions that could potentially cause dust. For heavily traveled and disturbed areas, wet suppression (watering), chemical dust suppression, gravel asphalt surfacing, temporary gravel construction entrances, equipment wash-out areas, and haul truck covers can be employed as dust control applications. Permanent or temporary vegetation and mulching can be employed for areas of occasional or no construction traffic. Preventive measures include minimizing surface areas to be disturbed, limiting onsite vehicle traffic to 15 mph or less, and controlling the number and activity of vehicles on a site at any given time.

Chemical dust suppressants include: mulch and fiber based dust palliatives (e.g. paper mulch with gypsum binder), salts and brines (e.g. calcium chloride, magnesium chloride), non-petroleum based organics (e.g. vegetable oil, lignosulfonate), petroleum based organics (e.g. asphalt emulsion, dust oils, petroleum resins), synthetic polymers (e.g. polyvinyl acetate, vinyl, acrylic), clay additives (e.g. bentonite, montmorillonite) and electrochemical products (e.g. enzymes, ionic products).

Site Condition	Dust Control Practices							
	Permanent Vegetation	Mulching	Wet Suppression (Watering)	Chemical Dust Suppression	Gravel or Asphalt	Temporary Gravel Construction Entrances/Equipment Wash Down	Synthetic Covers	Minimize Extent of Disturbed Area
Disturbed Areas not Subject to Traffic	X	X	X	X	X			X
Disturbed Areas Subject to Traffic			X	X	X	X		X
Material Stockpiles		X	X	X			X	X
Demolition			X			X	X	
Clearing/Excavation			X	X				X
Truck Traffic on Unpaved Roads			X	X	X	X	X	
Tracking					X	X		

Additional preventive measures include:

- Schedule construction activities to minimize exposed area (see EC-1, Scheduling).
- Quickly treat exposed soils using water, mulching, chemical dust suppressants, or stone/gravel layering.
- Identify and stabilize key access points prior to commencement of construction.
- Minimize the impact of dust by anticipating the direction of prevailing winds.
- Restrict construction traffic to stabilized roadways within the project site, as practicable.
- Water should be applied by means of pressure-type distributors or pipelines equipped with a spray system or hoses and nozzles that will ensure even distribution.
- All distribution equipment should be equipped with a positive means of shutoff.
- Unless water is applied by means of pipelines, at least one mobile unit should be available at all times to apply water or dust palliative to the project.
- If reclaimed waste water is used, the sources and discharge must meet California Department of Health Services water reclamation criteria and the Regional Water Quality

Control Board (RWQCB) requirements. Non-potable water should not be conveyed in tanks or drain pipes that will be used to convey potable water and there should be no connection between potable and non-potable supplies. Non-potable tanks, pipes, and other conveyances should be marked, "NON-POTABLE WATER - DO NOT DRINK."

- Pave or chemically stabilize access points where unpaved traffic surfaces adjoin paved roads.
- Provide covers for haul trucks transporting materials that contribute to dust.
- Provide for rapid clean up of sediments deposited on paved roads. Furnish stabilized construction road entrances and wheel wash areas.
- Stabilize inactive areas of construction sites using temporary vegetation or chemical stabilization methods.

For chemical stabilization, there are many products available for chemically stabilizing gravel roadways and stockpiles. If chemical stabilization is used, the chemicals should not create any adverse effects on stormwater, plant life, or groundwater and should meet all applicable regulatory requirements.

Costs

Installation costs for water and chemical dust suppression vary based on the method used and the length of effectiveness. Annual costs may be high since some of these measures are effective for only a few hours to a few days.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Check areas protected to ensure coverage.
- Most water-based dust control measures require frequent application, often daily or even multiple times per day. Obtain vendor or independent information on longevity of chemical dust suppressants.

Description and Purpose

Water conservation practices are activities that use water during the construction of a project in a manner that avoids causing erosion and the transport of pollutants offsite. These practices can reduce or eliminate non-stormwater discharges.

Suitable Applications

Water conservation practices are suitable for all construction sites where water is used, including piped water, metered water, trucked water, and water from a reservoir.

Limitations

- None identified.

Implementation

- Keep water equipment in good working condition.
- Stabilize water truck filling area.
- Repair water leaks promptly.
- Washing of vehicles and equipment on the construction site is discouraged.
- Avoid using water to clean construction areas. If water must be used for cleaning or surface preparation, surface should be swept and vacuumed first to remove dirt. This will minimize amount of water required.

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Direct construction water runoff to areas where it can soak into the ground or be collected and used.
- Authorized non-stormwater discharges to the storm drain system, channels, or receiving waters are acceptable with the implementation of appropriate BMPs.
- Lock water tank valves to prevent unauthorized use.

Costs

The cost is small to none compared to the benefits of conserving water.

Inspection and Maintenance

- Inspect and verify that activity based BMPs are in place prior to the commencement of authorized non-stormwater discharges.
- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges are occurring.
- Repair water equipment as needed to prevent unintended discharges.
 - Water trucks
 - Water reservoirs (water buffalos)
 - Irrigation systems
 - Hydrant connections

References

Stormwater Quality Handbooks - Construction Site Best Management Practices (BMPs) Manual, State of California Department of Transportation (Caltrans), November 2000.

Description and Purpose

Dewatering operations are practices that manage the discharge of pollutants when non-stormwater and accumulated precipitation (stormwater) must be removed from a work location to proceed with construction work or to provide vector control.

The General Permit incorporates Numeric Action Levels (NAL) for turbidity (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Discharges from dewatering operations can contain high levels of fine sediment that, if not properly treated, could lead to exceedances of the General Permit requirements or Basin Plan standards.

The dewatering operations described in this fact sheet are not Active Treatment Systems (ATS) and do not include the use of chemical coagulations, chemical flocculation or electrocoagulation.

Suitable Applications

These practices are implemented for discharges of non-stormwater from construction sites. Non-stormwaters include, but are not limited to, groundwater, water from cofferdams, water diversions, and waters used during construction activities that must be removed from a work area to facilitate construction.

Practices identified in this section are also appropriate for implementation when managing the removal of accumulated

precipitation (stormwater) from depressed areas at a construction site.

Stormwater mixed with non-stormwater should be managed as non-stormwater.

Limitations

- Dewatering operations will require and should comply with applicable local and project-specific permits and regulations. In some areas, all dewatering activities, regardless of the discharge volume, require a dewatering permit.
- Site conditions will dictate design and use of dewatering operations.
- The controls discussed in this fact sheet primarily address sediment. Other secondary pollutant removal benefits are discussed where applicable.
- The controls detailed in this fact sheet only allow for minimal settling time for sediment particles. Use only when site conditions restrict the use of the other control methods.
- Avoid dewatering discharges where possible by using the water for dust control.

Implementation

- A Construction Site Monitoring Plan (CSMP) should be included in the project Stormwater Pollution Prevention Plan (SWPPP).
- Regional Water Quality Control Board (RWQCB) Regions may require notification and approval prior to any discharge of water from construction sites.
- The destination of discharge from dewatering activities will typically determine the type of permit required for the discharge. For example, when discharging to a water of the U.S., a dewatering permit may be required through the site's governing RWQCB. When discharging to a sanitary sewer or Municipal Separate Storm Sewer System (MS4), a permit may need to be obtained from the owner of the sanitary sewer or MS4 in addition to obtaining an RWQCB dewatering permit. Additional permits or permissions from other agencies may be required for dewatering cofferdams or diversions.
- Dewatering discharges should not cause erosion at the discharge point. Appropriate BMPs should be implemented to maintain compliance with all applicable permits.
- Maintain dewatering records in accordance with all local and project-specific permits and regulations.

Sediment Treatment

A variety of methods can be used to treat water during dewatering operations. Several devices are presented below and provide options to achieve sediment removal. The sediment particle size and permit or receiving water limitations on sediment or turbidity are key considerations for selecting sediment treatment option(s); in some cases, the use of multiple devices may be appropriate. Use of other enhanced treatment methods (i.e., introduction of chemicals or electric current to enhance flocculation and removal of sediment) must comply with: 1) for storm drain or surface water discharges, the requirements for Active Treatment Systems (see SE-11); or 2) for sanitary sewer discharges, the requirements of applicable sanitary sewer discharge permits.

Sediment Basin (see also SE-2)

Description:

- A sediment basin is a temporary basin with a controlled release structure that is formed by excavation or construction of an embankment to detain sediment-laden runoff and allow sediment to settle out before discharging. Sediment basins are generally larger than Sediment Traps (SE-3) and have a designed outlet structure.

Appropriate Applications:

- Effective for the removal of trash, gravel, sand, silt, some metals that settle out with the sediment.

Implementation:

- Excavation and construction of related facilities is required.
- Temporary sediment basins should be fenced if safety is a concern.
- Outlet protection is required to prevent erosion at the outfall location.

Maintenance:

- Maintenance is required for safety fencing, vegetation, embankment, inlet and outlet, as well as other features.
- Removal of sediment is required when the storage volume is reduced by one-third.

Sediment Trap (See also SE-3)

Description:

- A sediment trap is a temporary basin formed by excavation and/or construction of an earthen embankment across a waterway or low drainage area to detain sediment-laden runoff and allow sediment to settle out before discharging. Sediment traps are generally smaller than Sediment Basins (SE-2) and do not have a designed outlet (but do have a spillway or overflow).

Appropriate Applications:

Effective for the removal of large and medium sized particles (sand and gravel) and some metals that settle out with the sediment.

Implementation:

- Excavation and construction of related facilities is required.
- Trap inlets should be located to maximize the travel distance to the trap outlet.
- Use rock or vegetation to protect the trap outlets against erosion.

Maintenance:

- Maintenance is required for vegetation, embankment, inlet and outfall structures, as well as other features.
- Removal of sediment is required when the storage volume is reduced by one-third.

Weir Tanks

Description:

- A weir tank separates water and waste by using weirs. The configuration of the weirs (over and under weirs) maximizes the residence time in the tank and determines the waste to be removed from the water, such as oil, grease, and sediments.

Appropriate Applications:

- The tank removes trash, some settleable solids (gravel, sand, and silt), some visible oil and grease, and some metals (removed with sediment). To achieve high levels of flow, multiple tanks can be used in parallel. If additional treatment is desired, the tanks can be placed in series or as pre-treatment for other methods.

Implementation:

- Tanks are delivered to the site by the vendor, who can provide assistance with set-up and operation.
- Tank size will depend on flow volume, constituents of concern, and residency period required. Vendors should be consulted to appropriately size tank.
- Treatment capacity (i.e., volume and number of tanks) should provide at a minimum the required volume for discrete particle settling for treatment design flows.

Maintenance:

- Periodic cleaning is required based on visual inspection or reduced flow.
- Oil and grease disposal should be conducted by a licensed waste disposal company.

Dewatering Tanks

Description:

- A dewatering tank removes debris and sediment. Flow enters the tank through the top, passes through a fabric filter, and is discharged through the bottom of the tank. The filter separates the solids from the liquids.

Appropriate Applications:

- The tank removes trash, gravel, sand, and silt, some visible oil and grease, and some metals (removed with sediment). To achieve high levels of flow, multiple tanks can be used in parallel. If additional treatment is desired, the tanks can be placed in series or as pre-treatment for other methods.

Implementation:

- Tanks are delivered to the site by the vendor, who can provide assistance with set-up and operation.
- Tank size will depend on flow volume, constituents of concern, and residency period required. Vendors should be consulted to appropriately size tank.

Maintenance:

- Periodic cleaning is required based on visual inspection or reduced flow.
- Oil and grease disposal should be conducted by licensed waste disposal company.

Gravity Bag Filter

Description:

- A gravity bag filter, also referred to as a dewatering bag, is a square or rectangular bag made of non-woven geotextile fabric that collects gravel, sand, silt, and fines.

Appropriate Applications:

- Effective for the removal of sediments (gravel, sand, silt, and fines). Some metals are removed with the sediment.

Implementation:

- Water is pumped into one side of the bag and seeps through the top, bottom, and sides of the bag.
- Place filter bag on pavement or a gravel bed or paved surface. Avoid placing a dewatering bag on unprotected bare soil. If placing the bag on bare soil is unavoidable, a secondary barrier should be used, such as a rock filter bed placed beneath and beyond the edges of the bag to, prevent erosion and capture sediments that escape the bag.
- Perimeter control around the downstream end of the bag should be implemented. Secondary sediment controls are important especially in the initial stages of discharge, which tend to allow fines to pass through the bag.

Maintenance:

- Inspection of the flow conditions, bag condition, bag capacity, and the secondary barrier (as applicable) is required.
- Replace the bag when it no longer filters sediment or passes water at a reasonable rate.
- Caution should be taken when removing and disposing of the bag, to prevent the release of captured sediment
- Properly dispose of the bag offsite. If sediment is removed from the bag prior to disposal (bags can potentially be reused depending upon their condition), dispose of sediment in accordance with the general maintenance procedures described at the end of this BMP Fact Sheet.

Sand Media Particulate Filter

Description:

- Water is treated by passing it through canisters filled with sand media. Generally, sand filters provide a final level of treatment. They are often used as a secondary or higher level of treatment after a significant amount of sediment and other pollutants have been removed using other methods.

Appropriate Applications:

- Effective for the removal of trash, gravel, sand, and silt and some metals, as well as the reduction of biochemical oxygen demand (BOD) and turbidity.
- Sand filters can be used for stand-alone treatment or in conjunction with bag and cartridge filtration if further treatment is required.
- Sand filters can also be used to provide additional treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance with installation and operation.

Maintenance:

- The filters require regular service to monitor and maintain the level of the sand media. If subjected to high loading rates, filters can plug quickly.
- Vendors generally provide data on maximum head loss through the filter. The filter should be monitored daily while in use and cleaned when head loss reaches target levels.
- If cleaned by backwashing, the backwash water may need to be hauled away for disposal or returned to the upper end of the treatment train for another pass through the series of dewatering BMPs.

Pressurized Bag Filter

Description:

- A pressurized bag filter is a unit composed of single filter bags made from polyester felt material. The water filters through the unit and is discharged through a header. Vendors provide bag filters in a variety of configurations. Some units include a combination of bag filters and cartridge filters for enhanced contaminant removal.

Appropriate Applications:

- Effective for the removal of sediment (sand and silt) and some metals, as well as the reduction of BOD, turbidity, and hydrocarbons. Oil absorbent bags are available for hydrocarbon removal.
- Filters can be used to provide secondary treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance with installation and operation.

Maintenance:

- The filter bags require replacement when the pressure differential equals or exceeds the manufacturer's recommendation.

Cartridge Filter

Description:

- Cartridge filters provide a high degree of pollutant removal by utilizing a number of individual cartridges as part of a larger filtering unit. They are often used as a secondary or higher (polishing) level of treatment after a significant amount of sediment and other pollutants are removed. Units come with various cartridge configurations (for use in series with bag filters) or with a larger single cartridge filtration unit (with multiple filters within).

Appropriate Applications:

- Effective for the removal of sediment (sand, silt, and some clays) and metals, as well as the reduction of BOD, turbidity, and hydrocarbons. Hydrocarbons can effectively be removed with special resin cartridges.
- Filters can be used to provide secondary treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance.

Maintenance:

- The cartridges require replacement when the pressure differential equals or exceeds the manufacturer's recommendation.

Costs

- Sediment control costs vary considerably depending on the dewatering and sediment treatment system that is selected. Pressurized filters tend to be more expensive than gravity settling but are often more effective. Simple tanks are generally rented on a long-term basis (one or more months) and can range from \$460 per month for a 1,000-gallon tank to \$3,400 per month for a 10,000-gallon tank (adjusted for inflation, 2016 dollars, by Tetra Tech Inc.). Mobilization and demobilization costs vary considerably.

Inspection and Maintenance

- Inspect and verify that dewatering BMPs are in place and functioning prior to the commencement of activities requiring dewatering.
- Inspect dewatering BMPs daily while dewatering activities are being conducted.

- Inspect all equipment before use. Monitor dewatering operations to ensure they do not cause offsite discharge or erosion.
- Sample dewatering discharges as required by the General Permit.
- Unit-specific maintenance requirements are included with the description of each unit.
- Sediment removed during the maintenance of a dewatering device may be either spread onsite and stabilized or disposed of at a disposal site as approved by the owner.
- Sediment that is commingled with other pollutants should be disposed of in accordance with all applicable laws and regulations and as approved by the owner.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the discharge of pollutants from paving operations, using measures to prevent runoff and runoff pollution, properly disposing of wastes, and training employees and subcontractors.

The General Permit incorporates Numeric Action Levels (NAL) for pH and turbidity (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Many types of construction materials associated with paving and grinding operations, including mortar, concrete, and cement and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications

These procedures are implemented where paving, surfacing, resurfacing, or sawcutting, may pollute stormwater runoff or discharge to the storm drain system or watercourses.

Limitations

- Paving opportunities may be limited during wet weather.

Discharges of freshly paved surfaces may raise pH to environmentally harmful levels and trigger permit violations.

Implementation

General

- Avoid paving during the wet season when feasible.
- Reschedule paving and grinding activities if rain is forecasted.
- Train employees and sub-contractors in pollution prevention and reduction.
- Store materials away from drainage courses to prevent stormwater runoff (see WM-1, Material Delivery and Storage).
- Protect drainage courses, particularly in areas with a grade, by employing BMPs to divert runoff or to trap and filter sediment.
- Stockpile material removed from roadways away from drain inlets, drainage ditches, and watercourses. These materials should be stored consistent with WM-3, Stockpile Management.
- Disposal of PCC (Portland cement concrete) and AC (asphalt concrete) waste should be in conformance with WM-8, Concrete Waste Management.

Saw Cutting, Grinding, and Pavement Removal

- Shovel or vacuum saw-cut slurry and remove from site. Cover or barricade storm drains during saw cutting to contain slurry.
- When paving involves AC, the following steps should be implemented to prevent the discharge of grinding residue, uncompacted or loose AC, tack coats, equipment cleaners, or unrelated paving materials:
 - AC grindings, pieces, or chunks used in embankments or shoulder backing should not be allowed to enter any storm drains or watercourses. Install inlet protection and perimeter controls until area is stabilized (i.e. cutting, grinding or other removal activities are complete and loose material has been properly removed and disposed of) or permanent controls are in place. Examples of temporary perimeter controls can be found in EC-9, Earth Dikes and Drainage Swales; SE-1, Silt Fence; SE-5, Fiber Rolls, or SE-13 Compost Socks and Berms
 - Collect and remove all broken asphalt and recycle when practical. Old or spilled asphalt should be recycled or disposed of properly.
- Do not allow saw-cut slurry to enter storm drains or watercourses. Residue from grinding operations should be picked up by a vacuum attachment to the grinding machine, or by sweeping, should not be allowed to flow across the pavement, and should not be left on the surface of the pavement. See also WM-8, Concrete Waste Management, and WM-10, Liquid Waste Management.
- Pavement removal activities should not be conducted in the rain.
- Collect removed pavement material by mechanical or manual methods. This material may be recycled for use as shoulder backing or base material.

- If removed pavement material cannot be recycled, transport the material back to an approved storage site.

Asphaltic Concrete Paving

- If paving involves asphaltic cement concrete, follow these steps:
 - Do not allow sand or gravel placed over new asphalt to wash into storm drains, streets, or creeks. Vacuum or sweep loose sand and gravel and properly dispose of this waste by referring to WM-5, Solid Waste Management.
 - Old asphalt should be disposed of properly. Collect and remove all broken asphalt from the site and recycle whenever possible.

Portland Cement Concrete Paving

- Do not wash sweepings from exposed aggregate concrete into a storm drain system. Collect waste materials by dry methods, such as sweeping or shoveling, and return to aggregate base stockpile or dispose of properly. Allow aggregate rinse to settle. Then, either allow rinse water to dry in a temporary pit as described in WM-8, Concrete Waste Management, or pump the water to the sanitary sewer if authorized by the local wastewater authority.

Sealing Operations

- During chip seal application and sweeping operations, petroleum or petroleum covered aggregate should not be allowed to enter any storm drain or water courses. Apply temporary perimeter controls until structure is stabilized (i.e. all sealing operations are complete and cured and loose materials have been properly removed and disposed).
- Inlet protection (SE-10, Storm Drain Inlet Protection) should be used during application of seal coat, tack coat, slurry seal, and fog seal.
- Seal coat, tack coat, slurry seal, or fog seal should not be applied if rainfall is predicted to occur during the application or curing period.

Paving Equipment

- Leaks and spills from paving equipment can contain toxic levels of heavy metals and oil and grease. Place drip pans or absorbent materials under paving equipment when not in use. Clean up spills with absorbent materials and dispose of in accordance with the applicable regulations. See NS-10, Vehicle and Equipment Maintenance, WM-4, Spill Prevention and Control, and WM-10, Liquid Waste Management.
- Substances used to coat asphalt transport trucks and asphalt spreading equipment should not contain soap and should be non-foaming and non-toxic.
- Paving equipment parked onsite should be parked over plastic to prevent soil contamination.
- Clean asphalt coated equipment offsite whenever possible. When cleaning dry, hardened asphalt from equipment, manage hardened asphalt debris as described in WM-5, Solid Waste Management. Any cleaning onsite should follow NS-8, Vehicle and Equipment Cleaning.

Thermoplastic Striping

- Thermoplastic striper and pre-heater equipment shutoff valves should be inspected to ensure that they are working properly to prevent leaking thermoplastic from entering drain inlets, the stormwater drainage system, or watercourses.
- Pre-heaters should be filled carefully to prevent splashing or spilling of hot thermoplastic. Leave six inches of space at the top of the pre-heater container when filling thermoplastic to allow room for material to move.
- Do not pre-heat, transfer, or load thermoplastic near drain inlets or watercourses.
- Clean truck beds daily of loose debris and melted thermoplastic. When possible, recycle thermoplastic material.

Raised/Recessed Pavement Marker Application and Removal

- Do not transfer or load bituminous material near drain inlets, the stormwater drainage system, or watercourses.
- Melting tanks should be loaded with care and not filled to beyond six inches from the top to leave room for splashing.
- When servicing or filling melting tanks, ensure all pressure is released before removing lids to avoid spills.
- On large-scale projects, use mechanical or manual methods to collect excess bituminous material from the roadway after removal of markers.

Costs

- All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of paving and grinding operations.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Sample stormwater runoff required by the General Permit.
- Keep ample supplies of drip pans or absorbent materials onsite.
- Inspect and maintain machinery regularly to minimize leaks and drips.

None

Description and Purpose

Procedures and practices designed for construction contractors to recognize illicit connections or illegally dumped or discharged materials on a construction site and report incidents.

Suitable Applications

This best management practice (BMP) applies to all construction projects. Illicit connection/discharge and reporting is applicable anytime an illicit connection or discharge is discovered, or illegally dumped material is found on the construction site.

Limitations

Illicit connections and illegal discharges or dumping, for the purposes of this BMP, refer to discharges and dumping caused by parties other than the contractor. If pre-existing hazardous materials or wastes are known to exist onsite, they should be identified in the SWPPP and handled as set forth in the SWPPP.

Implementation

Planning

- Review the SWPPP. Pre-existing areas of contamination should be identified and documented in the SWPPP.
- Inspect site before beginning the job for evidence of illicit connections, illegal dumping or discharges. Document any pre-existing conditions and notify the owner.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Inspect site regularly during project execution for evidence of illicit connections, illegal dumping or discharges.
- Observe site perimeter for evidence for potential of illicitly discharged or illegally dumped material, which may enter the job site.

Identification of Illicit Connections and Illegal Dumping or Discharges

- **General** – unlabeled and unidentifiable material should be treated as hazardous.
- **Solids** - Look for debris, or rubbish piles. Solid waste dumping often occurs on roadways with light traffic loads or in areas not easily visible from the traveled way.
- **Liquids** - signs of illegal liquid dumping or discharge can include:
 - Visible signs of staining or unusual colors to the pavement or surrounding adjacent soils
 - Pungent odors coming from the drainage systems
 - Discoloration or oily substances in the water or stains and residues detained within ditches, channels or drain boxes
 - Abnormal water flow during the dry weather season
- **Urban Areas** - Evidence of illicit connections or illegal discharges is typically detected at storm drain outfall locations or at manholes. Signs of an illicit connection or illegal discharge can include:
 - Abnormal water flow during the dry weather season
 - Unusual flows in sub drain systems used for dewatering
 - Pungent odors coming from the drainage systems
 - Discoloration or oily substances in the water or stains and residues detained within ditches, channels or drain boxes
 - Excessive sediment deposits, particularly adjacent to or near active offsite construction projects
- **Rural Areas** - Illicit connections or illegal discharges involving irrigation drainage ditches are detected by visual inspections. Signs of an illicit discharge can include:
 - Abnormal water flow during the non-irrigation season
 - Non-standard junction structures
 - Broken concrete or other disturbances at or near junction structures

Reporting

Notify the owner of any illicit connections and illegal dumping or discharge incidents at the time of discovery. For illicit connections or discharges to the storm drain system, notify the local stormwater management agency. For illegal dumping, notify the local law enforcement agency.

Cleanup and Removal

The responsibility for cleanup and removal of illicit or illegal dumping or discharges will vary by location. Contact the local stormwater management agency for further information.

Costs

Costs to look for and report illicit connections and illegal discharges and dumping are low. The best way to avoid costs associated with illicit connections and illegal discharges and dumping is to keep the project perimeters secure to prevent access to the site, to observe the site for vehicles that should not be there, and to document any waste or hazardous materials that exist onsite before taking possession of the site.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect the site regularly to check for any illegal dumping or discharge.
- Prohibit employees and subcontractors from disposing of non-job-related debris or materials at the construction site.
- Notify the owner of any illicit connections and illegal dumping or discharge incidents at the time of discovery.

References

Blueprint for a Clean Bay: Best Management Practices to Prevent Stormwater Pollution from Construction Related Activities; Santa Clara Valley Nonpoint Source Pollution Control Program, 1995.

Stormwater Quality Handbooks - Construction Site Best Management Practices (BMPs) Manual, State of California Department of Transportation (Caltrans), November 2000.

Stormwater Management for Construction Activities, Developing Pollution Prevention Plans and Best Management Practices, EPA 832-R-92005; USEPA, April 1992.

Description and Purpose

Vehicle and equipment cleaning procedures and practices eliminate or reduce the discharge of pollutants to stormwater from vehicle and equipment cleaning operations. Procedures and practices include but are not limited to: using offsite facilities; washing in designated, contained areas only; eliminating discharges to the storm drain by infiltrating the wash water; and training employees and subcontractors in proper cleaning procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment cleaning is performed.

Limitations

Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.

Implementation

Other options to washing equipment onsite include contracting with either an offsite or mobile commercial washing business. These businesses may be better equipped to handle and dispose of the wash waters properly. Performing this work offsite can also be economical by eliminating the need for a separate washing operation onsite.

If washing operations are to take place onsite, then:

NS	Non-Stormwater Management Control	<input checked="" type="checkbox"/>
WM	Waste Management and Materials Pollution Control	

Legend:

- ☒ Primary Objective
- ☒ Secondary Objective

Targeted Constituents

Sediment	<input checked="" type="checkbox"/>
Nutrients	<input checked="" type="checkbox"/>
Trash	
Metals	
Bacteria	
Oil and Grease	<input checked="" type="checkbox"/>
Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Use phosphate-free, biodegradable soaps.
- Educate employees and subcontractors on pollution prevention measures.
- Do not permit steam cleaning onsite. Steam cleaning can generate significant pollutant concentrates.
- Cleaning of vehicles and equipment with soap, solvents or steam should not occur on the project site unless resulting wastes are fully contained and disposed of. Resulting wastes should not be discharged or buried and must be captured and recycled or disposed according to the requirements of WM-10, Liquid Waste Management or WM-6, Hazardous Waste Management, depending on the waste characteristics. Minimize use of solvents. Use of diesel for vehicle and equipment cleaning is prohibited.
- All vehicles and equipment that regularly enter and leave the construction site must be cleaned offsite.
- When vehicle and equipment washing and cleaning must occur onsite, and the operation cannot be located within a structure or building equipped with appropriate disposal facilities, the outside cleaning area should have the following characteristics:
 - Located away from storm drain inlets, drainage facilities, or watercourses
 - Paved with concrete or asphalt and bermed to contain wash waters and to prevent runoff and runoff
 - Configured with a sump to allow collection and disposal of wash water
 - No discharge of wash waters to storm drains or watercourses
 - Used only when necessary
- When cleaning vehicles and equipment with water:
 - Use as little water as possible. High-pressure sprayers may use less water than a hose and should be considered
 - Use positive shutoff valve to minimize water usage
 - Facility wash racks should discharge to a sanitary sewer, recycle system or other approved discharge system and must not discharge to the storm drainage system, watercourses, or to groundwater

Costs

Cleaning vehicles and equipment at an offsite facility may reduce overall costs for vehicle and equipment cleaning by eliminating the need to provide similar services onsite. When onsite cleaning is needed, the cost to establish appropriate facilities is relatively low on larger, long-duration projects, and moderate to high on small, short-duration projects.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Inspection and maintenance is minimal, although some berm repair may be necessary.
- Monitor employees and subcontractors throughout the duration of the construction project to ensure appropriate practices are being implemented.
- Inspect sump regularly and remove liquids and sediment as needed.
- Prohibit employees and subcontractors from washing personal vehicles and equipment on the construction site.

Stormwater Quality Handbooks - Construction Site Best Management Practices (BMPs) Manual, State of California Department of Transportation (Caltrans), November 2000.

Swisher, R.D. Surfactant Biodegradation, Marcel Dekker Corporation, 1987.

Description and Purpose

Vehicle equipment fueling procedures and practices are designed to prevent fuel spills and leaks and reduce or eliminate contamination of stormwater. This can be accomplished by using offsite facilities, fueling in designated areas only, enclosing or covering stored fuel, implementing spill controls, and training employees and subcontractors in proper fueling procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment fueling takes place.

Limitations

Onsite vehicle and equipment fueling should only be used where it is impractical to send vehicles and equipment offsite for fueling. Sending vehicles and equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/ Exit.

Implementation

- Use offsite fueling stations as much as possible. These businesses are better equipped to handle fuel and spills properly. Performing this work offsite can also be economical by eliminating the need for a separate fueling area at a site.
- Discourage “topping-off” of fuel tanks.

Oil and Grease	<input checked="" type="checkbox"/>
Organics	

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Absorbent spill cleanup materials and spill kits should be available in fueling areas and on fueling trucks and should be disposed of properly after use.
- Drip pans or absorbent pads should be used during vehicle and equipment fueling, unless the fueling is performed over an impermeable surface in a dedicated fueling area.
- Use absorbent materials on small spills. Do not hose down or bury the spill. Remove the adsorbent materials promptly and dispose of properly.
- Avoid mobile fueling of mobile construction equipment around the site; rather, transport the equipment to designated fueling areas. With the exception of tracked equipment such as bulldozers and large excavators, most vehicles should be able to travel to a designated area with little lost time.
- Train employees and subcontractors in proper fueling and cleanup procedures.
- When fueling must take place onsite, designate an area away from drainage courses to be used. Fueling areas should be identified in the SWPPP.
- Dedicated fueling areas should be protected from stormwater runoff and should be located at least 50 ft away from downstream drainage facilities and watercourses. Fueling must be performed on level-grade areas.
- Protect fueling areas with berms and dikes to prevent runoff, and to contain spills.
- Nozzles used in vehicle and equipment fueling should be equipped with an automatic shutoff to control drips. Fueling operations should not be left unattended.
- Use vapor recovery nozzles to help control drips as well as air pollution where required by Air Quality Management Districts (AQMD).
- Federal, state, and local requirements should be observed for any stationary above ground storage tanks.

Costs

- All of the above measures are low cost except for the capital costs of above ground tanks that meet all local environmental, zoning, and fire codes.

Inspection and Maintenance

- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Vehicles and equipment should be inspected each day of use for leaks. Leaks should be repaired immediately, or problem vehicles or equipment should be removed from the project site.
- Keep ample supplies of spill cleanup materials onsite.

- Immediately clean up spills and properly dispose of contaminated soil and cleanup materials.

Vehicle & Equipment Maintenance NS-10

Description and Purpose

Prevent or reduce the contamination of stormwater resulting from vehicle and equipment maintenance by running a “dry and clean site”. The best option would be to perform maintenance activities at an offsite facility. If this option is not available then work should be performed in designated areas only, while providing cover for materials stored outside, checking for leaks and spills, and containing and cleaning up spills immediately. Employees and subcontractors must be trained in proper procedures.

Suitable Applications

These procedures are suitable on all construction projects where an onsite yard area is necessary for storage and maintenance of heavy equipment and vehicles.

Limitations

Onsite vehicle and equipment maintenance should only be used where it is impractical to send vehicles and equipment offsite for maintenance and repair. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.

Outdoor vehicle or equipment maintenance is a potentially significant source of stormwater pollution. Activities that can contaminate stormwater include engine repair and service, changing or replacement of fluids, and outdoor equipment storage and parking (engine fluid leaks). For further information on vehicle or equipment servicing, see NS-8,

Vehicle & Equipment Maintenance NS-10

Vehicle and Equipment Cleaning, and NS-9, Vehicle and Equipment Fueling.

Implementation

- Use offsite repair shops as much as possible. These businesses are better equipped to handle vehicle fluids and spills properly. Performing this work offsite can also be economical by eliminating the need for a separate maintenance area.
- If maintenance must occur onsite, use designated areas, located away from drainage courses. Dedicated maintenance areas should be protected from stormwater runoff and should be located at least 50 ft from downstream drainage facilities and watercourses.
- Drip pans or absorbent pads should be used during vehicle and equipment maintenance work that involves fluids, unless the maintenance work is performed over an impermeable surface in a dedicated maintenance area.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- All fueling trucks and fueling areas are required to have spill kits and/or use other spill protection devices.
- Use adsorbent materials on small spills. Remove the absorbent materials promptly and dispose of properly.
- Inspect onsite vehicles and equipment daily at startup for leaks, and repair immediately.
- Keep vehicles and equipment clean; do not allow excessive build-up of oil and grease.
- Segregate and recycle wastes, such as greases, used oil or oil filters, antifreeze, cleaning solutions, automotive batteries, hydraulic and transmission fluids. Provide secondary containment and covers for these materials if stored onsite.
- Train employees and subcontractors in proper maintenance and spill cleanup procedures.
- Drip pans or plastic sheeting should be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is planned to be idle for more than 1 hour.
- For long-term projects, consider using portable tents or covers over maintenance areas if maintenance cannot be performed offsite.
- Consider use of new, alternative greases and lubricants, such as adhesive greases, for chassis lubrication and fifth-wheel lubrication.
- Properly dispose of used oils, fluids, lubricants, and spill cleanup materials.
- Do not place used oil in a dumpster or pour into a storm drain or watercourse.
- Properly dispose of or recycle used batteries.
- Do not bury used tires.

Vehicle & Equipment Maintenance NS-10

- Repair leaks of fluids and oil immediately.

Listed below is further information if you must perform vehicle or equipment maintenance onsite.

Safer Alternative Products

- Consider products that are less toxic or hazardous than regular products. These products are often sold under an “environmentally friendly” label.
- Consider use of grease substitutes for lubrication of truck fifth-wheels. Follow manufacturers label for details on specific uses.
- Consider use of plastic friction plates on truck fifth-wheels in lieu of grease. Follow manufacturers label for details on specific uses.

Waste Reduction

Parts are often cleaned using solvents such as trichloroethylene, trichloroethane, or methylene chloride. Many of these cleaners are listed in California Toxic Rule as priority pollutants. These materials are harmful and must not contaminate stormwater. They must be disposed of as a hazardous waste. Reducing the number of solvents makes recycling easier and reduces hazardous waste management costs. Often, one solvent can perform a job as well as two different solvents. Also, if possible, eliminate or reduce the amount of hazardous materials and waste by substituting non-hazardous or less hazardous materials. For example, replace chlorinated organic solvents with non-chlorinated solvents. Non-chlorinated solvents like kerosene or mineral spirits are less toxic and less expensive to dispose of properly. Check the list of active ingredients to see whether it contains chlorinated solvents. The “chlor” term indicates that the solvent is chlorinated. Also, try substituting a wire brush for solvents to clean parts.

Recycling and Disposal

Separating wastes allows for easier recycling and may reduce disposal costs. Keep hazardous wastes separate, do not mix used oil solvents, and keep chlorinated solvents (like, trichloroethane) separate from non-chlorinated solvents (like kerosene and mineral spirits). Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around. Provide cover and secondary containment until these materials can be removed from the site.

Oil filters can be recycled. Ask your oil supplier or recycler about recycling oil filters.

Do not dispose of extra paints and coatings by dumping liquid onto the ground or throwing it into dumpsters. Allow coatings to dry or harden before disposal into covered dumpsters.

Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Costs

All of the above are low cost measures. Higher costs are incurred to setup and maintain onsite maintenance areas.

Vehicle & Equipment Maintenance NS-10

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Keep ample supplies of spill cleanup materials onsite.
- Maintain waste fluid containers in leak proof condition.
- Vehicles and equipment should be inspected on each day of use. Leaks should be repaired immediately, or the problem vehicle(s) or equipment should be removed from the project site.
- Inspect equipment for damaged hoses and leaky gaskets routinely. Repair or replace as needed.

References

Blueprint for a Clean Bay: Best Management Practices to Prevent Stormwater Pollution from Construction Related Activities; Santa Clara Valley Nonpoint Source Pollution Control Program, 1995.

Stormwater Quality Handbooks - Construction Site Best Management Practices (BMPs) Manual, State of California Department of Transportation (Caltrans), November 2000.

Description and Purpose

Concrete curing is used in the construction of structures such as bridges, retaining walls, pump houses, large slabs, and structured foundations. Concrete curing includes the use of both chemical and water methods.

Concrete and its associated curing materials have basic chemical properties that can raise the pH of water to levels outside of the permitted range. Discharges of stormwater and non-stormwater exposed to concrete during curing may have a high pH and may contain chemicals, metals, and fines. The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Proper procedures and care should be taken when managing concrete curing materials to prevent them from coming into contact with stormwater flows, which could result in a high pH discharge.

Suitable Applications

Suitable applications include all projects where Portland Cement Concrete (PCC) and concrete curing chemicals are placed where they can be exposed to rainfall, runoff from other areas, or where runoff from the PCC will leave the site.

Limitations

- Runoff contact with concrete waste can raise pH levels in the water to environmentally harmful levels and trigger permit violations.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Implementation

Chemical Curing

- Avoid over spray of curing compounds.
- Minimize the drift by applying the curing compound close to the concrete surface. Apply an amount of compound that covers the surface but does not allow any runoff of the compound.
- Use proper storage and handling techniques for concrete curing compounds. Refer to WM-1, Material Delivery and Storage.
- Protect drain inlets prior to the application of curing compounds.
- Refer to WM-4, Spill Prevention and Control.

Water Curing for Bridge Decks, Retaining Walls, and other Structures

- Direct cure water away from inlets and watercourses to collection areas for evaporation or other means of removal in accordance with all applicable permits. See WM-8 Concrete Waste Management.
- Collect cure water at the top of slopes and transport to a concrete waste management area in a non-erosive manner. See EC-9 Earth Dikes and Drainage Swales, EC-10, Velocity Dissipation Devices, and EC-11, Slope Drains.
- Utilize wet blankets or a similar method that maintains moisture while minimizing the use and possible discharge of water.

Education

- Educate employees, subcontractors, and suppliers on proper concrete curing techniques to prevent contact with discharge as described herein.
- Arrange for the QSP or the appropriately trained contractor's superintendent or representative to oversee and enforce concrete curing procedures.

Costs

All of the above measures are generally low cost.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Sample non-stormwater discharges and stormwater runoff that contacts uncured and partially cured concrete as required by the General Permit.

- Ensure that employees and subcontractors implement appropriate measures for storage, handling, and use of curing compounds.
- Inspect cure containers and spraying equipment for leaks.

Description and Purpose

Concrete finishing methods are used for bridge deck rehabilitation, paint removal, curing compound removal, and final surface finish appearances. Methods include sand blasting, shot blasting, grinding, or high-pressure water blasting. Stormwater and non-stormwater exposed to concrete finishing by-products may have a high pH and may contain chemicals, metals, and fines. Proper procedures and implementation of appropriate BMPs can minimize the impact that concrete-finishing methods may have on stormwater and non-stormwater discharges.

The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Concrete and its associated curing materials have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications

These procedures apply to all construction locations where concrete finishing operations are performed.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

- Runoff contact with concrete waste can raise pH levels in the water to environmentally harmful levels and trigger permit violations.

Implementation

- Collect and properly dispose of water from high-pressure water blasting operations.
- Collect contaminated water from blasting operations at the top of slopes. Transport or dispose of contaminated water while using BMPs such as those for erosion control. Refer to EC-9, Earth Dikes and Drainage Swales, EC-10, Velocity Dissipation Devices, and EC-11, Slope Drains.
- Direct water from blasting operations away from inlets and watercourses to collection areas for infiltration or other means of removal (dewatering). Refer to NS-2 Dewatering Operations.
- Protect inlets during sandblasting operations. Refer to SE-10, Storm Drain Inlet Protection.
- Refer to WM-8, Concrete Waste Management for disposal of concrete debris.
- Minimize the drift of dust and blast material as much as possible by keeping the blasting nozzle close to the surface.
- When blast residue contains a potentially hazardous waste, refer to WM-6, Hazardous Waste Management.

Education

- Educate employees, subcontractors, and suppliers on proper concrete finishing techniques to prevent contact with discharge as described herein.
- Arrange for the QSP or the appropriately trained contractor's superintendent or representative to oversee and enforce concrete finishing procedures.

Costs

These measures are generally of low cost.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Sample non-stormwater discharges and stormwater runoff that contacts concrete dust and debris as required by the General Permit.

- Sweep or vacuum up debris from sandblasting at the end of each shift.
- At the end of each work shift, remove and contain liquid and solid waste from containment structures, if any, and from the general work area.
- Inspect containment structures for damage prior to use and prior to onset of forecasted rain.

Stormwater Management for Construction Activities, Developing Pollution Prevention Plans and Best Management Practices, EPA 832-R-92005; USEPA, April 1992.

Description and Purpose

The construction of roads, bridges, retaining walls, and other large structures in remote areas, often requires temporary batch plant facilities to manufacture Portland Cement Concrete (PCC) or asphalt cement (AC). Temporary batch plant facilities typically consist of silos containing fly ash, lime, and cement; heated tanks of liquid asphalt; sand and gravel material storage areas; mixing equipment; above ground storage tanks containing concrete additives and water; and designated areas for sand and gravel truck unloading, concrete truck loading, and concrete truck washout. Proper control and use of equipment, materials, and waste products from temporary batch plant facilities will reduce the discharge of potential pollutants to the storm drain system or watercourses, reduce air emissions, and mitigate noise impacts.

The General Permit draft incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements). Many types of batch plant materials, including mortar, concrete, cement and block and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows which may cause an exceedance of the General Permit requirements.

Suitable Applications

These procedures typically apply to construction sites where temporary batch plant facilities are used; however, some of the

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

practices described are applicable to construction sites with general concrete use.

Limitations

The General Permit for discharges of stormwater associated with industrial activities (General Industrial Permit) may be applicable to temporary batch plants.

Specific permit requirements or mitigation measures such as Air Resources Board (ARB), Air Quality Management District (AQMD), Air Pollution Control District (APCD, Regional Water Quality Control Board (RWQCB), county ordinances and city ordinances may require alternative mitigation measures for temporary batch plants. Contact the local regulatory agencies to determine if a permit is required.

Implementation

Planning

- Temporary batch plants may be subject to the General Industrial Permit. To obtain a copy of this permit and the application forms, visit <http://www.waterboards.ca.gov> or contact the State Water Resources Control Board.
- Proper planning, design, and construction of temporary batch plants should be implemented to minimize potential water quality, air pollution, and noise impacts associated with temporary batch plants.
- BMPs and a Construction Site Monitoring Plan (CSMP) should be included in the project Stormwater Pollution Prevention Plan (SWPPP). BMPs should be implemented, inspected, and maintained in accordance with these plans.
- Temporary batch plants should be managed to comply with AQMD Statewide Registration Program and/or local AQMD Portable Equipment Registration requirements.
- Construct temporary batch plants downwind of existing developments whenever possible.
- Placement of access roads should be planned to mitigate water and air quality impacts.

Layout and Design

- Temporary batch plants should be properly located and designed to mitigate water quality impacts to receiving water bodies. Batch plants should be located away from watercourses, drainage courses, and drain inlets. Batch plants should be located to minimize the potential for stormwater runoff onto the site.
- Temporary batch plant facilities (including associated stationary equipment and stockpiles) should be located at least 300 ft from any recreational area, school, residence, or other structure not associated with the construction project.
- Construct continuous interior AC or PCC berms around batch plant equipment (mixing equipment, silos, concrete drop points, conveyor belts, admixture tanks, etc.) to facilitate proper containment and cleanup of releases. Rollover or flip top curbs or dikes should be placed at ingress and egress points (SE-12, Temporary Silt Dike).
- Direct runoff from the paved or unpaved portion of the batch plant into a sump and pipe to a lined washout area or dewatering tank.

- Direct stormwater and non-stormwater runoff from unpaved portions of batch plant facility to catchment ponds or tanks.
- Construct and remove concrete washout facilities in accordance with WM-8, Concrete Waste Management.
- Layout of a typical batch plant and associated BMP is located at the end of this BMP fact sheet.

Operational Procedures

- Washout of concrete trucks should be conducted in a designated area in accordance with WM-8, Concrete Waste Management.
- Do not dispose of concrete into drain inlets, the stormwater drainage system, or watercourses.
- Washing of concrete mixing and transport equipment (including concrete truck washout) should occur in a designated area in accordance with WM-8, Concrete Waste Management.
- Washing equipment, tools, or vehicles to remove PCC should be conducted in accordance with NS-7, Potable Water/Irrigation, NS-8, Vehicle and Equipment Cleaning, and WM-8, Concrete Waste Management.
- All dry material transfer points should be ducted through a fabric or cartridge type filter unless there are no visible emissions from the transfer point.
- Equip all bulk storage silos, including auxiliary bulk storage trailers, with fabric or cartridge type filter(s).
- Maintain silo vent filters in proper operating condition.
- Equip silos and auxiliary bulk storage trailers with dust-tight service hatches.
- Fabric dust collection system should be capable of controlling particulate matter in accordance with the California Air Resources Control Board and local Air Pollution Control District Regulations.
- Fabric dust collectors (except for vent filters) should be equipped with an operational pressure differential gauge to measure the pressure drop across the filters.
- All transfer points should be equipped with a wet suppression system to control fugitive particulate emissions unless there are no visible emissions.
- All conveyors should be covered, unless the material being transferred results in no visible emissions.
- There should be no visible emissions beyond the property line, while the equipment is being operated.
- Collect dust emissions from the loading of open-bodied trucks, at the drip point of dry batch plants, or dust emissions from the drum feed for central mix plants.

- Equip silos and auxiliary bulk storage trailers with a visible and/or audible warning mechanism to warn operators that the silo or trailer is full.
- All open-bodied vehicles transporting material should be loaded with a final layer of wet sand and the truck should be covered with a tarp to reduce emissions.

Tracking Control

- Plant roads (batch truck and material delivery truck roads) and areas between stockpiles and conveyor hoppers should be stabilized (TC-2, Stabilized Construction Roadway), watered, treated with dust-suppressant chemicals (WE-1, Wind Erosion Control), or paved with a cohesive hard surface that can be repeatedly swept, maintained intact, and cleaned as necessary to control dust emissions.
- Trucks should not track PCC from plants onto public roads. Use appropriate practices from TC-1, Stabilized Construction Entrance/Exit, to prevent tracking.

Materials Storage

- WM-1, Material Delivery and Storage, should be implemented at all batch plants using concrete components or compounds. An effective strategy is to cover and contain materials.
- WM-2, Material Use should be conducted in a way to minimize or eliminate the discharge of materials to storm drain system or watercourse.
- Ensure that finer materials are not dispersed into the air during operations, such as unloading of cement delivery trucks.
- Stockpiles should be covered and enclosed with perimeter sediment barriers per WM-3, Stockpile Management. Uncovered stockpiles should be sprayed with water and/or dust-suppressant chemicals as necessary to control dust emissions, unless the stockpiled material results in no visible emissions. An operable stockpile watering system should be onsite at all times.
- Store bagged and boxed materials on pallets and cover or store in a completely enclosed storage area on non-working days and prior to rain.
- Minimize stockpiles of demolished PCC by recycling them in a timely manner.
- Provide secondary containment for liquid materials (WM-1, Material Delivery and Storage, WM-10, Liquid Waste Management). Containment should provide sufficient volume to contain precipitation from a 25-year storm plus 10% of the aggregate volume of all containers or plus 100% of the largest container, whichever is greater.
- Handle solid and liquid waste in accordance with WM-5, Solid Waste Management, WM-10, Liquid Waste Management, and WM-8, Concrete Waste Management.
- Maintain adequate supplies of spill cleanup materials and train staff to respond to spills per WM-4, Spill Prevention and Control.
- Immediately contain and clean up spilled cement and fly ash and contain.

Equipment Maintenance

- Equipment should be maintained to prevent fluid leaks and spills per NS-9, Vehicle and Equipment Fueling, and NS-10, Vehicle and Equipment Maintenance.
- Maintain adequate supplies of spill cleanup materials and train staff to respond to spills per WM-4, Spill Prevention and Control.
- Incorporate other BMPs such as WM-5, Solid Waste Management, WM-6, Hazardous Waste Management, and WM-10, Liquid Waste Management.

Costs

Costs will vary depending on the size of the facility and combination of BMPs implemented.

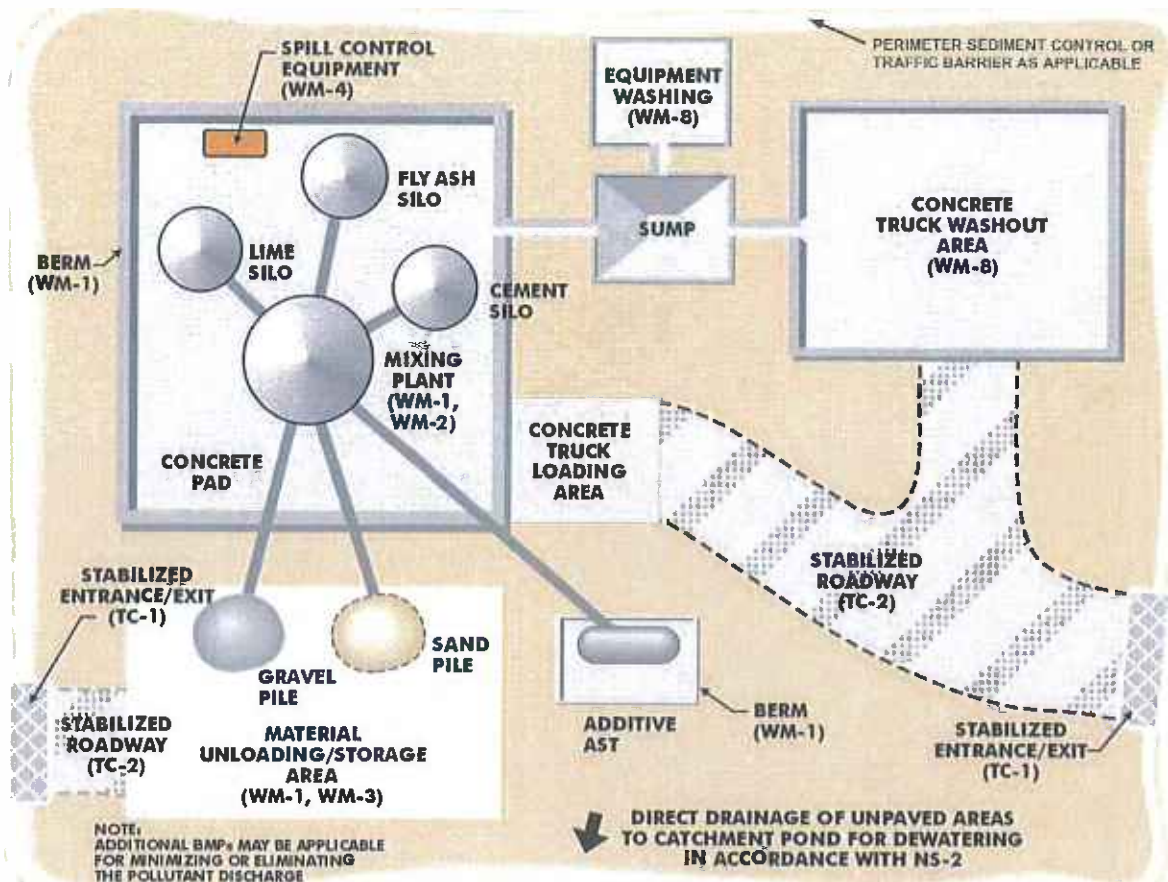

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.
- Sample non-stormwater discharges and stormwater runoff that contacts cementitious materials or fly ash as required by the General Permit.
- Inspect and repair equipment (for damaged hoses, fittings, and gaskets).
- Inspect and maintain a Stabilized Construction Entrance/Exit (TC-1) as needed.
- Inspect and maintain stabilized haul roads as needed (TC-2, Stabilized Construction Roadway).
- Inspect and maintain materials and waste storage areas as needed.

References

Stormwater Management for Construction Activities, Developing Pollution Prevention Plans and Best Management Practices, EPA 832-R-92005; USEPA, April 1992.

Typical Temporary Batch

Description and Purpose

Prevent, reduce, or eliminate the discharge of pollutants from material delivery and storage to the stormwater system or watercourses by minimizing the storage of hazardous materials onsite, storing materials in watertight containers and/or a completely enclosed designated area, installing secondary containment, conducting regular inspections, and training employees and subcontractors.

This best management practice covers only material delivery and storage. For other information on materials, see WM-2, Material Use, or WM-4, Spill Prevention and Control. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

These procedures are suitable for use at all construction sites with delivery and storage of the following materials:

- Soil stabilizers and binders
- Pesticides and herbicides
- Fertilizers
- Detergents
- Plaster
- Petroleum products such as fuel, oil, and grease

Bacteria	
Oil and Grease	<input checked="" type="checkbox"/>
Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Asphalt and concrete components
- Hazardous chemicals such as acids, lime, glues, adhesives, paints, solvents, and curing compounds
- Concrete compounds
- Other materials that may be detrimental if released to the environment

Limitations

- Space limitation may preclude indoor storage.
- Storage sheds often must meet building and fire code requirements.

Implementation

The following steps should be taken to minimize risk:

- Chemicals must be stored in water tight containers with appropriate secondary containment or in a storage shed.
- When a material storage area is located on bare soil, the area should be lined and bermed.
- Use containment pallets or other practical and available solutions, such as storing materials within newly constructed buildings or garages, to meet material storage requirements.
- Stack erodible landscape material on pallets and cover when not in use.
- Contain all fertilizers and other landscape materials when not in use.
- Temporary storage areas should be located away from vehicular traffic.
- Material Safety Data Sheets (MSDS) should be available on-site for all materials stored that have the potential to effect water quality.
- Construction site areas should be designated for material delivery and storage.
- Material delivery and storage areas should be located away from waterways, if possible.
 - Avoid transport near drainage paths or waterways.
 - Surround with earth berms or other appropriate containment BMP. See EC-9, Earth Dikes and Drainage Swales.
 - Place in an area that will be paved.
- Storage of reactive, ignitable, or flammable liquids must comply with the fire codes of your area. Contact the local Fire Marshal to review site materials, quantities, and proposed storage area to determine specific requirements. See the Flammable and Combustible Liquid Code, NFPA30.
- An up to date inventory of materials delivered and stored onsite should be kept.

- Hazardous materials storage onsite should be minimized.
- Hazardous materials should be handled as infrequently as possible.
- Keep ample spill cleanup supplies appropriate for the materials being stored. Ensure that cleanup supplies are in a conspicuous, labeled area.
- Employees and subcontractors should be trained on the proper material delivery and storage practices.
- Employees trained in emergency spill cleanup procedures must be present when dangerous materials or liquid chemicals are unloaded.
- If significant residual materials remain on the ground after construction is complete, properly remove and dispose of materials and any contaminated soil. See WM-7, Contaminated Soil Management. If the area is to be paved, pave as soon as materials are removed to stabilize the soil.

Material Storage Areas and Practices

- Liquids, petroleum products, and substances listed in 40 CFR Parts 110, 117, or 302 should be stored in approved containers and drums and should not be overfilled. Containers and drums should be placed in temporary containment facilities for storage.
- A temporary containment facility should provide for a spill containment volume able to contain precipitation from a 25-year storm event, plus the greater of 10% of the aggregate volume of all containers or 100% of the capacity of the largest container within its boundary, whichever is greater.
- A temporary containment facility should be impervious to the materials stored therein for a minimum contact time of 72 hours.
- A temporary containment facility should be maintained free of accumulated rainwater and spills. In the event of spills or leaks, accumulated rainwater and spills should be collected and placed into drums. These liquids should be handled as a hazardous waste unless testing determines them to be non-hazardous. All collected liquids or non-hazardous liquids should be sent to an approved disposal site.
- Sufficient separation should be provided between stored containers to allow for spill cleanup and emergency response access.
- Incompatible materials, such as chlorine and ammonia, should not be stored in the same temporary containment facility.
- Materials should be covered prior to, and during rain events.
- Materials should be stored in their original containers and the original product labels should be maintained in place in a legible condition. Damaged or otherwise illegible labels should be replaced immediately.

- Bagged and boxed materials should be stored on pallets and should not be allowed to accumulate on the ground. To provide protection from wind and rain throughout the rainy season, bagged and boxed materials should be covered during non-working days and prior to and during rain events.
- Stockpiles should be protected in accordance with WM-3, Stockpile Management.
- Materials should be stored indoors within existing structures or completely enclosed storage sheds when available.
- Proper storage instructions should be posted at all times in an open and conspicuous location.
- An ample supply of appropriate spill clean up material should be kept near storage areas.
- Also see WM-6, Hazardous Waste Management, for storing of hazardous wastes.

Material Delivery Practices

- Keep an accurate, up-to-date inventory of material delivered and stored onsite.
- Arrange for employees trained in emergency spill cleanup procedures to be present when dangerous materials or liquid chemicals are unloaded.

Spill Cleanup

- Contain and clean up any spill immediately.
- Properly remove and dispose of any hazardous materials or contaminated soil if significant residual materials remain on the ground after construction is complete. See WM-7, Contaminated Soil Management.
- See WM-4, Spill Prevention and Control, for spills of chemicals and/or hazardous materials.
- If spills or leaks of materials occur that are not contained and could discharge to surface waters, non-visible sampling of site discharge may be required. Refer to the General Permit or to your project specific Construction Site Monitoring Plan to determine if and where sampling is required.

Cost

- The largest cost of implementation may be in the construction of a materials storage area that is covered and provides secondary containment.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Keep storage areas clean and well organized, including a current list of all materials onsite.
- Inspect labels on containers for legibility and accuracy.

- Repair or replace perimeter controls, containment structures, covers, and liners as needed to maintain proper function.

Description and Purpose

Prevent or reduce the discharge of pollutants to the storm drain system or watercourses from material use by using alternative products, minimizing hazardous material use onsite, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for use at all construction projects. These procedures apply when the following materials are used or prepared onsite:

- Pesticides and herbicides
- Fertilizers
- Detergents
- Petroleum products such as fuel, oil, and grease
- Asphalt and other concrete components
- Other hazardous chemicals such as acids, lime, glues, adhesives, paints, solvents, and curing compounds
- Other materials that may be detrimental if released to the environment

Oil and Grease	<input checked="" type="checkbox"/>
Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

Safer alternative building and construction products may not be available or suitable in every instance.

Implementation

The following steps should be taken to minimize risk:

- Minimize use of hazardous materials onsite.
- Follow manufacturer instructions regarding uses, protective equipment, ventilation, flammability, and mixing of chemicals.
- Train personnel who use pesticides. The California Department of Pesticide Regulation and county agricultural commissioners license pesticide dealers, certify pesticide applicators, and conduct onsite inspections.
- The preferred method of termiticide application is soil injection near the existing or proposed structure foundation/slab; however, if not feasible, soil drench application of termiticides should follow EPA label guidelines and the following recommendations (most of which are applicable to most pesticide applications):
 - Do not treat soil that is water-saturated or frozen.
 - Application shall not commence within 24-hours of a predicted precipitation event with a 40% or greater probability. Weather tracking must be performed on a daily basis prior to termiticide application and during the period of termiticide application.
 - Do not allow treatment chemicals to runoff from the target area. Apply proper quantity to prevent excess runoff. Provide containment for and divert stormwater from application areas using berms or diversion ditches during application.
 - Dry season: Do not apply within 10 feet of storm drains. Do not apply within 25 feet of aquatic habitats (such as, but not limited to, lakes; reservoirs; rivers; permanent streams; marshes or ponds; estuaries; and commercial fish farm ponds).
 - Wet season: Do not apply within 50 feet of storm drains or aquatic habitats (such as, but not limited to, lakes; reservoirs; rivers; permanent streams; marshes or ponds; estuaries; and commercial fish farm ponds) unless a vegetative buffer is present (if so, refer to dry season requirements).
 - Do not make on-grade applications when sustained wind speeds are above 10 mph (at application site) at nozzle end height.
 - Cover treatment site prior to a rain event in order to prevent run-off of the pesticide into non-target areas. The treated area should be limited to a size that can be backfilled and/or covered by the end of the work shift. Backfilling or covering of the treated area shall be done by the end of the same work shift in which the application is made.
 - The applicator must either cover the soil him/herself or provide written notification of the above requirement to the contractor on site and to the person commissioning the

application (if different than the contractor). If notice is provided to the contractor or the person commissioning the application, then they are responsible under the Federal Insecticide Fungicide, and Rodenticide Act (FIFRA) to ensure that: 1) if the concrete slab cannot be poured over the treated soil within 24 hours of application, the treated soil is covered with a waterproof covering (such as polyethylene sheeting), and 2) the treated soil is covered if precipitation is predicted to occur before the concrete slab is scheduled to be poured.

- Do not over-apply fertilizers, herbicides, and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over-application is expensive and environmentally harmful. Unless on steep slopes, till fertilizers into the soil rather than hydraulic application. Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried offsite by runoff. Do not apply these chemicals before predicted rainfall.
- Train employees and subcontractors in proper material use.
- Supply Material Safety Data Sheets (MSDS) for all materials.
- Dispose of latex paint and paint cans, used brushes, rags, absorbent materials, and drop cloths, when thoroughly dry and are no longer hazardous, with other construction debris.
- Do not remove the original product label; it contains important safety and disposal information. Use the entire product before disposing of the container.
- Mix paint indoors or in a containment area. Never clean paintbrushes or rinse paint containers into a street, gutter, storm drain, or watercourse. Dispose of any paint thinners, residue, and sludge(s) that cannot be recycled, as hazardous waste.
- For water-based paint, clean brushes to the extent practicable, and rinse to a drain leading to a sanitary sewer where permitted or contain for proper disposal off site. For oil-based paints, clean brushes to the extent practicable, and filter and reuse thinners and solvents.
- Use recycled and less hazardous products when practical. Recycle residual paints, solvents, non-treated lumber, and other materials.
- Use materials only where and when needed to complete the construction activity. Use safer alternative materials as much as possible. Reduce or eliminate use of hazardous materials onsite when practical.
- Document the location, time, chemicals applied, and applicator's name and qualifications.
- Keep an ample supply of spill clean up material near use areas. Train employees in spill clean up procedures.
- Avoid exposing applied materials to rainfall and runoff unless sufficient time has been allowed for them to dry.
- Discontinue use of erodible landscape material within 2 days prior to a forecasted rain event and materials should be covered and/or bermed.

- Provide containment for material use areas such as masons' areas or paint mixing/preparation areas to prevent materials/pollutants from entering stormwater.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Ensure employees and subcontractors throughout the job are using appropriate practices.

Stormwater Management for Construction Activities; Developing Pollution Prevention Plans and Best Management Practice, EPA 832-R-92005; USEPA, April 1992.

Description and Purpose

Stockpile management procedures and practices are designed to reduce or eliminate air and stormwater pollution from stockpiles of soil, soil amendments, sand, paving materials such as Portland cement concrete (PCC) rubble, asphalt concrete (AC), asphalt concrete rubble, aggregate base, aggregate sub base or pre-mixed aggregate, asphalt minder (so called “cold mix” asphalt), and pressure treated wood.

Suitable Applications

Implement in all projects that stockpile soil and other loose materials.

Limitations

- Plastic sheeting as a stockpile protection is temporary and hard to manage in windy conditions. Where plastic is used, consider use of plastic tarps with nylon reinforcement which may be more durable than standard sheeting.
- Plastic sheeting can increase runoff volume due to lack of infiltration and potentially cause perimeter control failure.
- Plastic sheeting breaks down faster in sunlight.
- The use of Plastic materials and photodegradable plastics should be avoided.

Implementation

Protection of stockpiles is a year-round requirement. To properly manage stockpiles:

Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- On larger sites, a minimum of 50 ft separation from concentrated flows of stormwater, drainage courses, and inlets is recommended.
- After 14 days of inactivity, a stockpile is non-active and requires further protection described below. All stockpiles are required to be protected as non-active stockpiles immediately if they are not scheduled to be used within 14 days.
- Protect all stockpiles from stormwater run-on using temporary perimeter sediment barriers such as compost berms (SE-13), temporary silt dikes (SE-12), fiber rolls (SE-5), silt fences (SE-1), sandbags (SE-8), gravel bags (SE-6), or biofilter bags (SE-14). Refer to the individual fact sheet for each of these controls for installation information.
- Implement wind erosion control practices as appropriate on all stockpiled material. For specific information, see WE-1, Wind Erosion Control.
- Manage stockpiles of contaminated soil in accordance with WM-7, Contaminated Soil Management.
- Place bagged materials on pallets and under cover.
- Ensure that stockpile coverings are installed securely to protect from wind and rain.
- Some plastic covers withstand weather and sunlight better than others. Select cover materials or methods based on anticipated duration of use.

Protection of Non-Active Stockpiles

A stockpile is considered non-active if it either is not used for 14 days or if it is scheduled not to be used for 14 days or more. Stockpiles need to be protected immediately if they are not scheduled to be used within 14 days. Non-active stockpiles of the identified materials should be protected as follows:

Soil stockpiles

- Soil stockpiles should be covered or protected with soil stabilization measures and a temporary perimeter sediment barrier at all times.
- Temporary vegetation should be considered for topsoil piles that will be stockpiled for extended periods.

Stockpiles of Portland cement concrete rubble, asphalt concrete, asphalt concrete rubble, aggregate base, or aggregate sub base

- Stockpiles should be covered and protected with a temporary perimeter sediment barrier at all times.

Stockpiles of "cold mix"

- Cold mix stockpiles should be placed on and covered with plastic sheeting or comparable material at all times and surrounded by a berm.

Stockpiles of fly ash, stucco, hydrated lime

- Stockpiles of materials that may raise the pH of runoff (i.e., basic materials) should be covered with plastic and surrounded by a berm.

Stockpiles/Storage of treated wood

- Treated wood should be covered with plastic sheeting or comparable material at all times and surrounded by a berm.

Protection of Active Stockpiles

A stockpile is active when it is being used or is scheduled to be used within 14 days of the previous use. Active stockpiles of the identified materials should be protected as follows:

- All stockpiles should be covered and protected with a temporary linear sediment barrier prior to the onset of precipitation.
- Stockpiles of “cold mix” and treated wood, and basic materials should be placed on and covered with plastic sheeting or comparable material and surrounded by a berm prior to the onset of precipitation.
- The downstream perimeter of an active stockpile should be protected with a linear sediment barrier or berm and runoff should be diverted around or away from the stockpile on the upstream perimeter.

Costs

For cost information associated with stockpile protection refer to the individual erosion or sediment control BMP fact sheet considered for implementation (For example, refer to SE-1 Silt Fence for installation of silt fence around the perimeter of a stockpile.)

Inspection and Maintenance

- Stockpiles must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- It may be necessary to inspect stockpiles covered with plastic sheeting more frequently during certain conditions (for example, high winds or extreme heat).
- Repair and/or replace perimeter controls and covers as needed to keep them functioning properly.
- Sediment shall be removed when it reaches one-third of the barrier height.

References

Stormwater Quality Handbooks - Construction Site Best Management Practices (BMPs) Manual, State of California Department of Transportation (Caltrans), March 2003.

Description and Purpose

Prevent or reduce the discharge of pollutants to drainage systems or watercourses from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This best management practice covers only spill prevention and control. However, WM-1, Materials Delivery and Storage, and WM-2, Material Use, also contain useful information, particularly on spill prevention. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

This BMP is suitable for all construction projects. Spill control procedures are implemented anytime chemicals or hazardous substances are stored on the construction site, including the following materials:

- Soil stabilizers/binders
- Dust palliatives
- Herbicides
- Growth inhibitors
- Fertilizers
- Deicing/anti-icing chemicals

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Fuels
- Lubricants
- Other petroleum distillates

Limitations

- In some cases, it may be necessary to use a private spill cleanup company.
- This BMP applies to spills caused by the contractor and subcontractors.
- Procedures and practices presented in this BMP are general. Contractor should identify appropriate practices for the specific materials used or stored onsite

Implementation

The following steps will help reduce the stormwater impacts of leaks and spills:

Education

- Be aware that different materials pollute in different amounts. Make sure that each employee knows what a “significant spill” is for each material they use, and what is the appropriate response for “significant” and “insignificant” spills.
- Educate employees and subcontractors on potential dangers to humans and the environment from spills and leaks.
- Hold regular meetings to discuss and reinforce appropriate disposal procedures (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.
- Have contractor’s superintendent or representative oversee and enforce proper spill prevention and control measures.

General Measures

- To the extent that the work can be accomplished safely, spills of oil, petroleum products, substances listed under 40 CFR parts 110,117, and 302, and sanitary and septic wastes should be contained and cleaned up immediately.
- Store hazardous materials and wastes in covered containers and protect from vandalism.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Train employees in spill prevention and cleanup.
- Designate responsible individuals to oversee and enforce control measures.
- Spills should be covered and protected from stormwater runoff during rainfall to the extent that it doesn’t compromise clean up activities.
- Do not bury or wash spills with water.

- Store and dispose of used clean up materials, contaminated materials, and recovered spill material that is no longer suitable for the intended purpose in conformance with the provisions in applicable BMPs.
- Do not allow water used for cleaning and decontamination to enter storm drains or watercourses. Collect and dispose of contaminated water in accordance with WM-10, Liquid Waste Management.
- Contain water overflow or minor water spillage and do not allow it to discharge into drainage facilities or watercourses.
- Place proper storage, cleanup, and spill reporting instructions for hazardous materials stored or used on the project site in an open, conspicuous, and accessible location.
- Keep waste storage areas clean, well organized, and equipped with ample cleanup supplies as appropriate for the materials being stored. Perimeter controls, containment structures, covers, and liners should be repaired or replaced as needed to maintain proper function.

Cleanup

- Clean up leaks and spills immediately.
- Use a rag for small spills on paved surfaces, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to either a certified laundry (rags) or disposed of as hazardous waste.
- Never hose down or bury dry material spills. Clean up as much of the material as possible and dispose of properly. See the waste management BMPs in this section for specific information.

Minor Spills

- Minor spills typically involve small quantities of oil, gasoline, paint, etc. which can be controlled by the first responder at the discovery of the spill.
- Use absorbent materials on small spills rather than hosing down or burying the spill.
- Absorbent materials should be promptly removed and disposed of properly.
- Follow the practice below for a minor spill:
 - Contain the spread of the spill.
 - Recover spilled materials.
 - Clean the contaminated area and properly dispose of contaminated materials.

Semi-Significant Spills

- Semi-significant spills still can be controlled by the first responder along with the aid of other personnel such as laborers and the foreman, etc. This response may require the cessation of all other activities.

- Spills should be cleaned up immediately:
 - Contain spread of the spill.
 - Notify the project foreman immediately.
 - If the spill occurs on paved or impermeable surfaces, clean up using "dry" methods (absorbent materials, cat litter and/or rags). Contain the spill by encircling with absorbent materials and do not let the spill spread widely.
 - If the spill occurs in dirt areas, immediately contain the spill by constructing an earthen dike. Dig up and properly dispose of contaminated soil.
 - If the spill occurs during rain, cover spill with tarps or other material to prevent contaminating runoff.

Significant/Hazardous Spills

- For significant or hazardous spills that cannot be controlled by personnel in the immediate vicinity, the following steps should be taken:
 - Notify the local emergency response by dialing 911. In addition to 911, the contractor will notify the proper county officials. It is the contractor's responsibility to have all emergency phone numbers at the construction site.
 - Notify the Governor's Office of Emergency Services Warning Center, (916) 845-8911.
 - For spills of federal reportable quantities, in conformance with the requirements in 40 CFR parts 110,119, and 302, the contractor should notify the National Response Center at (800) 424-8802.
 - Notification should first be made by telephone and followed up with a written report.
 - The services of a spill's contractor or a Haz-Mat team should be obtained immediately. Construction personnel should not attempt to clean up until the appropriate and qualified staffs have arrived at the job site.
 - Other agencies which may need to be consulted include, but are not limited to, the Fire Department, the Public Works Department, the Coast Guard, the Highway Patrol, the City/County Police Department, Department of Toxic Substances, California Division of Oil and Gas, Cal/OSHA, etc.

Reporting

- Report significant spills to local agencies, such as the Fire Department; they can assist in cleanup.
- Federal regulations require that any significant oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hours).

Use the following measures related to specific activities:

Vehicle and Equipment Maintenance

- If maintenance must occur onsite, use a designated area and a secondary containment, located away from drainage courses, to prevent the runoff of stormwater and the runoff of spills.
- Regularly inspect onsite vehicles and equipment for leaks and repair immediately
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment onsite.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Place drip pans or absorbent materials under paving equipment when not in use.
- Use absorbent materials on small spills rather than hosing down or burying the spill. Remove the absorbent materials promptly and dispose of properly.
- Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around
- Oil filters disposed of in trashcans or dumpsters can leak oil and pollute stormwater. Place the oil filter in a funnel over a waste oil-recycling drum to drain excess oil before disposal. Oil filters can also be recycled. Ask the oil supplier or recycler about recycling oil filters.
- Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Vehicle and Equipment Fueling

- If fueling must occur onsite, use designate areas, located away from drainage courses, to prevent the runoff of stormwater and the runoff of spills.
- Discourage “topping off” of fuel tanks.
- Always use secondary containment, such as a drain pan, when fueling to catch spills/ leaks.

Costs

Prevention of leaks and spills is inexpensive. Treatment and/ or disposal of contaminated soil or water can be quite expensive.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.
- Keep ample supplies of spill control and cleanup materials onsite, near storage, unloading, and maintenance areas.
- Update your spill prevention and control plan and stock cleanup materials as changes occur in the types of chemicals onsite.

Stormwater Management for Construction Activities; Developing Pollution Prevention Plans and Best Management Practice, EPA 832-R-92005; USEPA, April 1992.

Description and Purpose

Solid waste management procedures and practices are designed to prevent or reduce the discharge of pollutants to stormwater from solid or construction waste by providing designated waste collection areas and containers, arranging for regular disposal, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for construction sites where the following wastes are generated or stored:

- Solid waste generated from trees and shrubs removed during land clearing, demolition of existing structures (rubble), and building construction
- Packaging materials including wood, paper, and plastic
- Scrap or surplus building materials including scrap metals, rubber, plastic, glass pieces, and masonry products
- Domestic wastes including food containers such as beverage cans, coffee cups, paper bags, plastic wrappers, and cigarettes
- Construction wastes including brick, mortar, timber, steel and metal scraps, pipe and electrical cuttings, non-hazardous equipment parts, styrofoam and other materials used to transport and package construction materials

Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Highway planting wastes, including vegetative material, plant containers, and packaging materials

Limitations

Temporary stockpiling of certain construction wastes may not necessitate stringent drainage related controls during the non-rainy season or in desert areas with low rainfall.

Implementation

The following steps will help keep a clean site and reduce stormwater pollution:

- Select designated waste collection areas onsite.
- Inform trash-hauling contractors that you will accept only watertight dumpsters for onsite use. Inspect dumpsters for leaks and repair any dumpster that is not watertight.
- Locate containers in a covered area or in a secondary containment.
- Provide an adequate number of containers with lids or covers that can be placed over the container to keep rain out or to prevent loss of wastes when it is windy.
- Cover waste containers at the end of each work day and when it is raining.
- Plan for additional containers and more frequent pickup during the demolition phase of construction.
- Collect site trash daily, especially during rainy and windy conditions.
- Remove this solid waste promptly since erosion and sediment control devices tend to collect litter.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Do not hose out dumpsters on the construction site. Leave dumpster cleaning to the trash hauling contractor.
- Arrange for regular waste collection before containers overflow.
- Clean up immediately if a container does spill.
- Make sure that construction waste is collected, removed, and disposed of only at authorized disposal areas.

Education

- Have the contractor's superintendent or representative oversee and enforce proper solid waste management procedures and practices.
- Instruct employees and subcontractors on identification of solid waste and hazardous waste.
- Educate employees and subcontractors on solid waste storage and disposal procedures.

- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Require that employees and subcontractors follow solid waste handling and storage procedures.
- Prohibit littering by employees, subcontractors, and visitors.
- Minimize production of solid waste materials wherever possible.

Collection, Storage, and Disposal

- Littering on the project site should be prohibited.
- To prevent clogging of the storm drainage system, litter and debris removal from drainage grates, trash racks, and ditch lines should be a priority.
- Trash receptacles should be provided in the contractor's yard, field trailer areas, and at locations where workers congregate for lunch and break periods.
- Litter from work areas within the construction limits of the project site should be collected and placed in watertight dumpsters at least weekly, regardless of whether the litter was generated by the contractor, the public, or others. Collected litter and debris should not be placed in or next to drain inlets, stormwater drainage systems, or watercourses.
- Dumpsters of sufficient size and number should be provided to contain the solid waste generated by the project.
- Full dumpsters should be removed from the project site and the contents should be disposed of by the trash hauling contractor.
- Construction debris and waste should be removed from the site biweekly or more frequently as needed.
- Construction material visible to the public should be stored or stacked in an orderly manner.
- Stormwater runoff should be prevented from contacting stored solid waste through the use of berms, dikes, or other temporary diversion structures or through the use of measures to elevate waste from site surfaces.
- Solid waste storage areas should be located at least 50 ft from drainage facilities and watercourses and should not be located in areas prone to flooding or ponding.
- Except during fair weather, construction and highway planting waste not stored in watertight dumpsters should be securely covered from wind and rain by covering the waste with tarps or plastic.
- Segregate potentially hazardous waste from non-hazardous construction site waste.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.

- For disposal of hazardous waste, see WM-6, Hazardous Waste Management. Have hazardous waste hauled to an appropriate disposal and/or recycling facility.
- Salvage or recycle useful vegetation debris, packaging and surplus building materials when practical. For example, trees and shrubs from land clearing can be used as a brush barrier, or converted into wood chips, then used as mulch on graded areas. Wood pallets, cardboard boxes, and construction scraps can also be recycled.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur
- Inspect construction waste area regularly.
- Arrange for regular waste collection.

Stormwater Management for Construction Activities; Developing Pollution Prevention Plans and Best Management Practice, EPA 832-R-92005; USEPA, April 1992.

Description and Purpose

Prevent or reduce the discharge of pollutants to stormwater from hazardous waste through proper material use, waste disposal, and training of employees and subcontractors.

Suitable Applications

This best management practice (BMP) applies to all construction projects. Hazardous waste management practices are implemented on construction projects that generate waste from the use of:

- Petroleum Products
- Concrete Curing Compounds
- Palliatives
- Septic Wastes
- Stains
- Wood Preservatives
- Asphalt Products
- Pesticides
- Acids
- Paints
- Solvents
- Roofing Tar
- Any materials deemed a hazardous waste in California, Title 22 Division 4.5, or listed in 40 CFR Parts 110, 117, 261, or 302

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

In addition, sites with existing structures may contain wastes, which must be disposed of in accordance with federal, state, and local regulations. These wastes include:

- Sandblasting grit mixed with lead-, cadmium-, or chromium-based paints
- Asbestos
- PCBs (particularly in older transformers)

Limitations

- Hazardous waste that cannot be reused or recycled must be disposed of by a licensed hazardous waste hauler.
- Nothing in this BMP relieves the contractor from responsibility for compliance with federal, state, and local laws regarding storage, handling, transportation, and disposal of hazardous wastes.
- This BMP does not cover aerially deposited lead (ADL) soils. For ADL soils refer to WM-7, Contaminated Soil Management.

Implementation

The following steps will help reduce stormwater pollution from hazardous wastes:

Material Use

- Wastes should be stored in sealed containers constructed of a suitable material and should be labeled as required by Title 22 CCR, Division 4.5 and 49 CFR Parts 172, 173, 178, and 179.
- All hazardous waste should be stored, transported, and disposed as required in Title 22 CCR, Division 4.5 and 49 CFR 261-263.
- Waste containers should be stored in temporary containment facilities that should comply with the following requirements:
 - Temporary containment facility should provide for a spill containment volume equal to 1.5 times the volume of all containers able to contain precipitation from a 25-year storm event, plus the greater of 10% of the aggregate volume of all containers or 100% of the capacity of the largest tank within its boundary, whichever is greater.
 - Temporary containment facility should be impervious to the materials stored there for a minimum contact time of 72 hours.
 - Temporary containment facilities should be maintained free of accumulated rainwater and spills. In the event of spills or leaks, accumulated rainwater and spills should be placed into drums after each rainfall. These liquids should be handled as a hazardous waste unless testing determines them to be non-hazardous. Non-hazardous liquids should be sent to an approved disposal site.
 - Sufficient separation should be provided between stored containers to allow for spill cleanup and emergency response access.

- Incompatible materials, such as chlorine and ammonia, should not be stored in the same temporary containment facility.
- Throughout the rainy season, temporary containment facilities should be covered during non-working days, and prior to rain events. Covered facilities may include use of plastic tarps for small facilities or constructed roofs with overhangs.
- Drums should not be overfilled, and wastes should not be mixed.
- Unless watertight, containers of dry waste should be stored on pallets.
- Do not over-apply herbicides and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over application is expensive and environmentally harmful. Apply surface dressings in several smaller applications, as opposed to one large application. Allow time for infiltration and avoid excess material being carried offsite by runoff. Do not apply these chemicals just before it rains. People applying pesticides must be certified in accordance with federal and state regulations.
- Paint brushes and equipment for water and oil-based paints should be cleaned within a contained area and should not be allowed to contaminate site soils, watercourses, or drainage systems. Waste paints, thinners, solvents, residues, and sludges that cannot be recycled or reused should be disposed of as hazardous waste. When thoroughly dry, latex paint and paint cans, used brushes, rags, absorbent materials, and drop cloths should be disposed of as solid waste.
- Do not clean out brushes or rinse paint containers into the dirt, street, gutter, storm drain, or stream. "Paint out" brushes as much as possible. Rinse water-based paints to the sanitary sewer. Filter and reuse thinners and solvents. Dispose of excess oil-based paints and sludge as hazardous waste.
- The following actions should be taken with respect to temporary contaminant:
 - Ensure that adequate hazardous waste storage volume is available.
 - Ensure that hazardous waste collection containers are conveniently located.
 - Designate hazardous waste storage areas onsite away from storm drains or watercourses and away from moving vehicles and equipment to prevent accidental spills.
 - Minimize production or generation of hazardous materials and hazardous waste on the job site.
 - Use containment berms in fueling and maintenance areas and where the potential for spills is high.
 - Segregate potentially hazardous waste from non-hazardous construction site debris.
 - Keep liquid or semi-liquid hazardous waste in appropriate containers (closed drums or similar) and under cover.

- Clearly label all hazardous waste containers with the waste being stored and the date of accumulation.
- Place hazardous waste containers in secondary containment.
- Do not allow potentially hazardous waste materials to accumulate on the ground.
- Do not mix wastes.
- Use all of the product before disposing of the container.
- Do not remove the original product label; it contains important safety and disposal information.

Waste Recycling Disposal

- Select designated hazardous waste collection areas onsite.
- Hazardous materials and wastes should be stored in covered containers and protected from vandalism.
- Place hazardous waste containers in secondary containment.
- Do not mix wastes, this can cause chemical reactions, making recycling impossible and complicating disposal.
- Recycle any useful materials such as used oil or water-based paint.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Arrange for regular waste collection before containers overflow.
- Make sure that hazardous waste (e.g., excess oil-based paint and sludge) is collected, removed, and disposed of only at authorized disposal areas.

Disposal Procedures

- Waste should be disposed of by a licensed hazardous waste transporter at an authorized and licensed disposal facility or recycling facility utilizing properly completed Uniform Hazardous Waste Manifest forms.
- A Department of Health Services certified laboratory should sample waste to determine the appropriate disposal facility.
- Properly dispose of rainwater in secondary containment that may have mixed with hazardous waste.
- Attention is directed to "Hazardous Material", "Contaminated Material", and "Aerially Deposited Lead" of the contract documents regarding the handling and disposal of hazardous materials.

Education

- Educate employees and subcontractors on hazardous waste storage and disposal procedures.
- Educate employees and subcontractors on potential dangers to humans and the environment from hazardous wastes.
- Instruct employees and subcontractors on safety procedures for common construction site hazardous wastes.
- Instruct employees and subcontractors in identification of hazardous and solid waste.
- Hold regular meetings to discuss and reinforce hazardous waste management procedures (incorporate into regular safety meetings).
- The contractor's superintendent or representative should oversee and enforce proper hazardous waste management procedures and practices.
- Make sure that hazardous waste is collected, removed, and disposed of only at authorized disposal areas.
- Warning signs should be placed in areas recently treated with chemicals.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- If a container does spill, clean up immediately.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur
- Hazardous waste should be regularly collected.
- A foreman or construction supervisor should monitor onsite hazardous waste storage and disposal procedures.
- Waste storage areas should be kept clean, well organized, and equipped with ample cleanup supplies as appropriate for the materials being stored.
- Perimeter controls, containment structures, covers, and liners should be repaired or replaced as needed to maintain proper function.

- Hazardous spills should be cleaned up and reported in conformance with the applicable Material Safety Data Sheet (MSDS) and the instructions posted at the project site.
- The National Response Center, at (800) 424-8802, should be notified of spills of federal reportable quantities in conformance with the requirements in 40 CFR parts 110, 117, and 302. Also notify the Governors Office of Emergency Services Warning Center at (916) 845-8911.
- A copy of the hazardous waste manifests should be provided.

Legend:

- ☒ Primary Objective
- ☒ Secondary Objective

Description and Purpose

Prevent or reduce the discharge of pollutants to stormwater from contaminated soil and highly acidic or alkaline soils by conducting pre-construction surveys, inspecting excavations regularly, and remediating contaminated soil promptly.

Suitable Applications

Contaminated soil management is implemented on construction projects in highly urbanized or industrial areas where soil contamination may have occurred due to spills, illicit discharges, aerial deposition, past use and leaks from underground storage tanks.

Limitations

Contaminated soils that cannot be treated onsite must be disposed of offsite by a licensed hazardous waste hauler. The presence of contaminated soil may indicate contaminated water as well. See NS-2, Dewatering Operations, for more information.

The procedures and practices presented in this BMP are general. The contractor should identify appropriate practices and procedures for the specific contaminants known to exist or discovered onsite.

Implementation

Most owners and developers conduct pre-construction environmental assessments as a matter of routine. Contaminated soils are often identified during project planning and development with known locations identified in the plans, specifications and in the SWPPP. The contractor should review applicable reports and investigate appropriate call-outs in the

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

plans, specifications, and SWPPP. Recent court rulings holding contractors liable for cleanup costs when they unknowingly move contaminated soil highlight the need for contractors to confirm a site assessment is completed before earth moving begins.

The following steps will help reduce stormwater pollution from contaminated soil:

- Conduct thorough, pre-construction inspections of the site and review documents related to the site. If inspection or reviews indicated presence of contaminated soils, develop a plan before starting work.
- Look for contaminated soil as evidenced by discoloration, odors, differences in soil properties, abandoned underground tanks or pipes, or buried debris.
- Prevent leaks and spills. Contaminated soil can be expensive to treat and dispose of properly. However, addressing the problem before construction is much less expensive than after the structures are in place.
- The contractor may further identify contaminated soils by investigating:
 - Past site uses and activities
 - Detected or undetected spills and leaks
 - Acid or alkaline solutions from exposed soil or rock formations high in acid or alkaline forming elements
 - Contaminated soil as evidenced by discoloration, odors, differences in soil properties, abandoned underground tanks or pipes, or buried debris.
 - Suspected soils should be tested at a certified laboratory.

Education

- Have employees and subcontractors complete a safety training program which meets 29 CFR 1910.120 and 8 CCR 5192 covering the potential hazards as identified, prior to performing any excavation work at the locations containing material classified as hazardous.
- Educate employees and subcontractors in identification of contaminated soil and on contaminated soil handling and disposal procedures.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).

Handling Procedures for Material with Aerially Deposited Lead (ADL)

- Materials from areas designated as containing (ADL) may, if allowed by the contract special provisions, be excavated, transported, and used in the construction of embankments and/or backfill.
- Excavation, transportation, and placement operations should result in no visible dust.
- Caution should be exercised to prevent spillage of lead containing material during transport.

- Quality should be monitored during excavation of soils contaminated with lead.

Handling Procedures for Contaminated Soils

- Minimize onsite storage. Contaminated soil should be disposed of properly in accordance with all applicable regulations. All hazardous waste storage will comply with the requirements in Title 22, CCR, Sections 66265.250 to 66265.260.
- Test suspected soils at an approved certified laboratory.
- Work with the local regulatory agencies to develop options for treatment or disposal if the soil is contaminated.
- Avoid temporary stockpiling of contaminated soils or hazardous material.
- Take the following precautions if temporary stockpiling is necessary:
 - Cover the stockpile with plastic sheeting or tarps.
 - Install a berm around the stockpile to prevent runoff from leaving the area.
 - Do not stockpile in or near storm drains or watercourses.
- Remove contaminated material and hazardous material on exteriors of transport vehicles and place either into the current transport vehicle or into the excavation prior to the vehicle leaving the exclusion zone.
- Monitor the air quality continuously during excavation operations at all locations containing hazardous material.
- Procure all permits and licenses, pay all charges and fees, and give all notices necessary and incident to the due and lawful prosecution of the work, including registration for transporting vehicles carrying the contaminated material and the hazardous material.
- Collect water from decontamination procedures and treat or dispose of it at an appropriate disposal site.
- Collect non-reusable protective equipment, once used by any personnel, and dispose of at an appropriate disposal site.
- Install temporary security fence to surround and secure the exclusion zone. Remove fencing when no longer needed.
- Excavate, transport, and dispose of contaminated material and hazardous material in accordance with the rules and regulations of the following agencies (the specifications of these agencies supersede the procedures outlined in this BMP):
 - United States Department of Transportation (USDOT)
 - United States Environmental Protection Agency (USEPA)
 - California Environmental Protection Agency (CAL-EPA)

- California Division of Occupation Safety and Health Administration (CAL-OSHA)
- Local regulatory agencies

Procedures for Underground Storage Tank Removals

- Prior to commencing tank removal operations, obtain the required underground storage tank removal permits and approval from the federal, state, and local agencies that have jurisdiction over such work.
- To determine if it contains hazardous substances, arrange to have tested, any liquid or sludge found in the underground tank prior to its removal.
- Following the tank removal, take soil samples beneath the excavated tank and perform analysis as required by the local agency representative(s).
- The underground storage tank, any liquid or sludge found within the tank, and all contaminated substances and hazardous substances removed during the tank removal and transported to disposal facilities permitted to accept such waste.

Water Control

- All necessary precautions and preventive measures should be taken to prevent the flow of water, including ground water, from mixing with hazardous substances or underground storage tank excavations. Such preventative measures may consist of, but are not limited to, berms, cofferdams, grout curtains, freeze walls, and seal course concrete or any combination thereof.
- If water does enter an excavation and becomes contaminated, such water, when necessary to proceed with the work, should be discharged to clean, closed top, watertight transportable holding tanks, treated, and disposed of in accordance with federal, state, and local laws.

Costs

Prevention of leaks and spills is inexpensive. Treatment or disposal of contaminated soil can be quite expensive.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Arrange for contractor's Water Pollution Control Manager, foreman, and/or construction supervisor to monitor onsite contaminated soil storage and disposal procedures.
- Monitor air quality continuously during excavation operations at all locations containing hazardous material.
- Coordinate contaminated soils and hazardous substances/waste management with the appropriate federal, state, and local agencies.

Contaminated Soil Management **WM-7**

- Implement WM-4, Spill Prevention and Control, to prevent leaks and spills as much as possible.

Stormwater Management for Construction Activities; Developing Pollution Prevention Plans and Best Management Practice, EPA 832-R-92005; USEPA, April 1992.

Description and Purpose

Prevent the discharge of pollutants to stormwater from concrete waste by conducting washout onsite or offsite in a designated area, and by employee and subcontractor training.

The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Many types of construction materials, including mortar, concrete, stucco, cement and block and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows and raising pH to levels outside the accepted range.

Suitable Applications

Concrete waste management procedures and practices are implemented on construction projects where:

- Concrete is used as a construction material or where concrete dust and debris result from demolition activities.
- Slurries containing Portland cement concrete (PCC) are generated, such as from saw cutting, coring, grinding, grooving, and hydro-concrete demolition.
- Concrete trucks and other concrete-coated equipment are washed onsite.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Mortar-mixing stations exist.
- Stucco mixing and spraying.
- See also NS-8, Vehicle and Equipment Cleaning.

Limitations

- Offsite washout of concrete wastes may not always be possible.
- Multiple washouts may be needed to assure adequate capacity and to allow for evaporation.

Implementation

The following steps will help reduce stormwater pollution from concrete wastes:

- Incorporate requirements for concrete waste management into material supplier and subcontractor agreements.
- Store dry and wet materials under cover, away from drainage areas. Refer to WM-1, Material Delivery and Storage for more information.
- Avoid mixing excess amounts of concrete.
- Perform washout of concrete trucks in designated areas only, where washout will not reach stormwater.
- Do not wash out concrete trucks into storm drains, open ditches, streets, streams or onto the ground. Trucks should always be washed out into designated facilities.
- Do not allow excess concrete to be dumped onsite, except in designated areas.
- For onsite washout:
 - On larger sites, it is recommended to locate washout areas at least 50 feet from storm drains, open ditches, or water bodies. Do not allow runoff from this area by constructing a temporary pit or bermed area large enough for liquid and solid waste.
 - Washout wastes into the temporary washout where the concrete can set, be broken up, and then disposed properly.
 - Washouts shall be implemented in a manner that prevents leaching to underlying soils. Washout containers must be water tight and washouts on or in the ground must be lined with a suitable impervious liner, typically a plastic type material.
- Do not wash sweepings from exposed aggregate concrete into the street or storm drain. Collect and return sweepings to aggregate base stockpile or dispose in the trash.
- See typical concrete washout installation details at the end of this fact sheet.

Education

- Educate employees, subcontractors, and suppliers on the concrete waste management techniques described herein.

- Arrange for contractor's superintendent or representative to oversee and enforce concrete waste management procedures.
- Discuss the concrete management techniques described in this BMP (such as handling of concrete waste and washout) with the ready-mix concrete supplier before any deliveries are made.

Concrete Demolition Wastes

- Stockpile concrete demolition waste in accordance with BMP WM-3, Stockpile Management.
- Dispose of or recycle hardened concrete waste in accordance with applicable federal, state or local regulations.

Concrete Slurry Wastes

- PCC and AC waste should not be allowed to enter storm drains or watercourses.
- PCC and AC waste should be collected and disposed of or placed in a temporary concrete washout facility (as described in Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures, below).
- A foreman or construction supervisor should monitor onsite concrete working tasks, such as saw cutting, coring, grinding and grooving to ensure proper methods are implemented.
- Saw-cut concrete slurry should not be allowed to enter storm drains or watercourses. Residue from grinding operations should be picked up by means of a vacuum attachment to the grinding machine or by sweeping. Saw cutting residue should not be allowed to flow across the pavement and should not be left on the surface of the pavement. See also NS-3, Paving and Grinding Operations; and WM-10, Liquid Waste Management.
- Concrete slurry residue should be disposed in a temporary washout facility (as described in Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures, below) and allowed to dry. Dispose of dry slurry residue in accordance with WM-5, Solid Waste Management.

Onsite Temporary Concrete Washout Facility, Transit Truck Washout Procedures

- Temporary concrete washout facilities should be located a minimum of 50 ft from storm drain inlets, open drainage facilities, and watercourses. Each facility should be located away from construction traffic or access areas to prevent disturbance or tracking.
- A sign should be installed adjacent to each washout facility to inform concrete equipment operators to utilize the proper facilities.
- Temporary concrete washout facilities should be constructed above grade or below grade at the option of the contractor. Temporary concrete washout facilities should be constructed and maintained in sufficient quantity and size to contain all liquid and concrete waste generated by washout operations.

- Temporary washout facilities should have a temporary pit or bermed areas of sufficient volume to completely contain all liquid and waste concrete materials generated during washout procedures.
- Temporary washout facilities should be lined to prevent discharge to the underlying ground or surrounding area.
- Washout of concrete trucks should be performed in designated areas only.
- Only concrete from mixer truck chutes should be washed into concrete wash out.
- Concrete washout from concrete pumper bins can be washed into concrete pumper trucks and discharged into designated washout area or properly disposed of or recycled offsite.
- Once concrete wastes are washed into the designated area and allowed to harden, the concrete should be broken up, removed, and disposed of per WM-5, Solid Waste Management. Dispose of or recycle hardened concrete on a regular basis.
- Temporary Concrete Washout Facility (Type Above Grade)
 - Temporary concrete washout facility (type above grade) should be constructed as shown on the details at the end of this BMP, with a recommended minimum length and minimum width of 10 ft; however, smaller sites or jobs may only need a smaller washout facility. With any washout, always maintain a sufficient quantity and volume to contain all liquid and concrete waste generated by washout operations.
 - Materials used to construct the washout area should conform to the provisions detailed in their respective BMPs (e.g., SE-8 Sandbag Barrier).
 - Plastic lining material should be a minimum of 10 mil in polyethylene sheeting and should be free of holes, tears, or other defects that compromise the impermeability of the material.
 - Alternatively, portable removable containers can be used as above grade concrete washouts. Also called a “roll-off”; this concrete washout facility should be properly sealed to prevent leakage and should be removed from the site and replaced when the container reaches 75% capacity.
- Temporary Concrete Washout Facility (Type Below Grade)
 - Temporary concrete washout facilities (type below grade) should be constructed as shown on the details at the end of this BMP, with a recommended minimum length and minimum width of 10 ft. The quantity and volume should be sufficient to contain all liquid and concrete waste generated by washout operations.
 - Lath and flagging should be commercial type.
 - Plastic lining material should be a minimum of 10 mil polyethylene sheeting and should be free of holes, tears, or other defects that compromise the impermeability of the material.

- The base of a washout facility should be free of rock or debris that may damage a plastic liner.

Removal of Temporary Concrete Washout Facilities

- When temporary concrete washout facilities are no longer required for the work, the hardened concrete should be removed and properly disposed or recycled in accordance with federal, state or local regulations. Materials used to construct temporary concrete washout facilities should be removed from the site of the work and properly disposed or recycled in accordance with federal, state or local regulations.
- Holes, depressions or other ground disturbance caused by the removal of the temporary concrete washout facilities should be backfilled and repaired.

Costs

All of the above are low cost measures. Roll-off concrete washout facilities can be more costly than other measures due to removal and replacement; however, provide a cleaner alternative to traditional washouts. The type of washout facility, size, and availability of materials will determine the cost of the washout.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Temporary concrete washout facilities should be maintained to provide adequate holding capacity with a minimum freeboard of 4 in. for above grade facilities and 12 in. for below grade facilities. Maintaining temporary concrete washout facilities should include removing and disposing of hardened concrete and returning the facilities to a functional condition. Hardened concrete materials should be removed and properly disposed or recycled in accordance with federal, state or local regulations.
- Washout facilities must be cleaned, or new facilities must be constructed and ready for use once the washout is 75% full.
- Inspect washout facilities for damage (e.g. torn liner, evidence of leaks, signage, etc.). Repair all identified damage.

NOTES

1. ACTUAL LAYOUT DETERMINED IN FIELD.
2. THE CONCRETE WASHOUT SIGN SHALL BE INSTALLED WITHIN 30 FT. OF THE TEMPORARY CONCRETE WASHOUT FACILITY.

Sanitary/Septic Waste Management WM-9

Description and Purpose

Proper sanitary and septic waste management prevent the discharge of pollutants to stormwater from sanitary and septic waste by providing convenient, well-maintained facilities, and arranging for regular service and disposal.

Suitable Applications

Sanitary septic waste management practices are suitable for use at all construction sites that use temporary or portable sanitary and septic waste systems.

Limitations

None identified.

Implementation

Sanitary or septic wastes should be treated or disposed of in accordance with state and local requirements. In many cases, one contract with a local facility supplier will be all that it takes to make sure sanitary wastes are properly disposed.

Storage and Disposal Procedures

- Temporary sanitary facilities should be located away from drainage facilities, watercourses, and from traffic circulation. If site conditions allow, place portable facilities a minimum of 50 feet from drainage conveyances and traffic areas. When subjected to high winds or risk of high winds, temporary sanitary facilities should be secured to prevent overturning.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Sanitary/Septic Waste Management WM-9

- Temporary sanitary facilities must be equipped with containment to prevent discharge of pollutants to the stormwater drainage system of the receiving water.
- Consider safety as well as environmental implications before placing temporary sanitary facilities.
- Wastewater should not be discharged or buried within the project site.
- Sanitary and septic systems that discharge directly into sanitary sewer systems, where permissible, should comply with the local health agency, city, county, and sewer district requirements.
- Only reputable, licensed sanitary and septic waste haulers should be used.
- Sanitary facilities should be located in a convenient location.
- Temporary septic systems should treat wastes to appropriate levels before discharging.
- If using an onsite disposal system (OSDS), such as a septic system, local health agency requirements must be followed.
- Temporary sanitary facilities that discharge to the sanitary sewer system should be properly connected to avoid illicit discharges.
- Sanitary and septic facilities should be maintained in good working order by a licensed service.
- Regular waste collection by a licensed hauler should be arranged before facilities overflow.
- If a spill does occur from a temporary sanitary facility, follow federal, state and local regulations for containment and clean-up.

Education

- Educate employees, subcontractors, and suppliers on sanitary and septic waste storage and disposal procedures.
- Educate employees, subcontractors, and suppliers of potential dangers to humans and the environment from sanitary and septic wastes.
- Instruct employees, subcontractors, and suppliers in identification of sanitary and septic waste.
- Hold regular meetings to discuss and reinforce the use of sanitary facilities (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.

Costs

All of the above are low cost measures.

Sanitary/Septic Waste Management WM-9

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Arrange for regular waste collection.
- If high winds are expected, portable sanitary facilities must be secured with spikes or weighed down to prevent over turning.
- If spills or leaks from sanitary or septic facilities occur that are not contained and discharge from the site, non-visible sampling of site discharge may be required. Refer to the General Permit or to your project specific Construction Site Monitoring Plan to determine if and where sampling is required.

Stormwater Management for Construction Activities; Developing Pollution Prevention Plans and Best Management Practice, EPA 832-R-92005; USEPA, April 1992.

Description and Purpose

Liquid waste management includes procedures and practices to prevent discharge of pollutants to the storm drain system or to watercourses as a result of the creation, collection, and disposal of non-hazardous liquid wastes.

Suitable Applications

Liquid waste management is applicable to construction projects that generate any of the following non-hazardous by-products, residuals, or wastes:

- Drilling slurries and drilling fluids
- Grease-free and oil-free wastewater and rinse water
- Dredgings
- Other non-stormwater liquid discharges not permitted by separate permits

Limitations

- Disposal of some liquid wastes may be subject to specific laws and regulations or to requirements of other permits secured for the construction project (e.g., NPDES permits, Army Corps permits, Coastal Commission permits, etc.).
- Liquid waste management does not apply to dewatering operations (NS-2 Dewatering Operations), solid waste management (WM-5, Solid Waste Management), hazardous wastes (WM-6, Hazardous Waste Management), or

concrete slurry residue (WM-8, Concrete Waste Management).

- Typical permitted non-stormwater discharges can include: water line flushing; landscape irrigation; diverted stream flows; rising ground waters; uncontaminated pumped ground water; discharges from potable water sources; foundation drains; irrigation water; springs; water from crawl space pumps; footing drains; lawn watering; flows from riparian habitats and wetlands; and discharges or flows from emergency fire fighting activities.

Implementation

General Practices

- Instruct employees and subcontractors how to safely differentiate between non-hazardous liquid waste and potential or known hazardous liquid waste.
- Instruct employees, subcontractors, and suppliers that it is unacceptable for any liquid waste to enter any storm drainage device, waterway, or receiving water.
- Educate employees and subcontractors on liquid waste generating activities and liquid waste storage and disposal procedures.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Verify which non-stormwater discharges are permitted by the statewide NPDES permit; different regions might have different requirements not outlined in this permit.
- Apply NS-8, Vehicle and Equipment Cleaning for managing wash water and rinse water from vehicle and equipment cleaning operations.

Containing Liquid Wastes

- Drilling residue and drilling fluids should not be allowed to enter storm drains and watercourses and should be disposed of.
- If an appropriate location is available, drilling residue and drilling fluids that are exempt under Title 23, CCR § 2511(g) may be dried by infiltration and evaporation in a containment facility constructed in conformance with the provisions concerning the Temporary Concrete Washout Facilities detailed in WM-8, Concrete Waste Management.
- Liquid wastes generated as part of an operational procedure, such as water-laden dredged material and drilling mud, should be contained and not allowed to flow into drainage channels or receiving waters prior to treatment.
- Liquid wastes should be contained in a controlled area such as a holding pit, sediment basin, roll-off bin, or portable tank.
- Containment devices must be structurally sound and leak free.
- Containment devices must be of sufficient quantity or volume to completely contain the liquid wastes generated.

- Precautions should be taken to avoid spills or accidental releases of contained liquid wastes. Apply the education measures and spill response procedures outlined in WM-4, Spill Prevention and Control.
- Containment areas or devices should not be located where accidental release of the contained liquid can threaten health or safety or discharge to water bodies, channels, or storm drains.

Capturing Liquid Wastes

- Capture all liquid wastes that have the potential to affect the storm drainage system (such as wash water and rinse water from cleaning walls or pavement), before they run off a surface.
- Do not allow liquid wastes to flow or discharge uncontrolled. Use temporary dikes or berms to intercept flows and direct them to a containment area or device for capture.
- Use a sediment trap (SE-3, Sediment Trap) for capturing and treating sediment laden liquid waste or capture in a containment device and allow sediment to settle.

Disposing of Liquid Wastes

- A typical method to handle liquid waste is to dewater the contained liquid waste, using procedures such as described in NS-2, Dewatering Operations, and SE-2, Sediment Basin, and dispose of resulting solids per WM-5, Solid Waste Management.
- Methods of disposal for some liquid wastes may be prescribed in Water Quality Reports, NPDES permits, Environmental Impact Reports, 401 or 404 permits, and local agency discharge permits, etc. Review the SWPPP to see if disposal methods are identified.
- Liquid wastes, such as from dredged material, may require testing and certification whether it is hazardous or not before a disposal method can be determined.
- For disposal of hazardous waste, see WM-6, Hazardous Waste Management.
- If necessary, further treat liquid wastes prior to disposal. Treatment may include, though is not limited to, sedimentation, filtration, and chemical neutralization.

Costs

Prevention costs for liquid waste management are minimal. Costs increase if cleanup or fines are involved.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect weekly during the rainy season and of two-week intervals in the non-rainy season to verify continued BMP implementation.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.

- Remove deposited solids in containment areas and capturing devices as needed and at the completion of the task. Dispose of any solids as described in WM-5, Solid Waste Management.
- Inspect containment areas and capturing devices and repair as needed.

BMP INSPECTION REPORT

Date and Time of Inspection:			Date Report Written:		
Inspection Type: (Circle One)	Weekly <i>Complete Parts I, II, III and VII</i>	Pre-Qualifying Precipitation Event (QPE) <i>Complete Parts I, II, III, IV and VII</i>	During-QPE <i>Complete Parts I, II, III, V and VII</i>	Post-QPE <i>Complete Parts I, II, III, VI and VII</i>	<i>Inactive Project Complete Parts I, II, III and VII</i>
Part I. General Information					
Site Information					
Construction Site Name:					
Construction stage and complete activities:				Approximate area of site that is exposed:	
Photos Taken: (Circle one)	Yes	No		Photo Reference IDs:	
Weather					
Estimate storm beginning: (date and time)			Estimate storm duration: (hours)		
Estimate time since last storm: (days or hours)			Rain gauge reading and location: (in)		
<p>Is a "Qualifying Precipitation Event" predicted or did one occur (i.e., any weather pattern with a 50% chance of 0.5" or more within a 24-hr period when 0.5" has been forecast and continues on subsequent 24-hour periods when 0.25" of precipitation or more is forecast)? (Y/N)</p> <p>If yes, summarize forecast:</p>					
<p>Exception Documentation (explanation required if inspection could not be conducted). Visual inspections are not required outside of business hours or during dangerous weather conditions such as electrical storms, flooding, and high winds above 40 miles per hour.</p>					
Inspector Information					
Inspector Name:			Inspector Title:		
Inspector Certification:			Date:		

Part II. BMP Observations. Describe deficiencies in Part III.			
Minimum BMPs for Risk Level 1 Sites	Adequately designed, implemented and effective (yes, no, N/A)	Action Required (yes/no)	Action Implemented (date)
Good Housekeeping for Construction Materials			
Inventory of products (excluding materials designed to be outdoors)			
Stockpiled construction material not actively in use are covered and bermed			
All chemicals are stored in watertight containers with appropriate secondary containment, or in a completely enclosed storage shed			
Construction materials are minimally exposed to precipitation			
BMPs preventing the off-site tracking of materials are implemented and properly effective			
Good Housekeeping for Waste Management			
Wash/rinse water and materials are prevented from being disposed into the storm drain system			
Portable toilets are contained to prevent discharges of waste			
Sanitation facilities are clean and with no apparent for leaks and spills			
Equipment is in place to cover waste disposal containers at the end of business day and during precipitation events			
Discharges from waste disposal containers are prevented from discharging to the storm drain system / receiving water			
Stockpiled waste material is securely protected from wind and rain if not actively in use			
Procedures are in place for addressing hazardous and nonhazardous spills			
Appropriate spill response personnel are assigned and trained			
Equipment and materials for cleanup of spills is available onsite			
Washout areas (e.g., concrete) are contained appropriately to prevent discharge or infiltration into the underlying soil			
Good Housekeeping for Vehicle Storage and Maintenance			
Measures are in place to prevent oil, grease, or fuel from leaking into the ground, storm drains, or surface waters			
All equipment or vehicles are fueled, maintained, and stored in a designated area with appropriate BMPs			

Part II. BMP Observations. Describe deficiencies in Part III.			
Minimum BMPs for Risk Level 1 Sites	Adequately designed, implemented and effective (yes, no, N/A)	Action Required (yes/no)	Action implemented (date)
Vehicle and equipment leaks are cleaned immediately and disposed of properly			
Good Housekeeping for Landscape Materials			
Stockpiled landscape materials such as mulches and topsoil are contained and covered when not actively in use			
Erodible landscape material has not been applied 2 days before a forecasted precipitation event or during an event			
Erodible landscape materials are applied at quantities and rates in accordance with manufacturer recommendations			
Bagged erodible landscape materials are stored on pallets and covered			
Good Housekeeping for Air Deposition of Site Materials			
Good housekeeping measures are implemented onsite to control the air deposition of site materials and from site operations			
Non-Stormwater Management			
Non-Stormwater discharges are properly controlled			
Vehicles are washed in a manner to prevent non-stormwater discharges to surface waters or drainage systems			
Streets are cleaned in a manner to prevent unauthorized non-stormwater discharges to surface waters or drainage systems.			
Erosion Controls			
Wind erosion controls are effectively implemented			
Effective soil cover is provided for disturbed areas inactive (i.e., not scheduled to be disturbed for 14 days) as well as finished slopes, open space, utility backfill, and completed lots			
The use of plastic materials is limited in cases when a more sustainable, environmentally friendly alternative exists			
Sediment Controls			
Perimeter controls are established and effective at controlling erosion and sediment discharges from the site			
Entrances and exits are stabilized to control erosion and sediment discharges from the site			
Sediment basins are properly maintained			

Part II. BMP Observations. Describe deficiencies in Part III.			
Minimum BMPs for Risk Level 1 Sites	Adequately designed, implemented and effective (yes, no, N/A)	Action Required (yes/no)	Action Implemented (date)
Inspect immediate access roads prior to forecasted precipitation			
Run-On and Run-Off Controls			
Run-on to the site is effectively managed and directed away from all disturbed areas.			
Other			
Are the project SWPPP and BMP plans up to date, available onsite and being properly implemented?			
Is the posting of the project's unique WDID number, waiver identification number, and site and project contact information publicly accessible?			
Part III. Descriptions of BMP Deficiencies			
Deficiency	Repairs Implemented: Note - Repairs must begin within 72 hours of identification and, complete repairs as soon as possible.		
	Start Date	Action	
1.			
2.			
3.			
4.			
Part IV. Additional Pre-QPE Observations. Note the presence or absence of floating and suspended materials, sheen, discoloration, turbidity, odors, and source(s) of pollutant(s).			
		Yes, No, N/A	
Do stormwater storage and containment areas have adequate freeboard? If not, complete Part III.			
Are drainage areas free of spills, leaks, or uncontrolled pollutant sources? If no, complete Part VII and describe below.			
Notes:			
Are stormwater storage and containment areas free of leaks? If no, complete Parts III and/or VII and describe below.			
Notes:			

Part V. Additional During-QPE Observations. If BMPs cannot be inspected during inclement weather, list the results of visual inspections at all relevant outfalls, discharge points, and downstream locations. Note odors or visible sheen on the surface of discharges. Complete Part VII (Corrective Actions) as needed

Outfall, Discharge Point, or Other Downstream Location	
Location	Description
Location	Description
Location	Description
Location	Description

Part VI. Additional Post-QPE Observations. Visually observe (inspect) stormwater discharges at all discharge locations within 96 hours after each qualifying precipitation event and observe (inspect) the discharge of stored or contained stormwater that is derived from and discharged subsequent to a Qualifying Precipitation Event producing precipitation of ½ inch or more at the time of discharge. Complete Part VII (Corrective Actions) as needed.

Discharge Location, Storage or Containment Area	Visual Observation

Part VII. Additional Corrective Actions Required. Identify additional corrective actions not included with BMP Deficiencies (Part III) above. Note if SWPPP change is required

Dear Sir/Madam,

Please be advised that the California State Water Resources Control Board has adopted the General Permit (General Permit) for Storm Water Discharges Associated with Construction Activity (CAS000002). The goal of this permit is to prevent the discharge of pollutants associated with construction activity from entering the stormdrain system, ground and surface waters.

Los Angeles World Airports (LAWA) has submitted Permit Registration Documents including a Stormwater Pollution Prevention Plan (SWPPP) to implement the requirements of the General Permit.

As a subcontractor, you are required to comply with the SWPPP and the General Permit for any work that you perform onsite. Any person or group who violates any condition of the General Permit may be subject to substantial penalties in accordance with state and federal law. You are encouraged to advise each of your employees working on this project of the requirements of the SWPPP and the General Permit. A copy of the General Permit and the SWPPP are available for your review at the construction office. Please contact me if you have further questions.

Sincerely,

Skanska-Flatiron, Joint Venture

Appendix B Contaminated Soil and Hazardous Material Management Report

1. Introduction

1.1 Project Description

The Los Angeles International Airports (LAX) is a world-class airport that serves as the primary airport for the greater Los Angeles area. The Airfield and Terminal Modernization Program (ATMP) Roadway Improvements are designed to improve traffic flow both into and out of the Central Terminal Area (CTA) by the construction and removal of select roadways and bridges. This includes alterations to Sepulveda Blvd and Century Blvd to reduce local traffic caused by airport-related congestion. In subsequent phases, the ATMP will include the construction of Concourse 0, construction of Terminal 9, and taxiway improvements on the airfield. This plan applies only to the Roadway Improvements portion of the ATMP. Construction and demolition are estimated to take roughly four or more years.

1.2 Purpose

This Hazardous Materials Management Plan (HMMP) has been prepared pursuant to Contract Sections PR-18.15.A and PR-19.3.A, federal, and state regulations. The purpose of this Plan is to provide Skanska-Flatiron management and field personnel with a document that addresses the proper classification, handling, storage, transportation, and off-site disposal of contaminated and hazardous materials during the ATMP in accordance with Contract Sections PR-18, PR-19, South Coast Air Quality District (SCAQMD) Rule 1166, and applicable federal and state regulations. This Plan is intended to be used in conjunction with a Site-Specific Health and Safety Plan.

1.3 Sources of Hazardous Materials

This HMMP addresses contaminated and hazardous soils encountered during excavation and demolition, as well as typical hazardous materials associated with demolition including asbestos, lead paint, and mercury. Contaminated soil may be encountered during general excavation that will require sampling and testing to determine the material classification. All hazardous materials transported to the project site and used (oils, solvents, paints, etc.) during construction will require approval by the Los Angeles World Airports.

1.4 Definitions

Hazardous Waste

A material is determined to be hazardous if it meets criteria listed in 22 CCR Section 66261.3 or 40 CFR 261.3. This may include excavated material, asbestos, loose and peeling lead-based paints and any other material that is regulated by and requires management, handling, transport, treatment, storage, and disposal according to the requirements of the Federal Resource Conservation Recovery Act (RCRA) and associated regulations (42 USC 6901 et seq. and 40 CFR Part 260 et seq.), or the California Hazardous Waste Control Law and associated regulations (Health and Safety Code 25000 et seq. and 22 CCR 66260 et seq.).

Material Classification Area (MCA)

A site or sites used by Skanska-Flatiron as a designated area for sampling and testing of suspect potentially contaminated material to determine whether the material must be disposed of at a hazardous waste site or whether it is acceptable for placement in the spoils disposal area.

Muck/Spoils

Unclassified excavated materials.

Soil Classifications

The following soil classifications with corresponding requirements are established for clarity on waste streams and payment for the transportation and disposal of the surplus waste excavated materials:

1. **Non-Contaminated but Impacted:** Soil with VOC readings greater than or equal to 1 but less than 50 PPM VOCs. SCAQMD does not consider this soil to be VOC contaminated. Sampling must be performed on this soil to clear it for reuse onsite or characterize it for disposal. Until the soil is cleared, it must be stored in a separate area from clean soil.
2. **Contaminated Soil with VOC readings exceeding or equal to 50 PPM.** Under SCAQMD Rule 1166, this material must be treated or disposed of within 30 days of excavation. This soil can be excavated and stockpiled, but must be stockpiled in a separate area from clean soil. This soil must be sprayed with a vapor suppressant prior to transport. Sampling must be performed on this soil to characterize it for disposal.
3. **Contaminated Soil – with VOC readings exceeding 1000 PPM.** Must be immediately sprayed with water or a vapor suppressant. Cannot be stockpiled, must be loaded directly into trucks or approved SCAQMD containers. SCAQMD must be notified within 1 hour of detection of this type of soil.
4. **RCRA Hazardous Soil** – Waste excavated material that is classified through soil characterization both as California hazardous waste and as a RCRA hazardous waste. As such, it requires disposal at a permitted disposal facility and may require stabilization prior to landfill disposal.
5. **California Class I Non-RCRA Hazardous Waste** – Waste excavated material that is classified as California Non-RCRA hazardous waste, requires disposal at a Class I disposal facility or similarly permitted out-of-state facility, and requires transport by a registered hazardous waste transporter.
6. **California Non-Hazardous Waste** – Waste that is not a California or Federal hazardous waste. It requires disposal at a Class III disposal facility or at a similarly permitted out-of-state facility without the need of a registered hazardous waste transporter.

Spoils Disposal Area

Area designated for the placement of non-contaminated spoils and demolished concrete material as indicated.

Suspect Material

Potentially contaminated excavated material suspected or observed to be contaminated because of the known occurrence of contamination in the vicinity of the excavation area, the presence of observable staining or odors, or other factors leading to a reasonable suspicion of possible contamination. For petroleum hydrocarbon contamination, odors can include hydrocarbon or strange smells and staining may be dark gray, black, or greenish.

Waste Excavated Soil

Excavated soil that is a waste and cannot be re-used within the Project per the re-use criteria of this

Specification. It is surplus, and is to be managed, transported, and disposed of as part of the Contract. Waste excavated soil does not include asphalt, concrete, vegetation, wood, debris, obstructions, and other organic, unsound, or deleterious matter.

1.5 Primary Personnel and Responsibilities

The qualified Project personnel responsible for the development and implementation of this Plan are described below.

LAWA

LAWA is the contracting agency for the Airfield and Terminal Modernization Project. They will ensure compliance with the requirements of the DA-5609 documents and oversee the construction, environmental, and engineering contractors, subcontractors, and consultants. LAWA will be the “Generator” of any hazardous waste discovered or encountered during construction operations.

Skanska-Flatiron, Joint Venture

Skanska-Flatiron, Joint Venture (SFJV) is the general contractor for the ATMP. SFJV is responsible for obtaining environmental and hazardous waste permits and submitting plans required during the construction phase. SFJV is responsible for compliance with applicable regulatory agency permits and confirm proper sampling, classification, handling, and disposal procedures for contaminated and hazardous materials management.

Kroner Environmental Services (KES)

KES is an environmental services provider and general engineering contractor licensed to handle hazardous substances. KES will provide construction site environmental support with oversight and management of contaminated and hazardous wastes generated during the Project. KES will be responsible for preparing environmental plans within their scope of work that are required under LAWA contract specifications.

Hazardous Materials Manager (HMM)

SFJV will appoint a Hazardous Materials Manager. The appointee will be qualified to identify hazardous and regulated materials, initiate responses, and contingency plans, provide notifications to LAWA and the proper regulatory agencies during a response, and train onsite personnel. The contact information for the Hazardous Materials Manager is:

Name: TBD
Email: TBD
Phone Number: TBD

2. Contaminated and Hazardous Wastes Management

As stated in Section 1.3, this HMMP addresses contaminated and hazardous soils expected to be encountered during excavation and demolition. These wastes will require proper management, handling, storage, transportation, and disposal in accordance with federal, state, and local laws and regulations.

2.1 Known Areas of Contamination

The five areas with known historic and current areas of contamination that are shown in Figure 1. Information below was taken from the three following documents: *LAX Environmental Site Review Close-*

Out Memorandum (LAWA 2019), Draft Environmental Impact Report (LAWA 2020), and the Final Environmental Assessment and General Conformity Assessment (R&A 2021)

Allied Signal-Honeywell Site / Concourse 0

Currently, the area planned for development into Concourse 0 stands as part of LAX's pickup area for services such as Uber and Lyft on the northwest corner of World Way and Sepulveda Blvd. Previously this location was used by Allied Signal Aerospace Company and Honeywell International Company. Previous, known contamination includes hydrocarbons, chlorinated hydrocarbons, 1,4 dioxane, halogenated volatile organic compounds (HVOCs), and related compounds. Thirteen Underground Storage Tanks (USTs) that were in use during previous land uses have all been removed. A soil vapor extraction system was installed to remove volatile organic compounds (VOCs) and approximately 400,000 pounds of VOCs were removed as of 2018 (R&A 2021). Cleanup operations intermittently continue in the northwest quadrant of the site. (R&A 2021). Additional studies, groundwater remediation, and site assessments are being coordinated and overseen by the Regional Water Quality Control Board (RWQCB). The cleanup status remains open and the RWQCB is overseeing site assessment activities. Groundwater contamination is known to exist beneath and to the east of the site and it is being monitored with monitoring wells (R&A 2021).

Terminal 1 Fuel Valve Vault

Located at 250 World Way West on the airfield, this location has soil and groundwater contaminated with jet-fuel and related compounds. On March 8, 2015 fuel spilled onto and through the soil into the groundwater approximately 100 feet below the ground surface. Free-product removal is ongoing. Contaminants include petroleum hydrocarbons, 1,4-Dioxane, and VOCs. Planned improvement at this location are additions to the taxiway. Remediation was ongoing as of December 2021 (R&A 2021).

United Airlines Maintenance Operations Center

Located above the east side of Taxiway C, this operations center was previously home to USTs and jet-fuel hydrant systems. Contaminants associated with the site are hydrocarbons, VOCs, and Stoddard solvents. Remediation is ongoing. A product recovery system removed over 6,000 gallons of liquid impacted with product. Remediation was completed on much of the site except a small area 600 feet east of the Terminal 9 site as of December 2021 (R&A 2021).

Continental Airlines Crash Site (1978)

This site is at the eastern end of the northern airfield and soil contaminants include low concentrations of PFAS. This location is listed in the Final Environmental Assessment as a hazardous materials site, however, PFAS is currently not a listed hazardous waste. As the project sequence advances, all suspect contaminated / hazardous materials - including PFAS will be managed in accordance with the most current federal or state rules and regulations, as applicable.

Delta Hangar

Located at 6040 Avion Drive, this previous Delta Maintenance Hangar was home to Above-ground Storage Tanks (ASTs), USTs, diesel, oil, oily water, two 5,600 gallon fire suppressant tanks, hydraulic lifts, trench drains, and two clarifiers. From 1988 to 1999 Delta conducted investigations and removal activities. After the cleanup activities, both the Los Angeles Fire Department and the Regional Water Quality Control Board requested "no further action," (LAWA 2019). At the time of writing the 2019 document, the LAWA

Environmental Programs Group still had an unresolved recommendation: sampling the soil beneath the cracked concrete floor of the machine room to test for metals. Two notable environmental matters that LAWA stated did not warrant further action on behalf of Delta Airlines included outdoor hydrocarbon staining on pavement that could only be partially removed and staining on the inside of the bottom of three hydraulic lifts could not be verified due to insufficient lighting (LAWA 2019).

2.2 Unknown Areas of Contamination

If any suspicious discoveries during excavation of unexpected or unexplainable contamination that pose a safety or regulatory risk are identified, such as stains or smells or waste piles, LAWA will be immediately notified. Work in the discovery area will cease until further characterization is completed and site access will be restricted.

For demolition, if a structure is suspected to contain a hazardous building material, building surveys will be conducted to identify potential sources of asbestos, mercury, PCBs, and lead based paint. If a building was painted prior to 1978, it is suspect for lead paint. If a building has transformers or trash compactors that date back to 1979, it is suspect for PCBs.

2.3 Material Classification Areas (MCAs)

It is anticipated that excavated or disturbed soil may potentially be contaminated or hazardous. Therefore, material classification areas (MCAs) will be established for the segregation, sampling, and testing of suspect materials to determine if the material needs special handling and if it needs to be disposed of at a contaminated or hazardous waste disposal facility. Trained personnel, such as the HMM, will identify, transfer, handle, segregate, and store the suspect contaminated or hazardous material within the MCAs to prevent cross-contamination while the material classification is determined. These personnel will keep documentation of material transfers and the results of soil screenings. Segregation, sampling, and testing will only be required for soils suspected of being potentially contaminated/hazardous. Segregated stockpiles with impacted or contaminated soil will need to be properly labeled to prevent accidental mixing. Stockpile locations will need to be approved by LAWA prior to their use. Excavated soils classified as California Class III Non-Hazardous at the MCAs will be transported and stockpiled in the spoils disposal areas. These areas are the designated on-site locations for the placement of non-contaminated soil and demolished concrete material.

2.4 Storage and Housekeeping Practices

Contaminated and hazardous wastes will be stored in a separate storage area than non-contaminated or non-hazardous wastes. Hazardous waste will be stored in accordance with local, state, and federal regulations. Storage area locations will be submitted to LAWA for approval prior to use. The storage areas will also be selected with respect to the Stormwater Pollution Prevention Plan (SWPPP). Soil stockpiles will be covered to prevent stormwater contact and movement from wind. Storage areas will be clearly labeled and defined with markers such as cones, flagging, and signage to prevent accidental mixing. Movement of materials into, out of, and within the storage areas will be documented by the HMM or trained personnel.

2.5 Material Testing and Classification

The definitions and corresponding requirements for RCRA Hazardous Soil, California Class I Non-RCRA Hazardous Waste, and Non-Hazardous Waste are provided in Section 1.4. To ensure proper handling and

disposal, suspect excavated material from any of the known areas of contamination or discovered areas of contamination will be segregated, sampled, tested, and classified within the designated MCA. Testing will be performed by a Certified Testing Laboratory to classify suspect materials in accordance with the respective landfill or disposal facility requirements. This project will use Positive Lab Services (Environmental Laboratory Accreditation Program #1131), which is located at 781 E Washington Blvd, Los Angeles, CA 90021.

The sampling frequency and protocol will be based on the (1) contract specifications, (2) acceptance criteria of the receiving landfill or waste disposal facility, (3) regulatory requirements, and (4) volume of excavated material generated. No other area or site will require testing unless otherwise required by applicable permits and regulations or identified as containing suspect materials.

The minimum testing needed to clear suspect materials for placement within the on-site spoils disposal areas will include:

1. Title 22 Metals in accordance with EPA Method 6010B and EPA Method 7471A for Mercury.
2. Total Petroleum Hydrocarbons (TPH) as diesel (TPH-d) and motor oil (TPH-mo) in accordance with EPA Method 8015B
3. VOCs in accordance with EPA Method 8260B

If the laboratory analytical results reveal that (1) the concentrations of metals, TPH, and other substances deemed as hazardous waste do not exceed screening levels for RCRA's TTLC or California's STLC and (2) the VOC readings from the soil do not subject the soil special handling required by SCAQMD (less than 1 PPM VOCs) then the suspect materials are permitted to be stockpiled in the designated spoils disposal area. If the material is deemed hazardous, then notifications will be made to LAWA and the appropriate regulatory agencies and the material will be sent to an appropriate landfill.

For building demolition, if a building is suspected of containing asbestos, lead based paint, mercury, PCBs or any hazardous building material, it will be considered a MCA until either the results of the building survey indicate there are no hazardous building materials or the materials identified as hazardous by the building survey have been properly removed and abated from the building in accordance with applicable local, state and federal regulations.

2.6 Petroleum Hydrocarbon Impacted Soil

The identification and screening process to determine if soil needs special handling as required by SCAQMD will involve a photoionization detector (PID) and waste profile sampling. For proper SCAQMD Rule 1166 screening using a PID, a reading will be taken by trained personnel at a distance of 3 inches from suspect excavated soil within 3 minutes of the soil being excavated. PID readings will be conducted if the excavation personnel observe any signs of contamination including staining and strange smells or if excavation is performed within an area suspected to contain hazardous waste.

- If the PID reading is less than 1 PPM VOCs, the soil will be treated as not impacted, not contaminated, and not hazardous.
- If the PID reading is greater than 1 PPM but less than 50 PPM VOCs, it will be treated as impacted, but not contaminated. Waste profile sampling must be conducted to determine if the waste is hazardous prior to disposal, suitable for reuse onsite, or viable to be added to the clean soil pile. Prior to waste profile sampling, the soil can be transported to a stockpile, but it must be stockpiled

in a LAWA approved area separated from clean soil.

- If the PID reading is 50 PPM VOCs or greater, the waste soil is considered contaminated by SCAQMD. Waste profile sampling must be conducted to determine if the waste is hazardous prior to disposal. This waste must be treated or disposed of within 30 days of excavation. Water or an approved vapor suppressant must be sprayed on the waste prior to transport. The waste cannot be stored in the same stockpile as non-contaminated soil and must be stored in its own area. The waste soil cannot be excavated without a site specific SCAQMD 1166 permit. KES holds and maintains a SCAQMD various locations permit that allows for the excavation of up to 1500 cubic yards.
- If the PID reading is 1000 PPM VOCs or greater, the waste is still considered impacted and contaminated, but more restrictions apply. SCAQMD must be notified within 1 hour of the PID reading. The excavation work area must be sprayed with water or an approved vapor suppressant. The waste soil cannot be excavated without a site specific SCAQMD 1166 permit. Waste profile sampling must be conducted to determine if the waste is hazardous prior to excavating it for disposal. The soil can only be removed from the ground directly into a truck and sprayed with a vapor suppressant or put into a SCAQMD approved, vapor tight container to be disposed of within 30 days.

3. Transportation and Disposal of Hazardous Waste

3.1 Transportation of Hazardous Waste

Materials classified as either RCRA Hazardous Soil or California Class I Non-RCRA Hazardous Waste will be transported separately from Non-Hazardous Waste to prevent mixing. Hazardous materials will be hauled off the site by a licensed hazardous waste hauler under a Uniform Hazardous Waste Manifest to an approved disposal facility in accordance with all applicable regulations, including but not limited to, 40 CFR Part 263, 22 CCR Section 66263, and DOT-HM 181 as per 49 CFR 172. The hauler(s) must also adhere to other applicable federal, state, and local laws, codes, and ordinances that govern the transportation of hazardous wastes.

At a minimum, the licensed hazardous waste hauler must have the following items during transportation:

1. Valid driver's license, vehicle registration, and insurance meeting regulatory requirements;
2. Licensing in compliance with all applicable California State and Local vehicle regulations;
3. Current Class I Certificate of Compliance from the California Highway Patrol;
4. Hazardous Substance Removal Certification granted by the State of California, Contractor's State License Board

LAWA will be the "Generator" of any excavated materials determined to be either RCRA Hazardous Soil or California Class I Non-RCRA Hazardous Waste. A LAWA representative will provide the hazardous waste generator identification number. Weights will be acquired when the hauler reaches the landfill. The licensed hazardous waste hauler will sign and date the manifests indicating that the identified load has been accepted on that date. A LAWA representative will sign the manifest on behalf of the "Generator."

All manifests will be processed in accordance with US EPA, California Department of Toxic Substances

Control (DTSC), and California state regulations. Uniform Hazardous Waste Manifests, Bills of Lading, Waste Profiles, and Landfill Agreements will be prepared and provided by SFJV and approved by the designated landfill in advance.

3.2 Disposal of Hazardous Waste

Conditions of acceptance at landfills and waste disposal facilities include: (1) providing a waste profile, (2) obtaining a landfill service agreement and account, and (3) visually confirming that the hazardous waste shipment has greater than 50 percent solids and no free liquids. Waste profiles must be submitted to LAWA for review and approval, which typically take 7 days.

The completed Uniform Hazardous Waste Manifest must be signed by the recipient of the waste shipment to confirm that the shipment was received at the landfill or waste disposal facility. At a minimum, all landfills and waste disposal facilities will be permitted under RCRA and state and local requirements.

Hazardous and Contaminated Waste Disposal Facilities:

Republic Services Beatty Facility – (VOC contaminated and Hazardous soil)

- Operated by Republic Services
- 11455 S US-95, Beatty, NV 89003
- Phone # 800.239.3943

Kettleman Hills Facility

- Operated by Waste Management
- 35251 Old Skyline Rd, Kettleman City, CA 93239
- Phone # 866.909.4458

Buttonwillow Landfill Facility

- Operated by Clean Harbors
- 2500 West Lokern Rd, Buttonwillow, CA 93206
- Phone # 661.762.6200

Petroleum Contaminated – Non-Hazardous Soil Disposal Facilities:

As stated in PR-19, soil considered by SCAQMD Rule 1166 to be VOC contaminated (over 50 PPM VOCs) that has been characterized as non-hazardous will be disposed of by recycling or as directed by LAWA.

Soil Safe of California

- Operated by Soil Safe
- 12328 Hibiscus Rd, Adelanto, CA 92301
- Phone # 760.246.8001

Simi Valley Landfill

- Operated by Waste Management
- 2801 Madera Rd, Simi Valley, CA 93065
- Phone # 805.579.7267

Non-Hazardous, Non Contaminated, but Impacted Soil Disposal Facilities:

This category is for soil that reads equal to or greater than 1 to 50 PPM VOCs. This soil meets the criteria for non contaminated, but impacted. that have been characterized as non-hazardous will be disposed of by recycling or as directed by LAWA.

Chiquita Canyon Landfill

- Operated by Chiquita Canyon
- 29201 Henry Mayo Dr, Castiac, CA 81384
- Phone # 661.257.3655

4. Health and Safety

4.1 Personal Protective Equipment

The Personal Protective Equipment (PPE) listed below will be required for construction activities involving contaminated or hazardous materials. More information will be available in the Site Specific Health and Safety Plan.

Table 1 - Levels of Protection

Level D	Initial Protection Level: Gloves, hard hat, steel-toed boots, eye protection (as needed), hearing protection (as needed). 1. Modified Level D protection for potential skin exposure includes an uncoated or coated Tyvek suit.
Level C	Level C includes the aforementioned PPE for Level D plus the following: 1. Protective coveralls (uncoated or coated Tyvek suit or equivalent); 2. Full face air purifying respirators equipped with organic vapor and acid gas HEPA cartridges, or other site specific filter cartridge specific to each area.

Level D PPE

Level D protection is the minimum level of respiratory and skin protection required by all onsite personnel and will be utilized for nuisance contamination only.

Level D protection includes:

- ANSI-approved hard hat;
- ANSI-approved safety glasses with side shields;
- ANSI-approved safety-toed boots (chemical resistant);
- Hearing protection (if working near a noise source);
- Gloves (if necessitated by direct contact);
- Safety vest (highlighted) and appropriate field attire (pants, long-sleeved shirts, etc.); and
- Chemical-resistant gloves (if there is potential for skin exposure).

Modified Level D PPE

Modified Level D protection includes all of the bullet points listed in Level D, with the addition of Tyvek and boot covers. If respiratory protection is needed, Level C PPE will be required.

Level C PPE

On-site personnel will upgrade to Level C PPE if an airborne substance is identified, its concentration measured, the criteria for using the air-purifying respirators met, and skin and eye exposure is unlikely. Periodic air monitoring must also be performed.

Level C protection includes:

- NIOSH-approved full-face or half-mask (with safety glasses), air purifying respirator;
- Chemical-resistant clothing (coveralls, hooded chemical splash suit, hood and apron, etc.); and
- Chemical-resistant inner and outer gloves; and
- Disposable chemical-resistant outer boot covers.

In addition to:

- ANSI-approved hard hat;
- ANSI-approved safety glasses with side shields;
- ANSI-approved steel-toed boots (chemical resistant);
- Ear plugs (if working near a noise source); and
- Safety vest (highlighted) and appropriate field attire (pants, etc.).

4.2 Required Training and Qualifications

Personnel working in areas with suspect material, contaminated material or hazardous material may be exposed to contaminated and/or hazardous disturbed soil. For any work subject to training requirements specified in 29CFR1910.120 and Title 8 CCR Section 5192(e), workers will be provided with current 40-Hour Hazardous Waste Operations and Emergency Response (HAZWOPER) Certification Training certifications will be provided via safety reporting and will not be managed under the HMMP.

4.3 Medical Monitoring Program

If required, qualified personnel involved in hazardous material-related work will be enrolled in personal and medical monitoring programs.

4.4 Spill Response

Accidental spills, leaks, and releases may occur when chemicals or hazardous materials are brought or used on-site. In the event of a spill, leak, or release, SFJV will be responsible for immediately notifying LAWA and the City Representative and initiating spill response and implementing emergency procedures.

The qualified emergency response personnel will review the Safety Data Sheets (SDS) in conjunction with the Site Safety Manager or equivalent designated individual to identify the chemical, biological, and physical hazards to determine the appropriate precautionary measures. The emergency response team will immediately eliminate the source to prevent further spread and contain the spill by using absorbent materials, patching, plugging, and/or diking. Fully stocked spill kits will be maintained at each project site for immediate deployment.

SFJV will also provide surface cleanup of spillage and proper disposal of contaminated and hazardous materials within the site boundaries and in the event of a hazardous waste discharge or spill during transportation to the designated disposal facility in accordance with the spill prevention and control measures included in the SWPPP.

4.5 Emergency Response

In the event of a fire, spill, natural disaster, or other emergency impacting the site, all affected personnel must immediately evacuate the work area, reassemble, and report to the Site Safety Manager or equivalent designated individual at a safe support zone where all personnel will be accounted for. The alarm message may be transmitted through radios and/or by voice and hand gestures. In the case of injury, personnel should take precautions to protect the victim from further harm and notify local or facility emergency services. The victim may require decontamination prior to treatment; requirements will vary based on the site conditions and activities performed before the injury. CalOSHA must be notified immediately in the event of a serious injury, death, or other emergency.

4.6 Air Monitoring

If airborne concentrations of contaminants are expected to exceed a CalOSHA PEL, air monitoring will be performed to determine the airborne concentration of contaminants. This measured concentration will also dictate the proper level of protection for on-site personnel. Only trained field personnel under the direction of the Site Safety Manager or equivalent designated individual will conduct area and personal air monitoring with direct reading instruments and sampling pumps. Sorbent tubes and filters will be analyzed by an American Industrial Hygiene Association (AIHA)-accredited laboratory using current National Institute of Occupational Safety and Health (NIOSH) and OSHA standard methods.

Personal Air Monitoring

Personal air monitoring will be performed to determine the actual exposure of specific chemicals to field personnel. A personal sampling pump will be connected to a sample collection media (sorbent tube, filter cassette, etc.) for vapor or particulates using Tygon tubing. The air monitoring apparatus will then be attached to the worker within their breathing zone.

Area Air Monitoring

Area air monitoring will be performed to assess the concentration of airborne contaminants in a given area. Direct reading instruments will be employed initially. Sampling pumps may also be positioned in various locations within the area suspected of contamination if deemed necessary.

Downwind and Fence Line Air Monitoring

In addition to personal and area air monitoring, downwind and fence line air monitoring may also be performed if the site conditions are evaluated and it is determined that Level C PPE is required. This air monitoring will be performed to ensure that any mitigation measures implemented are functioning properly and are sufficient in preventing fugitive emissions of airborne contaminants from extending beyond the site boundaries.

5. Documentation and Recordkeeping

The following records and documentation will be made available to LAWA, the EPA, the DTSC, and the City of Los Angeles.

Air Monitoring

Any air monitoring and sampling data, including calibration data, sampling equipment, and laboratory analysis results will be maintained by the Site Safety Manager or equivalent designated individual. Sampling and monitoring records will include information such as the sample ID number, date and location of sampling, and site activities.

Hazardous Materials Training

Proof of valid training records and certifications pertaining to hazardous materials such as the 40-Hour HAZWOPER Certification, 8-Hour HAZWOPER Annual Refresher Certification, respirator clearance, and fit-testing records must be maintained by the Site Safety Manager or equivalent designated individual. Training certifications will be provided via safety reporting and will not be managed under the HMMP.

Spill Control and Response

Maintain written and photograph records in addition to cleanup documentation of spills, leaks, and releases.

Hazardous Waste Transportation and Disposal

Uniform Hazardous Waste Manifests, Bills of Lading, Waste Profiles, and Landfill Agreements will be prepared and provided by SFJV and approved by the designated landfill in advance. Notifications and all applicable permits required for handling hazardous wastes must be maintained. Laboratory analytical results, records of waste disposal or treatment, and certified disposal facility/landfill permits and licenses will be retained by SFJV.

6. Reporting

Contaminated Soil and Hazardous Material Management Report

Required by contract specification PR-19, this document will be kept in Appendix B, and shall detail the characterization and disposition of all contaminated soil and hazardous materials removed from the site. The report must include the soil management approach, sampling and analyses, soil disposition for the several "phase" areas of earthwork, and confirmation sampling.

1. General

Skanska-Flatiron Joint Venture (SFJV) will extend partner company commitments to be a pioneering force of the green construction and development community. SFJV will partner with organizations seeking to transform the industry, and we will be active participants in researching and deploying sustainable construction practices on the ATMP Roadways Project.

This section will address SFJV's approach to environmental mitigation requirements for the project that include traffic, air quality, noise, water quality, recycling, waste disposal, material stockpiles, hazardous materials, and potential to encounter paleontological/archaeological resources.

This SFJV Project Environmental Monitoring and Control Plan (EMCP) is the framework for our project management team. This plan is a living document and, as such, will be maintained and updated throughout the duration of the Contract. This plan will be revised for subsequent task orders and construction phases as required under PR-01. We will provide continuous improvement and training to our team. SFJV Managers will be required to read, understand, implement and comply with this EMCP.

During the initial preconstruction phase, the primary contact from SFJV to ensure implementation of mitigation measures shall be Construction Manager Rick Finken. During the Construction phase, SFJV proposes that the primary contact from SFJV to ensure implementation of mitigation measures shall be Kurt Kroner, of Kroner Environmental Services, a DBE subcontractor from the SFJV team. This is contingent upon LAWA's approval of Kroner Environmental Services's scope and price in the Construction cGMP(s).

2. Requirements

SFJV will make available resources necessary to fulfill the environmental requirements of the Contract identified in PR-18 of the Airfield and Terminal Modernization Program. SFJV will also make resources available to comply with other requirements referenced under the Contract including, the ATMP Environmental Impact Report (EIR), ATM MMRP, the National Environmental Policy Act (NEPA), the Project Environmental Assessment (EA), Los Angeles Green Building Code "Tier 1" certification requirements, California Environmental Quality Act (CEQA) and the City of Los Angeles Low Impact Development Ordinance.

Pursuant to comment review clarification (James Owen, 8/15/2023) the 2004 LAX Master Plan MMRP requirement referenced in Section 1.C of the PR-18 is only applicable to Master Plan projects which the ATMP is not considered a part of. Additionally, both Exhibit 'B' and GC-76 reference the LAX Master Plan Final EIR, but not necessarily it's MMRP, as part of the definition for "Project Impact Area". Further pursuant to this clarification, removing the reference to the LAX Master Plan MMRP in the EMCP would not preclude or change the contractual requirements for the First Source Hiring Program.

3. Traffic

The objective of the Traffic Management Plan (TMP) will be to facilitate vehicular access to the CTA and movement on local streets at a level of service comparable to that in-place prior to construction. The TMP will be prepared using the selected basis of design (BOD) alternative and is included in Appendix 2. The TMP will comply with Contract requirements as well as applicable local, state, and Federal traffic safety standards, and will be subject to approval from local authorities having jurisdiction (AHJ's). The TMP will be incorporated here prior to initiation of construction.

SFJV will consider the maintenance of public traffic, construction haul routes, delivery hours, staging areas, and contractor employee parking in the TMP and site logistics plan.

4. Stockpiles

Stockpiling of materials such as excavated earth, demolition debris, aggregates, rock products, and drainage materials is anticipated. The environmental benefit of using on-site material stockpiles is to reduce the consumption of energy and carbon emissions that would be expended if materials were to be transported on/off site. Preliminary locations and types of stockpiles are identified in Appendix 3 – Construction Area Access, Phasing, and Logistics Plan. Stockpiles will be planned and managed to comply with environmental requirements to reduce or eliminate air and storm water pollution and to eliminate/avoid risk to LAWA operations. Stockpiles of rock and earth materials that are not actively being used shall be protected with a dust control product such as: water spray (reclaimed water shall be used for dust control), proprietary non-toxic crusting agents, anchored geotextile fabric or tarps, erosion control fabric, seeding, or other methods approved by LAWA. Bituminous prime coat products for dust control are not acceptable. All stockpile locations will be pre-approved by LAWA, allowing access by construction vehicles with minimal disruption to residences.

5. Air Pollution Control

SFJV will limit the potential discharge of smoke, dust, equipment exhaust or any other air contaminants as required by Federal, state and local regulations. SFJV will employ the best construction industry practices of onsite dust suppression, and street sweeping to abate dust, in accordance with South Coast Air Quality Management District (SCAQMD) Rule 403: Fugitive Dust. Fugitive dust is any solid particulate matter that becomes airborne, other than that emitted from an exhaust stack, directly or indirectly as a result of the activities of any person. PM₁₀ refers to particulate matter with an aerodynamic diameter smaller than or equal to 10 microns as measured by the applicable State and Federal reference test methods. According to SCAQMD Rule 403, Particulate matter shall not exceed 50 µg/m³ when determined as the difference between upwind and downwind samples collected on high volume particulate matter samplers or other EPA approved equivalent method for PM-10 monitoring at the property line for a five-hour period during the time of active operations.

Construction activities which may result in fugitive dust emissions include demolitions, soil excavation and hauling, land clearing, saw-cutting paved areas, and vehicle traffic on unpaved surfaces. This includes the stabilization of site ingress/egress per PR-18 specifications, continuously monitoring stockpiles, and

covering bins at the end of work shifts. The application of onsite dust suppression water will conform to the water pollution control requirements contained in this contract, as well as the project Stormwater Pollution Prevention Plan (SWPPP). Publicly visible signs will be posted outside of the construction site with the telephone number and person to contact regarding dust complaints; this person will then be required to respond and take corrective action within twenty-four hours.

The required minimum of three (3) CNG-fueled street sweepers and 90% renewable diesel fuel demand requirement for on-site, on-road, and off-road construction equipment will be included in a subsequent task order/GMP proposal.

6. Air Quality

Equipment used for construction by SFJV and its subcontractors will comply with Contract requirements and applicable Federal, State, and local air quality requirements. All off-road diesel-powered construction equipment greater than fifty (50) horsepower will meet, at a minimum, USEPA Tier 4 (final) off-road emissions standards. However, documentation of any approved exceptions will be provided to LAWA prior to use of any equipment not meeting the off-road equipment emissions requirements for construction equipment greater than 50 horsepower. Circumstances that may warrant exceptions include equipment currently unavailable in the inventory but has intent to meet applicable requirements when available, funding awarded by SCAQMD or another agency that would provide some or all of the cost to retrofit, repower, or purchase a piece of equipment or vehicle, but the funding has not yet been provided due to circumstances beyond control, diesel equipment/vehicle will be used on-site for fewer than twenty days.

All diesel-fueled equipment used for construction will be outfitted with the best available emission control devices, where technologically feasible, primarily to reduce emissions of diesel particulate matter, including fine PM_{2.5}, and secondarily, to reduce emissions of nitrogen oxides (NOx). This requirement will apply to diesel-fueled off-road equipment (such as construction machinery), diesel-fueled on-road vehicles (such as trucks), and stationary diesel-fueled engines (such as electric generators). It is unlikely that this measure will apply to equipment with Tier 4 engines, as these engines typically already incorporate the best available emission control devices. The emission control devices utilized in construction equipment shall be verified or certified by the California Air Resources Board (CARB) or US Environmental Protection Agency (USEPA) for use in on-road or off-road vehicles or engines. For vehicles and/or equipment outfitted with CARB approved best available control technology (BACT) devices, the BACT device shall be approved by CARB, specifications can be found on their website. A copy of each unit's certified BACT documentation, and each unit's CARB or SCAQMD operating permit, will be provided at the time of mobilization of each applicable unit of equipment. This requirement applies to diesel equipment owned and/or operated by SFJV and their subcontractors (including all sub-tiers). For multi-year construction projects, a reassessment of equipment availability, equipment fleet mixtures, and best available emission control devices will be conducted annually for equipment newly brought to the site each year. SFJV (and lower tier subcontractors) will comply with the 90% renewable diesel fuel demand requirement for off-road equipment and on-site, on-road trucks. On-road medium-duty and larger diesel-powered trucks used on LAX construction projects with a gross vehicle weight rating (GVWR) of at least 14,001 pounds shall, at a minimum, comply with USEPA 2010 on-road emissions standards for PM₁₀ and NOx. For NOx it is 0.2 grams per brake horsepower-hour (g/bhp-hr) or less, for PM it is 0.01 g/bhp-hr or less.

If SFJV and LAWA determine that locating a rock crusher and concrete batch plant facility on-site is best for the Project then SFJV will utilize such on-site batch plants. The decision to use on-site crushing facility depends largely on the quantities of demolished rubble material generated during removals and/or available from other nearby interfacing projects. Scheduling will also be factor in determining if demolition and removal will support processing of rubble in time for when recycled aggregates are needed. Additionally, on-site facilities will mitigate truck haul trips and thus reduce emissions. The design, installation, and operation of crushing plants and batch plants, if used, will comply with the Construction and Operation Compliance Manual dated May 12, 2015 and all applicable requirements of the SCAQMD Title V Permit for LAX.

Efforts to mitigate air pollution (to the extent feasible) include having construction employees commute during off-peak hours, suspending use of all construction equipment during second-stage smog alert in the immediate vicinity of LAWA, prohibiting tempering with construction equipment to increase horsepower/defeat emission control devices, restrict vehicle idling to no more than five minutes, utilize grid-based electric power. SFJV will create, provide, and maintain a list of all equipment to be used, including subcontractors' equipment. The list will be organized by SFJV and subcontractors, and will include equipment type, model, fuel source and emission characteristics. The list will also include subtotals and grand totals of quantities of equipment for each engine standard tier. The list will be updated monthly and be submitted to LAWA in the monthly reports. SFJV will ensure that equipment is in proper working order to minimize harmful emissions. To ensure the implementation of all components of the construction-related air quality/pollution-control measures, SFJV will designate a person(s) to conduct direct inspections, record reviews, and investigate complaints.

7. Noise Control

SFJV is committed to comply, to extent feasible, with the noise control requirements of the Contract and the City of Los Angeles noise ordinance. It is anticipated that significant construction activity and construction related noise will take place immediately adjacent to LAX area hotels. Included in the appropriate, subsequent task orders/CGMP, SFJV will propose to make resources available to collaborate with LAWA and the third-party hotel operators to find viable noise control measures. The noisiest on-site construction activities will avoid sensitive times of the day, as feasible, which include:

- Monday-Friday: 9:00 PM to 7:00 AM
- Saturday: 6:00 PM to 8:00 AM
- Anytime on Sunday and Holidays.

Noise control measures include utilizing devices such as equipment mufflers, enclosures, and barriers on all construction equipment to reduce noise impacts. Natural and artificial barriers such as existing dirt berms, ground elevation changes, solid fencing, and existing buildings can be utilized, where appropriate, to shield construction noise. Construction operations, loading/unloading of heavy materials/equipment, and stationary equipment (such as generators) will be staged as far from noise-sensitive uses as feasible.

When an increase of 5 dBA is projected to occur over the baseline exterior noise level, noise curtains during construction to shield noise-sensitive receptors from construction will be used. To verify the efficiency of the noise curtains, LAWA will measure construction noise levels at the closest sensitive receptors in

compliance with City standards. Should noise levels exceed the 5 dBA increase, LAWA will require SFJV to implement additional technical solutions and installation of (noise attenuation/shielding) equipment and will repeat measuring construction noise levels, until an increase of 5 dBA does not occur. SFJV will provide the required Construction Noise Control Plan (CNCN) to control noise impacts to noise-sensitive areas with each of the subsequent design packages and comply with the requirements of MM-CN (ATMP)-1 in the ATMP MMRP .

8. Sewage Spill Prevention and Emergency Response Plan

SFJV will prepare, submit, maintain, and implement a Sewage Spill Prevention and Emergency Response Plan (SSPERP) as required by the Contract. The SSPERP will comply with applicable LABOE Master Specification – Section 01563 Pollution Control, address sanitary sewer utility relocation work and account for all storm drain systems that could be affected by a sewage spill. The specific locations and details of sanitary sewer work will be determined as part of the Design Development Task Order scope. SFJV will include the SSPERP with that subsequent task order scope.

Additionally, the SSPERP will also address implementation of measures to prevent sewage spills; procedures for spill control and containment, notifications, emergency response, and cleanup; and spill and damage reporting. SFJV will utilize secondary containment measures for construction temporary portable sanitary toilets onsite. Catch basins that could receive spilled sewage will be identified. Unless otherwise specified in the specifications, these catch basins shall be sealed prior to operating the bypass and pumping system. SFJV will remove all material used to seal the catch basins when the bypass and pumping system operations are complete. SFJV will be fully responsible for containing any sewage spill, preventing any sewage from reaching a watercourse, recovery, and legal disposal of any spilled sewage, any fines or penalties associated with the sewage spilled. Should existing sewer facilities be disturbed, sewage will be conveyed in closed conduits and disposed of in a sanitary sewer system following all applicable codes.

9. Water Pollution Control

In a subsequent task order, SFJV will propose to include resources necessary to comply with applicable Federal, State and local regulations. Specific notable requirements are included in:

1. LAWA Guidance Manual for Construction Storm Water Pollution Prevention.
2. NPDES Permit for the City of Los Angeles (NPDES Permit No. CAS004001)
3. Los Angeles Standard Urban Storm Water Mitigation Plan (SUSMP)
4. City of Los Angeles, Bureau of Engineering Green Streets Standard Plans

In addition to complying with the applicable requirements of the National Pollutant Discharge Elimination System (NPDES) permit, SFJV will follow their approved project Stormwater Pollution Prevention Plan (SWPPP) as specified in Section 10 of this plan. SFJV will conduct/schedule its operations, follow, and implement best management practices (BMPs), in such a manner as to prevent water pollution, including that by introducing sediments into the receiving water, as defined by NPDES permit requirements.

10. Best Management Practices

SFJV has provided a preliminary SWPPP plan in Appendix 17, which will be updated to 100% construction ready status in future task orders that is compliant with the SWRCB Order No. 2022-0057-DWQ. SFJV will also propose to include resources necessary to comply with applicable Federal, State and local regulations.

SFJV has engaged Kroner Environmental as part of the Design-Build Contractor team. Kroner Environment is a highly qualified, reputable DBE environmental consulting firm with the Qualified SWPPP Developer (QSD) credential. Kroner Environmental will be commissioned by SFJV to oversee the design, implementation, and maintenance of the SWPPP BMPs.

The SWPPP, to be submitted to LAWA for review and approval, will outline in greater detail how the Project will prevent and control water pollution. Requirements for the selection, installation, maintenance, inspection, removal, documentation, and reporting of BMPs measures for effective stormwater pollution and construction runoff prevention during construction activities for projects governed by the California Construction General Permit (CGP), Federal, local, and project requirements. Stormwater controls and BMPs to be implemented may include perimeter controls, runoff controls, inlet protection, dust control, track out protections, stockpile management, soil erosion controls, vehicle/equipment washing, vehicle fueling, vehicle maintenance, concrete handling, concrete waste management, spill prevention and control, hazardous materials handling, trash, and fuels, oils, solvents, or other toxics management.

11. Dewatering

As part of the scope of a subsequent task order, prior to construction, SFJV will provide a dewatering plan. SFJV will conform to all applicable local, state, federal laws, and permits issued by regulatory authorities having jurisdiction (AHJ's).

Permits necessary for treatment and disposal of accumulated water will be obtained by SFJV. Accumulated water shall be treated prior to disposal if required by the SWPPP and/or permit. The plan will also identify the proposed location, type and size of dewatering devices and related equipment, including the size and type of materials composing the collection system, retainage system, treatment system (if required), and proposed disposal locations. Working drawings and supporting information detailing its proposed methodology of dewatering, treatment and disposal of accumulated water will be included.

SFJV anticipates that the locations requiring dewatering activity will be identified in subsequent design development. If a proposed disposal location is a sanitary sewer or storm drain system, SFJV will obtain written evidence of permission from the appropriate regulatory agencies and submit it to LAWA.

12. Drainage Control

As part of the scope of a subsequent task order, prior to construction, SFJV will provide a drainage control plan to ensure that storm and drainage water does not pond due to the temporary impacts to existing drainage facilities (blockages, removals, etc.). SFJV will provide temporary methods to allow for drainage during construction phases. The location and type of temporary drainage facilities will be identified in

subsequent design development.

13. Recycling and Solid Resources Management

SFJV will implement methods to recycle a minimum of 85% of waste materials generated during construction and demolition. The largest portion of recycled materials are anticipated to be excavated soil, demolished concrete/asphalt, steel, and green-waste. The format and data of the required monthly reporting to LAWA will be developed prior to the start of Construction. This is expected to include quantitative data (by weight and/or volume) of the materials recycled, reused and/or disposed of for the project, with subtotals and grand totals provided for each material type (i.e. concrete, steel, etc.).

14. Tribal, Archaeological, and Paleontological Resources

During construction, grading and excavation activities will comply with the requirements of the LAX Master Plan Paleontological Management Plan, LAX Master Plan Archeological Treatment Plan, and LAWA's tribal monitoring commitment. This includes a briefing by the appointed Cultural Resource Monitor and consultation with a Tribal monitor prior to excavation and grading activities. All personnel involved in grading and excavation will be required to attend the briefing. LAWA requires at least 90 days prior to grading/excavation, construction plans/specifications indicating whether and where grading/excavation will or may occur at depths greater than 5 feet beneath unpaved areas or 10 feet beneath paved areas. The Tribal monitor will have access to project areas during such grading/excavation activities that have the potential for encountering archaeological resources in undisturbed soils.

15. Hazardous and/or Regulated Materials

SFJV will provide a Hazardous and/or Regulated Materials Plan (HMMP) prior to construction. The HMMP will describe methods and procedures to safely detect, locate, identify, monitor, test, analyze, quantify, handle, treat, transport and dispose of hazardous and/or regulated materials within buildings, soils, and other areas on the project site in accordance with all federal, state and local rules and regulations. This includes, but is not limited to, asbestos, lead, mercury, polychlorinated biphenyls (PCBs), refrigerants, petroleum hydrocarbons, fuels, volatile organic compounds (VOCs), and other hazardous and/or regulated materials. A qualified Hazardous Materials Manager will be appointed by SFJV to identify hazardous and/or regulated materials, initiate response and contingency plans, provide notifications to LAWA and the proper regulatory agencies in the event of encountering such materials, and training personnel onsite as needed.

No specific hazardous or regulated materials have been identified and analyzed yet. Asbestos Containing Materials (ACM) are commonly encountered in demolition of structure bearings and some domestic water conveyance pipelines. SFJV will be conducting due diligence to identify and locate ACM's and other hazardous/regulated materials as part of the existing records and site investigation scope.

During construction SFJV will monitor excavations and demolition work for potential encounters of hazardous/regulated materials. The risk of encountering unknown hazardous/regulated materials will be allocated in future task orders/cGMP's.

16. Environmental Monitoring and Control – Compliance Reporting

During construction SFJV will submit a monthly environmental report demonstrating compliance with all environmental requirements on the project. The format of the required monthly reporting will be developed prior to the start of Construction. LAWA will randomly monitor compliance with environmental mitigation requirements throughout the term of the contract and retains the authority to assess penalties for non-compliance.

Should such non-compliance be not fully addressed and corrected to the satisfaction of LAWA within 24 hours from the time the non-compliance is first observed or noted by LAWA, or a corrective action plan acceptable to LAWA is not provided within that 24-hour period, the penalties set forth are subject to increase until the non-compliance is corrected to the satisfaction of LAWA or an acceptable corrective action plan is provided to LAWA.

Appendix 20 – Permitting Plan

Permitting Plan (PR-01)

Contents

Permitting Plan	3
1.0 Overview and Goals.....	3
2.0 Permitting Plan and AHJ Strategy	4
3.0 Permitting Close Out	6

Permitting Plan

1.0 Overview and Goals

The goal of the permitting plan is to outline the SFJV strategy to obtaining permits for the ATMP roadways so that construction can begin. As the new roadway network lies within both private property and public Right-of-Way limits both LAWA and City of Los Angeles are responsible for making sure that SFJV can obtain permits seamlessly.

The roadways that need to be permitted have been broken up into three different areas as shown on the map below:

1. Yellow area will follow Caltrans Standards
2. Blue will follow Project Specific Standards
3. Pink will follow City of Los Angeles Standards

2.0 Permitting Plan and AHJ Strategy

Through various meetings with LAWA, SFJV and the applicable City agencies it has been deemed that the permitting on the project will be completed as follows:

- LADBS will be the permitting authority for all improvements with Private Properties.
- Structural and Foundation review of Bridges will be undertaken by LABOE
- Pedestrian Bridges will be reviewed and permitted by LADBS.
- For the new roadway segments that serve as direct airport connectors and do not meet functional classifications of public or private streets defined by BOE's Street Design Manual, City of Los Angeles Complete Streets Design Guide, and municipal code, LADBS will issue a use-of-land permit with a clearance for structural review by LABOE.
- LABOE will review these roadway segments and issue B-permits (as clearances) as part of the process prior to LADBS issuing the applicable land use permits.
- LABOE will not issue B-permits until Caltrans also reviews and approves sections that cross Caltrans Right-of-Way.
- LADBS will also have purview over site grading, electrical, and drainage connections on LAWA's private facilities. LABOE will also review drainage connections to public drainage systems and drainage within bridge structures.
- Improvements to existing roadway elements in the City of Los Angeles public road Right-of-Way that do not serve as direct airport connectors are anticipated to be permitted by LABOE under the B-permit process.
- The permitting approach to 96th St. will follow a Use of land permit from LADBS with a B-permit clearance from LABOE. LAWA intends to vacate this portion of public Right-of-Way and establish a private street easement for the portion of 96th St. between Sepulveda Blvd and Jetway Blvd. This road will serve a multi-use function related to airport access.
- Significant coordination will be required with the following City of Los Angeles entities to review and approve the respective components of the LAWA roadway design:
 - Los Angeles Department of Transportation (LADOT)
 - Los Angeles Department of Building and Safety (LADBS)
 - Los Angeles Bureau of Street Lighting (LABSL)
 - Los Angeles Bureau of Street Services (LABSS)
 - Los Angeles Department of Water & Power (LADWP)
 - LA Sanitation & Environment (LASAN)
 - LACFD – Los Angeles County Fire Department (LAFD)

The LABOE B-permit will be issued once LADOT, LABSS, LABSL, LABOE and LASAN give their approval.

Through meetings with LAWA, LABSL and LADBS it has been determined that the Street Lighting will be permitted as follows.

- Private ROW (BLUE) – City of LA LABSL will review under a B permit. Any clearances for Electrical for the Land Use permit will be issued by LADBS.
- Public ROW (Pink) – City of LA LABSL will review.
- CALTRANS ROW (Yellow) – City of LA LABSL will review.

ATMP Street Lighting Permitting Agency and Reviewer Matrix			
Permitting Agency/Reviewer			
ITEM	BLUE (Private ROW)	PINK (Public ROW)	YELLOW (Caltrans ROW)
Lighting Calcs - Part of Plan Check	TED	LABSL	LABSL
Pole and Luminaire Types	LABOE / LABOE	LABOE / LABSL	LABOE / Caltrans / LABSL / Caltrans
Pole Anchorage/ Foundation	LABOE / LABOE	LABOE / LABSL	LABOE / Caltrans / LABSL / Caltrans
Point of Service Connection and Metering	LADBS / LABOE Electrical	LABOE / LABSL / LADWP	LABOE / LABSL / LADWP
Conduits and Pull Boxes (System Appurtenances)	LADBS / LABOE Electrical	LABOE / LABSL	LABOE / LABSL

Caltrans will be the AHJ for the improvements within their right-of-way, as well as reviewing and issuing encroachment permits for LAWA-owned structures that span over their right-of-way.

The following are the steps required to obtain an encroachment permit from Caltrans:

1. Complete the "Standard Encroachment Permit Application" (form TR-0100)
2. Attach supporting documentation, such as:
 - o Plans
 - o Location map
 - o Environmental documentation
 - o Letter of authorization
 - o Surety bonds
 - o Liability insurance
 - o Any applicable fees
3. Submit the application and documentation to the District Encroachment Permits Office that has jurisdiction over the proposed encroachment site

3.0 Permitting Close Out

Key strategies that will be used to facilitate AHJ permitting of the design include:

- Project Specific Design Criteria: Thru meetings with LADOT and LAWA the roadway geometry and typical section components such as lane width, shoulder width, non-crowned slope, and barrier, for new roadway segments that serve as direct airport connectors and that do not meet functional classifications defined by BOE's Street Design Manual and City of Los Angeles Complete Streets Design Guide have been discussed in detail.
- Improving collaboration between LAWA, Design-Builder (SFJV), Designer (HNTB), and AHJ plan reviewers by committing to co-locating at an integrated project management office throughout the duration of the project.
- AHJ participation in task force work groups to participate in design development will significantly improve the level of familiarity with the design and how specific challenges are being addressed.
- Utilizing experienced and local AHJ coordinators on the Design-Builder team to identify permit requirements.
- Discussing with BOE the optimum number of B-permits to allocate based on size of design packages and the need for other AHJs to be able to review design content holistically, beyond the permit limits of a package. Additionally, the B-permits will need to align with the construction sequencing strategy.

Appendix 21 – Third Party and Agency Coordination Plan (PR-12)

Third Party and Agency Coordination Plan (PR-12)

Third Party and Agency Coordination Plan	3
--	---

Third Party and Agency Coordination Plan

This third party and agency coordination plan outlines the strategies SFJV will take for effective coordination with third-party contractors and various agencies during the construction of the ATMP roadways project at LAWA. Successful implementation will ensure efficient project execution, minimize disruptions, and adhere to all regulatory authorities.

1.0 SFJV Third Party Coordination Team:

The SFJV Third Party Coordination Team is outlined below. This team has extensive experience successfully processing projects through AHJs in the City of Los Angeles. Jill Steiner will be the Third party Manager for the project.

2.0 Third Party Stakeholders:

There are various entities involved in the third-party coordination. SFJV will manage subcontractors. There are also Airport Stakeholders and Regulatory Agencies that will need to be coordinated with.

3.0 Utility Relocations:

SFJV will coordinate with public agencies, emergency services, and public and private utilities. SFJV will be responsible for ensuring that all Project requirements affecting facilities owned or controlled by these agencies will meet with their approval, in accordance with established agreements (MCA's, MOU's, established policies and procedures). These services will be provided to ensure that any relocation, abandonment, or protection in place of facilities owned or controlled by these agencies are in accordance with their requirements, and the required approvals and permits have been secured. These services will include a comprehensive technical description and plans for each facility or utility to assist in identifying possible impacted areas and in preparing and/or amending agreements with these organizations.

4.0 MCA and Utility Agreements with Cities:

SFJV will be responsible for performing any obligations under a Master Cooperative Agreement to the extent necessary to meet SFJV's obligations for the design and construction of the Work.

5.0 Third Party Coordination Strategies:

1. Early and Continuous Communication:

- SFJV will establish a Joint Information Center (JIC) using Procore for centralized communication and document sharing between the team.
- SFJV will convene regular stakeholder meetings (weekly, monthly) with clear agendas and action items.
- LAWA will develop communication protocols for proactive and timely updates (e.g., construction alerts, traffic impacts). This is part of the CALM process as shown in PR-02 and PR-03.
- SFJV will utilize online platforms for collaboration and transparent information access. For example: Procore and Bluebeam,
- SFJV will be assisting LAWA with establishing MOUs and utility relocation agreements.
- SFJV will keep LAWA informed of all Third-party communication and copy the LAWA third party team on all correspondence with third parties.

2. Clearly Defined Roles and Responsibilities:

- LAWA and SFJV together will establish clear lines of authority and decision-making processes.
- If required, LAWA will conduct training sessions for all stakeholders on their specific roles and responsibilities.

3. Effective Permitting and Regulatory Compliance:

- SFJV will Identify all required permits and approvals early in the planning process.
- SFJV will establish a dedicated team for permit acquisition and maintain regular communication with agencies.
- LAWA and SFJV will Proactively address potential compliance issues and develop mitigation strategies.
- LAWA will conduct regular inspections and audits to ensure adherence to regulations.

4. Community Engagement and Outreach:

- LAWA will develop a Community Outreach Plan (COP) to inform and engage surrounding communities.
- LAWA will establish a Community Liaison Officer (CLO) to handle community concerns and inquiries.
- LAWA will organize public meetings, information booths, and online communication channels.
- LAWA will address community concerns regarding noise, dust, traffic disruptions, and economic impacts with SFJV input.

5. Contract Management and Risk Mitigation:

- LAWA will develop a robust contract management process with clear performance metrics and milestones.
- SFJV would Identify and assess potential risks and develop mitigation plans.
- SFJV and LAWA will conduct regular risk reviews and update mitigation plans as needed.

- LAWA will implement a robust change management process to manage scope changes and budget adjustments making sure all third-party agencies are aware of such process.
- 6. **Sustainability and Environmental Management:**
 - SFJV will integrate sustainability practices into construction activities (e.g., recycled materials, energy efficiency) as outlined in PR18 and PR 20
 - SFJV and Kroner Environmental will monitor and report on environmental performance throughout construction.
 - SFJV will comply with all applicable environmental regulations and obtain necessary permits.
- 7. **Dispute Resolution and Conflict Management:**
 - SFJV and LAWA will establish a clear and efficient dispute resolution process to address disagreements promptly. Any issues that need to be resolved will be elevated to Partnering sessions.
 - SFJV and LAWA will encourage open communication and collaboration to resolve issues constructively.

Technology and Resources:

- SFJV will utilize project management software for streamlined communication, document sharing, and task management.
- SFJV will implement collaboration platforms for online meetings, real-time updates, and stakeholder engagement.
- SFJV will utilize tools to track progress, monitor performance, and identify potential issues.
- SFJV and LAWA will allocate sufficient resources for dedicated personnel, communication efforts, and risk management processes.

Conclusion:

Effective coordination with third-party contractors and various agencies is critical for the successful completion of the ATMP roadway construction project at LAWA. By implementing the strategies outlined in this plan, LAWA can ensure a smooth project execution, minimize disruptions, and achieve its project goals while fulfilling its commitment to safety, quality, sustainability, and community engagement.

Appendix 22 – Communication Plan

Communications Plan (PR-01)

Communication Plan

1 Overview and Goals

LAWA has made an investment in the future success of Los Angeles International Airport with the procurement and commencement of the ATMP Roadways Project. The communication plan will provide the outline for interacting with neighbors and businesses and working closely with LAWA to educate and inform stakeholders about construction activities.

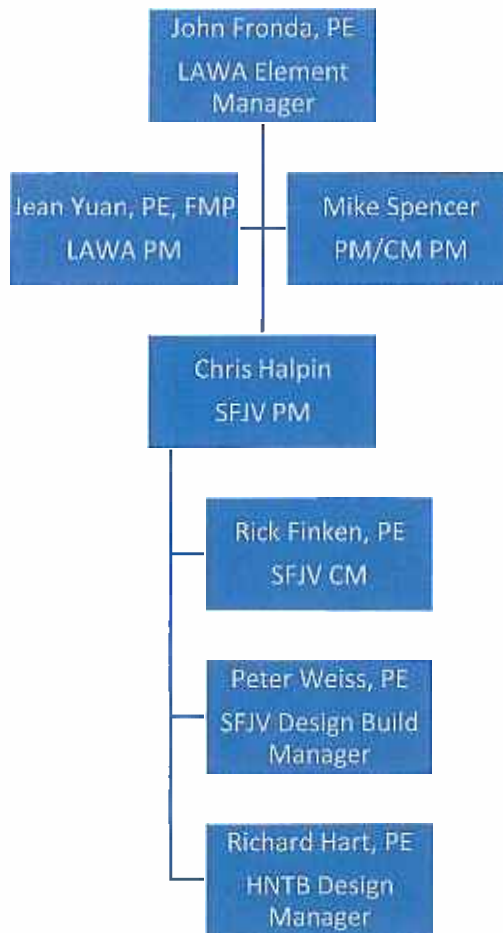

This document outlines the framework for a strategic communications plan that provides for the exchange and dissemination of timely, accurate and responsive information to stakeholders and the public at large.

The Goals of this Public Information and Communications Plan are to:

- Develop proactive outreach strategies to identify foreseeable problems and mitigate them when possible
- Provide communications on construction schedule and upcoming activities in a timely manner
- Establish a public participation process that allows stakeholders the opportunity to provide input during the design process
- Establish daily protocols, processes, roles and responsibilities
- Discuss procedures for complaint response and resolution
- Identify and create opportunities to celebrate milestones with Project stakeholders
- Build and maintain public goodwill

2 Organization

During the Preconstruction phase SFJV will coordinate all communications through the LAWA team, in particular with 3rd party and stakeholder outreach, as further defined in Appendix 23 Stakeholder Engagement and Management Plan. The organization as concerned with stakeholder outreach for the Preconstruction phase is shown below:

3 Continued Plan Development

As the project continues to develop, SFJV will coordinate with LAWA to develop further this plan on who will lead outreach and communication for the project, and how SFJV will implement that plan in either leading or supporting LAWA.

5. Control Stakeholder Engagement	10

Stakeholder Engagement and Management Plan

1 Overview and Goals

This project requires extensive coordination with stakeholders and third parties. Throughout the design and construction of the project design workshops, BIM fly-through presentations, digital simulations, and formal design reviews will all be required with LAWA, LADOT, Caltrans, LADPW-BOE, LADBS, Airlines, Tenants, Operators, and adjacent projects will be required to help with coordination and approvals. The purpose of this plan is to define the processes to identify the people, groups, and organizations that could affect or be affected by the project, to analyze stakeholder expectations and their impact on the project, and to develop appropriate strategies and tactics for effectively engaging stakeholders in a manner appropriate to the stakeholders' interest and involvement in the project.

2. Identification of Stakeholders

SFJV has prepared an initial list of stakeholders and provided the list to LAWA for review and their comments. The initial list is included below and will be updated as new information is obtained, people/positions change, or LAWA provides feedback for changes/additions/deletions.

Additionally, SFJV has provided it's initial recommendations for who should be included in the stakeholder interviews for the BOD phase as described in section 3 of this Stakeholder Engagement and Management Plan.

3. Plan for Stakeholder Management

Stakeholder management during the BOD phase shall consist of performing the stakeholder interviews identified in PR-01 3.C.2.b.5 with LAWA's CEO, CDO, and up to 10 other key stakeholders to be identified by LAWA, with SFJV having provided their recommendations in the table in Section 2 of this document. The purpose of these interviews is to learn and understand client and stakeholder goals, limitations, and aspirations for the ATMP Roadway Improvement Project.

SFJV will coordinate with LAWA to set up the interviews once LAWA has finalized the list of interviewees, and will document the goals, limitations, and aspirations for the project of each of the identified stakeholders.

Further plans for continued stakeholder management in future task orders will be developed in subsequent updates to this plan.

Stakeholder management post-BOD has consisted of the project's regular task force meetings, select individual meetings with key stakeholders on issues (ex. LAFD and APD), and supporting LAWA with outreach to external stakeholders such as adjacent property owners.

4. Management of Stakeholder Engagement

After the stakeholder interviews SFJV will document with meeting minutes the goals, limitations, and aspirations of each Stakeholder. SFJV will then review these with LAWA and determine how much of these can be incorporated into the project while still meeting the overall project goals, schedule, and budget.

Further plans for continued management of stakeholder engagement will be developed in subsequent updates to this plan.

Stakeholder management post-BOD has consisted of the project's regular task force meetings, select individual meetings with key stakeholders on issues (ex. LAFD and APD), and supporting LAWA with outreach to external stakeholders such as adjacent property owners.

5. Control Stakeholder Engagement

Plans for controlling stakeholder engagement beyond the stakeholder interviews will be developed in subsequent updates to this plan.

13.0	Subcontractor Management During Execution of the Work:	11
14.0	Subcontractor Close-out:	11
15.0	Appendices:.....	11
	Appendix A – Subcontract Sample	12

1.0 Overview:

Skanska-Flatiron Joint Venture (SFJV) prepared this Procurement Plan as the framework for our project management team to manage the subcontracted work and the procurement of permanent materials for self-performed work throughout Phase 2 of the LAWA ATMP Roadways Progressive Design-Build Contract (Contract). This plan is a living document and, as such, will be maintained and updated throughout the duration of the Contract. We will provide training based on this document to ensure continuity and consistency among our teammates throughout the Project. The plan includes companion documents for ease of understanding and organization. These documents are included in the appendices and referenced throughout the Construction Plan. This Table 4 – Self-perform Work procurement plan is preliminary and SFJV reserves the right to revise and amend it at a later date.

The SFJV team will provide recommendations for subcontractor and material vendor awards based on responsiveness (commitment to inclusivity goals, understanding of scope, quality fitness, capacity, key personnel, safety statistics, and experience) and lowest bid price. As a part of the open-book, transparent process, all quotes and estimates will be shared with LAWA for independent evaluation and quality assurance check.

2.0 Identification of Work Packages:

The table below, shows a breakdown of the anticipated Subcontract packages. This list includes specialty trade work as well as work that can be packaged to accommodate competitive proposals and DBE participation. SFJV will evaluate subcontractor scope to determine the level of support needed for best value and to cover potential scope gaps. SFJV will self-perform portions of the scope descriptions as a means to provide subcontractor support.

Table 2 – Subcontract Packages

Sub-Package:	Description:	ROM Estimate Cost:
01	Portable Sanitary Facilities, furnish/service (Construction Logistics Support)	
02	Temporary Facility Power (Construction Logistics Support)	
03	Site Security	
04	Cleaning Service (Construction Logistics Support)	
05	Shuttle Van Service (Construction Logistics Support)	
06	Temporary Construction Area Signs, Detours, Traffic Staging (signs not covered by LAWA CALM)	
07	Quality Control Inspection and Laboratory Testing	
08	Environmental Monitoring	

09	Construction Staking	
10	Construction Utility Verification (Pot-holing)	
11	Traffic Control	
12	Tree Removal/Landscape Clearing	
13	Demolition	
14	Underground Utility Construction	
15	CIDH Pile Foundations - Large Diameter Piles	
16	CIDH Pile Foundations - Small Diameter Piles	
17	Reinforcing Steel	
18	Concrete Pumping	
19	Post-Tensioning	
20	Shot-crete (Ground Anchor/Soil Nail Walls)	
21	Precast Girders/Bridge Deck Panels - (Furnish and Erect)	
22	Drywells	
23	Electrical Construction - Roadway Lighting and Traffic Signals, ITS System Devices	
24	Crushing	
25	Asphalt Paving	
26	Minor Concrete (Curb/Gutter, Sidewalk Driveways)	
27	Roadway Striping and Markings	
28	Masonry (AOA & Soundwalls)	
29	Fencing and Architectural Railings	
30	Roadway Metal guard railings and crash attenuators	
31	Overhead Sign Structures	
32	Roadway and Wayfinding signs	
33	Painting & Anti-graffiti Coatings	
34	Landscape & Irrigation	
35	Structural Steel (Pedestrian Bridge)	
36	Fireproofing (Pedestrian Bridge)	
37	Metal Framing (Pedestrian Bridge)	
38	Glass & Glazing (Pedestrian Bridge)	
39	Mechanical/Plumbing (Pedestrian Bridge)	
40	Scaffolding/Temp Stair towers	
45	Insulation (Pedestrian Bridge)	
46	Roofing (Pedestrian Bridge)	
47	Elevator (Pedestrian Bridge)	
48	Door Frames & Hardware (Pedestrian Bridge)	
49	Waterline Chlorination	

3.0 Schedule for the Project Trades:

The schedule for the project trades will be developed in the Project Baseline Schedule (PBL). The PBL can be filtered to show the schedule for all Subcontractors, selected combinations, or any single subcontract scope activity.

4.0 Self-Perform Work:

In accordance with Contract requirements, SFJV will self-perform a minimum of 30% of the Construction Work on the project. SFJV's decision as to which portion of the construction work to self-perform will be based primarily on the overriding need to optimize best value for the project and control the critical path to deliver the project on schedule. SFJV will prepare and submit a bottom-up, detailed estimate for all scopes of work intended to be self-performed. SFJV will also provide support and close supervision over the work performed by subcontractors. **Table 4** below, shows a breakdown of self-perform work.

Table 4 – Self-perform Work

Self-Perform Item	Description:	ROM Estimate Cost:
01	Project Temporary Facilities Construction and Maintenance	
02	SWPPP BMP Installation and Maintenance	
03	Subcontractor Scope Support	
04	Roadway Earthwork and Grading	
05	Aggregate Base	
06	Structure Excavation	
07	Structure Backfill	
08	Storm Drain Construction	
09	Underground Utility Construction	
10	Bridge Drainage	
11	Structure Concrete - Bridge Structures	
12	Structure Concrete - Retaining Walls	
13	Structure Concrete - Major Drainage Structures (Reinforced Box Culvert)	
14	Structure Concrete - Pedestrian Bridge (vertical core)	
15	Roadway Concrete Barriers	
16	Bridge Concrete Barriers	

5.0 Early Enabling Work:

An "Early Works" cGMP package would likely allow SFJV to get started on setting up site logistics, staging yards, construct detours, utility relocations, and if permitting is achieved possibly start CIDH piles on some of the off-line, LAWA "private parcels".

6.0 GMP/CGMP Packages

SFJV developed the preliminary schedule and construction staging to meet the objectives of mitigating impacts to traffic congestion, minimizing throw-away temporary work, and expediting project completion. Our anticipated breakout of cGMPs is also based on this sequential phasing. Our six phases of construction staging are spread into three cGMPs as follows:

- cGMP 1: Early Work, mobilization and Phase 1
- cGMP 2: Main Construction Package, Construction Phases 2 through 4
- cGMP 3: Main Construction Package, Construction Phases 5 and 6

7.0 Buy American/Build America Requirement:

SFJV agrees to comply with the Buy American/Build America Federal Requirement provisions of the Contract. This requirement will flow down to all Subcontractors/Material Vendors, as well as agreements with parties at all lower tiers.

8.0 Permanent Material Procurement for Self-Perform Work:

SFJV will procure permanent materials needed for the self-perform work. The procurement of major Materials will follow a process to solicit quotes and evaluate vendors for a best value-based selection including DBE participation, Quality, Availability to meet schedule, and competitive pricing. Table * below show a list of anticipated materials needed for self-perform work.

Table 8 – Permanent Material for Self-perform Work

Permanent Material Item:	Description:	ROM Estimate Cost:
01	Ready Mix Concrete	
02	Sand Cement Slurry	
03	Bridge Bearing Pads	
04	Bridge Expansion Joints	
05	Bridge Drainage Materials (Deck pans, Pipe, & Hangers)	
06	Bridge Fabricated Metal, Siesmic Restrainer, Cover plates, Anchor Bolts	
07	Isolation Casings	
08	Isolation Casing Covers	
09	Storm Drain Pipe, Reinforced Concrete Pipe	
10	Storm Drain Pipe, HDPE	
11	Waterline Pipe, Ductile Iron	
12	Waterline Valves & Fittings, fire hydrants	
13	Drainage frames & grates, ladder rungs, protection bars	
14	Drainage Pipe & fittings for tie-in of bridge drains, retaining walls, and abutments	
15	Sewer manhole risers	
16	Sewer Pipe, VCP/PVC	

17	Manhole/Valve Covers, Cast Iron	
18	Pipe Trench Bedding Material	
19	Aggregate Base	
20	Select Backfill Material	
21	Fill Soil for Embankments	
22	Geocomposite Drain Material	

9.0 Procurement of Long-Lead Items:

Some materials will require longer lead times due to detailing, review of submittals/shop drawings, fabrication, and transportation. SFJV will advise LAWA and collaborate on opportunities to evaluate risks of starting early procurement on materials identified as long lead items. Potential Long lead items may include:

- Precast Concrete Bridge Girders
- Structural Steel for the Sepulveda Pedestrian Bridge
- ITS switchgear, cameras, scanners, and VMS Displays
- Storm Drain, Reinforced Concrete Pipe
- Waterline, Ductile Iron Pipe
- Overhead Sign Structures
- Bridge Joint Seals
- Bridge Bearings
- Aesthetic Treatment Formliners for Cast-in-place Concrete Structures
- Aesthetic Monument Fabrications
- Traffic Signal Controllers
- Traffic Signal and lighting electroliner/poles

10.0 Subcontractor Procurement Process (GC-9):

- SFJV approach to subcontractor and supplier selection and contracting procedures are intended to promote pricing or buyout of the Work in a fair and reasonable manner and to maintain the best value for LAWA's ATMP Project. As such, all Work, except for work scope and General Conditions services which are a part of the Design/Builder's self-performance packages will be procured based upon either Competitive Bids awarded to the most qualified bidder or through the use of a best value selection process following DBIA Progressive Design Build Best Practices, awarded to proposers providing the best value to LAWA as defined below. Design/Builder shall utilize mandatory inclusivity goals consistent with LAWA's inclusivity requirement programs as listed in the Contract Documents. SFJV will develop lists of prospective bidders or proposers to solicit bids or proposals for the designated Subcontract work packages.
- SFJV will conduct an outreach effort to attract broad interest among qualified firms. For Major Subcontract packages with estimated values of \$100,000 or greater, shall use three (3) different

publications and/or other industry standard outreach vehicles to advertise each work package and each work package shall be advertised for a minimum of two (2) weeks, unless otherwise specified by LAWA. SFJV will contact potential bidders or proposers to develop a sufficient pool of bidders. SFJV will maintain evidence of such outreach and will provide full transparency to LAWA.

- C. For specialty scope items requiring less common expertise, SFJV may use a prequalification process, and will provide subcontractor prequalification criteria to LAWA for review. Prequalification criteria will be relevant to inclusivity compliance, the character of the scope of work and potential schedule constraints. Prequalification criteria will be submitted in writing to LAWA for its review prior to use. LAWA will confirm that such prequalification criteria are fair and reasonable.
- D. SFJV requests for subcontractor proposals will be submitted to LAWA for review and approval. The requests for proposal shall include as a minimum, the following:
 - 1. Detailed scope of services
 - 2. Qualifications and experience of proposers
 - 3. Proposal content requirements
 - 4. Terms of the proposal
 - 5. Submission instruction
 - 6. Evaluation criteria
 - 7. All legal, administrative and contractual information and requirements
- E. SFJV will secure the commitment to bid or propose on each identified Subcontract work package from a minimum of three (3) firms for each trade depending on the approved packaging in the procurement plan, unless SFJV elects to self-perform that work as permitted herein. SFJV will invite LAWA in writing five (5) days prior to all pre-bid or pre-proposal conferences, outreach events, bid openings, proposal reviews and scope and selection interviews (if conducted) for each work package.
 - 1. Instructions to Bidders and Proposers in each work package shall be clear and precise and reviewed by LAWA before solicitation.
 - 2. SFJV will ensure that subcontractors understand that all items in the Instructions to Bidders and Instructions to Proposers must be submitted at the time the bid or proposal is due in the manner of the detailed format requested. If there are gaps in the itemized pricing list as requested but the grand total is shown as inclusive of these items, SFJV will have the subcontractor resubmit the itemized list, dated and initialed by the subcontractor.
 - 3. Subcontractors shall have an EMR (Experience Modification Rate/Rating) of less than 1.0 to qualify for award. In lieu of a EMR of less than 1.0, subcontractors may have an EMR between 1.00 and 1.25. LAWA may modify this requirement on a case specific basis.
- F. SFJV will flow-down the LAWA goal of exceeding the inclusivity DBE levels to each prospective subcontractor and vendor. For each CGMP SFJV will meet the inclusivity DBE levels of participation given by LAWA to SFJV for this Contract, unless otherwise specified by LAWA. SFJV will respond to requests for proposal and bid questions and issue addenda as necessary during the bid and proposal preparation periods and at the pre-bid or pre-proposal conferences and

walk-throughs. When needed, SFJV will consult with LAWA to address the questions and addenda.

- G. SFJV will require that bids be submitted on-line, with a uniform bid closing deadline for each bid package. In the event that SFJV obtains fewer than three bids or proposals, we will provide LAWA with a written justification of its efforts to obtain competition and, if it recommends that it should proceed to award the subcontract with fewer than three (3) bidders or proposers, the justification, therefore. No award will be made where there are fewer than three (3) bidders or proposers without LAWA's concurrence. Any sole source award will be issued consistent with LAWA's concurrence. Bid openings and proposal reviews are to be held with LAWA present.

J. Upon receipt of bids or proposals:

1. SFJV will record all bids or proposals received and provide recording sheets to LAWA staff during the bid opening or proposal review that include contractors budget/estimate for the work, the list of bidders or proposers, and any specific bid or proposal requirements that would deem a bidder or proposer non-responsive. SFJV may utilize a system that allows for electronic submission of bids or proposals, provided that said system allows for confidential submission of bids or proposals.

a. The bids will be tabulated in a pre-approved format which allows for comparison of each GMP budgeted line item for review by SFJV and LAWA. The report shall also indicate all bids received and compare the lowest responsible, responsive bids with the cost estimate for that work package. Bidders should be discouraged from including clarifications and assumptions as these items may render the bidder nonresponsive to the scope requirements.

b. For proposals, SFJV will provide a selection criterion scoring sheet, previously approved by LAWA, which tabulates the scores of the proposers. A report shall be generated by SFJV comparing the scores of each proposer, the cost element from each proposer and a comparison of the apparent selected subcontractor with the cost estimate for that work package. The report shall also include results of all pass/fail criteria.

2. SFJV will analyze the bid results and proposal pricing for potential errors, the spread of bid amounts or pricing components and review the apparent low bids and proposals for responsiveness, responsibility and compliance with the relevant work package. Scoping meetings with the subcontractors are allowed to determine if the bidders or proposers understood the scope of work; however, LAWA shall be present if such meeting takes place.

3. Responsibility is defined as a bidder or proposer that has demonstrated it understands the Scope of Work and has the attribute of trustworthiness, as well as quality, fitness, capacity, and experience to satisfactorily perform the applicable Work at LAX. For proposers, additional attributes may include expertise and experience of key personnel that will be assigned to the project, specific project experience and expertise with references and the quality of the proposer's submitted project approach and work plan.

4. All non-responsive and non-responsible bids shall be rejected, and the reasons therefore documented and provided to LAWA.

K. For work packages bid, award shall be made to proposer offering the best value to LAWA's Project. SFJV will notify LAWA in writing of the proposed selected subcontractor, prior to awarding any subcontract, for a quality assurance check.

L. The Design/Builder must allow time for the subcontractor approval process. Before making award to a subcontractor or material supplier, the Design/Builder shall obtain approval from LAWA. The approval will be documented by the established Concurrence, C-Letter process utilized in Pre-construction Phase.

M. All subcontracts will be between SFJV and the subcontractors or suppliers. Subcontracts shall be written to protect LAWA from impacts and claims arising from the work.

A copy of every subcontract shall be furnished to LAWA at least five (5) calendar days prior to execution of the subcontract by SFJV. SFJV will be responsible to LAWA for the acts and omissions of its agents and employees, suppliers, subcontractors performing work under a contract with the Design/Builder, and of its lower tier subcontractors, agents or employees. SFJV will include an appropriate cost in the GMP for the loss-pick of the risk for this responsibility.

N. SFJV will require each subcontractor of every tier to be bound to the terms of the Contract Documents, and to assume toward SFJV all applicable obligations and responsibilities which the SFJV, by these Documents, assumes toward LAWA. Said Contract shall preserve and protect the rights of LAWA under the Contract Documents with respect to the Work to be performed by the subcontractors that the subcontracting thereof will not prejudice such rights. SFJV will make available to each proposed subcontractor, prior to the execution of the subcontract, copies of the Contract Documents and SFJV's schedule, to which the subcontractor shall similarly make copies of such Contract Documents available to their subcontractors of every tier. Subcontractors also shall be provided access to all RFI's, Schedule Updates, and any other information that arises during the performance of the work. No subcontract or purchase order shall bind or purport to bind LAWA. Each subcontract or purchase order shall provide, without requiring the prior consent of the relevant subcontractor or supplier, for assignment and delegation of such subcontract or purchase order by SFJV to LAWA in the occurrence of a SFJV Event of Default.

O. SFJV will make no substitution for any subcontractor, person or entity previously selected without the prior written concurrence of LAWA.

P. If the buyout process occurs prior to cGMP, then savings and losses resulting from the purchase or buyout of the Work will be tracked separately from the Design/Builder Contingency through the use of a Subcontracts Buyout Fund (SBF). To the extent the SFJV experiences an aggregate loss from this fund in buyout of the Work; the SFJV may fund the loss from the Contractor Contingency with concurrence from LAWA. To the extent that SFJV experiences an aggregate savings to this fund in buyout of the Work; the amount may be transferred to an underfunded allowance or contractor contingency with the approval of LAWA.

Q. In accordance with DBIA Progress Design Build Best Practices, all remaining Work budget in the SFJV "Cost of Work", upon completion will be considered incentive compensation for bearing the potential risk of loss.

11.0 Insurance Requirements for Subcontractors:

Unless other insurance coverage options, such as a Contractor Controlled Insurance Program (CCIP) is approved by LAWA, SFJV will flow down the Contract insurance requirements to subcontractors and include all of its subcontractors as insured's under its policies or shall furnish separate certificates and endorsements for each subcontractor (excluding professional services). All coverage's for subcontractors shall be subject to all of the requirements stated herein unless otherwise agreed to in writing by Executive Director and approved as to form by the Office of the City Attorney.

12.0 Project Labor Agreement:

In accordance with Contract SC-5, All work under this contract is subject to the Los Angeles Department of Airports Construction Project Labor Agreement (PLA), as amended, and attached hereto. In addition, SFJV is signatory to collective bargaining agreements with several construction trade unions. SFJV will require all Subcontractors to comply with the terms of the PLA, however, the PLA shall not be construed as superseding California Labor Code Requirements nor any applicable Federal, State and Local laws.

13.0 Subcontractor Management During Execution of the Work:

SFJV will assign superintendents and field engineers to provide the required coordination and to ensure that subcontracted work meets the safety, quality and performance requirements in the contract documents and our subcontract agreement. Subcontractors will participate in the pencil-copy approach for monthly invoicing to LAWA. Once pencil-copies are agreed to, subcontractors will submit electronic invoices for payment. Invoices will be processed through our electronic platform OnBase. OnBase will be configured to release payments to subcontractors within seven days after SFJV receives progress payment from LAWA. Final payment and release of retention will follow the prime contract terms unless modified by a LAWA-approved deviation in the subcontract. See Appendix A for the sample Subcontract Agreement Form containing further information relevant to Subcontract Management.

14.0 Subcontractor Close-out:

SFJV will hold Subcontractors responsible for the close out requirements in Contract PR-27. Closeout procedures will be included with our Subcontractor pre-work coordination meetings so the required documentation and record documents are outlined before work starts. Record documents include:

- As-Builts
- BIM Models
- Warranties/Guarantees
- O&M Manuals
- Recommended Spare Parts & Tools List

15.0 Appendices:

- Appendix A, SFJV Sample Subcontract Agreement Form

Appendix A – Subcontract Sample

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**
Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

This agreement ("Agreement") is made and entered into on February 16, 2023, in Los Angeles, CA, by and between Skanska-Flatiron a Joint Venture, of 1995 Agua Mansa Road Riverside, CA 92502 ("Contractor") and FOR EXAMPLE USE ONLY, of 1955 Agua Mansa Riverside, CA, 92509 USA ("Subcontractor"). (Contractor and Subcontractor individually referred to as "Party" and collectively as "Parties.") Contractor has entered into or is about to enter into a written contract, TBD ("Prime Contract") with City of Los Angeles - Los Angeles World Airports (LAWA) ("Owner") to perform all labor and to furnish all materials and equipment for the construction of the LAWAAATMP ROADWAY IMPROVEMENTS ("Project" or "Prime Work"). Subcontractor shall furnish, install, and perform the work set forth in Exhibit A and in any Change Order as defined below ("Scope of Work" or "Work") in strict accordance with the terms and conditions in this Agreement. Contractor shall pay pursuant to the terms in Exhibit A ("Price") for full and complete performance of the Work and Subcontractor's duties and obligations set forth herein.

1. CONTRACT DOCUMENTS. The "Contract Documents" include (a) this Agreement, including all appendices, riders, Contractor-approved progress schedules, exhibits and other documents incorporated into in this Agreement and/or its Exhibits, either by reference or other means, and any amendments thereto (collectively, the "Agreement") and (b) the Prime Contract, including the Prime Contract's plans, drawings and specifications ("Plans") and all other documents incorporated into the Prime Contract, whether by reference or other means, and any amendments thereto (collectively, "Prime Contract") to the fullest extent that the Prime Contract applies to the Work. This Agreement and the Prime Contract, including the Plans, (all as compared to each other and within each individually) supplement one another and are complementary and cumulative in nature. What is called for by one shall be as binding as if called for by all.

1.1 Review of Contract Documents. Subcontractor has reviewed and is familiar with all Contract Documents related to its Scope of Work and has considered the scheduling requirements of Owner and Contractor and the availability and cost of labor, materials, tools, and equipment. Contractor is not liable to Subcontractor for any costs or delays that may arise from Subcontractor's failure to do so. Subcontractor represents that it has by its own independent investigation ascertained the Work required herein and the conditions associated therewith, it has verified all information furnished by Contractor or others satisfying itself as to the correctness and accuracy of that information. Any failure by Subcontractor to independently investigate and become fully informed shall not relieve Subcontractor from its responsibilities hereunder.

1.2 Discrepancies. Unless the Prime Contract requires a shorter time period, Subcontractor shall notify Contractor of any discrepancies, conflicts, or ambiguities in the Contract Documents ("Discrepancy") within five business days from the date which Subcontractor discovers or reasonably should have discovered the Discrepancy. Subcontractor waives any claim arising out of any Discrepancy if it fails to give timely notice of the Discrepancy. Subcontractor may not assert a claim for any Discrepancy that Subcontractor failed to discover but reasonably should have discovered with due diligence. If there are conflicting terms among this Agreement and the Prime Contract, the more stringent as applicable to the Work shall prevail and govern, whether administrative or substantive in nature. Any disagreement with respect to the interpretation of any such conflicting terms shall ultimately be decided by Contractor. Work performed by Subcontractor prior to resolving the Discrepancy shall be at Subcontractor's sole risk, cost, and expense.

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

2. **SCOPE OF WORK.** Subcontractor shall perform its Work continuously, expeditiously, and in a good and workmanlike manner. The Scope of Work described in Exhibit A includes all work, labor, tools, equipment, materials, cutting, patching, and services required to satisfactorily perform and to timely complete. The Work is not limited by any titles on drawings or headings in specifications, and the Parties intend that all items and services customarily performed and provided with the Work described in Exhibit A shall be performed by Subcontractor including all items and services consistent with, contemplated by, and reasonably inferable from, the Contract Documents and/or necessary to provide a complete and fully functioning Scope of Work, to produce the intended utility and appearance of the Work and to provide a neat and workmanlike fit with the remainder of the Prime Work, whether or not such items and services are specifically mentioned therein, unless specifically excluded in Exhibit A.

3. **SCHEDULE.** Subcontractor shall perform all Work in accordance with Contractor's schedule for the Prime Contract as it may be amended from time to time ("Schedule"). Subcontractor will comply with the Schedule and strictly observe Contractor's schedule obligations and all requirements applicable thereto as set forth in the Prime Contract.

3.1 **Subcontractor Scheduling Information.** Contractor may request Subcontractor to provide detailed information showing how Subcontractor will perform its Work to meet the requirements of the Schedule. Subcontractor and its lower-tiered subcontractors shall promptly furnish all scheduling information requested by Contractor from time to time and in such form and detail as requested for its Work, within five days of the request.

3.2 **Timely Prosecution of Work.** Time is of the essence for the performance of the Work. Subcontractor shall promptly begin and continuously, expeditiously, and diligently prosecute its Work in accordance with the Schedule. Subcontractor assumes the risk and has considered the practical and cost impacts of all foreseeable hindrances and delays to its Work upon entering into this Agreement. If Subcontractor delays any portion of the Project, Contractor may direct Subcontractor to increase its workforce, the number of shifts, the days of work, and to institute overtime operations to maintain the Schedule or to regain any time lost, all which shall be done by Subcontractor at Subcontractor's expense. Subcontractor shall promptly follow Contractor's direction notwithstanding any dispute whether Subcontractor is entitled to additional compensation and/or time therefor pursuant to this Agreement.

3.3 **Change to Schedule.** Contractor will make the Schedule available for Subcontractor's review and Subcontractor is obligated to keep itself informed of any changes to the Schedule that affect Subcontractor's Work. Subcontractor shall comply with any changes to the Schedule that affect its Work and will perform that Work in accordance with the requirements of the changed Schedule. Subcontractor's entitlement to additional time or compensation, if any, for changes to the Schedule will be determined in accordance with the terms of this Agreement.

3.4 **Owner Delays.** If Owner is responsible for any delay, disruption, suspension, stoppage, interference, compression, or acceleration that impacts Subcontractor's Work, Subcontractor will be entitled to additional time and compensation only if and to the extent that Owner grants Contractor additional time and compensation therefor and Contractor actually recovers compensation for such damages from Owner on account of such impacts to Subcontractor's Work.

3.5 **Other Delays.** Except as otherwise prohibited by law, Subcontractor shall have no claim against Contractor for damages associated with any delay, disruption, suspension, stoppage, interference, compression, or acceleration of Work, including losses of labor and equipment productivity associated therewith (collectively, "Delay Damages"), caused or directed by Contractor for any reason, and all such claims shall be fully compensated by the granting of a time extension. Where Delay

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

Damages are mandated by law, Subcontractor may get Delay Damages only for delays which are not concurrent with any (i) delays for which Subcontractor is not entitled to compensation pursuant to the Prime Contract or (ii) delays which were caused by or are the responsibility of Subcontractor, in whole or part. Furthermore, such Delay Damages shall include only : (a) increased wages attributable to work being performed by trades in a higher wage period; (b) increased field office expenses due to extended Schedule for the Work; (c) increased materials cost attributable to purchase materials in a higher price period; (d) increased cost to store materials, to the extent that the Subcontractor can demonstrate that such storage is specific to this Project; (e) increased cost of insurance and bonding due to extended Schedule for the Work; (f) with respect to rented equipment during the extended Schedule period, the lesser of the actual rental cost or the reasonable rental value for idled equipment on the Site; and (g) with respect to Subcontractor-owned heavy construction equipment idled during the extended Schedule period, the lesser of a reasonable rental cost or the cost of transportation to remove and return the equipment to the jobsite. Contractor will only pay Delay Damages as set forth above for amounts which are actually, reasonably, and necessarily incurred and verifiable by appropriate documentation and which Subcontractor could not have reasonably avoided.

4. PROSECUTION OF THE WORK. It is Subcontractor's responsibility to inspect the location of the Project, the area surrounding the Project, and the location where the Work will be performed (collectively, "Work Site") and take into account all visible and reasonably inferable geographic and climatic conditions. Subcontractor shall inform Contractor if the Work Site is not ready for the reception and installation of the Work. Contractor is not responsible for or liable for any costs, loss, or damages that may arise if Subcontractor commences its Work before the Work Site is ready. Subcontractor represents that it has inspected the Work Site and is familiar with local conditions under which the Work is to be performed, including potential congestion, restrictions upon transportation of material, equipment, and labor forces to and within the Work. Subcontractor's entitlement to additional time or compensation resulting from the Work Site conditions differing from what it anticipated is limited by Contractor's entitlement to an adjustment for such circumstances pursuant to the terms of the Prime Contract.

4.1 Preceding Work. Subcontractor shall inspect the preceding work of others upon and adjacent to its Work. Prior to commencing its Work, Subcontractor shall promptly notify Contractor of any observable defect or condition that Subcontractor knew or reasonably should have known existed, regardless of whether or not it impedes, interferes with, or otherwise impacts Subcontractor's Work. If Subcontractor does not provide any such notice, Subcontractor will be deemed to have accepted the conditions of such work and Contractor is not responsible for any costs, losses, or damages that may arise from such conditions.

4.2 Lines, Grades, and Layout. Prior to beginning its Work, Subcontractor shall establish all the lines, grades and levels that may be required to perform its Work properly. Subcontractor shall lay out and install its Work in such manner as not to delay or interfere with the Prime Work being or to be performed by others. All dimensions and elevations indicated on the Plans are to be field verified by Subcontractor, who must promptly, before proceeding with any Work, report any errors or discrepancies to Contractor. Subcontractor shall confirm the accuracy of any lines, grades, or levels that may be furnished by others, unless Contractor has directed Subcontractor in writing to rely upon them. If Subcontractor fails to correctly establish all the lines, grades and levels, or does not otherwise properly lay out its Work, Subcontractor shall alter, correct, or repair its Work as necessitated by such failure, all at Subcontractor's expense.

4.3 Inspection of Work. Owner and Contractor have the right to inspect all of Subcontractor's material and workmanship at any time and at any location. Subcontractor shall notify Contractor whenever any portion of its Work is ready for inspection.

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

4.4 Hazardous Materials. Subcontractor will comply with all environmental laws and regulations, and the Prime Contract regarding the proper notice, handling, transportation, treatment, removal and/or storage of hazardous wastes, substances or materials, or any substance which requires investigation or remediation.

4.5 Repair or Corrections to Work. Subcontractor will protect its Work from any damage and shall, at its own expense, fully safeguard and secure its Work. Subcontractor shall promptly repair and correct any nonconformance or defect in its Work and any Work rejected by Owner or Contractor. If Subcontractor fails to repair or correct any damage, nonconformity, or defect to its Work within three days of receipt of notice from Contractor, Contractor may make any repairs or corrections and deduct the reasonable cost thereof from any amounts due Subcontractor without limiting any other remedy or right Contractor may have. If Owner or Contractor elects to accept nonconforming Work rather than requiring its removal or correction, the Price shall be adjusted as necessary to equitably compensate Contractor for any charge by Owner arising out of Subcontractor's failure to strictly comply with the Contract Documents.

4.6 Taxes, Assessments, Permits, and Fees. Subcontractor will obtain, at its cost and expense, all permits, and approvals and licenses required to perform its Work. Subcontractor will pay all federal, state, and local taxes, assessments, and fees now or hereafter in effect, related to its Work without additional charge to Contractor. Subcontractor will comply with all filing and reporting requirements for any such taxes, assessments, and premiums relating to its Work.

4.7 Temporary Facilities. Subcontractor will furnish all temporary facilities needed for its Work. Common facilities to be provided by Contractor, if any, are only those set forth in Exhibit A.

5. SUBCONTRACTOR OBLIGATIONS AND THE PRIME CONTRACT. Subcontractor assumes to Contractor all of the obligations and responsibilities applicable to the performance of this Agreement which Contractor assumes toward Owner with respect to such performance pursuant to the Prime Contract. Subcontractor is bound to Contractor in the same manner and to the same extent that Contractor is bound to Owner under the Prime Contract. Where the Prime Contract or other Contract Documents refer to Contractor, and the work therein pertains to Subcontractor's Work, such Prime Contract or other Contract Documents shall be interpreted to apply to Subcontractor and the performance of its Work hereunder, rather than Contractor. Contractor shall have, without diminution of any further rights it may have and to the fullest extent permitted by law, all rights and remedies against Subcontractor respecting the performance of this Agreement that Owner has against Contractor respecting the performance of the Prime Contract and Subcontractor assumes all of the obligations imposed by the Prime Contract, including, without limitation: any exculpatory and indemnitory provisions; audit and access to documents; any duty, including any absolute duty, to protect the Work; any exclusions or limitations upon claims for damages for delay; any limitations of time, notice requirements, procedures or conditions precedent respecting claims or requests of any kind including requests for extension of time; Owner changes to the Work; variances between the actual site conditions (including subsurface conditions) and the conditions shown or indicated in the Contract Documents; conditions precedent for receipt of progress payments; liquidated damages; suspension of work; termination of the Prime Contract; any requirements to document, substantiate, or certify claims or requests of any kind; any warranties or guarantees including specific guarantee retainage provisions; and any dispute resolution provisions, including dispute review boards, arbitrations, forum, jurisdiction and venue provisions. Any time provisions imposed upon Contractor under the Prime Contract or by law shall be binding upon Subcontractor, provided however, that Subcontractor must in each case act towards Contractor within one half of the time provided therein for action by Contractor towards Owner, or such lesser time as is elsewhere herein provided, to afford Contractor reasonable opportunity to evaluate and timely act upon any claim, request or position asserted by Subcontractor. Subcontractor has had ample opportunity to and has examined and understands all Prime Contract provisions related to its Work and accepts the rights and obligations imposed thereunder. Subcontractor is responsible for all laws, regulations, and other provisions of the Prime Contract that are required to be flowed

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**
Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

down to subcontractors by operation of law or the Prime Contract. Without limiting in any way the generality of this section, Subcontractor is fully bound by all clauses set forth in Exhibit E.

5.1 Safety. Contractor may withhold Progress Payments from Subcontractor and/or terminate this Agreement for its failure or its lower-tiered subcontractors' failure to comply with all safety obligations set forth in Exhibit B.

5.2 Insurance. Subcontractor shall provide and maintain at Subcontractor's own expense the insurance coverage listed in Exhibit C for the work and/or services provided by this Agreement and as required by the Prime Contract. Contractor may withhold Progress Payments from Subcontractor for its failure to comply with all insurance obligations set forth on Exhibit C, including the failure to prove that Subcontractor and its lower-tiered subcontractors are maintaining the contractually-required insurance policies.

5.3 Bonds. Prior to commencing its Work, at its expense Subcontractor shall procure and furnish to Contractor separate performance and payment bonds with an A or better Best-Rated surety company that is acceptable to Contractor, each in the penal sum equal to the Price, and in the forms as attached to this Subcontract as Exhibit G. Contractor has the right to reject any bond that is not for the requisite penal sum or with an acceptable surety company. Contractor may terminate this Subcontract for default at any time if Subcontractor fails to maintain acceptable performance and payment bonds or other security pursuant to this section. If Subcontractor is unable to obtain performance and payment bonds as required, Subcontractor must provide some other form of performance and payment security (for example, letter of credit, parent guarantee, joint check arrangements, or similar form of security or any combination thereof), as applicable to Subcontractor's Work. Any security for performance and payment offered in lieu of a bond must be in a form acceptable to Contractor, in Contractor's sole discretion, and Subcontractor expressly acknowledges and agrees that the Contractor has the right to reject any security it does not consider adequate, in its sole discretion, or to require additional forms of security. Contractor may terminate this Subcontract for cause at any time if Subcontractor fails to provide performance and payment bonds or other security as required by this Section.

5.4 Contractor Direction. Subcontractor will promptly comply with all orders and directions given by Contractor, irrespective of any dispute and without awaiting a determination by any person, entity or tribunal with respect to any such dispute. Any dispute will be subject to the claims procedure in this Agreement.

5.5 Registration Numbers. Prior to commencing its Work, Subcontractor will furnish Contractor with its employer's registration number (including tax identification number and W-9, as applicable) assigned to it by the state and federal agencies having the authority to issue such registration numbers.

5.6 Certified Payroll Reports. Subcontractor will furnish Contractor with certified copies of Subcontractor's payroll in full compliance with the Prime Contract and any applicable federal, state, or local government agency law, regulation, or requirement. Subcontractor shall furnish such evidence and document the completeness and accuracy thereof as Contractor may from time to time reasonably request. Subject to any applicable laws, regulations, and requirements and the Prime Contract, Contractor may designate the officer or principal of Subcontractor required to certify the payroll.

5.7 Cooperation. Subcontractor must keep itself informed of the conditions of and relating to the Project so as to avoid any delay. Contractor may require that certain portions of the Project be accessible and/or used concurrently by

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

Subcontractor and others. Subcontractor will cooperate with Contractor, Owner, and other contractors and subcontractors employed on the Project.

5.8 Subcontractor Materials. Subcontractor will document the exact quantities and qualities of the materials and equipment purchased, used, or to be used by Subcontractor. Subcontractor is responsible for the receipt, delivery, unloading, storage, warehousing, protection, insurance, and risk of loss relating to any materials or equipment it is to furnish, install, provide, or have provided to it under this Agreement.

5.9 Contractor-Furnished Materials. If Contractor furnishes or causes others to furnish material or equipment to Subcontractor ("Contractor-Furnished Materials"), Subcontractor will inspect such materials at time of delivery and prior to use or installation by Subcontractor and notify Contractor, immediately and in writing, of any observable defects or non-conformity in Contractor-Furnished Material. Failure to notify Contractor shall be deemed an acknowledgement and acceptance that Contractor-Furnished Material complies with the Contract Documents and serves as a waiver of any claims regarding any alleged defect or non-conformity, other than latent defects not readily discoverable when such Contractor-Furnished Materials are delivered to Subcontractor.

5.10 Privity. Until the final acceptance of the Project, Subcontractor shall not perform any work directly for Owner, or any other contractor, or deal directly with any representatives of same, in connection with the Project, unless otherwise directed or permitted in writing in advance by Contractor. All work for this Project performed by Subcontractor shall be processed and handled exclusively under this Agreement.

5.11 Submittals. Subcontractor is responsible for all submittals that relate to its Work. Approval of Subcontractor's submittals by Owner and/or Contractor does not authorize Subcontractor to deviate or substitute from the Work required under the Contract Documents. Subcontractor shall correct any deviation or substitution at Contractor's direction, at any time and at Subcontractor's expense. Notwithstanding the foregoing, Contractor may demand that Subcontractor comply with any approved submittal without additional charge.

5.12 Warranties. Subcontractor expressly assumes towards Contractor all of the obligations and responsibilities that Contractor assumes toward the Owner with respect to maintaining, warranting, and guaranteeing its Work. Subcontractor shall perform all necessary and required maintenance, warranty, and guarantee work at its own expense. Subcontractor shall also be fully responsible: (1) to repair or replace any defective or improper work or material, (2) to repair or correct any damages caused thereby, and (3) to undertake at its cost and expense, the repair or replacement of such work, materials or equipment, which are found by the Owner to be unacceptable, unsatisfactory or otherwise not in accordance with the Contract Documents. The provisions of the Prime Contract regarding retention of amounts as guaranty for maintenance or repair of the Prime Work to be performed, if any, apply to this Agreement. Unless a greater period of time is provided for in the Prime Contract, by law, or otherwise Subcontractor warrants all of its Work to be free from defects for a period of one year from the date of Owner's acceptance of the Project.

5.13 Government Funding. If this Agreement arises under or is related to a government contract, grant, or other government funding, Subcontractor certifies and agrees as follows:

5.13.1 Subcontractor certifies that it is eligible to receive such contracts, grants or funds from the government entity. Subcontractor further certifies that neither it nor its principals or management employees have been convicted of any acts

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Agreement Number: **90009220.SAMPLE2**

which would render Subcontractor or any of its principals or management employees ineligible for receipt of a contract, grant, or funds from such government entity.

5.13.2 Subcontractor will comply with all laws and regulations applicable to any government contract, grant or funding. Subcontractor will comply with all registrations required and execute all government forms or documents, including Federal Government Form SF 1413 as required.

5.13.3 Contractor may terminate this Agreement for default if Subcontractor fails to comply with this section, or is or becomes ineligible to receive government contracts, grants, or other government funding.

5.14 Management and Supervision of Employees and Work. Subcontractor will furnish its best skill, judgment, qualified field supervision, and project management continuously throughout the performance of the Work. Subcontractor shall keep a competent person on the Project at all times who shall have full authority to carry out all of Contractor's instructions. Subcontractor shall immediately replace any workers objectionable to Contractor or Owner without additional charge.

5.15 Labor Harmony. Subcontractor shall conform to all labor policies of Contractor and Owner. Subcontractor shall not employ labor or means or use materials which may cause strikes or other labor disharmony, disputes or trouble with workmen employed by Contractor or other contractors, subcontractors or persons on any work. Whenever a labor dispute delays or threatens to delay the Work, Subcontractor shall immediately give written notice thereof to Contractor containing all information relevant to the dispute and Subcontractor will take all measures at its sole cost and expense to prevent labor disputes or any related disruption to the Project.

5.16 Affirmative Action. Subcontractor shall abide by the requirements of 41 CFR §§ 60-1.4(a), 60-300.5(a) and 60-741.5(a), which prohibits discrimination against qualified individuals based on their status as protected veterans or individuals with disabilities, and prohibit discrimination against all individuals based on their race, color, religion, sex, sexual orientation, gender identity or national origin. Subcontractor shall also take affirmative action to employ and advance in employment individuals without regard to race, color, religion, sex, sexual orientation, gender identity, national origin, protected veteran status or disability. Subcontractor shall maintain an affirmative action plan as required by Executive Order 11246, the Vocational Rehabilitation Act of 1973, the Vietnam Era Veterans' Readjustment Assistance Act of 1974, and any other applicable state or federal requirement.

5.17 Lower-Tier Subcontractors, Suppliers, and Vendors. Subject to Contractor's prior written approval, Subcontractor may employ lower-tiered subcontractors, suppliers, and vendors. Each lower-tiered agreement shall: (a) be in writing; (b) specifically incorporate the entirety of this Agreement by reference; (c) be accompanied by proof of insurance as Owner and Contractor may require; (d) provide that Contractor and Owner are intended third-party beneficiaries of the lower-tiered subcontract or purchase order (without liability for benefits received); (e) provide a consent to be joined in any dispute resolution procedure or proceeding involving Contractor, Owner, and Subcontractor; (f) consent that any such agreement may be assigned at Owner's or Contractor's option if this Agreement is terminated for any reason; and (g) flow down all obligations as required by the Prime Contract and this Agreement.

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**
Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

5.18 Code of Conduct. Subcontractor acknowledges receipt and review of Contractor's Supplier Code of Conduct, a copy of which is attached hereto as Exhibit D. Subcontractor and all of its employees, consultants, vendors and suppliers shall comply with the Supplier Code of Conduct in connection with all Work. This Section is a material term of this Agreement and Subcontractor's failure to comply with the Supplier Code of Conduct shall be grounds for termination for default.

5.19 Advertising. Subcontractor may not publish or advertise any description relating to the Project without first obtaining Contractor's written consent.

5.20 Protection of the Work. Subcontractor assumes to Contractor all duties and obligations which Contractor assumes to Owner under the Prime Contract and shall have primary responsibility and liability with respect to the protection of its Work. Subcontractor shall, at its own expense, fully protect, safeguard and secure its Work from injury or damage. Any damage caused to Subcontractor's work prior to final acceptance and payment for the Project shall be immediately rectified by Subcontractor at its sole expense, or, without limiting any other remedy or right it may have, Contractor may remedy the damage caused thereby and deduct the reasonable cost thereof from any amounts due or to become due Subcontractor.

6. DISADVANTAGED BUSINESS ENTERPRISE PROGRAM. Contractor is committed to maximizing opportunities for disadvantaged business enterprises, including but not limited to any business enterprise owned by socially and economically disadvantaged individuals who are afforded protection by 49 CFR Part 26 or similar state program. Subcontractor shall comply with the Disadvantage Enterprises Participation Requirements set forth in Exhibit H.

7. CHANGE ORDERS. Changes to this Agreement may only be made in accordance with this section. Without notice to or the consent of Subcontractor's surety, Contractor may at any time direct changes in Subcontractor's Work consisting of additions, deletions, reductions, or other revisions to the Scope of Work and/or Schedule ("Change Order"). This Agreement may only be changed by a Change Order signed by a vice-president or more senior corporate officer of Contractor on the form attached as Exhibit J. Work reflected in a Change Order is referenced hereinafter as "Change Order Work."

7.1 Owner Changes. A Change Order may arise from changes to the Work or Schedule initiated by or the responsibility of Owner or from other reasons set forth in the Prime Contract ("Owner Change"). If Subcontractor requests additional time or money due to an Owner Change, Subcontractor must submit its request in strict accordance with the terms of the Contract Documents. The provisions of the Prime Contract with respect to schedule adjustment, pricing, mark-up, overhead, approval, and performance of an Owner Change shall apply to this Agreement and are fully binding upon Subcontractor. Contractor is liable to Subcontractor for an Owner Change only to the same extent that Owner is liable to Contractor for Subcontractor's Change Order Work. Owner's decision regarding compensation and time resulting from an Owner Change is binding upon Subcontractor. If Subcontractor disputes Owner's decision, Subcontractor may pursue a claim as set forth below.

7.2 Other Changes. If Subcontractor requests additional time or money for anything other than an Owner Change, the Parties will negotiate in good faith a Change Order. Subcontractor shall timely and diligently perform its Work, including all Change Order Work, regardless of whether the Parties agree upon the change in the Price or Schedule. If the Parties fail to reach an agreement, Contractor may direct the Change Order Work to be performed on a time and material basis or Contractor may issue a unilateral Change Order in good faith, subject to Subcontractor's right to file a claim. In no event shall Subcontractor delay or suspend the Work due to any disputed Change Order. In the case of reduced or deleted Work resulting from a Change Order other than an Owner Change, the Parties shall negotiate the credit and any change to the Schedule in good faith.

SUBCONTRACT

Project: **LAWAATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

7.3 Documentation Required. With regard to any request for a Change Order, Subcontractor shall promptly provide to Contractor all documents or other information required by the Prime Contract or requested by Contractor to show how the increase or deduction was calculated or Schedule impacts.

7.4 Amendment to Schedule of Values. The Schedule of Values may be amended to reflect any Change Order. By submitting any request for a Change Order, Subcontractor authorizes Contractor to contact its suppliers of labor and materials to confirm the charges for labor, materials, or other items claimed by Subcontractor.

7.5 Time and Material Work. If Contractor directs Subcontractor to perform any Change Order Work that is not directed by Owner on a time and material basis ("T&M Work"), such T&M Work will be payable as set forth below:

7.5.1 Labor. Payment for labor shall include only the following:

- (a) Wages: Direct field labor only up to and including the rank of working foreman;
- (b) Payroll Taxes: Actual cost. In determining actual costs, the statutory limitations for FICA, State Unemployment Insurance, and Federal Unemployment Insurance must be taken into account (a journeyman's six-month taxable gross income may be used to estimate reasonable tax rates);
- (c) Union Benefits: Actual cost per union agreements;
- (d) Insurance: Actual net additional cost of insurance paid as a result of the T&M Work. In determining the actual cost of insurance, Contractor will be given the benefit of premium discounts, experience modifications, etc. There will be no reimbursement for flat rate policies such as auto insurance, etc.; and
- (e) Worker's Compensation: If required for the performance of T&M Work; shall be the insurance carrier's rate at the standard wage for all hours worked. Additional state modifiers may apply.

7.5.2 Equipment. Payment for equipment shall only be made upon the following conditions:

- (a) Subcontractor must submit and Contractor must approve, in writing and prior to beginning any T&M Work, the estimated working time and idle time and the value or rates of equipment to be used by Subcontractor. Contractor's approval, in advance and in writing, of the estimated working time and idle time of equipment and the value and rates is a condition precedent to payment by Contractor for equipment under this section.
- (b) Payment for equipment shall be limited to the value or rates of equipment used of the size and capacity actually required for the safe and proper performance of the T&M Work. If Subcontractor elects to use equipment of greater size, capacity, value or rental value, Contractor is only obligated to pay for equipment at the rate applicable for equipment actually required.
- (c) Rental charged for equipment owned by Subcontractor shall in no case exceed the monthly rates in the edition of the Rental Rate Blue Book current at the time the equipment is used on

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

the T&M Work, as published by Equipment Watch. Contractor and Subcontractor may agree to a different rate, in writing in advance. Where a piece of equipment used by Subcontractor is not listed in this publication, the rental rate shall be agreed upon by Contractor and Subcontractor prior to its use on the T&M Work.

- (d) Contractor will pay only the amount actually invoiced by the rental or leasing company for leased or rented equipment plus a reasonable amount for fuel costs, if not included in the rental or leasing company invoice.

7.5.3 Material and Installed Equipment. Subcontractor will be paid the actual net cost of material and installed equipment. Contractor will be given the benefit of trade discounts provided to Subcontractor and salvage value. Subcontractor must submit vendor's invoice or bill of sale and evidence of payment with its Payment Application that includes T&M Work. Subcontractor's payment for material and installed equipment is a condition precedent to payment by Contractor.

7.5.4 Overhead and Profit. Subcontractor may add up to 10% to the cost of labor, material, and installed equipment for T&M Work as overhead and profit (combined), except that no overhead and profit is allowed on any additional or premium costs related to acceleration, overtime, or other nonstandard labor cost. No overhead and profit may be added to any other costs allowed under this section or on work performed by lower-tiered subcontractors. "Overhead and profit" as used in this subsection includes all home office general and administrative expenses, field supervision including superintendents, timekeeping, engineering, drafting, field office expense, small tools, general purpose equipment, and any other costs not specifically enumerated herein.

7.5.5 Documentation. No later than noon the day after the T&M Work was performed, Subcontractor must deliver, to Contractor's Project Manager material backup invoices from lower-tiered subcontractors and a daily time ticket reflecting:

- (a) The date that the T&M Work was performed and a complete description of the T&M Work;
- (b) The number of hours spent on the Change Order Work by employee name and specific trade classification;
- (c) The number of hours that an individual piece of equipment was used, with a description of the equipment, including manufacturer, model number, capacity, etc.; and
- (d) The quantity and specific nature of each item of material consumed or incorporated into the Work, equipment installed for Change Order Work, and materials and equipment retrieved for salvage.

The Project Manager shall review and, if approved, sign and return the daily time ticket to Subcontractor. Contractor may deny payment for T&M Work if Subcontractor fails to strictly adhere to the requirements set forth in this section.

7.6 Unit Price Work. Where unit prices apply to Work under the Prime Contract and are stipulated in this Agreement, either expressly or through incorporation by reference, all Change Orders unless otherwise directed by Contractor shall be made in accordance with the unit price terms and conditions of the Prime Contract. Unit prices stipulated in this Agreement include all general and administrative expenses, overhead, profit, supervision, and all other direct and indirect expenses applicable

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

to the Unit Price Work. Where Unit Price Work is not required by the Prime Contract but is ordered by Contractor, the unit prices stipulated in this Agreement, either expressly or through incorporation by reference, shall be subject to an equitable adjustment based upon any increase in costs due solely to the variation above 125% of the estimated quantity or any decrease in costs due solely to the variation below 75% of the estimated quantity. Subcontractor must establish that (a) the actual unit cost of the adjustable units is greater or lesser than the actual unit cost of the base units and (b) the difference in actual unit cost is due solely to the overrun or underrun and not to any other cause.

7.6.1 Subcontractor shall give notice to Contractor, in advance, that it may exceed the stipulated quantities of any unit stipulated in this Agreement in performing its Work before Subcontractor exceeds 80% of the stipulated unit, or at least seven days in advance, whichever is earlier. Any increase in the stipulated quantities or unit price for any unit must be agreed to by Contractor and set forth in a Change Order prior to exceeding the stipulated quantities.

7.6.2 Failure to provide notice required in this subsection shall constitute a waiver by Subcontractor of its right to any equitable adjustment in the unit price. Any dispute regarding Unit Price Work is subject to the claims procedures in this Agreement.

7.6.3 If any Change Order was issued increasing the unit price based upon Subcontractor's notice and Subcontractor does not subsequently incur an increase in the stipulated quantities greater than 25%, Contractor is entitled to a credit to the Price equal to the increase in the Price resulting from the unit price increase in the Change Order.

8. **PAYMENT.** Payments shall be made in accordance with the Schedule of Values included in Exhibit A. Contractor may request a more detailed Schedule of Values prior to Subcontractor's submission of its first application for payment. The detailed Schedule of Values shall show all items making up the total amount of the Subcontract Price. Contractor will either accept the detailed Schedule of Values in writing or provide its comments to Subcontractor. Upon receipt of any such comments, Subcontractor will revise and resubmit its proposed schedule of values accordingly until accepted by Contractor in writing.

8.1 **Progress Payments.** See State Specific Terms.

8.2 **Final Payment.** See State Specific Terms.

8.3 **Disputes with Lower-Tiered Subcontractors.** In the event of any disputes between Subcontractor and its laborers, lower-tiered subcontractors, suppliers or others, Subcontractor may except same from such waivers and releases but shall furnish complete details as to the nature of such disputes, showing that Contractor is adequately indemnified against any loss emanating from such dispute.

8.4 **Pay Quantities and Daily Reports.** If required by Contractor or Owner, documents supporting Payment Applications, including pay quantities and daily reports, shall be turned in daily to Contractor. Any delay may delay progress payments or constitute a waiver of payment for that amount which has not been adequately or appropriately supported as required by Contractor or Owner.

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**
Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

8.5 Satisfaction of Subcontractor Obligations. No payment received by Subcontractor may be used for any purpose other than to pay monies owed by Subcontractor to persons furnishing labor, equipment, or materials used in performing the Work unless and until all Subcontractor's obligations to such persons have been fully satisfied or discharged. Any sums received by Subcontractor from Contractor shall be received in trust for payment to persons furnishing labor, equipment, or materials used in performing the Work and Subcontractor shall not be deemed to hold any right, title or interest therein absent a contractual or legal right to the contrary. Subcontractor is liable for any loss, cost, damage or expense, including legal expenses, incurred by Contractor by reason of Subcontractor's violation of this covenant.

8.6 Backcharges. If, in Contractor's good faith opinion, Contractor is subject to any actual or potential losses, including but not limited to damages, judgments, or expenses (including attorneys' fees), for which Contractor is entitled to reimbursement or indemnity from Subcontractor, Contractor may withhold from any payment to Subcontractor an amount sufficient to cover such loss. If the backcharge is not sufficient to cover Contractor's actual losses arising from Subcontractor's Work, Subcontractor shall pay Contractor the difference within ten days of Contractor's demand.

8.7 Liens, Claims, or Suits. If, at any time before Final Payment, there is a lien, claim, or any other type of encumbrance (collectively "Lien") filed against Subcontractor related to its Work, Contractor shall have the right to retain out of any payment due or which may become due to Subcontractor an amount sufficient to indemnify Contractor against any loss, cost or expense arising from any such Lien, including reasonable attorney's fees. Subcontractor shall cause any Lien to be discharged by payment, bonding, or otherwise within seven days of receipt of notice of the Lien or within the time periods required by the Prime Contract, whichever is shorter. If Subcontractor fails to discharge such Lien within seven days, Contractor may pay or otherwise discharge such Lien and withhold the costs incurred in doing so, including reasonable attorney's fees, from any amounts owed Subcontractor. The rights contained in this section are absolute and not dependent upon the ultimate validity of such Lien. Any amounts retained by Contractor pursuant to this section will be interest free and will not be released until the invalidity of any such Lien has been conclusively determined by a tribunal of competent jurisdiction, or has been properly paid and satisfied, and documents evidencing such disposition have been presented to Contractor.

8.8 No Acceptance of Work by Payment. Payments to Subcontractor do not constitute or imply acceptance of Subcontractor's Work or waive Contractor's rights or remedies it may have under this Subcontractor or in law. Payments to Subcontractor do not constitute a waiver by Contractor or Owner with regard to defects respecting any portion of Subcontractor's Work that are discovered after any Progress Payment or Final Payment to be non-conforming or defective for any reason.

9. INDEMNIFICATION. See State Specific Terms.

10. DEFAULT, TERMINATION AND SUSPENSION.

10.1 Default and Termination for Default. If Subcontractor materially breaches any term of this Agreement, Contractor may declare a default and/or terminate this Agreement or any part thereof for default, as determined by Contractor in its sole discretion. Contractor may also declare a default and/or terminate this Agreement for default, in whole or in part, if:

- (a) The Work, or any part thereof, is not commenced or prosecuted by Subcontractor in accordance with the Schedule and in sufficient time for Contractor to meet its schedule under the Prime Contract;
- (b) Subcontractor fails or refuses to comply with Contractor's written orders or directions;
- (c) Subcontractor delays or interferes with the work of Contractor under the Prime Contract;

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

- (d) Subcontractor fails to pay its subcontractors, laborers, materialmen, or others to whom it may be indebted when such debts become due;
- (e) Subcontractor fails to comply with the requirements of any federal, state, or local law, regulations, or other legal requirement, including the requirement to provide certified copies of payroll;
- (f) Subcontractor fails to furnish adequate assurances, as determined in Contractor's discretion, of its ability to duly and timely complete the Work; or
- (g) Any petition for Subcontractor's bankruptcy, or any other insolvency proceedings, is filed or commenced by or against Subcontractor; a receiver is appointed for Subcontractor; or Subcontractor makes an assignment for the benefit of its creditors.

10.1.1 Contractor will provide written notice of any default to Subcontractor. Except as otherwise provided by law, if Subcontractor does not cure the default within three days after receipt of notice of default, Contractor may declare a default and/or terminate this Agreement for default, in whole or part. Contractor's failure to provide notice of a default within a certain time period shall not waive its right to do so thereafter during any time such default continues to exist and shall not relieve Subcontractor of any of its obligations under this Agreement.

10.1.2 Upon a Subcontractor default and/or termination for default, Contractor may take over and complete any Work not completed by Subcontractor prior to the default and/or termination under this section ("Defaulted Work") or, at its option, employ others to complete the Defaulted Work. Contractor, or anyone employed on Contractor's behalf to complete the Defaulted Work, may use any major equipment or materials provided by Subcontractor until all Defaulted Work has been completed. After the Defaulted Work has been completed, Subcontractor may remove such equipment or materials that remain, but neither Contractor nor any person employed on Contractor's behalf to complete the Defaulted Work is liable for ordinary wear and tear. Subcontractor shall reimburse Contractor for all costs to complete the Defaulted Work, including the following: (a) the actual and necessary expense of completing the Defaulted Work (including all charges of any person employed to finish the Work); (b) attorneys' fees incurred by Contractor in exercising its rights under this section; (c) damages incurred by Contractor, Owner, or any other subcontractor or contractor working on the Project arising from Subcontractor's default; and (d) 10% of direct costs for overhead if Contractor completes the Work itself (items (a) through (d) hereinafter "Completion Costs").

10.1.3 If this Agreement is terminated for default, Subcontractor is not entitled to any further payment until all of the Defaulted Work is completed and Contractor has received payment in full therefor from Owner. If such Completion Costs plus all previous payments made to Subcontractor exceeds the Price, Subcontractor shall pay the difference to Contractor. Except to the extent prohibited by any applicable statute, Contractor shall have the right to set off against any other balances and/or obligations due or to become due to Subcontractor under any other subcontract(s) between Contractor or its affiliates and Subcontractor. This right of set off shall be deemed to be included and incorporated in every other subcontract between Contractor or its affiliates and Subcontractor as an amendment in writing thereto.

10.1.4 If this Agreement is terminated for default, in whole or part, and it is determined that such termination was improper or wrongful, the termination shall then be deemed to be a termination for convenience, but no pre-judgment or other interest shall apply in respect of any payment due Subcontractor thereunder.

10.2 Termination for Convenience. Contractor shall have the right in its sole discretion to terminate, in whole or in part, this Agreement for its own or Owner's convenience, for any reason and regardless of whether Subcontractor is in default.

SUBCONTRACT

Project: **LAWAATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

Contractor shall provide written notice of any termination for convenience to Subcontractor signed by an authorized representative of Contractor. Subcontractor must stop its Work immediately upon receipt of such notice. If this Agreement is terminated for Contractor's convenience, Contractor shall pay Subcontractor for that portion of the Work actually performed plus any costs for labor, subcontractors, or materials, reasonably and necessarily incurred by Subcontractor to comply with such termination ("Subcontractor Termination Costs") plus an amount equal to 5% of such Subcontractor Termination Costs for and in lieu of overhead and profit thereon. Contractor shall not be liable to Subcontractor for any other costs nor for prospective profits on Work not performed. If this Agreement is terminated for convenience as a result of an Owner termination of the Prime Contract for convenience, Subcontractor shall be entitled to payment in connection with such termination to the extent Owner pays Contractor in connection with same on behalf of Subcontractor.

10.3 Owner Termination in general. If the termination is due to any default or action by Owner, or as a result of court order or public authority, Contractor is not liable to Subcontractor for any sum greater than that which Contractor receives from Owner with respect to Subcontractor's performance, less any costs incurred by Contractor in obtaining that amount from Owner.

10.4 Suspension of Prime Work. If the Prime Contract is suspended in whole or in part by Owner, Contractor may similarly suspend Subcontractor's Work and Subcontractor's rights will be limited to such extension of the Substantial Completion Date by the same time as may be allowed to Contractor by Owner. Subcontractor shall not be entitled to any compensation from Contractor on account of such suspension, unless and only to the extent that Owner compensates Contractor for additional costs incurred by Subcontractor on account of such suspension.

10.5 Suspension of Subcontract Work. If deemed to be in the Project's best interest, Contractor may temporarily suspend the Work or any part thereof. Subcontractor's entitlement to additional time or compensation is subject to the applicable terms of this Agreement.

11. CLAIMS. The term "claim" as used throughout this Agreement means any request, demand, or claim for, extra or additional money, time, change or reduction of responsibility, the adjustment or interpretation of contract terms, or other relief arising under or relating to this Agreement.

11.1 Strict Compliance. Subcontractor's strict compliance with all provisions in this Claims section and the Prime Contract, if applicable, is a condition precedent to Subcontractor's filing of any litigation or claim relating to this Agreement. Subcontractor's failure to comply strictly with the terms of this section will constitute a waiver of any such claim and shall relieve Contractor of all responsibility to make any payments or provide any extension of time or any other relief to Subcontractor, or to present Subcontractor's claim to Owner or any other entity for any amounts claimed or other relief sought by Subcontractor. Contractor's consideration, acceptance, presentation, or prosecution of any claim shall not constitute a waiver by Contractor of Subcontractor's failure to strictly comply with this section.

11.2 Notice Requirements. Unless the Prime Contract imposes a shorter deadline, Subcontractor must submit to Contractor written notice ("Claim Notice") of any claim within 72 hours after the commencement of the event or condition which is the basis for a claim. The Claim Notice must include the amount of increase in the Price and/or the Schedule or any other relief sought and the specific reasons why Subcontractor is entitled to the relief. Each Claim Notice must be accompanied by all documentation that supports the claim. If Subcontractor incurs additional costs or delays, or the relief sought by Subcontractor

SUBCONTRACT

Project: **LAWAATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

otherwise changes after the Claim Notice seeking such relief has been submitted, Subcontractor must amend its Claim Notice and update the supporting documentation within 30 days of such change (or within such shorter period as may be required by the Prime Contract).

11.3 Owner Related Claims. If Subcontractor's claim is due, in whole or in part, to any act, omission, direction or order of Owner or its agents or claims for which the Subcontractor believes it is entitled pursuant to the terms of the Prime Contract ("Owner Related Claim"), Subcontractor's only recourse under this Subcontract is Contractor's presentation of the Owner Related Claim to Owner. Contractor's liability to Subcontractor on account of any Owner Related Claim shall be limited to the compensation or relief obtained from Owner for same, less any costs to Contractor to present such Owner Related Claim.

11.3.1 The procedure provided for in the Prime Contract for the submission, documentation and determination of claims shall govern Subcontractor's Owner Related Claim and the determination of Owner shall be final, conclusive, and binding upon Subcontractor. Contractor shall present Subcontractor's Owner Related Claim to Owner in a timely manner, either in its own name or in the name of Subcontractor only if Subcontractor strictly complies with this section, including but not limited to the following requirements:

- (a) Within the deadlines set forth in this Agreement, Subcontractor must submit its Owner Related Claim in strict compliance with the requirements of the Prime Contract for the submission of Contractor's claims to Owner;
- (b) Subcontractor must include with its Owner Related Claim all substantiation for all relief sought as is required in the Prime Contract and this Agreement, as well as any certification of Subcontractor that may be required by Owner; and
- (c) Subcontractor must certify that it has duly substantiated its Owner Related Claim and that such Owner Related Claim is truthful and accurate.

Contractor may refuse to present a Subcontractor's Owner Related Claim to Owner to the extent that Contractor reasonably determines that such claim is without merit, unsubstantiated, or lacks a good faith basis for assertion.

11.3.2 Subcontractor shall pay all costs, including legal fees, incurred by Contractor in the presentation of any Owner Related Claim, regardless of the outcome. Contractor may treat Subcontractor's failure to promptly pay such costs as a withdrawal of its Owner Related Claim. If Contractor's submission of Subcontractor's Owner Related Claim is combined with Contractor's claims or another subcontractor's claims, Subcontractor will pay its reasonable portion, as determined by Contractor, of the costs, including legal fees, incurred by Contractor in accordance with this subsection.

11.3.3 If a recovery or settlement from Owner does not expressly allocate an amount to Subcontractor's Owner Related Claim, the Parties shall endeavor to agree upon such allocation in good faith; however, if they are unable to so agree, the allocation of any recovery or settlement, expenses, and costs will be made by Contractor in good faith.

11.3.4 It is within Contractor's discretion whether to commence or, if commenced, to continue, any legal proceedings against Owner, including compromise or settlement of any such proceedings, relating to Subcontractor's Owner Related Claim, provided, however, that Contractor shall endeavor in good faith to keep Subcontractor informed and to consult with Subcontractor in advance of the commencement, discontinuance, or settlement of any such proceedings.

SUBCONTRACT

Project: **LAWAATMP ROADWAY IMPROVEMENTS**
Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

11.4 Other Claims. Within 30 days after a Party sends notice to the other Party of any dispute other than an Owner Related Claim ("Dispute"), each Party shall designate a senior representative to engage in direct negotiation to resolve the Dispute. The senior representatives will meet in person, or if both Parties agree, via telephone, within 30 days of being so designated and will make a good faith attempt to resolve the Dispute. If the representatives cannot negotiate a resolution to the dispute, the Parties may submit the dispute for mediation administered by the American Arbitration Association under its Construction Industry Mediation Procedures. Each Party shall pay an equal share of the cost of the mediator and any AAA fees. The mediation will be held in the venue for litigation, unless otherwise agreed by both Parties. Mediation shall be a condition precedent to the initiation of any formal lawsuit in a court of competent jurisdiction. Any such lawsuit shall be initiated in a state or federal court of competent jurisdiction within the County and the State that the Project is located. However, should filing of such lawsuit be required to preserve a Party's rights hereunder, such filing shall be made and the matter stayed pending completion of mediation. Subcontractor waives any claim for special, incidental, consequential or penal damages for any Dispute, including, without limitation, any right to claims for loss of income, revenue, profit, interest or efficiency.

12. MISCELLANEOUS PROVISIONS.

12.1 Assignment. Subcontractor may not assign this Agreement, the Work or any part of either or both, or make any assignments of any money due or to become due to it hereunder, or give any orders to Contractor for payments to third parties, without the prior written consent of Contractor. Any such assignment without Contractor's prior written consent is void at Contractor's discretion. This Agreement is binding on and inures to the benefit of the permitted successors and assigns of the Parties. For the avoidance of doubt, transfers of equity in Subcontractor of greater than fifty percent (50%) are deemed to be prohibited assignments requiring the prior written consent of Contractor.

12.2 Inspection of Records. Contractor and Owner may audit all of Subcontractor's books, records, documents, schedules, bid estimates, and other data of Subcontractor relating to bidding, pricing or performance of this Agreement, any Change Order, or claim for any reason. This right is in addition to any other discovery or similar rights arising out of litigation, and is subject to specific enforcement and injunctive relief. Contractor may exercise this right for the same period of time that Owner may do so under the Prime Contract, but in no event shall such period of time be less than six years after Owner's acceptance of the Project.

12.3 Cumulative Rights and Remedies of Contractor. None of the rights and remedies granted to, conferred upon, or reserved by Contractor under this Agreement are exclusive or impose any limitations upon, or be in derogation of any right or remedy of Contractor now existing, or hereafter to exist, at law, in equity or by statute, or in the manner or time for the exercise thereof. Each and every right and remedy of Contractor under this Agreement is cumulative and in addition to all other rights and remedies of Contractor under this Agreement, now existing or hereafter to exist, at law, in equity, or by statute. Names or headings of Sections and the location of any clause shall not be construed so as to limit or restrict the purpose or intent thereof.

12.4 Owner Consent. Where the Prime Contract requires Owner approval of subcontractors, this Agreement shall be of no force or effect until Owner gives its consent and/or approval in writing to subcontracting the Work to Subcontractor unless Owner shall have waived such requirement. If this Agreement predates the Prime Contract, award of the Prime Contract to Contractor and full execution thereof is a condition precedent for either Party to enforce any rights or obligations in this Agreement.

12.5 Form and Manner of Notice. Where required by the terms of this Agreement, written notice may be either (a) by personal service or (b) by use of a recognized public overnight courier service, or Express United States mail. The written notice shall become effective upon receipt. Personal service may be delivered to the senior representative of the Party at the Project

SUBCONTRACT

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Skanska-Flatiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

site or to such person at the office address of the Party set forth in this Agreement. Service by mail, or overnight courier, shall be sent to the Party at its office address set forth herein.

12.6 No Oral Modification; No Third Party Rights. This Agreement constitutes the entire agreement and understanding between the Parties and supersedes all prior agreements and understandings, oral or written, relating to the subject matter hereof. This Agreement cannot be modified, nor any term or provision thereof waived, except by written instrument duly signed by the Parties or their successors in interest. Nothing in this Agreement shall be construed to create any rights of any kind in or for the benefit of any third-party.

12.7 Severability and Waiver. The invalidity of any term or provision of this Agreement, whether declared invalid by a court or otherwise, shall not affect the validity of any other term or provision hereof. The failure of Contractor to enforce any provision of this Agreement shall not constitute a waiver of the future enforcement of that provision and shall not constitute a waiver of the enforcement of any other provision.

12.8 Neutral Interpretation. This Agreement is deemed to have been jointly prepared by all Parties hereto and shall not be construed against any particular Party.

12.9 Governing Law. This Agreement shall be governed, construed, and enforced in accordance with the laws of the state of the state where the Project is located, without regard to its conflict of laws rules.

12.10 Sanctions. Subcontractor represents and warrants that it is not presently subject to any economic, humanitarian or political sanction, restrictive measure or similar adverse ruling or status determination issued by the United States Government (including those by the U.S. Dept. of the Treasury's Office of Foreign Assets Control (OFAC) and the U.S. Department of State), the United Nations Security Council and/or the European Union (collectively "Sanctions"). In the event Subcontractor hereafter becomes subject to Sanctions, it shall immediately notify Contractor of the circumstances surrounding same. Subcontractor's violation of the representation and warranty against Sanctions as of the date of this Agreement or it subsequently becoming subject to Sanctions shall constitute sufficient grounds for default and termination for cause hereunder, with the right to declare such default and termination being at the sole discretion of Contractor.

12.11 Anti-Corruption. Subcontractor represents and warrants that no payment, offer, gift, consideration or benefit of any kind that constitutes an illegal or corrupt practice has or will be made to anyone, either directly or indirectly, as an inducement or reward for the award, execution or subsequent modification of this Agreement or as an inducement or reward for anyone acting or forbearing action in connection with the administration of this Agreement. Furthermore, neither Subcontractor or its employees or agents shall do anything in the way of making any illegal or corrupt payment or conveyance of any benefit or any other thing of intrinsic monetary value to anyone (including, without limitation, employees or representatives of Contractor or any elected or appointed public officials or other persons charged with a public duty in connection with the administration or performance of the Prime Contract). Any violation of this provision shall be a material breach of this Agreement.

12.12 Counterparts. This Agreement may be executed and delivered electronically (including by email or facsimile transmission) in one or more counterparts, each of which when executed and delivered shall be deemed to be an original, but all of which taken together shall constitute one and the same instrument.

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: 90009220.SAMPLE2

STATE SPECIFIC PROVISIONS for CA

California Subcontract Provisions:

8.1 Progress Payments. Contractor shall pay the Price, less retainage in the same percentage as may be retained by Owner, through progress payments made pursuant to the Schedule of Values in Exhibit A. Subcontractor shall submit its application for progress payments ("Payment Application") in a form as directed by Contractor. Payment Applications must be submitted monthly, no later than three business days following the last day of Owner's current monthly pay period.

8.1.1 Payment Applications may be submitted only in conformance with the Schedule of Values, and only for that portion of Work that has been completed. Payment Applications shall be submitted to (a) Contractor's jobsite project office and (b) Contractor's Accounts Payable either by email electronically to US-Civil-invoices@skanska.com or via U.S. mail addressed to the attention of the Accounting Department at 1995 Agua Mansa Road, Riverside, CA 92509, unless otherwise directed in writing by Contractor. Each Payment Application shall include this Agreement Number on the face thereof. If approved in advance by Owner, Payment Applications may include requisitions for materials and equipment not incorporated in Subcontractor's Work but delivered and suitably stored at the site or at some other location, subject to further terms and conditions precedent as directed by Owner and Contractor. The risk of loss for such materials at all times shall remain on Subcontractor. If requested by Contractor, the application shall be accompanied by a forecast of next month's expected payment application.

8.1.2 Along with its Progress Payment Application, Subcontractor shall provide Contractor with all documentation necessary to substantiate payment as may be requested by Contractor or Owner, including: (a) an original executed unconditional waiver and release upon progress payment, certifying payment for all labor performed and materials furnished as of the last day of the preceding Payment Application period, in the form attached as Exhibit F; (b) an original executed conditional waiver and release upon progress payment, certifying payment for all labor performed and materials furnished as of the last day of the current Payment Application period, in the form attached as Exhibit F; and (c) an original unconditional and conditional waivers and releases, on the appropriate forms identified above, executed by all of Subcontractor's suppliers, vendors, materialmen, sub-subcontractors or others, including union benefit funds, furnishing labor or materials in connection with the Project. If required by Contractor, pay quantities and daily reports shall be turned in daily to Contractor's Project Engineer. Failure to do so may delay payment. Subcontractor's failure to timely submit its Progress Payment Waiver and Release, its Monthly Incident Summary Report, any EEO, MBE, WBE and similar reporting requirements of the Contract Documents required by Owner, or any other submission required by the Contract Documents for payment or this agreement may cause a delay in payment.

8.1.3 Unless Exhibit A, the Prime Contract, or governing law requires a different time, payment to Subcontractor shall be made no later than 30 days after Contractor receives both the approved and complete Payment Application and its payment from Owner for the portion of Subcontractor's Work for which Subcontractor has submitted a Payment Application.

8.1.4 If permitted by law, payment from Owner to Contractor is an express condition precedent to Subcontractor's entitlement to payment for its Work. Subcontractor is not entitled to any payment for any Work that is

State Specific Terms

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

rejected by Owner or Contractor, or for any Work for which Owner withholds any payment to Contractor. Subcontractor and Contractor acknowledge that there is a risk that the Owner may breach of the Prime Contract by making late payments or failing to pay Contractor. The Parties will share the credit risk of Owner and the risk of non-payment by Owner in proportion to their entitlement to payments due for their respective work, together with that of all subcontractors on the Project. Where applicable law does not allow for the Owner's prior payment to Contractor to serve as a condition precedent, then Subcontractor shall wait a reasonable period of time to receive payment so as to afford Contractor the opportunity to seek and obtain payment from Owner. Subcontractor is not entitled to receive payment which Contractor has not received from Owner for Subcontractor's Work until the expiration of such reasonable period of time.

8.2 Final Payment. Subcontractor shall submit a Final Payment Application promptly after Owner's final approval and acceptance of all of Subcontractor's Work.

8.2.1 Along with its Final Payment Application, Subcontractor shall provide Contractor with all documentation necessary to substantiate payment as may be requested by Contractor or Owner, including: (a) all required close-out obligations and documents for all Work required by the Contract Documents; (b) if Subcontractor furnished a payment or performance bond, the written consent of Subcontractor's surety(ies) to Contractor's release of Final Payment to Subcontractor; (c) an original executed conditional waiver and release upon final payment certifying payment for all labor and materials furnished as of the last day of Subcontractor's Work, in the form attached as Exhibit F; and (d) Unconditional waivers and releases upon final payment, in the form attached as Exhibit F, originally executed by all of Subcontractor's suppliers, vendors, materialmen, sub-subcontractors or others, including union benefit funds, furnishing labor or materials in connection with the Project.

8.2.2 Unless the Prime Contract or governing law requires a different time, Final Payment to Subcontractor will be made no later than 90 days after Contractor receives its payment from Owner for Subcontractor's Work. If permitted by law, the following are conditions precedent to Subcontractor's entitlement to receive final payment: (a) Owner's acceptance of Subcontractor's Work; (b) payment by Owner to Contractor for Subcontractor's Work, unless the Owner's failure to make such payment is for reasons unrelated to Subcontractor's Work or its failure to satisfy obligations under this Agreement; and (c) Contractor's receipt of all required close-out documentation required by the Contract Documents. To the extent applicable law does not permit the making of Final Payment by Owner to Contractor to serve as a condition precedent, Subcontractor shall wait a reasonable period of time to receive Final Payment so as to afford Contractor the opportunity to seek and obtain same from Owner. Subcontractor is not entitled to receive Final Payment which Contractor has not received from Owner for Subcontractor's Work until the expiration of such reasonable period of time.

9. INDEMNIFICATION. To the fullest extent permitted by law, Subcontractor agrees to fully defend, indemnify, and hold harmless Contractor (including its officers, directors, agents, servants, employees and affiliated and related corporate entities), Contractor's surety, and Owner, as well as each and every party and/or person which Contractor is contractually or legally required to defend and/or indemnify (collectively "Indemnitees" and individually the "Indemnatee"), from and against any and all claims, demands, losses, damages, liens, stop payment notices, penalties, costs, expenses, and/or liabilities arising out of, pertaining to, or relating to (a) Subcontractor's Work and/or contractual obligations whether performed by Subcontractor and/or anyone acting through or on its behalf, (b) materials and services provided by Subcontractor and/or anyone acting through or on its behalf, (c)

State Specific Terms

Project: **LAWAATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

the performance or failure to perform the Work by Subcontractor and/or anyone acting through or on its behalf, and/or (d) violation or infringement of any patent and/or intellectual property rights by Subcontractor and/or anyone acting through or on its behalf (collectively "Indemnified Claims" and individually "Indemnified Claim"). This duty to defend, indemnify, and hold harmless is without regard to any negligence or fault by Subcontractor and/or anyone acting through or on its behalf. Having fully considered its options at law, Subcontractor elects to proceed under Civil Code section 2782.05, subdivision (e)(2) with respect to its duty to defend. Upon final resolution of any such Indemnified Claim, any reallocation of defense fees and costs shall be governed by section 2782.05 of the Civil Code and the Claims provisions of this Subcontract.

9.1 Scope. In no event shall Subcontractor's obligations hereunder be construed to require indemnity or defense to a greater extent than permissible under the statutes or public policy of the State of California. Subcontractor has no duty to defend and indemnify Contractor (including its officers, directors, agents, servants, employees and affiliated and related corporate entities) or its surety to the extent that any Indemnified Claim (a) arises out of the sole or active negligence or willful misconduct of Contractor, its agents, servants and/or other independent contractors, (b) arises out of defects in design furnished by the Contractor, its agents, servants and/or other independent contractors, or (c) does not arise out of the Subcontract Work, whether performed by Subcontractor and/or anyone acting through or on behalf of Subcontractor. Subcontractor agrees to defend and indemnify Owner, as well as each and every party and/or person which Contractor is contractually or legally required to defend and/or indemnify, to the same extent that Contractor is required to do so. Subcontractor agrees to ensure that all of its lower-tiered subcontractors are obligated to fully indemnify, defend, and hold harmless all Indemnitees to the same extent that Subcontractor is obligated hereunder. Subcontractor's obligations hereunder shall not be limited by the provisions of any worker's compensation laws or by the existence of any insurance.

SCOPE OF WORK AND PRICE

The Work shall include, but not be limited to **providing all work, labor, tools, equipment, materials and services to timely perform and complete the work required by the Contract Documents** with respect to the following:

Scope of Work:

Schedule of Values:

COST CODE	DESCRIPTION	QTY	UM	Unit Price	TOTAL
TOTAL:					\$200,000.00
PRICE: Two Hundred Thousand Dollars					

THIS IS A LUMP SUM / UNIT PRICE CONTRACT NOT TO EXCEED \$200,000.00 ("Price"), WITHOUT AN EXECUTED CHANGE ORDER.

SPECIFICATIONS AND DRAWINGS:

The Work shall be performed in accordance with the Contract Documents, including but not limited to the following Contract Specifications and Drawings, as may be amended:

Specifications pertaining to all Work on the Project (as applicable):

1. Owner's RFP and all addenda thereto
2. Standard Specifications
3. Design-Build Specifications (dated)

If applicable, JOBSITE INSERTS by confirming bond % with Sub:

Subcontractor shall provide Performance and Payment Bonds for the value of this Agreement, as it may be amended. Contractor will reimburse to Subcontractor the actual costs for providing the bonds up to _____%, provided Subcontractor has furnished Contractor with bonds acceptable to Contractor and a copy of the paid receipt therefor.

SALES TAX:

Sales tax is included in the Contract Price, and Subcontractor is responsible for remitting all applicable sales tax to the appropriate taxing authorities.

SCHEDULE:

JOBSITE INSERTS specifics as required, including start date and completion date. If start date is unknown, insert what prompts the start date (such as notice from Contractor, receipt of a Material Release form from Contractor, etc.) and the required duration of the Work.

DBE PROGRAM AND OJT REQUIREMENTS:

1. If applicable, Subcontractor's DBE/SBE Program shall meet or exceed the following:
DBE participation: 10%. Non-DBE Small Business participation: 3%

GENERAL REQUIREMENTS:

1. Quantities may increase or decrease at Contractor's option. There shall be no escalation in any unit price in the event of a change of quantities.
2. Unit prices are firm and fixed for the duration of the Project.
3. Subcontractor is required to submit certified payroll reports weekly, if required by law or the Contract Documents, and is responsible for submittal of same from its lower tier subcontractors.
4. Subcontractor shall submit a work execution plan at least two (2) weeks prior to mobilization, for review and approval by Contractor, detailing all aspects of Work including but not limited to labor, equipment, materials, safety and schedule. Work plan will be reviewed for completeness by Contractor prior to commencing Work.
5. No Work shall commence until Work plans, quality control and safety procedures have been established, notifications made to and accepted by the Contractor's representative and appropriate quality control meetings have taken place.
6. Subcontractor employees shall attend a site specific safety orientation prior to beginning Work on site.
7. Subcontractor shall perform a daily "Pre-task" planning meeting with crews performing the Work. The meeting will review the day's planned activities and will identify the hazards associated with the Work and the mitigating measures that will be implemented to address the hazards. The meeting will be documented and signed by all attendees and turned in to the Contractor's field office daily.
8. Subcontractor shall attend all coordination meetings and Owner-requested workshops with appropriate personnel when specifically requested by Contractor.
9. Subcontractor shall make, and pay for, necessary off-site storage arrangements as required in addition to any Contractor provided laydown area if provided.

10. Submittals: At a minimum Subcontractor shall prepare and make submittals to Contractor for approval as required by the specifications incorporated into the scope of work above. Contractor reserves the right to require Subcontractor to make additional submittals as it deems necessary to progress the Work.

PROJECT SITE SPECIFIC REQUIREMENTS:

1. All Project rules and regulations included in this Agreement or posted at the Project site must be strictly followed.
2. Delivery personnel shall abide by all traffic signs and regulations while on the Project site.
3. Solicitation of any kind will not be permitted on the jobsite.
4. Drivers and operators for deliveries shall remain in the truck and only leave the truck as directed by Contractor's authorized representative for unloading. If drivers or operators are required to exit the truck, proper Personal Protective Equipment (PPE) must be worn at all times while outside the truck. PPE, at a minimum shall include; hard hat, OSHA approved safety glasses, boots, long pants and gloves. Any truck backed up on site shall have a spotter(s) to flag. All spotters required for Subcontractor's trucks shall be provided by Subcontractor.
5. Prior to shipment, Subcontractor will provide a letter detailing any special handling and all short term and long term storage requirements necessary to preserve the warranty and to protect the material and/or equipment. Subcontractor shall include with this letter the detailed bill of materials to be shipped and received.
6. Subcontractor must park in Contractor designated areas. Any required busing will be the responsibility of the Subcontractor. Proof of insurance shall be provided for non-Contractor vehicles located or used on site.

SAFETY

GENERAL RESPONSIBILITY

SUBCONTRACTOR is obligated to provide a safe and healthful working environment for its employees and any other persons exposed to its work.

SUBCONTRACTOR is obligated to comply with all applicable environmental, health and safety requirements of the CONTRACTOR and owner; as well as all laws, codes, ordinances, rules, regulations and lawful orders of all public authorities as they pertain to the SUBCONTRACTOR's work.

TRANSPORTATION AND ENVIRONMENTAL COMPLIANCE:

If a SUBCONTRACTOR's work activities involve transportation or shipping of hazardous materials, as defined by the Department of Transportation, or if the work requires Environmental Controls for spills/releases, SUBCONTRACTOR will appoint a designee to provide compliance support. In the event of an incident/release, the designee will coordinate all response activities for the SUBCONTRACTOR. The designee will also notify the insurance carriers and HAZMAT of any incidents/releases.

SUBCONTRACTOR will submit copies of Material Safety Data Sheets (MSDS) for all listed hazardous materials it intends to bring on-site, prior to their arrival. When requested, SUBCONTRACTOR will provide training to CONTRACTOR'S employees and other parties who may be routinely exposed to these materials, at no cost to CONTRACTOR.

REQUIREMENTS PERTAINING TO WORK AT CONTRACTOR FACILITIES AND ON-PROJECT ACTIVITIES

The following shall apply to SUBCONTRACTORS of all tiers, providing ON-PROJECT or CONTRACTOR FACILITY construction, renovation and services at no additional cost to the CONTRACTOR. If the requirements set forth in this agreement conflict with any of the following; Prime Contract, SHEMS, or other applicable safety documents, the most stringent standards will apply. Weekly Safety meetings shall be conducted specific to hazard exposure in each phase of work. In addition, Daily Foreman Safety meeting will be held at the project office/site 30 minutes prior to the start of each shift; attendance at this meeting is mandatory.

Full compliance with the CONTRACTOR's safety program (SHEMS) including required drug testing. A copy will be available for review and distribution at the CONTRACTOR's field or area office(s).

A SUBCONTRACTOR's safety record, procedures and relevant exceptions are to be made available to CONTRACTOR for review, as requested. SUBCONTRACTORS that do not meet the following maximum limits must provide an acceptable explanation of their current deficiencies and proposed efforts to ensure an acceptable safety performance in the future. Exceptions are acceptable at CONTRACTOR's discretion.

- Experience Modification Rate = 1.25 (interstate or intrastate as applicable)
Note: EMR is not applicable to Joint Venture organizations but EMR of parent companies may be requested for review.
- OSHA Recordable Incidence Rate (for the most recent calendar year)= 3.5
- Lost workday Rate = 1.0 (for the most recent calendar year).

EXHIBIT B

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**
Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

- Company and/or its corporate officials may not be listed on the EPA Criminal Enforcement Docket.

SAFETY VIOLATIONS:

SUBCONTRACTOR must promptly correct any violation of safety protocol within their area of responsibility. CONTRACTOR will notify SUBCONTRACTOR if an apparent violation is observed.

If notified of any non-compliance, SUBCONTRACTOR will take immediate action and make all reasonable efforts to correct the unsafe or unhealthy condition(s) or act(s) within a reasonable time. If SUBCONTRACTOR refuses to take corrective action, CONTRACTOR will initiate one or more of the appropriate actions, in accordance with the subcontract provisions:

- A. Cease the operation or a portion thereof (particularly in the case of an imminent danger).
- B. Correct the situation and back charge SUBCONTRACTOR.
- C. Stop or delay payment for the work being performed.
- D. Invoke subcontract penalties and/or terminate the subcontract.
- E. Order the permanent or temporary removal of personnel from the project.

In the event SUBCONTRACTOR fails to comply with the project safety and health regulations and/or fails to correct identified hazards, CONTRACTOR may, without prejudice to any other legal or contractual rights of CONTRACTOR, issue a stop work order and/or the removal of personnel from the project. A start order to resume work will be issued, at the discretion of CONTRACTOR. SUBCONTRACTOR will not file a claim(s) for time-extension or additional compensation by reason of, or in connection with, such action on behalf of the CONTRACTOR.

If safety protocol is violated, SUBCONTRACTOR will enforce uniform disciplinary action to the appropriate party. The enforced action will be consistent with the Owner and/or CONTRACTOR's safety policy. CONTRACTOR may order the immediate, permanent or temporary, removal of any individual(s) from the project site if they violate safety protocol. CONTRACTOR may order the immediate removal of any individual in a supervisory position, who fails to take prompt, corrective action when notified of non-compliance with safety requirements.

REQUIREMENTS PERTAINING TO ON-PROJECT ACTIVITIES

The following shall apply to SUBCONTRACTORS of all tiers, providing ON-PROJECT construction, renovation and services. If the requirements set forth in this agreement conflict with any of the following; Prime Contract, SHEMS, or other applicable safety documents, the most stringent standards will apply.

SUBCONTRACTORS of all tiers are responsible for the development, implementation, administration and enforcement of their individual environmental, health and safety programs. SUBCONTRACTOR will ensure that all requirements are passed on to its SUBCONTRACTORS to include but not limited to: CONSTRUCTION WORK PLANS (CWP); PERSONAL PROTECTIVE EQUIPMENT (PPE) AND DRESS REQUIREMENTS and SUBSTANCE ABUSE PREVENTION PROGRAM.

Prior to the commencement of each activity, SUBCONTRACTORS shall provide a copy of their Construction Work Plans (CWPs) utilizing the Skanska template, to include task-specific activities and associated competent persons. The Construction Work Plans will be created, monitored and readjusted in Skanska's "PlanIt" software package. The full details and requirements for said CWPs is located in the project specific EHS Manual. The Subcontractor has included providing the required computers and/or mobile devices (iOS or Android based) to Subcontractors staff dedicated to the project site.

EXHIBIT B

Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: 90009220.SAMPLE2

EMPLOYEE ORIENTATION AND TRAINING:

Employees of SUBCONTRACTORS of all tiers, upon their first day of employment or initial entrance onto the project site, are required to attend a CONTRACTOR Project Safety Orientation. SUBCONTRACTOR is responsible for all costs associated with employee training. CONTRACTOR will provide SUBCONTRACTOR with copies of the site specific orientation materials. This orientation program will include:

SUBCONTRACTOR project supervisory personnel at the Foreman level and above are required to complete an OSHA 30 hour Construction Safety Training Class. Authorized documentation of completion must be provided to CONTRACTOR within 60 calendar days of attending CONTRACTOR's Project Orientation. Failure to comply will result in removal of the individual(s) from the project. Documentation must be dated within 12 months prior to the CONTRACTOR's Project Orientation.

SUBCONTRACTOR, at its own expense, will provide safety training for its employees and the employees of its lower tiered SUBCONTRACTORS. Such training will be documented, with copies provided to CONTRACTOR as requested. Safety training will include:

1. Orientation of safety policies stipulated by the SUBCONTRACTOR prior to each employee's initial work assignment on the project.
2. Supervisor orientation to safety policies and their responsibility to enforce them.
3. Daily "Toolbox Talks" on an appropriate safety subject, for all employees.
4. Hazardous materials training (HAZCOM).
5. Personal protective equipment
6. Personal safe work practices
7. Special safety training for those affected, including but not limited to: confined space entry, respiratory protection, hot work permits, fire watch, trenching/excavation, fall protection, scaffolding, lock-out/tag-out, forklifts, hoisting and rigging, etc.
8. Employee's rights and obligations
9. OSHA 30 hour Construction Safety Class for all supervisors.

SAFETY REPRESENTATIVE:

SUBCONTRACTOR will designate a "Safety Representative" with authority to manage SUBCONTRACTOR's work, and its lower-tier SUBCONTRACTORS, and project environmental, health and safety programs. The Safety Representative's responsibilities, including implementation and enforcement of the program(s), will be specified in the SHEMS.

Prior to the commencement of work, SUBCONTRACTOR will provide the name and qualifications of the on-site Safety Representative to CONTRACTOR for approval. The Safety Representative must have a current certification in First-Aid/CPR from an accredited agency, and have completed the basic "30 hour Introduction to OSHA" Construction Safety Outreach course within the last 5 years.

No field related work will commence prior to the CONTRACTOR's Safety Department approving the SUBCONTRACTOR Safety Representative

SAFETY MANAGER:

EXHIBIT B

Project: **LAWAATMP ROADWAY IMPROVEMENTS**
Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flätiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

If any of the following criteria is met SUBCONTRACTOR and any lower tier SUBCONTRACTOR shall designate a full time Safety Manager:

- SUBCONTRACTOR employs 30 or more employees at the project site.
- SUBCONTRACTOR contract is greater than 10 million dollars.
- CONTRACTOR determines that SUBCONTRACTOR work warrants a Safety Manager due to scope and risk factors.
- SUBCONTRACTOR whose work is observed to be in gross non-compliance with CONTRACTOR's SHEMS, project safety requirements or regulations.

The Safety Manager shall be a full time position. The Safety Manager cannot hold any other position for the SUBCONTRACTOR. The Safety Manager must have a current OSHA 500 certification and a minimum of 5 plus years of experience in Heavy Civil construction specifically in a Safety position or similar as approved by the CONTRACTOR's Director of Environmental Health and Safety (EHS). The Safety Manager shall have specific knowledge of the SUBCONTRACTOR works, i.e.; hazardous waste, NFPA 70E, demolition, scaffolding, etc. Safety Manager's qualifications must be approved by the CONTRACTOR's Director of EHS. Safety Manager must be available and on site when work is ongoing.

No field related work will commence prior to approval of the Safety Manager by the CONTRACTOR's Director of EHS.

A summary form (included in this appendix) of occupational injuries and illnesses is submitted by the 4th of every month. SUBCONTRACTORS will report all fatal or serious occupational injuries/illnesses, as defined by CCR Title 8, paragraph 330(h) immediately. If an employee sustains an on-the-job, partially disabling injury that results in lost time at work, the SUBCONTRACTOR may choose to discontinue employment on a modified basis. In these instances, SUBCONTRACTOR will notify CONTRACTOR twenty-four (24) hours prior to the discontinuance of employment. CONTRACTOR reserves the right to perform an independent investigation at no additional cost to SUBCONTRACTOR.

STANDARD INSURANCE REQUIREMENTS

SECTION I: DEFINITIONS

As used in this Exhibit C:

- (a) "Project" means the project that is the subject of the Subcontract/Purchase Agreement.
- (b) "Scope" means the scope of Work to be provided by Subcontractor under the Subcontract or the Goods and Services to be supplied and performed by Seller under the Purchase Agreement, as applicable.
- (c) "State" means a state of the United States or the District of Columbia or the Commonwealth of Puerto Rico, as applicable.

Capitalized terms used in this Exhibit C and not defined in the Subcontract/Purchase Agreement shall have the meanings generally ascribed to such terms in the commercial insurance industry in the United States.

SECTION II: STANDARD INSURANCE COVERAGES

Subcontractor/Seller shall comply with the following:

1. **Standard Insurance Coverages:** Unless higher limits or additional coverages are required by the Subcontract/Purchase Agreement or Prime Contract, Subcontractor/Seller shall secure and maintain from the earlier of commencement of work or the effective date of the Subcontract/Purchase Agreement the minimum insurance coverages and limits required by this Exhibit C. Failure of the Contractor/Buyer to identify deficiencies in any insurance provided by Subcontractor/Seller shall not relieve Subcontractor/Seller from any insurance obligations. Required coverages are as follows:

- 1.1 **Workers Compensation and Employer's Liability:**

On-site exposures will be insured through: **Standard**

Standard	The Subcontractor/Seller's own Worker's Compensation Insurance and Employer's Liability Insurance policy. (Refer to the same limits, terms and conditions as set forth below under "Off-site Worker's Compensation Insurance and Employer's Liability Insurance".)
OCIP	An Owner Controlled Insurance Program ("OCIP"). The manual explaining these coverages is attached hereto as Exhibit C-1.
CCIP	A Contractor Controlled Insurance Program ("CCIP"). The manual explaining these coverages is attached hereto as Exhibit C-1.

Off-site Worker's Compensation Insurance and Employer's Liability Insurance (including occupational disease) to cover statutory benefits and limits under the Worker's Compensation laws of any applicable jurisdiction in which the Scope is to be performed, and Employers' Liability Insurance with minimum limits of \$1,000,000 each accident; \$1,000,000 for disease, each employee and \$1,000,000 disease, policy limit.

Policy coverage terms and conditions to include:

- USL&H – where applicable.
- Jones Act – where applicable.
- All states endorsement – where applicable.
- Employers Liability/Stop Gap Liability if work is performed in the State of Washington, Wyoming, Ohio, North Dakota or the Commonwealth of Puerto Rico.

EXHIBIT C

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: 90009220.SAMPLE2

- For the attainment of Workers Compensation in monopolistic states and Puerto Rico, coverage must be secured through the state fund of that state.
- Certificate must clearly identify that coverage applies in the State in which the Project is located.

1.2 Commercial General Liability Insurance:

On-site exposures will be insured through this type of insurance: **Standard**

|-----------|--|
| Standard: | The Subcontractor/Seller's own Commercial General Liability Insurance ("CGL") policy. (Refer to the same limits, terms and conditions as set forth below under "Off-site Commercial General Liability Insurance".) |
| OCIP: | An Owner Controlled Insurance Program ("OCIP"). The manual explaining these coverages is attached hereto as Exhibit C-1. |
| CCIP: | A Contractor Controlled Insurance Program ("CCIP"). The manual explaining these coverages is attached hereto as Exhibit C-1. |

Off-site Commercial General Liability Insurance ("CGL") written on ISO form CG 00 01 Edition date 10/01 or prior ISO edition occurrence form or equivalent for hazards of: (a) Construction Operation, (b) Subcontractors and Independent Contractors, (c) Products and Completed Operations applicable to the Additional Insured (with Completed Operations coverage to remain in force from the date of final completion of the Scope until the expiration of the statute of repose of the State in which the Project is located). The insurance shall include: (1) Contractual Liability coverage sufficient to meet the requirements of the Subcontract/Purchase Agreement (including defense costs and attorney's fees assumed under contract, which shall be payable in addition to the limit of liability); (2) Personal Injury Liability (with the standard contractual and employee exclusions deleted); (3) Notice and Knowledge of Occurrence; and (4) no subsidence exclusion.

If marked as required, Subcontractor's/Seller's CGL insurance is required to provide the following coverages:

	<u>Required</u>
• Mold	No
• Operations (performed within) 50' of railroad property	No
• Pollution Coverage (Exhibit O Required)	No
• Marine Protection and Indemnity	No
• Hull and Machinery	No
• Marine Pollution Liability	No

If the Subcontractor's/Seller's CGL insurance excludes any of the required coverages, a separate policy acceptable to Contractor/Buyer must be obtained.

For each insurance category checked 'Yes' above, Subcontractor/Seller's CGL insurer and/or broker will evidence, through Policy endorsement, or provide written confirmation, that such coverage is intact, even if each respective insurance certificate lists that type of coverage and describes its liability limits.

The insurance shall have the following minimum limits of liability, which shall be available to the Project:

EACH OCCURRENCE	\$ 1,000,000
PRODUCTS-COMP/OP AGG.	\$ 2,000,000
PERSONAL & ADV INJURY	\$ 1,000,000
GENERAL AGGREGATE	\$ 2,000,000

The general aggregate coverage limits shall be per project general aggregate and shall be evidenced on Subcontractor's/Seller's Certificate of Insurance.

EXHIBIT C

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

1.3 Commercial Auto Liability Insurance:

Commercial Automobile Liability insurance covering all owned, leased and non-owned vehicles used in connection with the Scope with limits of: \$1,000,000 combined single limit per accident for bodily injury and property damage. The policy must include coverage for bodily injury, death and property damage arising out of ownership, maintenance or use of any motorized vehicle on or off the site of the Project, and Contractual Liability coverage. If hauling of hazardous waste is part of the Scope, Automobile Liability Insurance with a \$5,000,000 combined single limit per occurrence for bodily injury and property damage applicable to all hazardous waste hauling vehicles, and include MCS 90 endorsement and the ISO Form CA 9948 (Pollution Liability Broadened Coverage for Business Automobile).

If CGL 12/04 or later edition is provided, the CA0051 1204: Mobile Equipment Subject to Motor Vehicles Laws shall also be provided. This additional endorsement is not required if the 2006 ISO Auto form is provided.

1.4 Commercial Umbrella Liability Insurance:

On-site exposures will be insured through: **Standard**

Standard: The Subcontractor/Seller's own Commercial Umbrella Liability Insurance policy. (Refer to the same limits, terms and conditions as set forth below under "Off-site Commercial Umbrella Liability Insurance".)

OCIP: An Owner Controlled Insurance Program ("OCIP"). The manual explaining these coverages is attached hereto as Exhibit C-1. Commercial Automobile Liability Insurance is NOT included in the OCIP policy. Refer to Section 1.3 for the requirements of the Commercial Automobile Liability Insurance coverage.

CCIP: A Contractor Controlled Insurance Program ("CCIP"). The manual explaining these coverages is attached hereto as Exhibit C-1. Commercial Automobile Liability Insurance is NOT included in the CCIP policy. Refer to Section 1.3 for the requirements of the Commercial Automobile Liability Insurance coverage.

Off-site Commercial Umbrella Liability Insurance for bodily injury and property damage liability over Subcontractor/Seller's primary Employer's Liability, Commercial General Liability and Commercial Automobile Liability with limits available to the Project in the amount of \$5,000,000 each occurrence and aggregate. All coverages and terms required under the Commercial General Liability, Automobile Liability and Employers Liability (sections 1.1, 1.2, and 1.3 above) must be included on the Umbrella Liability policy.

Higher limits may be required by Contractor/Buyer or Owner on a project by project basis.

Subcontractor/Seller's Umbrella Liability Policy shall evidence, through a policy endorsement that it will provide liability coverage in excess of all available underlying coverage before any primary or excess coverage held by any Additional Insured or Indemnified Party is utilized.

1.5 Leased Employee Liability:

If Subcontractor/Seller leases one or more employees through the use of a payroll, employee management or other company, Subcontractor/Seller must directly procure workers compensation/employer's liability insurance. The insurance shall be written on a "Minimum Premium" or "If Any" policy form. In addition, the workers compensation/employer's liability coverage provided to and for the leased employees by the payroll, employee management or other company must be evidenced and include an Alternate Employer/Leased Employee Endorsement, naming Subcontractor/Seller as the alternate employer. The employer's liability must be scheduled under a \$5,000,000 umbrella (except in states where employer's liability is unlimited).

EXHIBIT C

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

1.6 Property Insurance:

Property Insurance coverage for tools and equipment owned, leased or used by the Subcontractor/Seller in the performance of the Scope. The Property Insurance shall extend to equipment, materials and supplies stored off the Project site or in transit to the Project site to be furnished as part of the Scope and incorporated into the Project.

1.7 Professional Liability Insurance:

Required
No

If marked as required, the Scope involves professional services and Professional Liability Insurance is required covering liability for claims that arise from the errors, omissions or acts of the Subcontractor/Seller or any entity for which the Subcontractor/Seller is legally responsible, in the provision of professional services. The policy shall be primary and non-contributory, with the insuring agreement to read: "to pay on behalf of" and shall be effective (retroactively, if applicable) from the date of commencement of all professional activities in connection with the Scope. The coverage shall be maintained for a period of 5 years following final acceptance of the Project. Minimum limits are: (1) Prime Subcontractor Design Professional: \$5,000,000 per claim/annual aggregate; (2) Lower-Tier Subcontractor-Design Professional: \$1,000,000 per claim/annual aggregate. A copy of the policy shall be provided to the Contractor/Buyer upon request.

Coverages shall not include any exclusions or other limitations related to:

- scope of the services.
- delays in project completion and cost overruns.
- who can notify the carrier of a claim or potential claim.
- mold, fungus, asbestos, pollutants or other hazardous substances.

For the purposes of Professional Liability Insurance, the term "Prime Design Professional" means the architect/engineer providing architectural, engineering and/or other professional services under a contract directly with Contractor/Buyer, and the term "Sub-Design Professional" means any architect/engineer providing architectural, engineering and/or other professional services directly or indirectly to a Prime Design Professional in connection with the Project. A Prime Design Professional is also a Subcontractor/Supplier and a Sub-Design Professional is also a Sub-subcontractor/Sub-supplier.

1.8 Riggers Liability Required:

Required
No

If marked as required, the Scope involves the rigging, hoisting, lowering, raising or moving of property or equipment belonging to others and Riggers Liability Insurance is required to insure against physical loss or damage to the property or equipment.

1.9 Aircraft/Watercraft:

Required
No

If marked as required, the Scope involves the use of any owned, leased, chartered or hired aircraft or watercraft of any type and Aircraft Liability Insurance or Watercraft Liability Insurance, as applicable, is required in an amount of not less than \$10,000,000 per occurrence, including Passenger Liability for bodily injury and property damage.

1.10 Watercraft:

Marine Protection and Indemnity
Hull and Machinery
Marine Pollution Liability

Required
No
No
No

EXHIBIT C

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

If marked as required, Marine Protection and Indemnity and Charter Legal Liability are required in an amount of not less than \$5,000,000, and Marine Pollution Liability is required in an amount of not less than \$5,000,000, where applicable or similar watercraft coverage relating to the operation, maintenance or use of any vessel (whether self-propelled or being towed.)

2. **Insurer Requirements:** Each insurer providing insurance coverage as required in this Exhibit C shall be a licensed admitted insurer authorized to issue such coverages in each State in which any part of the Scope is performed. The insurer shall be acceptable to Contractor/Buyer and shall have an AM Best rating of "A-X" or better.
3. **Certificate of Insurance:** Prior to commencing its performance and throughout the warranty period under the Subcontract/Purchase Agreement, Subcontractor/Seller shall provide Contractor/Buyer a current certificate of insurance evidencing the coverages required by this Exhibit C (a sample Certificate of Insurance is attached for reference purposes).
4. **Sub-subcontractor/Sub-supplier:** Before permitting any Sub-subcontractor/Sub-supplier to perform Scope under the Subcontract/Purchase Agreement, the Subcontractor/Seller shall require the Sub-subcontractor/Sub-supplier to maintain insurance in like form and amounts to that required herein. Subcontractor/Seller shall be responsible to ensure that Sub-subcontractor/Sub-supplier maintains insurance in like form and amounts and shall provide evidence of same to Contractor/Buyer if requested.
5. **Notice of Cancellation:** All insurance coverages required by this Exhibit C shall contain a provision that the coverage afforded hereunder cannot be cancelled, non-renewed, allowed to lapse, or have any restricted modifications added unless at least thirty (30) days prior written notice has been given to the Contractor/Buyer.
6. **Additional Insureds:** All insurance required by this Exhibit C (excluding only Workers Compensation Insurance and Professional Liability Insurance) shall name Indemnified Parties as Additional Insureds and any other parties as required by the Prime Contract, and shall be primary and non-contributory to any insurance maintained by Indemnified Parties and Additional Insureds and any other parties as required by Prime Contract, all of which shall be stated on the Certificate of Insurance provided by the Subcontractor. The General Liability Additional Insured Endorsement shall be on Form CG 2010 11/85, or CG 20 10 10/01 plus CG 20 37 10/01, or equivalent and shall include ongoing and completed operations. **Evidence, by endorsement or policy language, of Additional Insured and Primary and Non-Contributory coverage must be provided with the certificate of insurance for General Liability.**
7. **Deductibles/Denial of Claims:** Subcontractor/Seller shall be responsible, at no additional cost to Contractor/Buyer, for the payment of any deductibles or self-insured retention in connection with the insurance coverages required by this Exhibit C both for itself and all Additional Insureds. Any self-insured retention or deductible in excess of \$25,000 must be declared at the time Subcontractor/Seller submits its bid and must be specifically approved by Contractor/Buyer prior to execution of the Subcontract/Purchase Agreement. Subcontractor/Seller shall be responsible for any loss arising out of coverage denial by its insurance carrier.
8. **Dilution of Limits:** For those policies containing an aggregate, as soon as incurred loss activity (paid plus reserve) depletes the aggregate by 50% or more, written notice must be sent to the Contractor/Buyer by certified mail return receipt requested.
9. **OCIP/CCIP Program:** Subcontractor/Seller may be required by Contractor/Buyer to enroll in an Owner Controlled Insurance Program ("OCIP") or Contractor Controlled Insurance Program ("CCIP"). Subcontractor/Seller shall strictly comply with all requirements of the program in which it is required to enroll and the Subcontract Amount/Purchase Agreement Amount shall be reduced by the amount included therein by Subcontractor/Seller for insurance coverage replaced by the OCIP or CCIP as provided in the manual.
10. **Waiver of Subrogation:** All insurance coverages maintained by Subcontractor/Seller shall include a waiver of any right of subrogation of the insurers thereunder against Indemnified Parties and Additional Insureds and all of their respective

EXHIBIT C

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

assigns, subsidiaries, affiliates, employees, insurers and underwriters, and of any right of the insurers to any set-off or counterclaim or any other deduction, whether by attachment or otherwise, in respect of any liability of any person insured under any such policy (Workers Compensation – where permitted). Subcontractor/Seller further waives all claims and all rights of subrogation against Indemnified Parties' and Additional Insureds' other contractors and all of their respective assigns, subsidiaries, affiliates, employees, insurers and underwriters for loss of, or damage to, Subcontractor's/Seller's Scope, tools, machinery, equipment, material, supplies, or any other losses within the scope of any insurance maintained by Subcontractor/Seller. If any of the Indemnified Parties and Additional Insureds is partially or wholly self insured, then the waiver of subrogation shall apply as if they were in fact covered by their own insurance.

11. No Limitation: The insurance coverages maintained by Subcontractor/Seller shall not limit any of Subcontractor's/Seller's indemnity obligations or other liabilities under the Subcontract/Purchase Agreement. Insurance coverages maintained by Subcontractor/Seller that exceed the minimum requirements in this Exhibit C shall be applicable to the Subcontract/Purchase Agreement.
12. Severability of Interests (Cross Liability): All insurance required by this Exhibit C (excluding only Workers Compensation Insurance and Professional Liability Insurance) shall be endorsed to provide that, inasmuch as the policy is written to cover more than one insured, all terms, conditions, insuring agreements and endorsements, with the exception of limits of liability, shall operate in the same manner as if there were a separate policy covering each insured. No cross liability exclusion will be accepted. Nor shall there be any restrictions in any policies that limit coverage for a claim brought by an Additional Insured against a named insured.
13. Insurance Policy Review/Exclusions/Copies: Contractor/Buyer has the right to receive copies of all insurance policies upon request. Policies shall not contain any exclusions that are not acceptable to Contractor/Buyer and Owner. If requested by Contractor/Buyer or Owner, all policies must be certified by the insurance carrier as being true and complete. Policies shall not contain any exclusions that are not acceptable to Contractor/Buyer and Owner, in their sole discretion. Contractor/Buyer's right to review and approve all insurance policies will not constitute a waiver of any rights created by or provisions contained in this Exhibit C should they differ from those contained in such policies.
14. Claims-Made Policies: Except for Professional Liability Insurance, claims-made policies are not acceptable.
15. Effect of Specified Coverages: In specifying minimum requirements herein, neither Contractor nor Owner assert or recommend this insurance as adequate to Subcontractor's/Seller's requirements. Subcontractor/Seller is solely responsible to inform itself of types of insurance it may need beyond these minimum requirements to protect itself from loss, damage or liability.
16. Breach of Insurance Requirements: Subcontractor's/Seller's failure to obtain and maintain insurance coverages as required by this Exhibit C or any other Exhibit or attachment shall constitute a material breach of the Subcontract/Purchase Agreement. In such event, in addition to any and all other rights and remedies contained in the Subcontract/Purchase Agreement, (i) Contractor/Buyer may, at its option, terminate the Subcontractor/Seller for default; (ii) Contractor/Buyer may, at its option, purchase such coverage and backcharge the premium and associated costs to Subcontractor/Seller; and/or (iii) any of the Indemnified Parties or Additional Insureds can require, that Subcontractor and/or its subcontractors to pay for all attorney's fees, expenses and liability as a result of any claim or lawsuit for which coverage would have been provided to the Indemnified Parties or Additional Insureds under Subcontractor's/Seller's insurance program but for a breach by Subcontractor/Seller or any of its subcontractors. Furthermore, to the extent of their respective interests, the Insurers of those entities that were to be included as Additional Insureds are deemed to be third-party beneficiaries of the insurance procurement obligation and as such have the same rights against the breaching party as the Indemnified Parties or Additional Insureds.

CODE OF CONDUCT

Skanska strives to achieve mutually beneficial supplier relationships built on common values and expected behaviors. The Skanska Code of Conduct (our Code) outlines the behaviors we expect from our employees. This Skanska Supplier Code of Conduct (our Supplier Code) contains relevant portions of our Code that apply to you as an important part of our supply chain. We encourage our suppliers to engage in constructive dialogue with us regarding our Supplier Code and doing business together.

Foundation of the Supplier Code

Skanska is committed to conducting business in a responsible and sustainable way. We require the same of our suppliers. Our Code and our Supplier Code are based on our Skanska Values, described here:

Care for Life

We care for life of people and the environment. We work safely, or not at all. We never walk by if we notice unsafe actions. We support health and well-being. We promote green solutions and conduct our operations in a green way. We are accountable to future generations.

Act Ethically and Transparently

We do business with a high degree of integrity and transparency. We live by our Code of Conduct and never accept shortcuts. We foster a working climate where everyone can speak their mind.

Be Better – Together

We always strive to be better in all we do. We are a learning organization and generously share our expertise. We take pride in quality and innovation. We build One Skanska teams together with customers, partners and communities. We leverage diversity to deliver the best solutions. We foster inclusive cultures where we are open and fair, showing trust and respect for each other.

Commit to Customers

We help our customers to be successful in their business. We strive to understand their needs and their customers' needs. We are here to help our customers turn their visions into reality. Importantly, Skanska is a signatory to the United Nations (UN) Global Compact, and we adhere to its Ten Principles reflecting human rights, labor, the environment and anti-corruption. We further support the rights of all people as described in the Universal Declaration of Human Rights adopted by the UN and in the conventions of the UN's International Labour Organization. In addition, as a founding and participating member of the World Economic Forum's Partnering Against Corruption Initiative (PACI), we subscribe to the principles supported by PACI.

Who the Code Applies To

This Supplier Code applies to providers of goods and services – and their employees – in their work with Skanska through a contractual agreement. It is not applicable to single transactions such as a taxi ride, dinner at a restaurant, purchasing a railway ticket, or any similar type of transaction not subject to a frame agreement.

The group that we collectively call “suppliers” includes suppliers, subcontractors, service providers, professional service providers, consultants, intermediaries and agents. As a supplier, you must ensure that the practices and principles outlined in Skanska's Supplier Code are flowed down throughout your own supply chain.

Project: LAWAATMP ROADWAY IMPROVEMENTS

Project Number: 90009220

Subcontractor: FOR EXAMPLE USE ONLY

Skanska-Flatiron a Joint Venture
Agreement Number: 90009220.SAMPLE2

Compliance with Laws

You are required to comply with all applicable laws and with our Supplier Code, including when our Supplier Code sets a higher standard than, but does not conflict with, legal requirements. Customs or local practices never take precedence over legal requirements. If you find that our Supplier Code is in conflict with applicable legal requirements, you should inform the relevant Skanska manager.

Reporting Misconduct

Skanska believes that a strong ethical culture depends in part upon creating an environment in which employees feel free to report instances of non-compliance with our Code or Supplier Code. Such non-compliance might include suspected illegal or unethical conduct (collectively called misconduct). We are committed to investigating reports of suspected or known misconduct, and to taking appropriate action based on our findings. Similarly, you – including your employees and your supply chain – are obligated to report to us suspected or known misconduct. Suspected or known misconduct must be reported by speaking with the relevant Skanska manager, or to the Ethics Committee of the Business Unit or Reporting Unit (Skanska Unit) for which you are working. If you prefer, you may report suspected or known misconduct confidentially and anonymously to the Skanska Code of Conduct Hotline, either by telephone or online (instructions appear near the end of this Supplier Code).

No Retaliation

Skanska does not retaliate against anyone for submitting in good faith a report of suspected or known misconduct, nor do we tolerate others retaliating. Similarly, you must not retaliate or tolerate retaliation against anyone who, in good faith, reports suspected or known misconduct. “Good faith” means that to the best of a person’s knowledge and belief, everything reported is true and that everything known is reported.

Auditing

Skanska reserves the right to monitor and audit each supplier’s compliance with our Supplier Code. Accordingly, you must cooperate by providing relevant information that we request, and by making individuals accessible so Skanska can conduct a meaningful audit. Similarly, you are required to evaluate your supply chain to ensure compliance with our Supplier Code, and to conduct audits of your supply chain when requested by Skanska. Any non-compliance by you or your supply chain must be effectively remediated both in a timely manner and at no additional cost to us or our customers. Breaches of the Supplier Code may negatively impact your business relationship with Skanska. Potential consequences may include but are not limited to contract termination. This provision for Auditing does not relieve or limit a supplier’s obligations or responsibilities.

Health, Safety and Well-Being

We care for our people and the people affected by our workplaces, and we continuously strive to develop a work environment that promotes health, safety and well-being. We aim to lead our industry in health and safety performance, with continuous, measurable improvements toward our goal of an injury-free environment. We promote and share sound personal safety and accident prevention practices with our supply chain and throughout our industry.

What does it mean for you?

- You work together with Skanska and other suppliers to ensure a healthy and safe working environment.
- You ensure that your employees and others in your supply chain are adequately trained and provided with the proper equipment to safely carry out their work.
- You recognize that all employees have a right and an obligation to stop unsafe work.
- You report to Skanska all health and safety incidents related to our project sites and in our workplaces.

EXHIBIT D

Project Number: 90009220

Subcontractor: FOR EXAMPLE USE ONLY

Skanska-Flatiron a Joint Venture
Agreement Number: 90009220.SAMPLE2

Fair Working Conditions

We support recognized global human rights and fair working conditions for persons working on our projects, in our workplaces, and in our supply chain.

What does it mean for you?

- You ensure that working conditions, hours, wages and benefits comply with applicable national and local laws and relevant ILO conventions.
- You have zero tolerance for any form of human trafficking or child, forced or compulsory labor, including such practices as the unlawful or illegitimate withholding of wages. A child is anyone below the age of 15, or below any higher minimum age specified by local law.
- You do not allow any practice that would restrict free movement of employees. Such practices can include requiring that employees hand over identification documents, passports or work permits as a condition of employment.
- You recognize and respect employees' right to freedom of association and collective bargaining, where permissible by law.
- You recognize the special needs of employees under the age of 18, and your duty of care toward them.

No Discrimination or Harassment

We respect all individuals and strive to work as one team, and to foster open, straightforward and respectful communication. We provide equal treatment and employment opportunities, and we do not tolerate any form of harassment or discrimination.

What does it mean for you?

- You do not tolerate disrespectful behavior, bullying, discrimination, harassment or unwanted sexual advances.
- You do not discriminate, and you provide equal treatment and opportunities for employees and job applicants.
- You embrace and promote an inclusive culture.

Environment

We are committed to protecting the environment and believe that we can make major contributions to a more sustainable world. We actively work to improve the environmental performance of our operations, projects, products and services during their entire life cycles.

What does it mean for you?

- You conduct your operations in an environmentally responsible manner and in accordance with applicable environmental laws.
- You comply with standards required by Skanska's environmental management system.

Protection of Assets, Property and Equipment

We safeguard and protect our assets from damage, theft, loss and misuse, as they are essential to our business. Assets are either tangible or intangible. Examples of tangible assets are raw materials, money, products, machines and equipment, computers and real estate. Examples of intangible assets are our brand, patents, trademarks, knowhow, trade secrets and copyrights.

What does it mean for you?

- You respect the assets of Skanska and our stakeholders.

EXHIBIT D

Project: LAWA ATMP ROADWAY IMPROVEMENTS
Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: 90009220.SAMPLE2

- You only use assets belonging to Skanska and others as and when appropriately authorized.
- You do not tolerate theft of assets.

Confidentiality

We respect confidential information relating to Skanska and our stakeholders, and take all reasonable measures to prevent confidential information from being disclosed to any person who does not need and have a right to that information in the course of their work.

What does it mean for you?

- You ensure the protection of confidential information entrusted to you by Skanska, our customers and others.
- You do not act on confidential information received in error, whether it has come from Skanska, our customers or others. You contact the sender and disclose the situation to Skanska.

Protection of Personal Data (Data Protection)

We respect everyone's right to the protection of his or her personal data and the right to his/ her integrity in connection with processing of personal data. The definition of personal data, and the legal requirements for safeguarding it, varies by country. It could include someone's names, personal healthcare information, photographs or identity number.

What does it mean for you?

- You ensure that all uses of personal data – such as collection, registration, comparison, storage and deletion, or a combination of these – take place in accordance with applicable laws and regulations.

Anti-Corruption and Anti-Bribery

We are committed to conducting business with a high level of integrity, and we do not tolerate any form of bribery or corruption, including embezzlement, money laundering, kickbacks, extortion, fraud, nepotism (family) or cronyism (friends).

What does it mean for you?

- You conduct business with integrity, and you likewise do not tolerate any form of bribery or corruption.
- You never request, accept, pay, offer or authorize bribes, either directly or indirectly, under any circumstances. This includes never seeking to improperly influence or bribe a Skanska employee, customer, or public official (including foreign public officials) or any other individual or entity.
- You do not offer or make facilitation payments, nor do you permit others to offer or make such payments on your behalf. Facilitation payments are bribes – often small – paid to public officials to speed up non-discretionary bureaucratic processes and access services to which the payer is lawfully entitled.
- You ensure that all reports, records and invoices are complete and accurate and not false or misleading.

Fair Competition

We believe fair competition benefits Skanska, our stakeholders and society as it drives efficiency and innovation, which are the basis of a well-functioning market economy. We are committed to fair competition and do not tolerate any violation of antitrust laws, competition laws or related regulations.

What does it mean for you?

- You practice fair competition.

EXHIBIT D

Project: LAWA ATMP ROADWAY IMPROVEMENTS
Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: 90009220.SAMPLE2

- You do not participate in bid rigging by way of bid suppression, complementary or cover bidding, bid rotation, or other mechanisms that limit fair competition in tender situations.
- You do not participate in any other form of cartel practices with competitors, such as dividing or allocating markets or customers or price fixing.

Conflict of Interest

When acting as a representative of an employer or other party, we all are responsible for making decisions in the best interest of that employer or party without regard for personal gain. Conflicts of interest can be rooted in hospitality and entertainment, gifts, charitable contributions, political contributions, sponsorships and close personal relationships. Skanska strives to operate in a manner in which conflicts of interests are actively avoided, and we require our supply chain to do the same.

What does it mean for you?

- You avoid situations that – in your work with Skanska – may present a conflict of interest or appear to do so.
- You notify Skanska if you become aware of an actual or perceived conflict of interest in your work with Skanska.

Hospitality and Gifts

We do not request, accept, offer, authorize or provide hospitality or gifts that may improperly influence – or create the appearance of improperly influencing – our business decisions, or decisions by our customers or others with whom we work. Each Skanska Unit has established a hospitality and gifts policy that outlines acceptable circumstances and monetary limits for hospitality and gifts.

What does it mean for you?

- You do not offer or accept hospitality or gifts that may improperly influence – or create the appearance of improperly influencing – your business decisions or those of Skanska, our customers or others.
- You respect and observe the hospitality and gifts policy of the Skanska Unit with which you are working.
- If a Skanska employee requests any type of hospitality, gift or personal service for free or at less than fair market value, you report it to Skanska.

Sanctions

Sanctions are legal instruments used by governments and multinational bodies to influence foreign policy by prohibiting business dealings with certain countries, individuals, entities or sectors. Sanctions lists are maintained by the United Nations, the EU, and the United States, among others.

What does it mean for you?

- You respect that Skanska needs to know its external parties and you are transparent about the real beneficial owners with whom Skanska conducts business.
- You respect and observe that Skanska is vigilant in watching for external parties who may be on a sanctions list or may have a related company in a country subject to sanctions.
- You report to Skanska if you have questions or concerns regarding sanctions laws and regulations.

How to Report a Concern

You can report a concern to the relevant Skanska manager, or the following information can be used to report suspected or known misconduct to the respective Skanska Ethics Committee (email addresses). Alternatively, you

CERTAIN PRIME CONTRACT CLAUSES

Subcontractor shall have the same duties and obligations to Contractor also referred to as “Design/Builder” with respect to its performance of its own Work as Contractor has to Owner under the Prime Contract.

Without limiting in any way the generality of the clause in the Agreement entitled, “OBLIGATIONS AND THE PRIME CONTRACT” Subcontractor/Seller/Consultant is fully bound by the following clauses in the Prime Contract, including but not limited to:

GC- 2. ORDER OF PRECEDENCE AND CONTRACT INTERPRETATION

Subcontractor expressly agrees that it is fully bound by all applicable clauses of the Prime Contract, including but not limited to the following Contract Documents:

A. Conflicts in the application or interpretation of any parts of the Contract Documents that cannot be resolved shall be interpreted in accordance with the following order of precedence (the first listed being the highest precedence):

1. Applicable Laws and Regulations
2. Permits
3. Executed Change Orders (more recent controlling)
4. Executed Contract Agreement
5. Special Conditions
6. General Conditions
7. Project Requirements
8. Technical Specifications
9. Project Plans/Drawings (detailed plans having greater precedence)
10. Reference Documents

B. Publication Dates: Date of Reference Standard in effect as of date of Request For Proposals except when specific date is specified or when Reference Standard is part of applicable code which includes edition date.

C. Where compliance with two (2) or more Reference Standards are specified and Reference Standards establish different or conflicting requirements for minimum quantities or quality levels, the more restrictive/most stringent interpretation shall govern. Refer uncertainties and requirements that are different but apparently equal to LAWA for decision before proceeding.

D. In case of a conflict within a part of a Contract Document, the provision with the more restrictive/most stringent interpretation shall govern.

Section 9.0 Compliance With Los Angeles City Charter Section 470(c)(12) and 609(E).

9.1 The Design-Builder, other underwriting firm members of the underwriting syndicate, Subcontractors, and their Principals are obligated to fully comply with City of Los Angeles Charter Sections 470(c)(12), 609(e) and related ordinances, regarding limitations on campaign contributions and fundraising to certain elected City officials or candidates for elected City office. Gifts to elected officials and certain City officials are also limited. Additionally, Design-Builder and other underwriting firm members of the underwriting syndicate are required to provide and update certain information to the City as specified by law. Any Design-Builder and other underwriting firm

EXHIBIT E

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

members of the underwriting syndicate subject to Charter Section 470(c)(12) and 609(e), shall include the following notice in any contract with a subcontractor expected to receive at least \$100,000 for performance under this contract:

"Notice Regarding City of Los Angeles Campaign Contribution and Fundraising Restrictions

As provided in Charter Sections 470(c)(12), 609(e) and related ordinances, you are subcontractor or underwriting firm on City of Los Angeles Contract/Resolution #_____. Pursuant to City Charter Section 470(c)(12) and 609(e), underwriting firm, subcontractor and principals are prohibited from making campaign contributions and fundraising for certain elected City officials or candidates for elected City office for 12 months after the City contract is signed. Additionally, gifts are limited to elected officials and certain City officials. Subcontractor is required to provide to contractor names and addresses of the subcontractor's principals and contact information and shall update that information if it changes during the 12 month time period. Subcontractor's information included must be provided to contractor within 10 business days. Failure to comply may result in termination of contract or any other available legal remedies including fines. Information about the restrictions may be found at the City Ethics Commission's website at <http://ethics.lacity.org/> or by calling 213/978-1960."

GC- 9. SUBCONTRACTS

N. Each Subcontractor of every tier to be bound to the Design/Builder by the terms of the Contract Documents, and to assume toward the Design/Builder all applicable obligations and responsibilities which the Design/Builder, by these Documents, assumes toward LAWA. Said Contract shall preserve and protect the rights of LAWA under the Contract Documents with respect to the Work to be performed by the subcontractors that the subcontracting thereof will not prejudice such rights.

Section 12.0 Prevailing Wage

Subcontractor shall, at all times during the performance of the work hereunder, pay the general prevailing rate of per diem wages for each craft or type of worker needed to execute this Contract, at such rate(s) as has been determined by the Director of the Department of Industrial Relations of the State of California, or by the U.S. Department of Labor (Davis-Bacon and Related Acts ("DBRA")) as specifically applied to Los Angeles County. Design-Builder shall pay the higher of these stated prevailing labor rates.

Section 13.0 Iran Contracting Act, 2010.

In accordance with California Public Contract Code Sections 2200-2208, contractors entering into or renewing contracts with City for goods or services estimated at one million dollars (\$1,000,000) or more are required to complete, sign and submit the Iran Contracting Act of 2010 Compliance Affidavit ("Affidavit"). Subcontractor's compliance with the terms of the Iran Contracting Act of 2010 is made a requirement and condition of this Agreement.

GC-14. OWNERSHIP AND USE OF CONTRACT WORK PRODUCTS

A. Ownership. All Work Products originated and prepared by Design/Builder, or its subcontractors of any tier under this Contract shall be and remain the property of LAWA for its use in any manner it deems appropriate; provided, however, that any use unintended under the Contract, or modification or alteration of the Work Products without the direct involvement of the Design/Builder shall be without Liability to Design/Builder. Work Products are all works, tangible or not, created under this Contract for LAWA including, without limitation, documents, material, data, reports, manuals, specifications, artwork, drawings, sketches, computer programs and databases, schematics, photographs, video and audiovisual recordings, sound recordings, marks, logos, graphic designs, notes, websites, domain names, inventions, processes, formulas, matters and combinations thereof, and all forms of intellectual property therein. To the extent applicable under the U.S. Copyright Act, all works created by Design/Builder under this Contract are work-made-for-hire created for the sole benefit and ownership of LAWA. LAWA hereby grants to Design/Builder a license, revocable at will of City, to use and copy such documents during the term of this Contract for the sole purpose of performing the Services. All copies of tangible materials or writings embodying such intellectual properties shall be turned over to City upon termination of this Contract or completion of work pursuant to this Contract. Design/Builder hereby assigns, and agrees to assign to City, all goodwill, copyrights and trademarks in all Work Products originated and prepared by Design/Builder under this Contract. Design/Builder further agrees to execute any documents necessary for LAWA to perfect, memorialize, or record LAWA's ownership of rights provided herein. This paragraph shall survive expiration or termination of this Contract.

B. Obligation on Subcontractor. Any subcontract entered into by Subcontractor relating to this Contract, to the extent allowed hereunder, shall include a like provision (on City's ownership in Work Products) for work to be performed under this Contract to Contractually bind or otherwise oblige its subcontractor performing work under this Contract such that LAWA's ownership rights of all Work Products are preserved and protected as intended herein. Failure of Subcontractor to comply with this requirement or to obtain the compliance of its subcontractor with such obligations shall subject Subcontractor to all remedies allowed under law and termination of this Contract.

GC- 69. LIVING WAGE AND SERVICE CONTRACT WORKER RETENTION REQUIREMENTS

A. Living Wage Ordinance

1. General Provisions: Living Wage Policy. This Contract is subject to the Living Wage Ordinance ("LWO") (Section 10.37, et seq., of the Los Angeles Administrative Code, which is incorporated herein by this reference. The LWO requires that, unless specific exemptions apply, any employees of service contractors who render services that involve an expenditure in excess of twenty-five thousand dollars (\$25,000) and a contract term of at least three (3) months are covered by the LWO if any of the following applies: (1) at least some of the services are rendered by employees whose Project Site is on property owned by the City, (2) the services could feasibly be performed by City of Los Angeles employees if the awarding authority had the requisite financial and staffing resources, or (3) the designated administrative agency of the City of Los Angeles has determined in writing that coverage would further the proprietary interests of the City of Los Angeles. Employees covered by the LWO are required to be paid not less than a minimum initial

EXHIBIT E

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: 90009220.SAMPLE2

wage rate, as adjusted each year. The LWO also requires that employees be provided with at least twelve (12) compensated days off per year for sick leave, vacation, or personal necessity at the employee's request, and at least ten (10) additional days per year of uncompensated time pursuant to Section 10.37.2(b). The LWO requires employers to inform employees making less than twelve dollars (\$12) per hour of their possible right to the federal Earned Income Tax Credit ("EITC") and to make available the forms required to secure advance EITC payments from the employer pursuant to Section 10.37.4. Contractor shall permit access to Project Sites for authorized City representatives to review the operation, payroll, and related documents, and to provide certified copies of the relevant records upon request by the City. Whether or not subject to the LWO, Contractor shall not retaliate against any employee claiming non-compliance with the provisions of the LWO, and, in addition, pursuant to Section 10.37.6(c), Contractor agrees to comply with federal law prohibiting retaliation for union organizing.

2. **Living Wage Coverage Determination.** An initial determination has been made that this is a service contract under the LWO, and that it is not exempt from coverage by the LWO. Determinations as to whether this Contract is a service contract covered by the LWO, or whether an employer or employee are exempt from coverage under the LWO are not final, but are subject to review and revision as additional facts are examined and/or other interpretations of the law are considered. In some circumstances, applications for exemption must be reviewed periodically. City shall notify Contractor in writing about any redetermination by City of coverage or exemption status. To the extent Contractor claims non-coverage or exemption from the provisions of the LWO, the burden shall be on Contractor to prove such non-coverage or exemption.

3. **Compliance. Termination Provisions and Other Remedies: Living Wage Policy.** If Contractor is not initially exempt from the LWO, Contractor shall comply with all of the provisions of the LWO, including payment to employees at the minimum wage rates, effective on the Execution Date of this Contract, and shall execute the Declaration of Compliance Form attached to this Contract, contemporaneously with the execution of this Contract. If Contractor is initially exempt from the LWO, but later no longer qualifies for any exemption, Contractor shall, at such time as Contractor is no longer exempt, comply with the provisions of the LWO and execute the then currently used Declaration of Compliance Form, or such form as the LWO requires. Under the provisions of Section 10.37.6(c) of the Los Angeles Administrative Code, violation of the LWO shall constitute a material breach of this Contract and City shall be entitled to terminate this Contract and otherwise pursue legal remedies that may be available, including those set forth in the LWO, if City determines that Contractor violated the provisions of the LWO. The procedures and time periods provided in the LWO are in lieu of the procedures and time periods provided elsewhere in this Contract. Nothing in this Contract shall be construed to extend the time periods or limit the remedies provided in the LWO.

4. **Subcontractor Compliance.** Contractor agrees to include in every subcontract involving this Contract entered into between Contractor and any subcontractor, a provision pursuant to which such subcontractor (A) agrees to comply with the Living Wage Ordinance and the Service Contractor Worker Retention Ordinance with respect to this Contract; (B)

EXHIBIT E

Project: LAWAATMP ROADWAY IMPROVEMENTS
Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: 90009220.SAMPLE2

agrees not to retaliate against any employee lawfully asserting noncompliance on the part of the subcontractor with the provisions of either the Living Wage Ordinance or the Service Contractor Worker Retention Ordinance; and (C) agrees and acknowledges that City, as the intended third-party beneficiary of this provision may (i) enforce the Living Wage Ordinance and Service Contractor Worker Retention Ordinance directly against the subcontractor with respect to this Contract, and (ii) invoke, directly against the subcontractor with respect to this Contract, all the rights and remedies available to City under Section 10.37.5 of the Living Wage Ordinance and Section 10.36.3 of the Service Contractor Worker Retention Ordinance, as same may be amended from time to time.

B. Service Contract Worker Retention Ordinance. This Contract may be subject to the Service Contract Worker Retention Ordinance ("SCWRO")(Section 10.36, et seq, of the Los Angeles Administrative Code), which is incorporated herein by this reference. If applicable, Contractor must also comply with the SCWRO which requires that, unless specific exemptions apply, all employers under contracts that are primarily for the furnishing of services to or for the City of Los Angeles and that involve an expenditure or receipt in excess of \$25,000 and a contract term of at least three (3) months, shall provide retention by a successor contractor for a ninety day (90-day) transition period of the employees who have been employed for the preceding twelve (12) months or more by the terminated contractor or subcontractor, if any, as provided for in the SCWRO. Under the provisions of Section 10.36.3(c) of the Los Angeles Administrative Code, City has the authority, under appropriate circumstances, to terminate this Contract and otherwise pursue legal remedies that may be available if City determines that the subject contractor violated the provisions of the SCWRO.

GC-70. NON-DISCRIMINATION AND EQUAL EMPLOYMENT PRACTICES / AFFIRMATIVE ACTION PROGRAM.

A. During the term of this Contract, SUBCONTRACTOR agrees and obligates itself in the performance of this Contract not to discriminate against any employee or applicant for employment because of the employee's or applicant's race, religion, national origin, ancestry, sex, sexual orientation, age, physical handicap, marital status, domestic partner status, or medical condition. SUBCONTRACTOR shall take affirmative action to ensure that applicants for employment are treated, during the term of this Contract, without regard to the aforementioned factors and SUBCONTRACTOR shall comply with the affirmative action requirements of Los Angeles Administrative Code Sections 10.8, et seq., or any successor ordinances or laws pertaining to discrimination.

B. During the performance of this Contract, SUBCONTRACTOR agrees to comply with Section 10.8.3 of the Los Angeles Administrative Code ("Equal Employment Practices"), including any future amendments thereto, which is incorporated herein by this reference. By way of specification, but not limitation, pursuant to Sections 10.8.3.E and 10.8.3.F of said Administrative Code, the failure of SUBCONTRACTOR to comply with the Equal Employment Practices provisions of this Contract may be deemed to be a material breach of this Contract. No such finding shall be made, nor penalties assessed, except upon a full and fair hearing after notice and an opportunity to be heard has been provided to SUBCONTRACTOR. Upon a finding duly made that

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: 90009220.SAMPLE2

SUBCONTRACTOR has failed to comply with said Equal Employment Practices provisions of this Contract, this Contract may be forthwith terminated, cancelled or suspended.

C. During the performance of this Contract, SUBCONTRACTOR agrees to comply with Section 10.8.4 of the Los Angeles Administrative Code ("Affirmative Action Program"), including any future amendments thereto, which is incorporated herein by this reference. By way of specification, but not limitation, pursuant to Sections 10.8.4.E and 10.8.4.F of said Administrative Code, the failure of SUBCONTRACTOR to comply with the Affirmative Action Program provisions of this Contract may be deemed to be a material breach of this Contract. No such finding shall be made, nor penalties assessed, except upon a full and fair hearing after notice and an opportunity to be heard has been provided to SUBCONTRACTOR. Upon a finding duly made that SUBCONTRACTOR has failed to comply with the Affirmative Action Program provisions of this Contract, this Contract may be forthwith terminated, cancelled or suspended.

D. All subcontracts awarded under this Contract shall contain similar provisions and SUBCONTRACTOR shall require each of its subcontractors to complete a like certification and to submit to it an Affirmative Action Plan acceptable to City.

E. SUBCONTRACTOR also agrees to comply with the provisions of Article 3 of Chapter 1, Part 7, Division 2 of the Labor Code of the State of California, and with all other applicable statutes, ordinances, and regulations relative to employment, wages, and hours of labor.

GC-74. CONTRACTOR RESPONSIBILITY PROGRAM

A. Pursuant to Resolution No. 21601 adopted by the Board of Airport Commissioners, effective May 20, 2002, it is the policy of LAWA to ensure that all LAWA contractors have the necessary quality, fitness and capacity to perform the Work set forth in the contract. LAWA shall award contracts only to entities and individuals it has determined to be Responsible Contractors.

The provisions of this Program apply to leases and contracts for construction, for services, and for purchases of goods and products that require Board approval.

B. Bidders/Proposers are required to complete and submit with the bid/proposal the attached "Contractor Responsibility Program Questionnaire" that provides information LAWA needs in order to determine if the bidder/proposer is responsible and has the capability to perform the contract. The information contained in the CRP Questionnaire is subject to public review for a period of not less than fourteen (14) days. Bidders/Proposers are also required to complete, sign and submit with the bid/proposal the attached "Contractor Responsibility Program Pledge of Compliance." Bidders/Proposers are also required to respond within the specified time to LAWA's request for information and documentation needed to support a Contractor Responsibility determination. Subcontractors will be required to submit the Pledge to the prime contractor prior to commencing work. The CRP Rules and Regulations are available at <http://www.lawa.org>.

GC-75. EQUAL BENEFITS ORDINANCE (EBO)

A. Unless otherwise exempt in accordance with the provisions of the Equal Benefits ("EBO") Ordinance, this Contract is subject to the applicable provisions of EBO Section 10.8.2.1 of the Los Angeles Administrative Code, as amended from time to time.

EXHIBIT E

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: 90009220.SAMPLE2

B. During the term of this Contract, SUBCONTRACTOR certifies and represents that the SUBCONTRACTOR will comply with the EBO. Furthermore, SUBCONTRACTOR agrees to post the following statement in conspicuous places at its place of business available to employees and applicants for employment:

During the term of a Contract with the City of Los Angeles, the SUBCONTRACTOR will provide equal benefits to employees with spouses and its employees with domestic partners. Additional information about the City of Los Angeles' Equal Benefits Ordinance may be obtained from the Department of Public Works, Bureau of Contract Administration, Office of Contract Compliance at (213) 847-6480.'

GC-76. FIRST SOURCE HIRING PROGRAM FOR AIRPORT EMPLOYERS (LAX ONLY)

SUBCONTRACTOR shall comply with the provisions of the First Source Hiring Program adopted by the Board.

GC-78. ANTITRUST CLAIMS

By entering into this Contract, the Subcontractor offers and agrees to assign to the awarding body all rights, title, and interest in and to all causes of action it may have under Section 4 of the Clayton Act (15 U.S.C. Sec 15) or Cartwright Act (Chapter 2 [commencing with Section 16700] of Part 2 of Division 7 of the Business and professions Code) arising from purchases of goods, services, or material pursuant to the public works contract. The Subcontractor shall include in each subcontract a provision corresponding to the forgoing, binding the subcontractor to offer and agree to assign to the City such rights, title and interest held by such subcontractor.

RECITALS

WHEREAS, Project Owner has awarded a contract (hereinafter called the "Prime Contract") to Obligee for LAWA ATMP ROADWAY IMPROVEMENTS; and

WHEREAS, Principal has entered into a written Subcontract with Obligee, dated February 16, 2023, to perform, as Subcontractor, certain portions of the work in connection with the Prime Contract, consisting of _____ [description of Subcontract work], which Subcontract is incorporated into this Performance Bond by reference and made a part of this Performance Bond.

PAYMENT GUARANTY

A. Principal and Surety, jointly and severally, bind themselves and their heirs, executors, administrators, successors and assigns to Obligee to guaranty Principal's payment to all persons supplying labor, material, and equipment in the prosecution of the work provided for in the Subcontract, and any modifications or changes to the Subcontract and to indemnify and hold harmless Obligee from all claims, demands, liens, suits, including attorney's fees and costs, by any person or entity seeking payment for labor, materials, or equipment furnished for use in the performance of the Subcontract.

B. Surety agrees that no change, extension of time, alteration, addition, or other modification of the terms of either the Subcontract or the Prime Contract, or both, or in the work to be performed pursuant to the Subcontract or Prime Contract, or in the plans or specifications, shall affect its obligation on this Payment Bond and hereby waives notice of any such changes, extensions of time, alterations, additions, omissions, and other modifications.

C. This Payment Bond shall inure to the benefit of all persons supplying labor, material, and equipment in the prosecution of the work provided for in the Subcontract and that such persons may maintain independent actions upon this Payment Bond in their own names.

PROJECT: LAWA ATMP ROADWAY
IMPROVEMENTS

RECITALS

WHEREAS, Project Owner has awarded a contract (hereinafter called the "Prime Contract") to Obligee for LAWA ATMP ROADWAY IMPROVEMENTS [description of Project]; and

WHEREAS, Principal has entered into a written Subcontract with Obligee, dated February 16, 2023, to perform, as subcontractor, certain portions of the work in connection with the Prime Contract, consisting of _____ [description of Subcontract work], which Subcontract is incorporated into this Performance Bond by reference and made a part of this Performance Bond.

PERFORMANCE GUARANTY

A. Principal and Surety, jointly and severally, bind themselves and their heirs, executors, administrators, successors and assigns to Obligee to guaranty the performance of the Subcontract, all undertakings, covenants, terms, conditions, time limits, and agreements of the Subcontract, any modifications or changes to the Subcontract, any warranties required under the Subcontract as well as to indemnify and save harmless Obligee of and from any and all loss, damage, and expense, including costs and attorney's fees, which Obligee may sustain or incur by reason of the failure to perform the Subcontract.

B. Surety's liability under this Performance Bond shall not be greater than the Bond Amount. The amount of this Performance Bond shall be reduced by and to the extent of any payments made under this Performance Bond.

C. Surety agrees that no change, extension of time, alteration, addition, or other modification of the terms of either the Subcontract or the Prime Contract, or both, or in the work to be performed pursuant to the Subcontract or Prime Contract, or in the plans or specifications, shall affect its obligation on this Performance Bond and hereby waives notice of any such changes, extensions of time, alterations, additions, omissions, and other modifications.

Agreement Number: 90009220.SAMPLE2

D. If Obligor declares Principal to be in default of the Subcontract, upon demand by Obligor, Surety shall promptly and at its own expense, elect to:

1. Upon Obligor's approval, arrange for Principal to complete the Subcontract with financial, technical, or management assistance from Surety and/or its consultants;
2. Upon Obligor's approval, enter into a takeover agreement with Obligor and a completion subcontract with either Principal or a third party completion subcontractor in order to complete the Subcontract. If Surety enters into a completion subcontract with a third party completion subcontractor, Surety shall require the third party completion subcontractor to provide payment and performance bonds in the full amount of the completion contract naming Surety and Obligor as bond obligees;
3. Upon Obligor's approval, arrange completion of the Subcontract by tendering to Obligor (a) a completion subcontract, (b) a third party completion subcontractor, (c) payment for the difference between the remaining contract balance in the Subcontract and the third party completion subcontract price, and (d) payment and performance bonds in the full amount of the completion subcontract naming Obligor as bond obligee;
4. Upon Obligor's approval, arrange completion of the Subcontract by an alternate arrangement that assures completion of the Subcontract according to its terms and condition;
5. Pay Obligor's costs to complete the Subcontract without Surety involvement.
6. Cure Principal's default:
 - a. By arranging correction or replacement of any defective work;
 - b. By paying any subcontractors, suppliers, or laborers who have made claims against the Project;
 - c. By defending and indemnifying Obligor from any claims made by subcontractors, suppliers, laborers, or other third parties, arising out of Principal's performance of the Subcontract; and/or
 - d. By otherwise remedying any other default by Principal with Obligor's approval.

E. Upon Surety's agreement to arrange completion and/or to cure Principal's default, Obligor will agree to pay the balance of the Subcontract price to Surety or a completion subcontractor, as applicable, in accordance with the terms and conditions of the Subcontract.

F. Obligor agrees that, if there is a dispute as to whether Principal is in material default on the Subcontract and if Surety proceeds as described in Paragraph D, above, both Principal and Surety may reserve their rights to challenge Obligor's declaration of default.

G. No right of action shall accrue on this Performance Bond to any person or entity other than Obligor or successors and assigns.

H. Should it be necessary for Obligee to engage in any dispute resolution procedure, be in litigation, arbitration, or otherwise, to recover against Principal and/or Surety on this Performance Bond, Obligee shall be entitled to recover its actual attorney's fees, consultant and expert fees, and other costs from Surety.

IN WITNESS WHEREOF, Surety and Principal hereby agree to the terms and conditions set forth in this Performance Bond.

DBE PARTICIPATION REQUIREMENTS

Note: If this Exhibit is annexed to a Purchase Agreement, Service Provider Agreement or Professional Services Agreement, the term "Subcontract" herein shall mean and refer to such Purchase Agreement, Service Provider Agreement or Professional Services Agreement, as applicable.

For a Purchase Agreement, the term "Contractor" herein means "Buyer", the term "Subcontractor" herein means "Seller", the term "Sub-subcontractors" herein means "Sub-suppliers" and the term "Work" herein means "Materials," each as described in the Purchase Agreement.

For a Service Provider Agreement, the term "Subcontractor" herein means "Service Provider", the term "Sub-subcontractors" herein means "Sub-Service Providers" and the term "Work" herein means "Services", each as described in the Service Provider Agreement.

For a Professional Services Agreement, the term "Subcontractor" herein means "Service Provider" and the term "Sub-subcontractors" herein means "Sub-Service Providers," each as described in the Professional Services Agreement.

1. Owner's Program. As set forth in the Prime Contract and any related program rules incorporated therein by reference or by Applicable Law ("Owner's Program"), Contractor is required to make good faith efforts to meet or exceed Owner established Project contracting goals with persons or firms that have been duly certified as disadvantaged business enterprises ("DBEs"), local business-based enterprises ("LBEs"), minority business enterprises ("MBEs"), small business enterprises ("SBEs"), women owned business enterprises ("WBEs"), or other eligible certified business enterprises ("Other Enterprises"), as applicable to the Owner's Program (referred to collectively as "Disadvantaged Enterprises"). The terms "Disadvantaged Enterprises" is intended to include any entity which is certified to participate in any program(s) specified in the Owner Contract (or Developer Prime Contract, as applicable) in furtherance of or pursuant to Title VI of the Civil Rights Act of 1964, as amended, or any state or municipal act of similar purpose, or any rules or regulations promulgated under any thereof.

2. Participation Goals. Subcontractor acknowledges that the Owner (and/or Developer, as applicable) has established goals for this Project. In support of Contractor's efforts to reach those goals, Subcontractor shall meet or exceed the Disadvantaged Enterprise goal as a percentage of the value of its Subcontract amount for this Project.

If the Subcontract amount is increased as a result of change orders, Subcontractor shall achieve a commensurate increase in Subcontractor's Disadvantaged Enterprise Participation for the Project as fully set forth in Exhibit A attached hereto and made a part hereof.

Subcontractor shall ensure that qualified and certified Disadvantaged Enterprises are provided opportunities to compete for work under this Subcontract. Subcontractor shall carry out all requirements of Applicable Law in the award, administration and participation of certified Disadvantaged Enterprises to achieve the Subcontractor's Participation Goal. Contractor shall have the right to disqualify a Subcontractor proposed Disadvantaged Enterprise from Subcontractor's Participation Goal if, in Contractor's judgment, the Disadvantaged Enterprise would not qualify for Participation Credit under the Owner's Program, Prime Contract and/or Applicable Law. In such event, Subcontractor shall be required to make alternative arrangements to meet Subcontractor's Participation Goal.

3. Damages. The Owner Contract (or Developer Prime Contract, as applicable) provides or may provide for damages

with respect to a failure to achieve the Owner's Goal in accordance with the Owner's Program. To the extent that such damages are assessed against the Contractor, Subcontractor shall, on the same basis, be liable to Contractor for any such damages that are attributable to Subcontractor or anyone for whom Subcontractor is responsible, and such liability shall be without prejudice to any other remedies available to Contractor under the terms of the Subcontract, at law or in equity. In addition, the Subcontractor acknowledges and agrees that the Contractor is entering into this Subcontract in reliance upon Subcontractor's representations that it will meet or exceed the Subcontractor's Participation Goal. If the Subcontractor fails to meet or exceed the Subcontractor's Participation Goal, or the Contractor has reason to believe, in its sole discretion that the Subcontractor will not meet the Subcontractor's Participation Goal, at any time during the Project, the Contractor has the right to seek relief against the Subcontractor as a result of such failure, and to withhold monies until the Subcontractor provides the Contractor with a recovery plan, that is subject to Contractor's prior approval, evidencing that Subcontractor is or will be meeting the Subcontractor's Participation Goal. At a minimum, the Contractor has the right to withhold and/or affirmatively seek, at its discretion, the shortfall percentage of the Subcontractor's Participation Goal in relation to the Subcontract amount. By way of example, if the Subcontract amount is \$100,000, and the Subcontractor Participation Goal is 30%, but the Subcontractor only has Disadvantaged Enterprise utilization of 10%, Contractor, without prejudicing other rights it may have against Subcontractor, shall have the right to seek \$20,000 in damages against the Subcontractor, and/or deduct/withhold \$20,000 of the payment amounts to Subcontractor. In no event shall this remedy be exclusive.

4. Subcontractor's Participation Plan. Subcontractor agrees that, as a condition precedent to Contractor's obligation to pay Subcontractor under the terms herein, Subcontractor shall be required to submit to Contractor a Disadvantaged Business Enterprise Participation Plan ("Subcontractor's Participation Plan"), which such Plan, and any amendments thereto, shall be subject to the written approval of Contractor. Attached hereto as Exhibit H-1 is Subcontractor's Participation Plan for meeting Subcontractor's Participation Goal, which identifies, to the extent known, the certified Disadvantaged Enterprises that Subcontractor plans to engage to satisfy Subcontractor's Participation Goal, and which includes a copy of each identified Disadvantaged

EXHIBIT H

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Enterprise's certification. Subcontractor warrants that each Disadvantaged Enterprise listed in Subcontractor's Plan is certified by the Owner or appropriate agency as of the execution date of this Subcontract for the Subcontractor's scope of work set forth in the Subcontract and Subcontractor shall be obliged to monitor the status thereof on not less than a monthly basis and to immediately advise Contractor in writing of any change in such certification status, scope of work or value of the subcontract of the Disadvantaged Enterprise. If Subcontractor is itself a Disadvantaged Enterprise, or if it reasonably knows or should know that Contractor is awarding the Work to it based in whole or in part upon its belief that Subcontractor is a Disadvantaged Enterprise, Subcontractor agrees that it shall fully self-perform the Subcontract Work except as otherwise provided herein, and it shall further provide to Contractor upon or before signature of this Subcontract a copy of its Disadvantaged Enterprise certification, and shall be further required to monitor the status thereof on not less than a monthly basis and to immediately advise Contractor in writing of any change in its certification status. Throughout the course of the Project and whenever requested by Contractor in writing, Subcontractor shall update the Subcontractor's Participation Plan, demonstrating the level of Disadvantaged Enterprise participation necessary to achieve Subcontractor's Participation Goal. Subcontractor represents with respect to each Disadvantaged Enterprise listed in its Subcontractor's Participation Plan that:

(a) based on information known to Subcontractor after reasonable inquiry, Subcontractor believes the person or business entity listed to be a bona fide Disadvantaged Enterprise within the meaning of the Owner's Program and it is independently, technically and financially qualified as well as properly certified to perform the scope of work or services specified in Subcontractor's Participation Plan; and,

(b) Subcontractor will enter into a written agreement with the Disadvantaged Enterprise or with an approved substitute (see Article 5 of this Exhibit for procedures to make changes to Subcontractor's Plan), subject to the terms and conditions of the Subcontract for the work described in Subcontractor's Participation Plan.

5. Procedure for Changes to Subcontractor's Plan and/or Utilization Reports. Subcontractor agrees that it will make no changes to Subcontractor's Participation Plan nor terminate an agreement with a Disadvantaged Enterprise identified in Subcontractor's Participation Plan or Utilization Reports without delivering written notice to Contractor at least five (5) business days in advance. Should a Disadvantaged Enterprise fail to complete its work for any reason, Subcontractor shall secure a replacement Disadvantaged Enterprise to attain the same type and amount of Participation Credit. In addition to the above, Subcontractor agrees that where required by the Owner's Contract, Owner's Program, Developer, Prime Contract (as applicable), or Applicable Law, Subcontractor shall not terminate, substitute or add a Disadvantaged Enterprise without the Contractor's (and/or Owner's or Developer's, as applicable) prior written approval.

6. Utilization Reports and Affidavits. Subcontractor shall submit to Contractor with each monthly estimate for payment a written utilization report (the "Utilization Report") in the form annexed hereto as Exhibit H-2 (or such Owner required reports such as B2G Now shall be deemed Exhibit H-2), listing all lower-

tier Disadvantaged Enterprises for which Subcontractor is seeking payment and identifying its progress towards meeting Subcontractor's Participation Goal.

In addition, Subcontractor shall furnish to Contractor a Disadvantaged Enterprise Affidavit ("Affidavit") in the form annexed hereto as Exhibit H-3 signed by each Disadvantaged Enterprise and verifying payment for which Subcontractor is claiming Participation Credit in any Utilization Report. The Affidavit shall be submitted by Subcontractor with the first estimate for payment/payment application that includes amounts payable to the Disadvantaged Enterprise(s). Subcontractor acknowledges that Contractor may withhold amounts allocable to the Disadvantaged Enterprise in said estimate for payment and any subsequent estimates for payment until such time as Subcontractor submits the Utilization Report and Affidavit on behalf of the Disadvantaged Business Enterprise(s).

Subcontractor acknowledges that Contractor shall have the right to further verify Subcontractor's payments to lower-tier Disadvantaged Enterprises identified in Subcontractor's Utilization Reports in order to track progress toward achievement of Subcontractor's Participation Goal.

Subcontractor understands that Contractor is relying upon the information contained in Subcontractor's Participation Plan, Utilization Reports and Affidavits. By submitting each Participation Plan, Utilization Report, and Affidavit, Subcontractor and each Disadvantaged Enterprise, as applicable, certifies that the information contained therein is current, full, truthful, accurate and complete to the best of the Subcontractor's knowledge, information and belief, and further represents and warrants to Contractor that it (they) is (are) in compliance with Applicable Law and Owner's Program. Subcontractor shall promptly notify Contractor should there be any material change to the Participation Plan, Utilization Reports or Affidavits submitted. The making of false statements and/or submission of incorrect information to Contractor in any of said documents constitutes a material breach of this Subcontract, which, at the option of Contractor, shall subject Subcontractor to the default and termination provisions of this Subcontract and any other remedies available to Contractor under the terms of this Subcontract, at law, or in equity.

7. Participation Shortfall and Good Faith Efforts. Subcontractor acknowledges that it must meet or exceed Subcontractor's Participation Goal. If Subcontractor is unable, after diligent inquiry, to identify a Disadvantaged Enterprise to perform a specific scope of work in furtherance of meeting Subcontractor's Participation Goal, Subcontractor shall notify Contractor in writing immediately so that Contractor may, if appropriate and as determined by Contractor in its discretion, request a waiver from the Owner (and/or Developer, as applicable) for the portion of Subcontractor's Participation Goal allocable to that scope. In such event, Subcontractor shall promptly furnish Contractor with documentation demonstrating its good faith efforts with respect to the scope of work that is the subject of the requested waiver.

8. Subcontractor's Compliance. Subcontractor shall comply with all Applicable Laws, including but not limited to those relating to the Owner's Program, and whether or not provided for by the Plans, Specifications, General Conditions, or other Contract

EXHIBIT H

Documents. Subcontractor shall remedy any violations or instances of non-compliance at its own expense, and shall, upon written demand by Contractor, furnish such evidence as Contractor (and/ or Owner or Developer, as applicable) may require demonstrating that such violation or non-compliance has been remedied. Subcontractor agrees that Contractor has the right, at no additional cost to Contractor, to direct Subcontractor to take necessary corrective and remedial actions.

9. Audit Rights. Subcontractor shall freely permit Contractor from time to time to audit Subcontractor's books and records during the duration of the Work and for a period of three years following acceptance by Owner (and/or Developer, as applicable) of the Work and/or the official termination of any governmental audit, investigation or inquiry, for the purpose of verifying Subcontractor's bona fide participation and performance of a commercially useful function in connection with the Project Work or Work under this Subcontract. Subcontractor shall require any Disadvantaged Enterprise to whom it sublets a portion of the Work to provide in its Sub-subcontract, the same rights to Contractor and Subcontractor.

10. Severability. The invalidity of any term or provision of this Exhibit H, with attachments Exhibits H-1, H-2 or H-3, whether declared invalid by a court or otherwise, shall not affect the validity of any other term or provision of this Subcontract, including the other exhibits or appendices thereto.

DISADVANTAGED ENTERPRISE AFFIDAVIT

Consistent with the Contractor's Disadvantaged Enterprises Participation Requirements for the above-referenced Project, this Disadvantaged Enterprise Affidavit (hereinafter "Affidavit") is required to be completed by every Disadvantaged Enterprise (as defined in EXHIBIT H of the Subcontract / Purchase Agreement / Service Provider Agreement / Professional Services Agreement) for which participation credit is being claimed under the Owner's Program for this Project. This Affidavit must be signed by an authorized officer of the Disadvantaged Enterprise, notarized, and then included ONLY with the first estimate for payment or invoice submitted to the Contractor by the Subcontractor/Seller/Service Provider that includes amounts allocable to the Disadvantaged Enterprise. Contractor may withhold amounts allocable to the Disadvantaged Enterprise under the first estimate for payment or invoice (or any subsequent estimate for payment or invoice) until this Affidavit is received by Contractor.

Enterprise Name: _____ (hereinafter the "Enterprise")

Enterprise Phone: _____

Enterprise Address: _____

Email Address for Contact Person: _____

I, _____ (name), being duly sworn, am employed by the
aforementioned Enterprise as _____ (title) for the Enterprise and depose and say:

As of the date of this Affidavit, the Enterprise holds the following valid and current certifications for which utilization credit is being claimed under the Owner's Program for this Project (circle all that apply):

DBE LBE MBE SBE WBE Other: _____

For each certification identified above, identify the name of the certifying agency:

For each certification identified above, attached hereto are true and accurate copies of documents issued by the certifying agency confirming said certification. (attached documents)

Have you ever been de-certified or otherwise lost your certification (e.g. graduated from Owner's Program)? (circle one)

a. Yes b. No

If the answer to this question is "Yes", please attach a written explanation of the change in status and identify the date on which the Enterprise ceased to be certified.

EXHIBIT H-3

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**
Project Number: 90009220
Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

Does the Enterprise intend to subcontract or in any other way use another entity ("Other Entity") to perform any portion of the Enterprise's work on this Project? (circle one)

a. Yes b. No

If the answer to this question is "Yes", please attach the following information:

- o Name of the Other Entity;
- o Comprehensive description of the work the Other Entity will perform;
- o Exact dollar value of the Other Entity's work;
- o Explanation of the reason the Enterprise will not perform the work;
- o State whether the Enterprise notified Subcontractor and Contractor of its intention to engage Other Entity for this work and if so provide a copy of such notification;
- o State whether and explain to what extent there is any relationship between the Enterprise and the Other Entity; such as an ownership interest, shared facilities, employees or equipment; and,
- o Provide a copy of the agreement between the Enterprise and the Other Entity for this work.

Is the Enterprise compliant with all Applicable Laws, including those but not limited to those relating to the Owner's Program, as of the date of the execution of this Affidavit? (circle one)

a. Yes b. No

Enterprise agrees that, if any of the Enterprise's circumstances materially change causing modifications to any answers provided in this form, then the Enterprise has an affirmative duty and must immediately notify the Subcontractor with whom the Enterprise is contracted and the Contractor, in writing, at the time such information changes. Such updated information shall be certified by the Enterprise as current, full, accurate and complete when submitted.

I, an Officer of the Enterprise, hereby certify that I have supplied current, full, truthful, accurate and complete responses to each item in this form on behalf of the Enterprise to the best of my knowledge, information and belief. The Enterprise and I understand that both the Subcontractor with whom the Enterprise is contracted and the Contractor will rely upon the information supplied in this Affidavit in claiming Disadvantaged Enterprise participation credit under the Owner's Program for the Project.

END OF TABLE OF CONTENTS

FEDERAL REQUIREMENT: FR-1

ACCESS TO RECORDS AND REPORTS

2 CFR § 200.333, 2 CFR § 200.336, FAA Order 5100.38

The Contractor must maintain an acceptable cost accounting system. The Contractor agrees to provide the Sponsor, the Federal Aviation Administration and the Comptroller General of the United States or any of their duly authorized representatives access to any books, documents, papers and records of the Contractor which are directly pertinent to the specific contract for the purpose of making audit, examination, excerpts and transcriptions. The Contractor agrees to maintain all books, records and reports required under this contract for a period of not less than three years after final payment is made and all pending matters are closed.

This provision must be included in all contracts and subcontracts.

FEDERAL REQUIREMENT: FR-2

AFFIRMATIVE ACTION REQUIREMENT

41 CFR part 60-4, Executive Order 11246

1. The Contractor's attention is called to the "Equal Opportunity Clause" and the "Standard Federal Equal Employment Opportunity Construction Contract Specifications" set forth herein.
2. The goals and timetables for minority and female participation, expressed in percentage terms for the Contractor's aggregate workforce in each trade on all construction work in the covered area, are as follows:

Timetables:

Goals for minority participation for each trade: 28.3%

Goals for female participation in each trade 6.9%

These goals are applicable to all of the Contractor's construction work (whether or not it is Federal or federally assisted) performed in the covered area. If the Contractor performs construction work in a geographical area located outside of the covered area, it shall apply the goals established for such geographical area where the work is actually performed. With regard to this second area, the Contractor also is subject to the goals for both its federally involved and non-federally involved construction.

The Contractor's compliance with the Executive Order and the regulations in 41 CFR Part 60-4 shall be based on its implementation of the Equal Opportunity Clause, specific affirmative action obligations required by the specifications set forth in 41 CFR 60-4.3(a) and its efforts to meet the goals. The hours of minority and female employment and training must be substantially uniform throughout the length of the contract, and in each trade, and the Contractor shall make a good faith effort to employ minorities and women evenly on each of its projects. The transfer of minority or female employees or trainees from Contractor to Contractor or from project to project for the sole purpose of meeting the Contractor's goals shall be a violation of the contract, the Executive Order and the regulations in 41 CFR Part 60-4. Compliance with the goals will be measured against the total work hours performed.

3. The Contractor shall provide written notification to the Director of the Office of Federal Contract Compliance Programs (OFCCP) within 10 working days of award of any construction subcontract in excess of \$10,000 at any tier for construction work under the contract resulting from this solicitation. The notification shall list the name, address, and telephone number of the subcontractor; employer identification number of the subcontractor; estimated dollar amount of the subcontract; estimated starting and completion dates of the subcontract; and the geographical area in which the subcontract is to be performed.
4. As used in this notice and in the contract resulting from this solicitation, the "covered area" is Los Angeles World Airports, City of Los Angeles, County of Los Angeles, California.

FEDERAL REQUIREMENT: FR-3

BREACH OF CONTRACT

2 CFR § 200 Appendix II(A)

Any violation or breach of terms of this contract on the part of the Contractor or its subcontractors may result in the suspension or termination of this contract or such other action that may be necessary to enforce the rights of the parties of this agreement.

Owner will provide Contractor written notice that describes the nature of the breach and corrective actions the Contractor must undertake in order to avoid termination of the contract. Owner reserves the right to withhold payments to Contractor until such time the Contractor corrects the breach or the Owner elects to terminate the contract. The Owner's notice will identify a specific date by which the Contractor must correct the breach. Owner may proceed with termination of the contract if the Contractor fails to correct the breach by the deadline indicated in the Owner's notice.

The duties and obligations imposed by the Contract Documents and the rights and remedies available thereunder are in addition to, and not a limitation of, any duties, obligations, rights and remedies otherwise imposed or available by law.

FEDERAL REQUIREMENT: FR-4

BUY AMERICAN PREFERENCES

Title 49 USC § 50101

4.3.1. Buy American Preference

The Contractor agrees to comply with 49 USC § 50101, which provides that Federal funds may not be obligated unless all steel and manufactured goods used in AIP funded projects are produced in the United States, unless the Federal Aviation Administration has issued a waiver for the product; the product is listed as an Excepted Article, Material Or Supply in Federal Acquisition Regulation subpart 25.108; or is included in the FAA Nationwide Buy American Waivers Issued list.

A bidder or offeror must complete and submit the Buy America certification included herein with their bid or offer. The Owner will reject as nonresponsive any bid or offer that does not include a completed Certificate of Buy American Compliance.

The Buy America requirements flow down from the owner to first tier contractors, who are responsible for ensuring that lower tier contractors and subcontractors are also in compliance. The Buy American Preference does not apply to equipment a contractor uses as a tool of its trade and which does not remain as part of the project.

4.3.2. Certificate of Buy American Compliance - Total Facility

As a matter of bid responsiveness, the bidder or offeror must complete, sign, date, and submit this certification statement with its proposal. The bidder or offeror must indicate how it intends to comply with 49 USC § 50101 by selecting one of the following certification statements. These statements are mutually exclusive. Bidder must select one or the other (i.e. not both) by inserting a checkmark (☐) or the letter "X".

- ☐ Bidder or offeror hereby certifies that it will comply with 49 USC § 50101 by:
- a) Only installing steel and manufactured products produced in the United States; or
 - b) Installing manufactured products for which the Federal Aviation Administration (FAA) has issued a waiver as indicated by inclusion on the current FAA Nationwide Buy American Waivers Issued listing; or
 - c) Installing products listed as an Excepted Article, Material or Supply in Federal Acquisition Regulation Subpart 25.108.

By selecting this certification statement, the bidder or offeror agrees:

- To provide to the Owner evidence that documents the source and origin of the steel and manufactured product.
 - To faithfully comply with providing U.S. domestic products.
 - To refrain from seeking a waiver request after establishment of the contract, unless extenuating circumstances emerge that the FAA determines justified.
- ☐ The bidder or offeror hereby certifies it cannot comply with the 100 percent Buy American Preferences of 49 USC § 50101(a) but may qualify for either a Type 3 or Type 4 waiver under 49 USC § 50101(b). By selecting this certification statement, the apparent bidder or offeror with the apparent low bid agrees:
- a) To submit to the Owner within 15 calendar days of the bid opening, a formal waiver request and required documentation that supports the type of waiver being

requested.

- b) That failure to submit the required documentation within the specified timeframe is cause for a non-responsive determination that may result in rejection of the proposal.
- c) To faithfully comply with providing U.S. domestic products at or above the approved U.S. domestic content percentage as approved by the FAA.
- d) To furnish U.S. domestic product for any waiver request that the FAA rejects.
- e) To refrain from seeking a waiver request after establishment of the contract, unless extenuating circumstances emerge that the FAA determines justified.

Required Documentation

Type 3 Waiver - The cost of components and subcomponents produced in the United States is more than 60 percent of the cost of all components and subcomponents of the "facility". The required documentation for a Type 3 waiver is:

- a) Listing of all manufactured products that are not comprised of 100 percent U.S. domestic content (excludes products listed on the FAA Nationwide Buy American Waivers Issued listing and products excluded by Federal Acquisition Regulation Subpart 25.108; products of unknown origin must be considered as non-domestic products in their entirety).
- b) Cost of non-domestic components and subcomponents, excluding labor costs associated with final assembly and installation at project location.
- c) Percentage of non-domestic component and subcomponent cost as compared to total "facility" component and subcomponent costs, excluding labor costs associated with final assembly and installation at project location.

Type 4 Waiver – Total cost of project using U.S. domestic source product exceeds the total project cost using non-domestic product by 25 percent. The required documentation for a Type 4 of waiver is:

- a) Detailed cost information for total project using U.S. domestic product.
- b) Detailed cost information for total project using non-domestic product.

False Statements: Per 49 USC § 47126, this certification concerns a matter within the jurisdiction of the Federal Aviation Administration and the making of a false, fictitious or fraudulent certification may render the maker subject to prosecution under Title 18, United States Code.

Title

FEDERAL REQUIREMENT: FR-5

CIVIL RIGHTS - GENERAL

49 USC § 47123

The Contractor agrees to comply with pertinent statutes, Executive Orders and such rules as are promulgated to ensure that no person shall, on the grounds of race, creed, color, national origin, sex, age, or disability be excluded from participating in any activity conducted with or benefiting from Federal assistance.

This provision binds the Contractor and subcontractors from the bid solicitation period through the completion of the contract. This provision is in addition to that required by Title VI of the Civil Rights Act of 1964.

FEDERAL REQUIREMENT: FR-6

CIVIL RIGHTS - TITLE VI ASSURANCES

49 USC § 47123, FAA Order 1400.11

The City of Los Angeles, Los Angeles World Airports, in accordance with the provisions of Title VI of the Civil Rights Act of 1964 (78 Stat. 252, 42 USC §§ 2000d to 2000d-4) and the Regulations, hereby notifies all bidders or offerors that it will affirmatively ensure that any contract entered into pursuant to this advertisement, disadvantaged business enterprises will be afforded full and fair opportunity to submit bids in response to this invitation and will not be discriminated against on the grounds of race, color, or national origin in consideration for an award.

During the performance of this contract, the Contractor, for itself, its assignees, and successors in interest (hereinafter referred to as the "Contractor"), agrees as follows:

1. **Compliance with Regulations:** The Contractor (hereinafter includes consultants) will comply with the Title VI List of Pertinent Nondiscrimination Acts and Authorities, as they may be amended from time to time, which are herein incorporated by reference and made a part of this contract.
2. **Nondiscrimination:** The Contractor, with regard to the work performed by it during the contract, will not discriminate on the grounds of race, color, or national origin in the selection and retention of subcontractors, including procurements of materials and leases of equipment. The Contractor will not participate directly or indirectly in the discrimination prohibited by the Nondiscrimination Acts and Authorities, including employment practices when the contract covers any activity, project, or program set forth in Appendix B of 49 CFR part 21.
3. **Solicitations for Subcontracts, including Procurements of Materials and Equipment:** In all solicitations, either by competitive bidding or negotiation made by the Contractor for work to be performed under a subcontract, including procurements of materials, or leases of equipment, each potential subcontractor or supplier will be notified by the Contractor of the contractor's obligations under this contract and the Nondiscrimination Acts and Authorities on the grounds of race, color, or national origin.
4. **Information and Reports:** The Contractor will provide all information and reports required by the Acts, the Regulations, and directives issued pursuant thereto and will permit access to its books, records, accounts, other sources of information, and its facilities as may be determined by the sponsor or the Federal Aviation Administration to be pertinent to ascertain compliance with such Nondiscrimination Acts and Authorities and instructions. Where any information required of a contractor is in the exclusive possession of another who fails or refuses to furnish the information, the Contractor will so certify to the sponsor or the Federal Aviation Administration, as appropriate, and will set forth what efforts it has made to obtain the information.
5. **Sanctions for Noncompliance:** In the event of a Contractor's noncompliance with the non-discrimination provisions of this contract, the sponsor will impose such contract sanctions as it or the Federal Aviation Administration may determine to be appropriate, including, but not limited to:
 - a. Withholding payments to the Contractor under the contract until the Contractor complies; and/or
 - b. Cancelling, terminating, or suspending a contract, in whole or in part.
6. **Incorporation of Provisions:** The Contractor will include the provisions of paragraphs one through six in every subcontract, including procurements of materials and leases of

equipment, unless exempt by the Acts, the Regulations, and directives issued pursuant thereto. The Contractor will take action with respect to any subcontract or procurement as the sponsor or the Federal Aviation Administration may direct as a means of enforcing such provisions including sanctions for noncompliance. Provided, that if the Contractor becomes involved in, or is threatened with litigation by a subcontractor, or supplier because of such direction, the Contractor may request the sponsor to enter into any litigation to protect the interests of the sponsor. In addition, the Contractor may request the United States to enter into the litigation to protect the interests of the United States.

Title VI List of Pertinent Nondiscrimination Acts and Authorities

During the performance of this contract, the Contractor, for itself, its assignees, and successors in interest (hereinafter referred to as the "Contractor") agrees to comply with the following non-discrimination statutes and authorities; including but not limited to:

- Title VI of the Civil Rights Act of 1964 (42 USC § 2000d et seq., 78 stat. 252) (prohibits discrimination on the basis of race, color, national origin);
- 49 CFR part 21 (Non-discrimination in Federally-assisted programs of the Department of Transportation—Effectuation of Title VI of the Civil Rights Act of 1964);
- The Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, (42 USC § 4601) (prohibits unfair treatment of persons displaced or whose property has been acquired because of Federal or Federal-aid programs and projects);
- Section 504 of the Rehabilitation Act of 1973 (29 USC § 794 et seq.), as amended (prohibits discrimination on the basis of disability); and 49 CFR part 27;
- The Age Discrimination Act of 1975, as amended (42 USC § 6101 et seq.) (prohibits discrimination on the basis of age);
- Airport and Airway Improvement Act of 1982 (49 USC § 471, Section 47123), as amended (prohibits discrimination based on race, creed, color, national origin, or sex);
- The Civil Rights Restoration Act of 1987 (PL 100-209) (broadened the scope, coverage and applicability of Title VI of the Civil Rights Act of 1964, the Age Discrimination Act of 1975 and Section 504 of the Rehabilitation Act of 1973, by expanding the definition of the terms "programs or activities" to include all of the programs or activities of the Federal-aid recipients, sub-recipients and contractors, whether such programs or activities are Federally funded or not);
- Titles II and III of the Americans with Disabilities Act of 1990, which prohibit discrimination on the basis of disability in the operation of public entities, public and private transportation systems, places of public accommodation, and certain testing entities (42 USC §§ 12131 – 12189) as implemented by U.S. Department of Transportation regulations at 49 CFR parts 37 and 38;
- The Federal Aviation Administration's Nondiscrimination statute (49 USC § 47123) (prohibits discrimination on the basis of race, color, national origin, and sex);
- Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, which ensures nondiscrimination against minority populations by discouraging programs, policies, and activities with disproportionately high and adverse human health or environmental effects on minority and low-income populations;

- Executive Order 13166, Improving Access to Services for Persons with Limited English Proficiency, and resulting agency guidance, national origin discrimination includes discrimination because of limited English proficiency (LEP). To ensure compliance with Title VI, you must take reasonable steps to ensure that LEP persons have meaningful access to your programs (70 Fed. Reg. at 74087 to 74100);
- Title IX of the Education Amendments of 1972, as amended, which prohibits you from discriminating because of sex in education programs or activities (20 USC 1681 et seq).

FEDERAL REQUIREMENT: FR-7

CLEAN AIR/WATER POLLUTION CONTROL

2 CFR § 200, Appendix II(G)

Contractor agrees to comply with all applicable standards, orders, and regulations issued pursuant to the Clean Air Act (42 USC § 740-7671q) and the Federal Water Pollution Control Act as amended (33 USC § 1251-1387). The Contractor agrees to report any violation to the Owner immediately upon discovery. The Owner assumes responsibility for notifying the Environmental Protection Agency (EPA) and the Federal Aviation Administration.

Contractor must include this requirement in all subcontracts that exceeds \$150,000.

FEDERAL REQUIREMENT: FR-8

CONTRACT WORKHOURS AND SAFETY STANDARDS

2 CFR § 200, Appendix II(E)

1. Overtime Requirements: No contractor or subcontractor contracting for any part of the contract work which may require or involve the employment of laborers or mechanics shall require or permit any such laborer or mechanic, including watchmen and guards, in any workweek in which he or she is employed on such work to work in excess of forty hours in such workweek unless such laborer or mechanic receives compensation at a rate not less than one and one-half times the basic rate of pay for all hours worked in excess of forty hours in such workweek.
2. Violation; Liability for Unpaid Wages; Liquidated Damages: In the event of any violation of the clause set forth in paragraph (1) of this clause, the Contractor and any subcontractor responsible therefor shall be liable for the unpaid wages. In addition, such contractor and subcontractor shall be liable to the United States (in the case of work done under contract for the District of Columbia or a territory, to such District or to such territory), for liquidated damages. Such liquidated damages shall be computed with respect to each individual laborer or mechanic, including watchmen and guards, employed in violation of the clause set forth in paragraph (1) of this clause, in the sum of \$10 for each calendar day on which such individual was required or permitted to work in excess of the standard workweek of forty hours without payment of the overtime wages required by the clause set forth in paragraph (1) of this clause.
3. Withholding for Unpaid Wages and Liquidated Damages: The Federal Aviation Administration (FAA) or the Owner shall upon its own action or upon written request of an authorized representative of the Department of Labor withhold or cause to be withheld, from any moneys payable on account of work performed by the contractor or subcontractor under any such contract or any other Federal contract with the same prime contractor, or any other federally assisted contract subject to the Contract Work Hours and Safety Standards Act, which is held by the same prime contractor, such sums as may be determined to be necessary to satisfy any liabilities of such contractor or subcontractor for unpaid wages and liquidated damages as provided in the clause set forth in paragraph (2) of this clause.
4. Subcontractors: The Contractor or subcontractor shall insert in any subcontracts the clauses set forth in paragraphs (1) through (4) and also a clause requiring the subcontractor to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for compliance by any subcontractor or lower tier subcontractor with the clauses set forth in paragraphs (1) through (4) of this clause.

Contract Workhours and Safety Standards Act Requirements (CWHSSA) prohibits unsanitary, hazardous, or dangerous working conditions on federally assisted projects. The Wage and Hour Division (WHD) within the U.S. Department of Labor (DOL) enforces the compensation requirements of this Act, while DOL's Occupational Safety and Health Administration (OSHA) enforces the safety and health requirements. This provision applies to all contracts and lower tier contracts that exceed \$100,000, and employ laborers, mechanics, watchmen, and guards. This provision applies to any equipment project exceeding \$100,000 that involves installation of equipment onsite (e.g. electrical vault equipment). This provision does not apply to equipment acquisition projects where the manufacture of the equipment takes place offsite at the vendor plant (e.g. ARFF and SRE vehicles). This provision applies to professional service agreements that exceed \$100,000 and employs laborers, mechanics, watchmen, and guards. This includes members of survey crews and exploratory drilling operations.

FEDERAL REQUIREMENT: FR-9

COPELAND ANTI-KICKBACK ACT

2 CFR § 200, Appendix II(D), 29 CFR Parts 3 and 5

Contractor must comply with the requirements of the Copeland "Anti-Kickback" Act (18 USC 874 and 40 USC 3145), as supplemented by Department of Labor regulation 29 CFR part 3. Contractor and subcontractors are prohibited from inducing, by any means, any person employed on the project to give up any part of the compensation to which the employee is entitled. The Contractor and each Subcontractor must submit to the Owner, a weekly statement on the wages paid to each employee performing on covered work during the prior week. Owner must report any violations of the Act to the Federal Aviation Administration.

This provision applies to all construction contracts and subcontracts that exceed \$2,000. This provision applies to all equipment installation projects (e.g. electrical vault improvements) that exceed \$2,000. This provision does not apply to equipment acquisitions where the equipment is manufactured at the vendor's plant (e.g. SRE and ARFF vehicles). Professional Service Agreements (PSAs) that include tasks that meet the definition of construction, alteration, or repair as defined in 29 CFR Part 5 and exceeds \$2,000 must incorporate the Copeland Anti-kickback provision.

FEDERAL REQUIREMENT: FR-10

DAVIS BACON REQUIREMENTS 2 CFR § 200, Appendix II(D), 29 CFR Part 5

1. Minimum Wage: (i) All laborers and mechanics employed or working upon the site of the work will be paid unconditionally and not less often than once a week, and without subsequent deduction or rebate on any account (except such payroll deductions as are permitted by the Secretary of Labor under the Copeland Act (29 CFR Part 3)), the full amount of wages and bona fide fringe benefits (or cash equivalent thereof) due at time of payment computed at rates not less than those contained in the wage determination of the Secretary of Labor which is attached hereto and made a part hereof, regardless of any contractual relationship which may be alleged to exist between the Contractor and such laborers and mechanics.

Contributions made or costs reasonably anticipated for bona fide fringe benefits under section 1(b)(2) of the Davis-Bacon Act on behalf of laborers or mechanics are considered wages paid to such laborers or mechanics, subject to the provisions of paragraph (1)(iv) of this section; also, regular contributions made or costs incurred for more than a weekly period (but not less often than quarterly) under plans, funds, or programs which cover the particular weekly period, are deemed to be constructively made or incurred during such weekly period. Such laborers and mechanics shall be paid the appropriate wage rate and fringe benefits on the wage determination for the classification of work actually performed, without regard to skill, except as provided in 29 CFR Part 5.5(a)(4). Laborers or mechanics performing work in more than one classification may be compensated at the rate specified for each classification for the time actually worked therein: Provided that the employer's payroll records accurately set forth the time spent in each classification in which work is performed. The wage determination (including any additional classification and wage rates conformed under (1)(ii) of this section) and the Davis-Bacon poster (WH-1321) shall be posted at all times by the Contractor and its subcontractors at the site of the work in a prominent and accessible place where it can easily be seen by the workers.

(ii)(A) The contracting officer shall require that any class of laborers or mechanics, including helpers, which is not listed in the wage determination and which is to be employed under the contract shall be classified in conformance with the wage determination. The contracting officer shall approve an additional classification and wage rate and fringe benefits therefore only when the following criteria have been met:

- (1) The work to be performed by the classification requested is not performed by a classification in the wage determination;
- (2) The classification is utilized in the area by the construction industry; and
- (3) The proposed wage rate, including any bona fide fringe benefits, bears a reasonable relationship to the wage rates contained in the wage determination.

(B) If the Contractor and the laborers and mechanics to be employed in the classification (if known), or their representatives, and the contracting officer agree on the classification and wage rate (including the amount designated for fringe benefits where appropriate), a report of the action taken shall be sent by the contracting officer to the Administrator of the Wage and Hour Division, Employment Standards Administration, U.S. Department of Labor, Washington, DC 20210. The Administrator, or an authorized representative, will approve, modify, or disapprove every additional classification action within 30 days of receipt and so advise the contracting officer or will notify the contracting officer within the 30-day period that additional time is necessary.

(C) In the event the Contractor, the laborers, or mechanics to be employed in the classification, or their representatives, and the contracting officer do not agree on the proposed classification and wage rate (including the amount designated for fringe benefits where appropriate), the contracting officer shall refer the questions, including the views of all interested parties and the recommendation of the contracting officer, to the Administrator for determination. The Administrator, or an authorized representative, will issue a determination within 30 days of receipt and so advise the contracting officer or will notify the contracting officer within the 30-day period that additional time is necessary.

(D) The wage rate (including fringe benefits where appropriate) determined pursuant to subparagraphs (1)(ii) (B) or (C) of this paragraph, shall be paid to all workers performing work in the classification under this contract from the first day on which work is performed in the classification.

(iii) Whenever the minimum wage rate prescribed in the contract for a class of laborers or mechanics includes a fringe benefit which is not expressed as an hourly rate, the contractor shall either pay the benefit as stated in the wage determination or shall pay another bona fide fringe benefit or an hourly cash equivalent thereof.

(iv) If the Contractor does not make payments to a trustee or other third person, the Contractor may consider as part of the wages of any laborer or mechanic the amount of any costs reasonably anticipated in providing bona fide fringe benefits under a plan or program: Provided that the Secretary of Labor has found, upon the written request of the Contractor, that the applicable standards of the Davis-Bacon Act have been met. The Secretary of Labor may require the Contractor to set aside in a separate account assets for the meeting of obligations under the plan or program.

2. Withholding: The Federal Aviation Administration or the sponsor shall upon its own action or upon written request of an authorized representative of the Department of Labor withhold or cause to be withheld from the Contractor under this contract or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to Davis-Bacon prevailing wage requirements, which is held by the same prime contractor, so much of the accrued payments or advances as may be considered necessary to pay laborers and mechanics, including apprentices, trainees, and helpers, employed by the Contractor or any subcontractor the full amount of wages required by the contract. In the event of failure to pay any laborer or mechanic, including any apprentice, trainee, or helper, employed or working on the site of work, all or part of the wages required by the contract, the Federal Aviation Administration may, after written notice to the Contractor, Sponsor, Applicant, or Owner, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds until such violations have ceased.
3. Payrolls and Basic Records: (i) Payrolls and basic records relating thereto shall be maintained by the Contractor during the course of the work and preserved for a period of three years thereafter for all laborers and mechanics working at the site of the work. Such records shall contain the name, address, and social security number of each such worker; his or her correct classification; hourly rates of wages paid (including rates of contributions or costs anticipated for bona fide fringe benefits or cash equivalents thereof of the types described in 1(b)(2)(B) of the Davis-Bacon Act); daily and weekly number of hours worked; deductions made; and actual wages paid. Whenever the Secretary of Labor has found under 29 CFR 5.5(a)(1)(iv) that the wages of any laborer or mechanic include the amount of any costs reasonably anticipated in providing benefits under a plan or program described in section 1(b)(2)(B) of the Davis-Bacon Act, the Contractor shall maintain records that show that the commitment to provide such benefits is enforceable, that the plan or program is financially responsible, and that the plan

or program has been communicated in writing to the laborers or mechanics affected, and that show the costs anticipated or the actual costs incurred in providing such benefits. Contractors employing apprentices or trainees under approved programs shall maintain written evidence of the registration of apprenticeship programs and certification of trainee programs, the registration of the apprentices and trainees, and the ratios and wage rates prescribed in the applicable programs.

(ii)(A) The Contractor shall submit weekly for each week in which any contract work is performed a copy of all payrolls to the Federal Aviation Administration if the agency is a party to the contract, but if the agency is not such a party, the Contractor will submit the payrolls to the applicant, Sponsor, or Owner, as the case may be, for transmission to the Federal Aviation Administration. The payrolls submitted shall set out accurately and completely all of the information required to be maintained under 29 CFR 5.5(a)(3)(i), except that full social security numbers and home addresses shall not be included on weekly transmittals. Instead the payrolls shall only need to include an individually identifying number for each employee (e.g. the last four digits of the employee's social security number). The required weekly payroll information may be submitted in any form desired. Optional Form WH-347 is available for this purpose from the Wage and Hour Division Web site at www.dol.gov/whd/forms/wh347instr.htm or its successor site. The prime contractor is responsible for the submission of copies of payrolls by all subcontractors. Contractors and subcontractors shall maintain the full social security number and current address of each covered worker and shall provide them upon request to the Federal Aviation Administration if the agency is a party to the contract, but if the agency is not such a party, the Contractor will submit them to the applicant, sponsor, or Owner, as the case may be, for transmission to the Federal Aviation Administration, the Contractor, or the Wage and Hour Division of the Department of Labor for purposes of an investigation or audit of compliance with prevailing wage requirements. It is not a violation of this section for a prime contractor to require a subcontractor to provide addresses and social security numbers to the prime contractor for its own records, without weekly submission to the sponsoring government agency (or the applicant, Sponsor, or Owner).

(B) Each payroll submitted shall be accompanied by a "Statement of Compliance," signed by the Contractor or subcontractor or his or her agent who pays or supervises the payment of the persons employed under the contract and shall certify the following:

(1) The payroll for the payroll period contains the information required to be provided under 29 CFR § 5.5(a)(3)(ii), the appropriate information is being maintained under 29 CFR § 5.5(a)(3)(i), and that such information is correct and complete;

(2) Each laborer and mechanic (including each helper, apprentice, and trainee) employed on the contract during the payroll period has been paid the full weekly wages earned, without rebate, either directly or indirectly, and that no deductions have been made either directly or indirectly from the full wages earned, other than permissible deductions as set forth in Regulations 29 CFR Part 3;

(3) Each laborer or mechanic has been paid not less than the applicable wage rates and fringe benefits or cash equivalents for the classification of work performed, as specified in the applicable wage determination incorporated into the contract.

(C) The weekly submission of a properly executed certification set forth on the reverse side of Optional Form WH-347 shall satisfy the requirement for submission of the "Statement of Compliance" required by paragraph (3)(ii)(B) of this section.

(D) The falsification of any of the above certifications may subject the Contractor or subcontractor to civil or criminal prosecution under Section 1001 of Title 18 and Section 231 of Title 31 of the United States Code.

(iii) The Contractor or subcontractor shall make the records required under paragraph (3)(i) of this section available for inspection, copying, or transcription by authorized representatives of the sponsor, the Federal Aviation Administration, or the Department of Labor and shall permit such representatives to interview employees during working hours on the job. If the Contractor or subcontractor fails to submit the required records or to make them available, the Federal agency may, after written notice to the Contractor, Sponsor, applicant, or Owner, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds. Furthermore, failure to submit the required records upon request or to make such records available may be grounds for debarment action pursuant to 29 CFR 5.12.

4. Apprentices and Trainees: (i) Apprentices. Apprentices will be permitted to work at less than the predetermined rate for the work they performed when they are employed pursuant to and individually registered in a bona fide apprenticeship program registered with the U.S. Department of Labor, Employment and Training Administration, Bureau of Apprenticeship and Training, or with a State Apprenticeship Agency recognized by the Bureau, or if a person is employed in his or her first 90 days of probationary employment as an apprentice in such an apprenticeship program, who is not individually registered in the program, but who has been certified by the Bureau of Apprenticeship and Training or a State Apprenticeship Agency (where appropriate) to be eligible for probationary employment as an apprentice. The allowable ratio of apprentices to journeymen on the job site in any craft classification shall not be greater than the ratio permitted to the contractor as to the entire work force under the registered program. Any worker listed on a payroll at an apprentice wage rate, who is not registered or otherwise employed as stated above, shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any apprentice performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. Where a contractor is performing construction on a project in a locality other than that in which its program is registered, the ratios and wage rates (expressed in percentages of the journeyman's hourly rate) specified in the Contractor's or subcontractor's registered program shall be observed. Every apprentice must be paid at not less than the rate specified in the registered program for the apprentice's level of progress, expressed as a percentage of the journeymen hourly rate specified in the applicable wage determination. Apprentices shall be paid fringe benefits in accordance with the provisions of the apprenticeship program. If the apprenticeship program does not specify fringe benefits, apprentices must be paid the full amount of fringe benefits listed on the wage determination for the applicable classification. If the Administrator determines that a different practice prevails for the applicable apprentice classification, fringes shall be paid in accordance with that determination. In the event the Bureau of Apprenticeship and Training, or a State Apprenticeship Agency recognized by the Bureau, withdraws approval of an apprenticeship program, the Contractor will no longer be permitted to utilize apprentices at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(ii) Trainees. Except as provided in 29 CFR 5.16, trainees will not be permitted to work at less than the predetermined rate for the work performed unless they are employed pursuant to and individually registered in a program which has received prior approval, evidenced by formal certification by the U.S. Department of Labor, Employment and Training Administration. The ratio of trainees to journeymen on the job site shall not be greater than permitted under the

plan approved by the Employment and Training Administration. Every trainee must be paid at not less than the rate specified in the approved program for the trainee's level of progress, expressed as a percentage of the journeyman hourly rate specified in the applicable wage determination. Trainees shall be paid fringe benefits in accordance with the provisions of the trainee program. If the trainee program does not mention fringe benefits, trainees shall be paid the full amount of fringe benefits listed on the wage determination unless the Administrator of the Wage and Hour Division determines that there is an apprenticeship program associated with the corresponding journeyman wage rate on the wage determination that provides for less than full fringe benefits for apprentices. Any employee listed on the payroll at a trainee rate that is not registered and participating in a training plan approved by the Employment and Training Administration shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any trainee performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. In the event the Employment and Training Administration withdraws approval of a training program, the Contractor will no longer be permitted to utilize trainees at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(iii) Equal Employment Opportunity. The utilization of apprentices, trainees, and journeymen under this part shall be in conformity with the equal employment opportunity requirements of Executive Order 11246, as amended, and 29 CFR Part 30.

5. Compliance with Copeland Act Requirements: The Contractor shall comply with the requirements of 29 CFR Part 3, which are incorporated by reference in this contract.
6. Subcontracts: The Contractor or subcontractor shall insert in any subcontracts the clauses contained in 29 CFR Part 5.5(a)(1) through (10) and such other clauses as the Federal Aviation Administration may by appropriate instructions require, and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for the compliance by any subcontractor or lower tier subcontractor with all the contract clauses in 29 CFR Part 5.5.
7. Contract Termination Debarment: A breach of the contract clauses in paragraph 1 through 10 of this section may be grounds for termination of the contract, and for debarment as a contractor and a subcontractor as provided in 29 CFR 5.12.
8. Compliance with Davis-Bacon and Related Act Requirements: All rulings and interpretations of the Davis-Bacon and Related Acts contained in 29 CFR Parts 1, 3, and 5 are herein incorporated by reference in this contract.
9. Disputes Concerning Labor Standards: Disputes arising out of the labor standards provisions of this contract shall not be subject to the general disputes clause of this contract. Such disputes shall be resolved in accordance with the procedures of the Department of Labor set forth in 29 CFR Parts 5, 6, and 7. Disputes within the meaning of this clause include disputes between the Contractor (or any of its subcontractors) and the contracting agency, the U.S. Department of Labor, or the employees or their representatives.
10. Certification of Eligibility: (i) By entering into this contract, the Contractor certifies that neither it (nor he or she) nor any person or firm who has an interest in the Contractor's firm is a person or firm ineligible to be awarded Government contracts by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).
(ii) No part of this contract shall be subcontracted to any person or firm ineligible for award of a Government contract by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

(iii) The penalty for making false statements is prescribed in the U.S. Criminal Code, 18 USC 1001.

This shall be incorporated into all construction contracts and subcontracts that exceed \$2,000. This provision applies to all equipment installation projects (e.g. electrical vault improvements) that exceed \$ 2,000. This provision does not apply to equipment acquisitions where the equipment is manufactured at the vendor's plant (e.g. SRE and ARFF vehicles). Professional Service Agreements (PSAs) including tasks that meet the definition of construction, alteration, or repair as defined in 29 CFR Part that exceed \$2,000 must incorporate this clause. Fencing projects that exceed \$2,000 must include this provision.

FEDERAL REQUIREMENT: FR-11

DEBARMENT AND SUSPENSION

2 CFR part 180 (Subpart C), 2 CFR part 1200, DOT Order 4200.5

CERTIFICATION OF OFFERER/BIDDER REGARDING DEBARMENT

By submitting a bid/proposal under this solicitation, the bidder or offeror certifies that neither it nor its principals are presently debarred or suspended by any Federal department or agency from participation in this transaction.

CERTIFICATION OF LOWER TIER CONTRACTORS REGARDING DEBARMENT

The successful bidder, by administering each lower tier subcontract that exceeds \$25,000 as a "covered transaction", must verify each lower tier participant of a "covered transaction" under the project is not presently debarred or otherwise disqualified from participation in this federally assisted project. The successful bidder will accomplish this by:

1. Checking the System for Award Management at website: <http://www.sam.gov>
2. Collecting a certification statement similar to the Certification of Offerer /Bidder Regarding Debarment, above.
3. Inserting a clause or condition in the covered transaction with the lower tier contract.

If the Federal Aviation Administration later determines that a lower tier participant failed to disclose to a higher tier participant that it was excluded or disqualified at the time it entered the covered transaction, the FAA may pursue any available remedies, including suspension and debarment of the non-compliant participant.

This requirement applies to covered transactions, which are defined in 2 CFR part 180. AIP funded contracts are non-procurement transactions, as defined by §180.970. Covered transactions include any AIP-funded contract, regardless of tier, that is awarded by a contractor, subcontractor, supplier, consultant, or its agent or representative in any transaction, if the amount of the contract is expected to equal or exceed \$25,000.

FEDERAL REQUIREMENT: FR-12

DISADVANTAGED BUSINESS ENTERPRISE

49 CFR part 26

The requirements of 49 CFR part 26 apply to this contract. It is the policy of the City of Los Angeles, Los Angeles World Airports to practice nondiscrimination based on race, color, sex, or national origin in the award or performance of this contract. The Owner encourages participation by all firms qualifying under this solicitation regardless of business size or ownership.

Contract Assurance (§ 26.13): The Contractor or subcontractor shall not discriminate on the basis of race, color, national origin, or sex in the performance of this contract. The Contractor shall carry out applicable requirements of 49 CFR part 26 in the award and administration of Department of Transportation-assisted contracts. Failure by the Contractor to carry out these requirements is a material breach of this contract, which may result in the termination of this contract or such other remedy as the Owner deems appropriate, which may include, but is not limited to:

1. Withholding monthly progress payments
2. Assessing sanctions
3. Liquidated damages; and/or
4. Disqualifying the Contractor from future bidding as non-responsible

Prompt Payment (§26.29): The prime contractor agrees to pay each subcontractor under this prime contract for satisfactory performance of its contract no later than seven days from the receipt of each payment the prime contractor receives from City of Los Angeles, Los Angeles World Airports. The prime contractor agrees further to return retainage payments to each subcontractor within seven days after the subcontractor's work is satisfactorily completed. Any delay or postponement of payment from the above referenced time frame may occur only for good cause following written approval of the City of Los Angeles, Los Angeles World Airports. This clause applies to both DBE and non-DBE subcontractors.

Information Submitted as a matter of bidder responsiveness:

The Owner's award of this contract is conditioned upon Bidder or Offeror satisfying the good faith effort requirements of 49 CFR §26.53.

As a condition of bid responsiveness, the Bidder or Offeror must submit the following information with its proposal on the forms provided herein:

- 1) The names and addresses of Disadvantaged Business Enterprise (DBE) firms that will participate in the contract;
- 2) A description of the work that each DBE firm will perform;
- 3) The dollar amount of the participation of each DBE firm listed under (1)
- 4) Written statement from Bidder or Offeror that attests their commitment to use the DBE firm(s) listed under (1) to meet the Owner's project goal; and
- 5) If Bidder or Offeror cannot meet the advertised project DBE goal, evidence of good faith efforts undertaken by the Bidder or Offeror as described in appendix A to 49 CFR part 26.

Information submitted as a matter of bidder responsibility:

The Owner's award of this contract is conditioned upon Bidder or Offeror satisfying the good faith effort requirements of 49 CFR §26.53.

The successful Bidder or Offeror must provide written confirmation of participation from each of the DBE firms the Bidder or Offeror lists in its commitment within five days after bid opening

- 1) The names and addresses of Disadvantaged Business Enterprise (DBE) firms that will participate in the contract;
- 2) A description of the work that each DBE firm will perform;
- 3) The dollar amount of the participation of each DBE firm listed under (1)
- 4) Written statement from Bidder or Offeror that attests their commitment to use the DBE firm(s) listed under (1) to meet the Owner's project goal; and
- 5) If Bidder or Offeror cannot meet the advertised project DBE goal, evidence of good faith efforts undertaken by the Bidder or Offeror as described in appendix A to 49 CFR part 26.

FEDERAL REQUIREMENT: FR-13

DISTRACTED DRIVING

Executive Order 13513, DOT Order 3902.10

Contractor is to promote policies and initiatives for its employees and other work personnel that decrease crashes by distracted drivers, including policies that ban text messaging while driving motor vehicles while performing work activities associated with the project. The Contractor must include the substance of this clause in all sub-tier contracts exceeding \$3,500 that involve driving a motor vehicle in performance of work activities associated with the project.

FEDERAL REQUIREMENT: FR-14

ENERGY CONSERVATION REQUIREMENTS

2 CFR § 200, Appendix II(H)

Contractor and Subcontractor agree to comply with mandatory standards and policies relating to energy efficiency as contained in the state energy conservation plan issued in compliance with the Energy Policy and Conservation Act (42 USC 6201et seq).

FEDERAL REQUIREMENT: FR-15

EQUAL EMPLOYMENT OPPORTUNITY

2 CFR 200, Appendix II(C), 41 CFR § 60-1.4, 41 CFR § 60-4.3, Executive Order 11246

EQUAL OPPORTUNITY CLAUSE

During the performance of this contract, the Contractor agrees as follows:

(1) The Contractor will not discriminate against any employee or applicant for employment because of race, color, religion, sex, or national origin. The Contractor will take affirmative action to ensure that applicants are employed, and that employees are treated during employment, without regard to their race, color, religion, sex, sexual orientation, gender identify, or national origin. Such action shall include, but not be limited to, the following: employment, upgrading, demotion, or transfer; recruitment or recruitment advertising; layoff, or termination; rates of pay or other forms of compensation; and selection for training, including apprenticeship. The Contractor agrees to post in conspicuous places, available to employees and applicants for employment, notices to be provided setting forth the provisions of this nondiscrimination clause.

(2) The Contractor will, in all solicitations or advertisements for employees placed by or on behalf of the Contractor, state that all qualified applicants will receive considerations for employment without regard to race, color, religion, sex, or national origin.

(3) The Contractor will send to each labor union or representative of workers with which it has a collective bargaining agreement or other contract or understanding, a notice to be provided advising the said labor union or workers' representatives of the Contractor's commitments under this section and shall post copies of the notice in conspicuous places available to employees and applicants for employment.

(4) The Contractor will comply with all provisions of Executive Order 11246 of September 24, 1965, and of the rules, regulations, and relevant orders of the Secretary of Labor.

(5) The Contractor will furnish all information and reports required by Executive Order 11246 of September 24, 1965, and by rules, regulations, and orders of the Secretary of Labor, or pursuant thereto, and will permit access to his books, records, and accounts by the administering agency and the Secretary of Labor for purposes of investigation to ascertain compliance with such rules, regulations, and orders.

(6) In the event of the Contractor's noncompliance with the nondiscrimination clauses of this contract or with any of the said rules, regulations, or orders, this contract may be canceled, terminated, or suspended in whole or in part and the Contractor may be declared ineligible for further Government contracts or federally assisted construction contracts in accordance with procedures authorized in Executive Order 11246 of September 24, 1965, and such other sanctions may be imposed and remedies invoked as provided in Executive Order 11246 of September 24, 1965, or by rule, regulation, or order of the Secretary of Labor, or as otherwise provided by law.

(7) The Contractor will include the portion of the sentence immediately preceding paragraph (1) and the provisions of paragraphs (1) through (7) in every subcontract or purchase order unless exempted by rules, regulations, or orders of the Secretary of Labor issued pursuant to section 204 of Executive Order 11246 of September 24, 1965, so that such provisions will be binding upon each subcontractor or vendor. The Contractor will take such action with respect to any subcontract or purchase order as the

EQUAL EMPLOYMENT OPPORTUNITY SPECIFICATION

1. As used in these specifications:

- a. "Covered area" means the geographical area described in the solicitation from which this contract resulted;
- b. "Director" means Director, Office of Federal Contract Compliance Programs (OFCCP), U.S. Department of Labor, or any person to whom the Director delegates authority;
- c. "Employer identification number" means the Federal social security number used on the Employer's Quarterly Federal Tax Return, U.S. Treasury Department Form 941;
- d. "Minority" includes:
 - (1) Black (all persons having origins in any of the Black African racial groups not of Hispanic origin);
 - (2) Hispanic (all persons of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin regardless of race);
 - (3) Asian and Pacific Islander (all persons having origins in any of the original peoples of the Far East, Southeast Asia, the Indian Subcontinent, or the Pacific Islands); and
 - (4) American Indian or Alaskan native (all persons having origins in any of the original peoples of North America and maintaining identifiable tribal affiliations through membership and participation or community identification).
2. Whenever the Contractor, or any subcontractor at any tier, subcontracts a portion of the work involving any construction trade, it shall physically include in each subcontract in excess of \$10,000 the provisions of these specifications and the Notice which contains the applicable goals for minority and female participation and which is set forth in the solicitations from which this contract resulted.
3. If the Contractor is participating (pursuant to 41 CFR part 60-4.5) in a Hometown Plan approved by the U.S. Department of Labor in the covered area either individually or through an association, its affirmative action obligations on all work in the Plan area (including goals and timetables) shall be in accordance with that Plan for those trades which have unions participating in the Plan. Contractors shall be able to demonstrate their participation in and compliance with the provisions of any such Hometown Plan. Each contractor or subcontractor participating in an approved plan is individually required to comply with its obligations under the EEO clause and to make a good faith effort to achieve each goal under the Plan in each trade in which it has employees. The overall good faith performance by other contractors or subcontractors toward a goal in an approved Plan does not excuse any covered contractor's or subcontractor's failure to take good faith efforts to achieve the Plan goals and timetables.
4. The Contractor shall implement the specific affirmative action standards provided in paragraphs 7a through 7p of these specifications. The goals set forth in the solicitation from which this contract resulted are expressed as percentages of the total hours of employment and training of minority and female utilization the Contractor should reasonably be able to achieve in each construction trade in which it has employees in the covered area. Covered construction contractors performing construction work in a geographical area where they do not have a Federal or federally assisted construction contract shall apply the minority and female goals established for the geographical area where the work is being performed. Goals are published periodically in the Federal Register in notice form, and such notices may be obtained from any Office of Federal Contract Compliance Programs office or from Federal procurement contracting officers. The Contractor is expected to make substantially uniform progress in meeting its goals in each craft during the period specified.
5. Neither the provisions of any collective bargaining agreement nor the failure by a union with whom the Contractor has a collective bargaining agreement to refer either minorities or

women shall excuse the Contractor's obligations under these specifications, Executive Order 11246, or the regulations promulgated pursuant thereto.

6. In order for the non-working training hours of apprentices and trainees to be counted in meeting the goals, such apprentices and trainees shall be employed by the Contractor during the training period and the Contractor shall have made a commitment to employ the apprentices and trainees at the completion of their training, subject to the availability of employment opportunities. Trainees shall be trained pursuant to training programs approved by the U.S. Department of Labor.
7. The Contractor shall take specific affirmative actions to ensure equal employment opportunity. The evaluation of the Contractor's compliance with these specifications shall be based upon its effort to achieve maximum results from its actions. The Contractor shall document these efforts fully and shall implement affirmative action steps at least as extensive as the following:
 - a. Ensure and maintain a working environment free of harassment, intimidation, and coercion at all sites, and in all facilities at which the Contractor's employees are assigned to work. The Contractor, where possible, will assign two or more women to each construction project. The Contractor shall specifically ensure that all foremen, superintendents, and other onsite supervisory personnel are aware of and carry out the Contractor's obligation to maintain such a working environment, with specific attention to minority or female individuals working at such sites or in such facilities.
 - b. Establish and maintain a current list of minority and female recruitment sources, provide written notification to minority and female recruitment sources and to community organizations when the Contractor or its unions have employment opportunities available, and maintain a record of the organizations' responses.
 - c. Maintain a current file of the names, addresses, and telephone numbers of each minority and female off-the-street applicant and minority or female referral from a union, a recruitment source, or community organization and of what action was taken with respect to each such individual. If such individual was sent to the union hiring hall for referral and was not referred back to the Contractor by the union or, if referred, not employed by the Contractor, this shall be documented in the file with the reason therefore along with whatever additional actions the Contractor may have taken.
 - d. Provide immediate written notification to the Director when the union or unions with which the Contractor has a collective bargaining agreement has not referred to the Contractor a minority person or female sent by the Contractor, or when the Contractor has other information that the union referral process has impeded the Contractor's efforts to meet its obligations.
 - e. Develop on-the-job training opportunities and/or participate in training programs for the area which expressly include minorities and women, including upgrading programs and apprenticeship and trainee programs relevant to the Contractor's employment needs, especially those programs funded or approved by the Department of Labor. The Contractor shall provide notice of these programs to the sources compiled under 7b above.
 - f. Disseminate the Contractor's EEO policy by providing notice of the policy to unions and training programs and requesting their cooperation in assisting the Contractor in meeting its EEO obligations; by including it in any policy manual and collective bargaining agreement; by publicizing it in the company newspaper, annual report, etc.; by specific review of the policy with all management personnel and with all minority and female

- employees at least once a year; and by posting the company EEO policy on bulletin boards accessible to all employees at each location where construction work is performed.
- g. Review, at least annually, the company's EEO policy and affirmative action obligations under these specifications with all employees having any responsibility for hiring, assignment, layoff, termination, or other employment decisions, including specific review of these items, with onsite supervisory personnel such as superintendents, general foremen, etc., prior to the initiation of construction work at any job site. A written record shall be made and maintained identifying the time and place of these meetings, persons attending, subject matter discussed, and disposition of the subject matter.
 - h. Disseminate the Contractor's EEO policy externally by including it in any advertising in the news media, specifically including minority and female news media, and providing written notification to and discussing the Contractor's EEO policy with other contractors and subcontractors with whom the Contractor does or anticipates doing business.
 - i. Direct its recruitment efforts, both oral and written, to minority, female, and community organizations, to schools with minority and female students; and to minority and female recruitment and training organizations serving the Contractor's recruitment area and employment needs. Not later than one month prior to the date for the acceptance of applications for apprenticeship or other training by any recruitment source, the Contractor shall send written notification to organizations, such as the above, describing the openings, screening procedures, and tests to be used in the selection process.
 - j. Encourage present minority and female employees to recruit other minority persons and women and, where reasonable, provide after school, summer, and vacation employment to minority and female youth both on the site and in other areas of a contractor's workforce.
 - k. Validate all tests and other selection requirements where there is an obligation to do so under 41 CFR part 60-3.
 - l. Conduct, at least annually, an inventory and evaluation at least of all minority and female personnel, for promotional opportunities and encourage these employees to seek or to prepare for, through appropriate training, etc., such opportunities.
 - m. Ensure that seniority practices, job classifications, work assignments, and other personnel practices do not have a discriminatory effect by continually monitoring all personnel and employment related activities to ensure that the EEO policy and the Contractor's obligations under these specifications are being carried out.
 - n. Ensure that all facilities and company activities are non-segregated except that separate or single user toilet and necessary changing facilities shall be provided to assure privacy between the sexes.
 - o. Document and maintain a record of all solicitations of offers for subcontracts from minority and female construction contractors and suppliers, including circulation of solicitations to minority and female contractor associations and other business associations.
 - p. Conduct a review, at least annually, of all supervisor's adherence to and performance under the Contractor's EEO policies and affirmative action obligations.
8. Contractors are encouraged to participate in voluntary associations, which assist in fulfilling one or more of their affirmative action obligations (7a through 7p). The efforts of a contractor association, joint contractor union, contractor community, or other similar groups of which the Contractor is a member and participant may be asserted as fulfilling any one or more of its obligations under 7a through 7p of these specifications provided that the Contractor actively participates in the group, makes every effort to assure that the group has a positive impact on

the employment of minorities and women in the industry, ensures that the concrete benefits of the program are reflected in the Contractor's minority and female workforce participation, makes a good faith effort to meet its individual goals and timetables, and can provide access to documentation which demonstrates the effectiveness of actions taken on behalf of the Contractor. The obligation to comply, however, is the Contractor's and failure of such a group to fulfill an obligation shall not be a defense for the Contractor's noncompliance.

9. A single goal for minorities and a separate single goal for women have been established. The Contractor, however, is required to provide equal employment opportunity and to take affirmative action for all minority groups, both male and female, and all women, both minority and non-minority. Consequently, if the particular group is employed in a substantially disparate manner (for example, even though the Contractor has achieved its goals for women generally), the Contractor may be in violation of the Executive Order if a specific minority group of women is underutilized.
10. The Contractor shall not use the goals and timetables or affirmative action standards to discriminate against any person because of race, color, religion, sex, or national origin.
11. The Contractor shall not enter into any subcontract with any person or firm debarred from Government contracts pursuant to Executive Order 11246.
12. The Contractor shall carry out such sanctions and penalties for violation of these specifications and of the Equal Opportunity Clause, including suspension, termination, and cancellation of existing subcontracts as may be imposed or ordered pursuant to Executive Order 11246, as amended, and its implementing regulations, by the Office of Federal Contract Compliance Programs. Any contractor who fails to carry out such sanctions and penalties shall be in violation of these specifications and Executive Order 11246, as amended.
13. The Contractor, in fulfilling its obligations under these specifications, shall implement specific affirmative action steps, at least as extensive as those standards prescribed in paragraph 7 of these specifications, so as to achieve maximum results from its efforts to ensure equal employment opportunity. If the Contractor fails to comply with the requirements of the Executive Order, the implementing regulations, or these specifications, the Director shall proceed in accordance with 41 CFR part 60-4.8.
14. The Contractor shall designate a responsible official to monitor all employment related activity to ensure that the company EEO policy is being carried out, to submit reports relating to the provisions hereof as may be required by the Government, and to keep records. Records shall at least include for each employee, the name, address, telephone number, construction trade, union affiliation if any, employee identification number when assigned, social security number, race, sex, status (e.g., mechanic, apprentice, trainee, helper, or laborer), dates of changes in status, hours worked per week in the indicated trade, rate of pay, and locations at which the work was performed. Records shall be maintained in an easily understandable and retrievable form; however, to the degree that existing records satisfy this requirement, contractors shall not be required to maintain separate records.
15. Nothing herein provided shall be construed as a limitation upon the application of other laws which establish different standards of compliance or upon the application of requirements for the hiring of local or other area residents (e.g. those under the Public Works Employment Act of 1977 and the Community Development Block Grant Program).

The equal opportunity contract clause must be included in any contract or subcontract when the amount exceeds \$10,000. Once the equal opportunity clause is determined to be applicable, the

contract or subcontract must include the clause for the remainder of the year, regardless of the amount or the contract. The contract and specification language must be incorporated in all construction contracts and subcontracts that exceed \$10,000.

FEDERAL REQUIREMENT: FR-16

FEDERAL FAIR LABOR STANDARDS ACT

29 USC § 201, et seq

All contracts and subcontracts that result from this solicitation incorporate by reference the provisions of 29 CFR part 201, the Federal Fair Labor Standards Act (FLSA), with the same force and effect as if given in full text. The FLSA sets minimum wage, overtime pay, recordkeeping, and child labor standards for full and part-time workers.

The Contractor has full responsibility to monitor compliance to the referenced statute or regulation. The Contractor must address any claims or disputes that arise from this requirement directly with the U.S. Department of Labor – Wage and Hour Division.

All consultants, sub-consultants, contractors, and subcontractors employed under this federally assisted project must comply with the FLSA. 29 CFR § 213 exempts professional services employees in a bona fide executive, administrative or professional capacity. Because professional firms employ individuals that are not covered by this exemption, the sponsor's agreement with a professional services firm must include the FLSA provision.

FEDERAL REQUIREMENT: FR-17

FOREIGN TRADE RESTRICTION

49 USC § 50104, 49 CFR part 30

This language must be used in all contracts and subcontracts without modification.

By submission of an offer, the Offeror certifies that with respect to this solicitation and any resultant contract, the Offeror:

- 1) is not owned or controlled by one or more citizens of a foreign country included in the list of countries that discriminate against U.S. firms as published by the Office of the United States Trade Representative (USTR);
- 2) has not knowingly entered into any contract or subcontract for this project with a person that is a citizen or national of a foreign country included on the list of countries that discriminate against U.S. firms as published by the USTR; and
- 3) has not entered into any subcontract for any product to be used on the Federal project that is produced in a foreign country included on the list of countries that discriminate against U.S. firms published by the USTR.

This certification concerns a matter within the jurisdiction of an agency of the United States of America and the making of a false, fictitious, or fraudulent certification may render the maker subject to prosecution under Title 18 USC Section 1001.

The Offeror/Contractor must provide immediate written notice to the Owner if the Offeror/Contractor learns that its certification or that of a subcontractor was erroneous when submitted or has become erroneous by reason of changed circumstances. The Contractor must require subcontractors provide immediate written notice to the Contractor if at any time it learns that its certification was erroneous by reason of changed circumstances.

Unless the restrictions of this clause are waived by the Secretary of Transportation in accordance with 49 CFR 30.17, no contract shall be awarded to an Offeror or subcontractor:

- 1) who is owned or controlled by one or more citizens or nationals of a foreign country included on the list of countries that discriminate against U.S. firms published by the USTR or
- 2) whose subcontractors are owned or controlled by one or more citizens or nationals of a foreign country on such USTR list or
- 3) who incorporates in the public works project any product of a foreign country on such USTR list

Nothing contained in the foregoing shall be construed to require establishment of a system of records in order to render, in good faith, the certification required by this provision. The knowledge and information of a contractor is not required to exceed that which is normally possessed by a prudent person in the ordinary course of business dealings.

The Offeror agrees that, if awarded a contract resulting from this solicitation, it will incorporate this provision for certification without modification in all lower tier subcontracts. The Contractor may rely on the certification of a prospective subcontractor that it is not a firm from a foreign country included on the list of countries that discriminate against U.S. firms as published by USTR, unless the Offeror has knowledge that the certification is erroneous.

This certification is a material representation of fact upon which reliance was placed when making an award. If it is later determined that the Contractor or subcontractor knowingly rendered an erroneous certification, the Federal Aviation Administration (FAA) may direct through the Owner cancellation of the contract or subcontract for default at no cost to the Owner or the FAA.

FEDERAL REQUIREMENT: FR-18

LOBBYING AND INFLUENCING FEDERAL EMPLOYEES

31 USC § 1352 – Byrd Anti-Lobbying Amendment, 2 CFR part 200, Appendix II(J), 49 CFR part 20, Appendix A

The Bidder or Offeror certifies by signing and submitting this bid or proposal, to the best of his or her knowledge and belief, that:

- (1) No Federal appropriated funds have been paid or will be paid, by or on behalf of the Bidder or Offeror, to any person for influencing or attempting to influence an officer or employee of an agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with the awarding of any Federal contract, the making of any Federal grant, the making of any Federal loan, the entering into of any cooperative agreement, and the extension, continuation, renewal, amendment, or modification of any Federal contract, grant, loan, or cooperative agreement.
- (2) If any funds other than Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with this Federal contract, grant, loan, or cooperative agreement, the undersigned shall complete and submit Standard Form-LLL, "Disclosure Form to Report Lobbying," in accordance with its instructions.
- (3) The undersigned shall require that the language of this certification be included in the award documents for all sub-awards at all tiers (including subcontracts, subgrants, and contracts under grants, loans, and cooperative agreements) and that all sub-recipients shall certify and disclose accordingly.

This certification is a material representation of fact upon which reliance was placed when this transaction was made or entered into. Submission of this certification is a prerequisite for making or entering into this transaction imposed by section 1352, title 31, U.S. Code. Any person who fails to file the required certification shall be subject to a civil penalty of not less than \$10,000 and not more than \$100,000 for each such failure.

FEDERAL REQUIREMENT: FR-19

OCCUPATIONAL SAFETY AND HEALTH ACT

29 CFR part 1910

All contracts and subcontracts that result from this solicitation incorporate by reference the requirements of 29 CFR Part 1910 with the same force and effect as if given in full text. The employer must provide a work environment that is free from recognized hazards that may cause death or serious physical harm to the employee. The employer retains full responsibility to monitor its compliance and their subcontractor's compliance with the applicable requirements of the Occupational Safety and Health Act of 1970 (29 CFR Part 1910). The employer must address any claims or disputes that pertain to a referenced requirement directly with the U.S. Department of Labor - Occupational Safety and Health Administration.

FEDERAL REQUIREMENT: FR-20

PROHIBITION OF SEGREGATED FACILITIES

41 CFR § 60

(a) The Contractor agrees that it does not and will not maintain or provide for its employees any segregated facilities at any of its establishments, and that it does not and will not permit its employees to perform their services at any location under its control where segregated facilities are maintained. The Contractor agrees that a breach of this clause is a violation of the Equal Employment Opportunity clause in this contract.

b) "Segregated facilities," as used in this clause, means any waiting rooms, work areas, rest rooms and wash rooms, restaurants and other eating areas, time clocks, locker rooms and other storage or dressing areas, parking lots, drinking fountains, recreation or entertainment areas, transportation, and housing facilities provided for employees that are segregated by explicit directive or are in fact segregated on the basis of race, color, religion, sex, or national origin because of written or oral policies or employee custom. The term does not include separate or single-user rest rooms or necessary dressing or sleeping areas provided to assure privacy between the sexes.

(c) The Contractor shall include this clause in every subcontract and purchase order that is subject to the Equal Employment Opportunity clause of this contract.

FEDERAL REQUIREMENT: FR-21

RECYCLED MATERIALS

2 CFR § 200.322, 40 CFR part 247, Solid Waste Disposal Act

Contractor and subcontractor agree to comply with Section 6002 of the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act, and the regulatory provisions of 40 CFR Part 247. In the performance of this contract and to the extent practicable, the Contractor and subcontractors are to use products containing the highest percentage of recovered materials for items designated by the Environmental Protection Agency (EPA) under 40 CFR Part 247 whenever:

- 1) The contract requires procurement of \$10,000 or more of a designated item during the fiscal year; or
- 2) The contractor has procured \$10,000 or more of a designated item using Federal funding during the previous fiscal year

The list of EPA-designated items is available at www.epa.gov/smm/comprehensive-procurement-guidelines-construction-products.

Section 6002(c) establishes exceptions to the preference for recovery of EPA-designated products if the contractor can demonstrate the item is:

- a) Not reasonably available within a timeframe providing for compliance with the contract performance schedule;
- b) Fails to meet reasonable contract performance requirements; or
- c) Is only available at an unreasonable price.

FEDERAL REQUIREMENT: FR-22
LIMITED
RIGHTS TO INVENTORIES

2 CFR § 200, Appendix II(F), 37 CFR §401

Contracts or agreements that include the performance of experimental, developmental, or research work must provide for the rights of the Federal Government and the Owner in any resulting invention as established by 37 CFR part 401, Rights to Inventions Made by Non-profit Organizations and Small Business Firms under Government Grants, Contracts, and Cooperative Agreements. This contract incorporates by reference the patent and inventions rights as specified within 37 CFR §401.14. Contractor must include this requirement in all sub-tier contracts involving experimental, developmental, or research work.

FEDERAL REQUIREMENT: FR-23
LIMITED
SEISMIC SAFETY
49 CFR part 41

Construction Contracts

The Contractor agrees to ensure that all work performed under this contract, including work performed by subcontractors, conforms to a building code standard that provides a level of seismic safety substantially equivalent to standards established by the National Earthquake Hazards Reduction Program (NEHRP). Local building codes that model their code after the current version of the International Building Code (IBC) meet the NEHRP equivalency level for seismic safety.

Professional Service Agreements for Design

In the performance of design services, the Consultant agrees to furnish a building design and associated construction specification that conform to a building code standard that provides a level of seismic safety substantially equivalent to standards as established by the National Earthquake Hazards Reduction Program (NEHRP). Local building codes that model their building code after the current version of the International Building Code (IBC) meet the NEHRP equivalency level for seismic safety. At the conclusion of the design services, the Consultant agrees to furnish the Owner a "certification of compliance" that attests conformance of the building design and the construction specifications with the seismic standards of NEHRP or an equivalent building code.

This provision applies to any contract involved in the construction of new buildings or structural addition to existing buildings.

FEDERAL REQUIREMENT: FR-24

TAX DELINQUENT AND FELONY CONVICTION

Sections 415 and 416 of Title IV, Division L of the Consolidated Appropriations Act, 2014 (Pub. L. 113-76), DOT Order 4200.6 - Requirements for Procurement and Non-Procurement Regarding Tax Delinquency and Felony Convictions

The applicant must complete the two certification statements on the RF-24 Tax Delinquency and Felony Conviction Forms. The applicant must indicate its current status as it relates to tax delinquency and felony conviction by inserting a checkmark (✓) in the space following the applicable response on the forms. The applicant agrees that, if awarded a contract resulting from this solicitation, it will incorporate this provision for certification in all lower tier subcontracts.

Term Definitions

Felony conviction: Felony conviction means a conviction within the preceding twenty-four (24) months of a felony criminal violation under any Federal law and includes conviction of an offense defined in a section of the U.S. code that specifically classifies the offense as a felony and conviction of an offense that is classified as a felony under 18 U.S.C. § 3559.

Tax Delinquency: A tax delinquency is any unpaid Federal tax liability that has been assessed, for which all judicial and administrative remedies have been exhausted, or have lapsed, and that is not being paid in a timely manner pursuant to an agreement with the authority responsible for collecting the tax liability.

FEDERAL REQUIREMENT: FR-25

TERMINATION OF CONTRACT

2 CFR § 200 Appendix II(B), FAA Advisory Circular 150/5370-10, Section 80-09

Termination for Convince (Construction & Equipment Contracts)

The Owner may terminate this contract in whole or in part at any time by providing written notice to the Contractor. Such action may be without cause and without prejudice to any other right or remedy of Owner. Upon receipt of a written notice of termination, except as explicitly directed by the Owner, the Contractor shall immediately proceed with the following obligations regardless of any delay in determining or adjusting amounts due under this clause:

1. Contractor must immediately discontinue work as specified in the written notice.
2. Terminate all subcontracts to the extent they relate to the work terminated under the notice.
3. Discontinue orders for materials and services except as directed by the written notice.
4. Deliver to the Owner all fabricated and partially fabricated parts, completed and partially completed work, supplies, equipment and materials acquired prior to termination of the work, and as directed in the written notice
5. Complete performance of the work not terminated by the notice.
6. Take action as directed by the Owner to protect and preserve property and work related to this contract that Owner will take possession.

Owner agrees to pay Contractor for:

- 1) completed and acceptable work executed in accordance with the contract documents prior to the effective date of termination;
- 2) documented expenses sustained prior to the effective date of termination in performing work and furnishing labor, materials, or equipment as required by the contract documents in connection with uncompleted work;
- 3) reasonable and substantiated claims, costs, and damages incurred in settlement of terminated contracts with Subcontractors and Suppliers; and
- 4) reasonable and substantiated expenses to the Contractor directly attributable to Owner's termination action.

Owner will not pay Contractor for loss of anticipated profits or revenue or other economic loss arising out of or resulting from the Owner's termination action.

The rights and remedies this clause provides are in addition to any other rights and remedies provided by law or under this contract.

Termination for Default (Construction)

Section 80-09 of FAA Advisory Circular 150/5370-10 establishes conditions, rights, and remedies associated with Owner termination of this contract due to default of the Contractor.

Termination for Default (Equipment)

The Owner may, by written notice of default to the Contractor, terminate all or part of this Contract if the Contractor:

1. Fails to commence the Work under the Contract within the time specified in the Notice- to-Proceed;

2. Fails to make adequate progress as to endanger performance of this Contract in accordance with its terms;
3. Fails to make delivery of the equipment within the time specified in the Contract, including any Owner approved extensions;
4. Fails to comply with material provisions of the Contract;
5. Submits certifications made under the Contract and as part of their proposal that include false or fraudulent statements; or
6. Becomes insolvent or declares bankruptcy.

If one or more of the stated events occur, the Owner will give notice in writing to the Contractor and Surety of its intent to terminate the contract for cause. At the Owner's discretion, the notice may allow the Contractor and Surety an opportunity to cure the breach or default.

If within [10] days of the receipt of notice, the Contractor or Surety fails to remedy the breach or default to the satisfaction of the Owner, the Owner has authority to acquire equipment by other procurement action. The Contractor will be liable to the Owner for any excess costs the Owner incurs for acquiring such similar equipment.

Payment for completed equipment delivered to and accepted by the Owner shall be at the Contract price. The Owner may withhold from amounts otherwise due the Contractor for such completed equipment, such sum as the Owner determines to be necessary to protect the Owner against loss because of Contractor default.

Owner will not terminate the Contractor's right to proceed with the Work under this clause if the delay in completing the work arises from unforeseeable causes beyond the control and without the fault or negligence of the Contractor. Examples of such acceptable causes include: acts of God, acts of the Owner, acts of another Contractor in the performance of a contract with the Owner, and severe weather events that substantially exceed normal conditions for the location.

If, after termination of the Contractor's right to proceed, the Owner determines that the Contractor was not in default, or that the delay was excusable, the rights and obligations of the parties will be the same as if the Owner issued the termination for the convenience the Owner.

The rights and remedies of the Owner in this clause are in addition to any other rights and remedies provided by law or under this contract.

FEDERAL REQUIREMENT: FR-26

VETERAN'S PREFERENCE

49 USC § 47112(c)

In the employment of labor (excluding executive, administrative, and supervisory positions), the Contractor and all sub-tier contractors must give preference to covered veterans as defined within Title 49 United States Code Section 47112. Covered veterans include Vietnam-era veterans, Persian Gulf veterans, Afghanistan-Iraq war veterans, disabled veterans, and small business concerns (as defined by 15 USC 632) owned and controlled by disabled veterans. This preference only applies when there are covered veterans readily available and qualified to perform the work to which the employment relates.

Exhibit F:

Project Labor Agreement

**LOS ANGELES DEPARTMENT OF
AIRPORTS CONSTRUCTION
PROJECT LABOR AGREEMENT**

2020 AMENDMENT

**2020 AMENDMENT TO THE
LOS ANGELES DEPARTMENT OF AIRPORTS CONSTRUCTION
PROJECT LABOR AGREEMENT**

Parsons Constructors Inc. ("Parsons") and the Los Angeles/Orange Counties Building and Constructions Trades Council ("Council") on behalf of itself and on behalf of the Unions signing this Agreement, hereby agree to amend their Project Labor Agreement ("PLA") as follows:

1. Page 2 of the Table of Contents (which lists the Attachment and Addenda) is hereby deleted in its entirety and replaced with the following:

Attachment 1
Letter of Assent (Revised)

Addendum No. 1 (Revised per Item 18 of this 2020
Amendment) May 1, 2000 Letter of Clarification

Addendum No. 2 (Superseded by Item 8 of this 2020 Amendment)
Morgan, Lewis & Bockius April 16, 2001 letter
(Permanent Arbitrators)

Addendum No. 3 (Superseded by Item 8 of this 2020 Amendment)
Memorandum of Understanding
(List of Available Arbitrators)

Addendum No. 4
Parsons' December 14, 1999 letter
(Redi-mix material delivery)

Addendum No. 5
Parsons' December 9, 1999 letter
(Elevator Union Clarification)

Addendum No. 6
December 3, 2010 PLA Amendment
(Extension of Agreement/Duration)

Addendum No. 7
December 2010 Clarification
(Hiring Obligations)

Addendum No. 8
Craft Employee Request Form

Addendum No. 9
Resolution No. 24316
(Additional Projects)

Addendum No. 10
Drug and Alcohol Testing Policy

2. Article II Section 4(b) is hereby deleted in its entirety and replaced with the following:

Any dispute as to the applicable source between this Agreement and any Schedule A for determining the wages, hours and working conditions of employees on the Project shall be resolved by one of the Arbitrators, selected by the negotiating parties, under the procedures established in Article VII. It is understood that this Agreement, together with the referenced Schedule As constitute a self-contained, stand-alone agreement and by the virtue of having become bound to this Project Labor Agreement the Contractor will not be obligated to sign any other local, area or national Agreement as a condition of performing work within the scope of this Agreement.

3. Article III Section 6 is hereby deleted in its entirety and replaced with the following:

The local unions will exert their utmost efforts to recruit and refer sufficient numbers of skilled craft workers to fulfill the labor requirements of the Contractor, including specific employment obligations to which the Contractor may be legally obligated. The parties to this Agreement support the development of increased numbers of skilled construction workers from the residents of the area of the Project to meet the needs of the Project and the requirements of the industry generally. Toward that end, the unions agree to first refer, to the extent permitted by law and the hiring hall procedures, Impact Area Residents or Local Residents as journeymen and apprentices for employment on the Project. The qualifying zip codes for both Impact Area Residents and Local Residents are listed in Addendum No. 8 – Craft Employee Request Form. Local Residents are defined as those employees living within the zip codes of the City of Los Angeles, Culver City, Hawthorne and the West Los Angeles Veterans Affairs Campus (90073) that are not otherwise included in the Impact Area zip codes. In addition, the parties agree to recruit Impact Area Residents and Local Residents and facilitate entrance into such apprenticeship and training programs as may be operated by the signatory local unions. All parties agree to fully cooperate in local hiring and training programs such as the HireLAX Apprenticeship Readiness Program.

4. Article III Section 8 is hereby deleted in its entirety.
5. Article III Section 9 is hereby deleted in its entirety and replaced with the following:

Employees are not required to become or remain union members as a condition of performing work on a Project under this Agreement. Contractors shall make and transmit all deductions for union dues, fees, and assessments that have been authorized by employees in writing in accordance with the applicable Schedule A. Nothing in this Section 9 is intended to supersede the requirements of the applicable Schedule A(s) as to those Contractors otherwise signatory to such Schedule A(s) and as to the employees of those Contractors who are performing work on a Project.

6. The last full paragraph of Article III Section 10 is hereby deleted in its entirety and replaced with the following:

For each covered Project, the Union will refer to such Contractor one employee from the hiring hall out-of-work list for each affected trade or craft, and will then refer one of such Contractor's "core" employees and shall repeat the process as follows: one from the hiring hall and one "core" employee, until such contractor's requirements are met or until such contractor has hired five (5) such "core" employees for that craft, whichever occurs first. Thereafter, all additional employees in the affected trade or craft shall be hired exclusively from the hiring hall out-of-work list. In the event of a reduction-in-force or layoff, such will take place in a manner to assure that the number of core employees in the affected craft does not exceed, at any time, the number of others working in that craft who were employed pursuant to other procedures available to the Contractor under this Agreement.

7. The following new Section 13 (c) is hereby added to Article III as follows:

The Contractors and the Unions recognize a desire to facilitate the entry into the building and construction trades of veterans who are interested in careers in the building and construction industry. The Contractors and Unions agree to utilize the services of the Center for Military Recruitment, Assessment and Veterans Employment (hereinafter "Center") and the Center's "Helmets to Hardhats" program to serve as a resource for preliminary orientation, assessment of construction aptitude, referral to apprenticeship programs or hiring halls, counseling and mentoring, support network, employment opportunities and other needs as identified by the Parties. For purposes of this Agreement the term "Eligible Veteran" shall have the same meaning as the term "veteran" as defined under Title 5, Section 2108(1) of the United States Code as the same may be amended or re-codified from time to time. It shall be the responsibility of each qualified Veteran to provide the Unions with proof of his/her status as an Eligible Veteran.

The Unions and Contractors agree to coordinate with the Center to create and maintain an integrated database of veterans interested in working on this Project and of apprenticeship and employment opportunities for this Project. To the

(extent permitted by law, the Unions will give credit to such veterans for bona fide, provable past experience.

8. Article VII Section 2 (iii), Addendum No. 2 and Addendum No.3 are hereby deleted in their entirety and replaced with the following new Article VII Section 2 (iii), as follows:

Step 3(a). If the grievance shall have been submitted but not resolved under Step 2, either party may request in writing to the Agreement Coordinator (with copy(ies) to the other party(ies)) within seven (7) calendar days after the initial Step 2 meeting, that the grievance be submitted to an arbitrator mutually agreed upon by the parties to the grievance, selected from the following permanent panel of six (6) arbitrators, pre-selected by the negotiating parties to this Agreement, as follows: (1) Thomas Pagan; (2) David Hart; (3) Edna Francis; (4) Michael Prihar; (5) Fred Horowitz; and (6) Sara Adler. Should the parties to the grievance be unable to agree upon the selection of one of the six listed arbitrators, within ten (10) working days of the arbitration request, the Agreement Coordinator shall select one of the seven listed arbitrators on a rotational basis. The decision of the arbitrator shall be final and binding on all parties and the fee and expenses of such arbitrations shall be borne equally by the involved Contractor and the involved Union(s).

9. The following new subsection (a) is added to Article VIII section 2 as follows:

(If a dispute arising under this Article involves the Southwest Regional Council of Carpenters or any of its subordinate bodies, an Arbitrator shall be chosen by the procedures specified in Article V, Section 5, of the Plan from a list composed of John Kagel, Thomas Angelo, Robert Hirsch, and Thomas Pagan, and the Arbitrator's hearing on the dispute shall be held at the offices of the Council within 14 days of the selection of the Arbitrator. All other procedures shall be as specified in the Plan.

10. Article IX Section 1 is deleted in its entirety and replaced with the following:

All employees covered by this Agreement shall be classified in accordance with work performed and paid the hourly wage rates for those classifications in compliance with the applicable prevailing federal or state rate determination. If the prevailing wage laws are repealed during the term of this Agreement, the Contractor shall pay the wage rates established under the Schedule As, except as otherwise provided in this Agreement. Notwithstanding any other provision in this Agreement, Contractors directly signatory to one or more of the Schedule A Agreements are required to pay all of the wages set forth in those Schedule A Agreements without reference to the forgoing.

11. The first paragraph of Article IX Section 2 is deleted in its entirety and replaced with the following:

Contractor is to pay contributions to the established employee benefits funds in the amounts designated in the appropriate Schedule A and to make all employee-authorized deductions on behalf of all employees in the amounts designated in the appropriate Schedule A; provided, however, that the Contractor and the Union agree that only such bona fide employee benefits as accrue to the direct benefit of the employees (such as pension and annuity, health and welfare, vacation, apprenticeship, training funds, etc.) shall be included in this requirement and required to be paid by the Contractor on this Project; and provided that such contributions shall not exceed the contribution amounts set forth in the applicable prevailing wage determination. Bona fide jointly-trusted benefit plans or authorized employee deduction programs established or negotiated under the applicable Schedule A or by the parties to this Agreement during the life of this Agreement may be added, subject to the limitations upon such negotiated changes contained in Article XVII, Section 2 of this Agreement, and provided that contributions do not exceed contribution amounts set forth in the applicable prevailing wage determination. Notwithstanding any other provision in this Agreement, Contractors directly signatory to one or more of the Schedule A Agreements are required to pay all contributions set forth in those Schedule A Agreements without reference to the forgoing.

12. Sections 2, 3, 4, 5, 6, 7, 9 and 11 of Article X are hereby deleted in their entirety.

13. Article XI Section 1 is hereby deleted in its entirety and replaced with the following:

The parties recognize the need to maintain continuing support of programs designed to develop adequate numbers of competent workers in the construction industry, and the special need and obligation to capitalize on the availability of the local workforce in the Los Angeles area entering the construction industry. To these ends, the Contractor will employ apprentices in their respective crafts to perform such work as is within their capabilities and which is customarily performed by the craft in which they are indentured. Further, the parties will recruit and encourage Impact Area Residents, Local Residents, minorities and women to commence and progress in apprenticeship programs in the construction industry.

14. Article XI Section 3 is hereby deleted in its entirety and replaced with the following:

It is recognized that special procedures may be established by joint agreement of the parties to this Agreement and governmental agencies for the training and employment of persons who have not previously qualified to be employed on construction Projects of the type covered by this Agreement. The parties agree that they will make all good faith efforts to assist in the proper implementation of such orders, regulations or agreements for the general benefit of the Impact Area Residents and Local Residents, including the utilization of the HireLAX Apprenticeship Readiness Program.

- (
15. Article XII Section 1(c) is hereby deleted in its entirety and replaced with the following:

The Parties to this Agreement adopt the Los Angeles/Orange Counties Building and Construction Trades Council Approved Drug and Alcohol Testing Policy, a copy of which is hereby attached to the PLA as Addendum 10 and which shall be the policy and procedure utilized under this Agreement.

16. Article XIII Section 1 is deleted in its entirety and replaced with the following:

The Contractor and Union agree that they will not discriminate against any employee or applicant for employment because of race, sex, religion, creed, political affiliation, membership in a labor organization, national origin, color, disability as defined by law, disabled veteran status, Vietnam veteran status, religion, age (40 and above), medical condition, marital status, ancestry, or sexual orientation in any manner prohibited by law or regulation, in hiring and dispatching workers for the Project. The Union shall cooperate with the Contractors' obligations to take affirmative action to ensure that applicants are employed, and that employees are treated during employment without regard to such status. Relevant employment actions shall include, but not be limited to the following: employment, upgrading, demotion, or transfer; recruitment or recruitment advertising; layoff or termination; rates of pay or other forms of compensation; and selection for training, including apprenticeship. Any complaints regarding the application of this provision shall be brought to the immediate attention of the involved contractor for consideration and resolution.

- (
17. Article XIV is hereby deleted in its entirety.

18. It is understood by the Parties to the Agreement that the City no longer owns or operates Ontario Airport. All references to airport-related facilities owned and controlled by the City is limited to Los Angeles International Airport (LAX), Van Nuys Airport (VNY), and Palmdale Aviation-related Property. Consequently, it will not be required for the San Bernardino and Riverside County Building and Construction Trades Council to remain signatory to this Agreement.

Therefore, Item 2, Section 1(b) of Addendum 1 is hereby deleted in its entirety and replaced with the following:

(b) Such other major construction, rehabilitation, and renovation Projects involving airport-related facilities at Los Angeles International Airport (LAX), Van Nuys Airport (VNY), and Palmdale Aviation-related Property, as are designated by the City to be covered by this Agreement.

19. The following new Section 1(c) is hereby added to Addendum No. 6, the December 3, 2010 PLA Amendment which further amends Section 1 of Article XIX, as follows:

(

Section 1(c) The signatory parties mutually agree this 3rd day of September, 2020, to extend the existing Agreement effective January 1, 2021 for an additional ten

(10) years, through December 31, 2030, for Project work meeting conditions established in Article II, Section 1 (a) or (b) with a bid advertisement date or request for proposal advertisement date on or after January 1, 2021. The amended Agreement shall continue in effect until December 31, 2030, and thereafter with regard to any work covered by this Agreement commenced prior to that date but not executed to Final Completion prior to that date. The Agreement may be extended by mutual agreement of the City and the Unions, not to exceed ten (10) additional years, with twelve (12) month notice to the other party.

20. The three (3) paragraphs under item (1) of Addendum No. 7 is hereby deleted in its entirety and replaced with the following:

It is understood that all Contractors awarded contracts or sub-contracts for a covered Project are legally obligated (pursuant to their commercial contracts relating to such covered work on a Project), to maximize the employment of qualified Impact Area Residents and Local Residents, with the goal that at least 30% of the total hours worked by covered employees on each Project shall be performed by Impact Area Residents or Local Residents. The qualifying zip codes for Impact Area Residents and Local Residents are listed in Addendum No. 8 – Craft Employee Request Form. Contractors shall develop a hiring plan for maximizing the employment of Impact Area Residents and Local Residents and maintain records of their compliance efforts. Those plans and records shall be made available to the Agreement Coordinator upon request. The Contractors and the signatory unions will make every good faith effort to request for referral and to refer, respectively, qualified individuals meeting the Impact Area Resident and Local Resident hiring residency qualifications.

In recognition of these obligations, the signatory unions, as the prime referral source, as well as the apprenticeship programs in which the signatory unions participate, shall cooperate and work with the contractors, LAWA, the City of Los Angeles, and the organizations designated by LAWA, to assist in the identification and training of Impact Area Residents and Local Residents for work and the referral of such persons to work opportunities arising under this Agreement.

The contractors and referral systems of the signatory unions will maintain records with regard to all requests for referral, referrals, and employment of both Impact Area Residents and Local Residents. Such records shall be available upon request to the Agreement Coordinator.

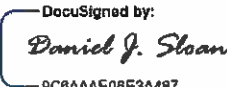

21. The Parties agree that Addendum 9 is obsolete.

SIGNATURE PAGES

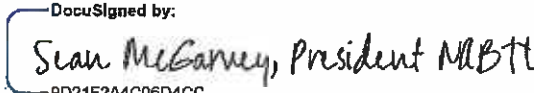

**2020 AMENDMENT OF THE LOS ANGELES WORLD AIRPORTS
PROJECT LABOR AGREEMENT**

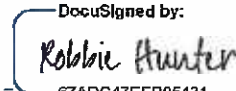

This Amendment may be executed in one or more counterparts, each of which shall be deemed an original, but all which together shall constitute one and the same instrument. Electronic signatures collected using a bona fide electronic signature collection system are to be deemed equivalent to original "wet ink" signatures under this Amendment.

**LOS ANGELES INTERNATIONAL AIRPORT
CONSTRUCTION
PROJECT LABOR AGREEMENT**

This Project Labor Agreement (hereinafter, the "Agreement") is entered into this 19th day of November, 1999, by and between Parsons Constructors, Inc., its successors or assigns (hereinafter "PCI" or "Agreement Coordinator") and The Building and Construction Trades Department, AFL-CIO (hereinafter "BCTD"), on behalf of its affiliated International Unions, The Building and Construction Trades Council of California (hereinafter "California Council"), The Building and Construction Trades Council of Los Angeles-Orange County (hereinafter "Los Angeles Council"), and the signatory Craft Unions affiliated with The Building & Construction Trades Department AFL-CIO (all hereinafter, collectively called the "Union" or "Unions"), with respect to the construction work within the scope of this Agreement owned by The City of Los Angeles, Department of Airports, acting through the Board of Airport Commissioners (hereinafter, "City," "Department," or "Commission," as appropriate) for the renovation and improvement of the Los Angeles International Airport's ("LAX") Tom Bradley International Terminal (hereinafter, "TBIT"), and such other major construction projects and related construction work as the City determines is appropriate for coverage and which is commenced prior to December 31, 2010, collectively referred to herein as the "Project."

It is understood by the parties to this Agreement that if this Agreement is acceptable to the Commission, it will become the policy of the Commission that the construction work covered by this Agreement shall be contracted exclusively to Contractors who agree to execute and be bound by the terms of this Agreement. Therefore, the Unions agree that other contractors may execute the Agreement for purposes of covering such work. PCI shall administer this Agreement and shall monitor the compliance with it by all contractors, who, together with their subcontractors, through their execution of this Agreement, the Letter of Assent, or other document binding them to this Agreement, shall become bound hereto. It is understood, however, that the current contractual arrangement between the City and PCI is of limited duration, not for the length of the Project, and that should a new Contract not be awarded to PCI, a new Agreement Coordinator will be designated by the City and such Agreement Coordinator will execute this Agreement and accept and undertake the obligations, responsibilities and authority of PCI for the implementation of this Agreement.

The term "Contractor" shall include all construction contractors and subcontractors of whatever tier engaged in on-site construction work within the scope of this Agreement, including the Agreement Coordinator, if awarded construction work within the scope of this Agreement. Where specific reference to PCI (or its successor) alone is intended, the term "PCI" or "Agreement Coordinator" is used.

The Unions, the Agreement Coordinator and all signatory contractors agree to abide by the terms and conditions contained in this Agreement. This Agreement represents complete understanding of the parties, and no Contractor is or will be required to sign any other agreement with a signatory union as a condition of performing work within the scope of this Agreement. No practice, understanding or agreement between a Contractor and a Union party which is not specifically set forth in this Agreement will be binding on any other party unless endorsed in writing by the Agreement Coordinator

The Unions agree that this Agreement will be made available to, and will fully apply to, any successful bidder for Project work who becomes a signatory hereto, without regard to whether that successful bidder performs work at other sites on either a union or a non-union basis, and without regard to whether employees of such bidder are or are not members of any union. This Agreement shall not apply to the work of any contractor which is performed at any location other than the project site as defined in this Agreement.

The use of the masculine or feminine gender or titles in this Agreement shall be construed as including both genders and not as gender limitations unless the Agreement clearly requires a different construction.

ARTICLE I

PURPOSE

The initial phase of the Project, the renovation and improvement of TBIT, is a multi-year, over \$100 million dollar undertaking of the City. The goal of this Project is to provide added space to LAX's existing Tom Bradley International Terminal Facility, which provides more than 8.7 million international travelers with transportation services in and out of the Los Angeles area.

The TBIT construction will rehabilitate, renovate, and improve the existing terminal facility by "infilling" the central area to the west of the main terminal building. The Project includes improvement of airline and public lounge areas, baggage claim areas and devices, and administrative offices. The design changes to TBIT will provide approximately 285,000 net usable square feet of floor space, distributed over seven floor levels. Also included in the renovations is approximately 195,000 net square feet of the existing central terminal area.

Finally, the TBIT Project is the first of many major construction projects expected to be approved and built at the Airport during the next decade. These projects are critical to the continued value of the Airport for the domestic and international transportation of passengers and cargo without delay, and for the overall economic well-being of the greater Los Angeles and Southern California. Therefore, the timely and successful completion of the construction work covered by this Agreement is vital and it is essential that the construction be done in an efficient and economical manner in order to secure the optimum productivity and eliminate delay. The parties recognize that such work will take place in the middle of the

continuing operation of the Airport and that it is critical to minimize the inconvenience to the 62 million people who use the facilities annually. The parties acknowledge the vital economic role which the efficient and functioning of the Airport holds for the economy of California. They will endeavor to avoid interference with the ongoing operations of the Airport, completing the work within the scope of this Agreement without delay or unnecessary cost.

In recognition of these special needs of this Project and to maintain a spirit of harmony, labor management peace and stability during the term of this Project Labor Agreement, the parties agree to establish effective and binding methods for the settlement of all misunderstandings, disputes or grievances which may arise; and in recognition of such methods and procedures, the Unions agree not to engage in any strikes, slow downs or interruption of work and the Contractor agrees not to engage in any lock out.

ARTICLE II

SCOPE OF AGREEMENT

This Agreement, hereinafter designated as the "Project Labor Agreement" or "Agreement" shall apply and is limited to all construction as generally described in Section 1 of this Article performed by those contractor(s) of whatever tier which have contracts awarded for such work, which may include the Agreement Coordinator, on or after the effective date of this Agreement, with regard to the construction, reconstruction, rehabilitation, or any other construction-related activities necessary to the development of Tom Bradley International Terminal and related facilities and such other major construction projects within the scope of this Agreement, all of which are hereinafter referred to as the "Project" and generally defined below.

Section 1. The Project is generally defined as and limited to:

(a) The renovation, rehabilitation and improvement of the Tom Bradley International Terminal Facility, in an approximately 285,000 square foot infill area of that terminal, and which will include the renovation of airline and public lounge areas, baggage claim facilities, and the Federal Inspection Service and Department administrative offices; and

(b) Such other major construction, rehabilitation, and renovation projects involving Airport-related facilities as are designated by the City to be covered by this Agreement.

It is understood by the parties that the City may at any time and at its sole discretion determine to build segments of the Project under this Agreement not currently proposed, or to modify or not to build any one or more of the particular segments proposed to be covered.

Section 2. Items specifically excluded from the scope of this Agreement include the following:

(a) Work of non-manual employees, including but not limited to, superintendents, supervisors, staff engineers, quality control and quality assurance personnel, timekeepers, mail carriers, clerks, office workers, including messengers, guards, safety personnel, emergency medical and first aid technicians, and other professional, engineering, administrative, supervisory and management employees.

(b) Equipment and machinery owned or controlled and operated by the City, Department, or Commission.

(c) All off-site manufacture and handling of materials, equipment or machinery; provided, however, that lay-down or storage areas dedicated solely to Project work, delivery of material or goods between locations on the site, and all on-site transportation involving any batch plant erected on the site, are within the scope of this Agreement.

(d) All employees of the City, Department, Commission, Agreement Coordinator, and design team, or any other consultant of the City not performing manual labor with the scope of this Agreement.

(e) Any work performed on or near or leading to or into the site of work covered by this Agreement and undertaken by state, county, city or other governmental bodies, or their contractors; or by public utilities or their contractors; and/or by the City or its contractors (for work which is not part of the scope of this Agreement).

(f) Off-site maintenance of leased equipment and on-site supervision of such work.

(g) Work by employees of a manufacturer or vendor necessary to maintain such manufacturer's or vendor's warranty or guarantee.

(h) Non-construction support services contracted by the City, Agreement Coordinator, or Contractor in connection with this Project.

(i) Any work performed by tenants of the City or their contractors.

(j) All work by employees of the City or its contractors involving general maintenance, emergency repair, and/or cleaning work, except as specifically covered by this Agreement.

(k) Installation of speciality items which may be purchased by the City may be performed by employees employed under this Agreement with the participation of other

personnel in a supervisory role, or, in limited circumstances requiring special knowledge of the particular item(s), or where required to protect a guarantee or warranty, may be performed by employees of the vendor or other companies where employees working under this Agreement lack the required necessary skills or cannot protect a guarantee or warranty offered by the vendor. These speciality items may include but are not limited to baggage handling and security systems.

(l) The City's controlled environmental and hazardous materials management program and integrated security system, unless such is included in new construction contracts let as part of projects covered by this Agreement.

Section 3(a). The City, the PCI, and/or Contractors, as appropriate, have the absolute right to award contracts or subcontracts on this Project notwithstanding the existence or non-existence of any Agreements between such contractor and any union party provided only that such Contractor is willing, ready and able to execute and comply with this Project Labor Agreement, should such Contractor be awarded work covered by this Agreement.

(b) It is agreed that all contractors and subcontractors, of whatever tier, who have been awarded contracts of work covered by this Agreement on or after the effective date of this Agreement shall be required to accept and to be bound by the terms and conditions of this Project Labor Agreement, and shall evidence their acceptance by the execution of the Agreement or the Letter of Assent, as set forth in Attachment 1 hereto, prior to the commencement of work. A copy of the Agreement or Letter of Assent executed by the Contractor shall be available for review by the Union.

Section 4(a). The provisions of this Project Labor Agreement (including the Schedule As, which are the local Collective Bargaining Agreements of the signatory unions having jurisdiction over the work on the Project (as may be changed from time-to-time consistent with Article XIX, Section 2) and which are incorporated herein by reference) shall apply to the work covered by this Agreement, notwithstanding the provisions of any other local, area and/or National Agreements which may conflict with or differ from the terms of this Agreement. Where a subject covered by the provisions of this Agreement is also covered by a Schedule A, the provisions of this Agreement shall prevail. Where subject is covered by the provisions of a Schedule A and is not covered by this Agreement, the provisions of the Schedule A shall prevail.

(b) Any dispute as to the applicable source between this Agreement and any Schedule A for determining the wages, hours and working conditions of employees on the Project shall be resolved by Howard S. Block, selected by the negotiating parties, under the procedures established in Article VII. It is understood that this Agreement, together with the referenced Schedule As constitute a self-contained, stand-alone agreement and by the virtue of having become bound to this Project Labor Agreement the Contractor will not be obligated to sign any other local, area or national Agreement as a condition of performing work within the scope of this Agreement.

Section 5. The Agreement shall only be binding on the signatory parties hereto and shall not apply to the parents, affiliates, subsidiaries, or other ventures of any such party.

Section 6. This Agreement shall be limited to the construction work within the scope of this Agreement for which bids have been received on and after the effective date of this Agreement, including, specifically, site preparation and related demolition work, and utilities and modifications or rehabilitation of existing facilities. Nothing contained herein shall be construed to prohibit, restrict, or interfere with the performance of any other operation, work or function which may be performed or contracted by the City for its own account on the property or in and around the construction site.

Section 7. It is understood that the liability of the Contractor and the liability of the separate unions under this Agreement shall be several and not joint. The Unions agree that this Agreement does not have the effect of creating any joint employment status between or among the City or the PCI and/or any Contractor.

Section 8. None of the provisions of this Agreement shall be construed to prohibit or restrict the City or its employees from performing work not covered by this Agreement on or around the construction site. As areas of covered work are accepted by the City, the Agreement shall have no further force or effect on such items or areas except where the Contractor is directed by the City to engage in repairs, modifications, check-out and/or warranty functions required by its contract(s) with the City.

Section 9. It is understood that the City, at its sole option, may terminate, delay and/or suspend any and all portions of the covered work at any time. Further, the City may prohibit some or all work on certain days, for example, peak travel days in holiday periods, to accommodate LAX operational considerations; and/or require such other operational or scheduled changes as it may deem necessary to maintain efficient operations for the traveling public. In order to permit the Contractor and Union to make appropriate scheduling plans, the City will provide the Agreement Coordinator, the Contractor, and the Union with sufficient reasonable notice of any changes it is requiring pursuant to this Clause.

Section 10. The parties recognize that by virtue of the operation of the Airport, the City, its Contractors, and their employees are subject to regulations and directives issued by the Federal Aviation Administration and other federal and state agencies. Nothing in this Agreement is intended to compromise compliance by the City or any entity covered by this Agreement, with their obligations to the state and federal agencies and authorities with jurisdiction over their operations or those of the Airport. In the event a directive is received which conflicts with any provision of the Agreement, the directive shall take priority and the Agreement Coordinator and affected contractors and unions will be notified by the most expeditious means available.

ARTICLE III
UNION RECOGNITION AND EMPLOYMENT

Section 1. The Contractor recognizes the Union as the sole and exclusive bargaining representative of all employees working on the Project within the scope of this Agreement.

Section 2. The Contractor shall have the right to determine the competency of all employees, the number of employees required and shall have the sole responsibility for selecting employees to be laid off, consistent with Section 11 and with Article IV, Section 3, below. The Contractor shall also have the right to reject any applicant referred by a local Union, subject to any show-up payment required by Article X, Section 8(a).

Section 3. For signatory unions now having a job referral system contained in Schedule A, the Contractor agrees to comply with such system and it shall be used exclusively by such Contractor, except as it may be modified by this Article. Such job referral system will be operated in a non-discriminatory manner and in full compliance with federal, state, and local laws and regulations which require equal employment opportunities and non-discrimination, and referrals shall not be affected in any way by the rules, regulations, by-laws, constitutional provisions or any other aspects or obligations of union membership, policies or requirements. All of the foregoing hiring procedures, including related practices affecting apprenticeship and training, will be operated so as to facilitate the ability of the contractors to meet any and all equal employment opportunity/affirmative action obligations.

Section 4. In the event that local unions are unable to fill any requisitions for employees within forty-eight (48) hours after such requisition is made by the Contractor (Saturdays, Sundays, and holidays excepted), the Contractor may employ applicants from any other available source. The Contractor shall inform the Union of any applicants hired from other sources.

Section 5. The local unions shall not knowingly refer an employee currently employed by any Contractor working under this Agreement to any other Contractor. No Contractor shall knowingly hire an employee employed by a Contractor working under this Agreement, nor shall they induce an employee to change employers.

Section 6. The local unions will exert their utmost efforts to recruit and refer sufficient numbers of skilled craft workers to fulfill the labor requirements of the Contractor, including specific employment obligations to which the Contractor may be legally obligated. The parties to this Agreement support the development of increased numbers of skilled construction workers from the residents of the area of the Project to meet the needs of this Project and the requirements of the industry generally. Toward that end, the unions agree to encourage the referral and utilization, to the extent permitted by law and the hiring hall procedures, of qualified residents as journeymen, apprentices and trainees on this Project and entrance into such apprenticeship and training programs as may be operated by the signatory

local unions. All parties agree to fully cooperate in local hiring and training programs such as the "Workforce Development System."

Section 7. In the event that a signatory local union does not have a job referral system as set forth in Section 3 above, the Contractor shall give the union equal opportunity to refer applicants, subject to the provision of Section 4 of this Article and in a non-discriminatory manner consistent with Section 3 of this Article. The Contractor shall notify the Union of employees hired from any source other than referral by the Union.

Section 8. Notwithstanding any other provision, in the event any Union either fails or is unable to refer qualified minority or female applicants in numbers equaling the City's or a Contractor's expected levels of participation, the Contractor may use employment sources other than the Union registration and referral systems if such use is necessary to meet affirmative action or equal employment opportunity obligations applicable to the City or Contractor by virtue of any federal, state, or local law, rule, ordinance, regulation or executive order, or judicial decision or decree.

Section 9. No employee covered by this Agreement shall be required to join any union as a condition of being employed, or remaining employed, on the Project; provided, however, that an employee who is a member of the referring union at the time of referral shall maintain that membership in good standing while employed under the Agreement. All employees shall, however, be required to comply with the union security provisions of the applicable Schedule A for the period during which they are performing on-site Project work to the extent, as required by law, of rendering payment of the applicable monthly working dues and all non-initiation or application fees uniformly required for union membership in the local union which is signatory to this Agreement.

Section 10. The parties recognize the City's commitment to provide opportunities to participate on the Project to minority, women, disadvantaged and other business enterprises as well as other enterprises which may not have previously had a relationship with the unions signatory to this Agreement. To ensure that such enterprises will have an opportunity to employ their experienced "core" employees on this Project, the parties agree that in those situations where a Contractor not a party to the current collective bargaining agreement with the signatory union having jurisdiction over the affected work is a successful bidder, that Contractor may request by name, and the local will honor, referral of persons who have applied to the local union for Project work and who meet the following qualifications:

- (1) possess any license required by state or federal law for the Project work to be performed;
- (2) have worked a total of at least 3,000 hours in the construction craft during the prior three (3) years.

(3) were on the Contractor's active payroll for at least 90 out of the 180 calendar days prior to the contract award;

(4) have the ability to perform safely the basic functions of the applicable trade.

The Union will refer to such Contractor one employee from the hiring hall out-of-work list for each affected trade or craft, and will then refer one of such Contractor's "core" employees and shall repeat the process as follows: one from the hiring hall and one "core" employee, until such contractor's requirements are met or until such contractor has hired ten (10) such "core" employees for that craft, whichever occurs first. Thereafter, all additional employees in the affected trade or craft shall be hired exclusively from the hiring hall out-of-work list. In the event of a reduction-in-force or layoff, such will take place in a manner to assure that the number of core employees in the affected craft does not exceed, at any time, the number of others working in that craft who were employed pursuant to other procedures available to the Contractor under this Agreement.

Section 11. Except as provided in Article IV, Section 3, individual seniority should not be recognized or applied to employees working on the Project provided, however, that group and/or classification seniority in a Union Schedule A as of effective date of this Agreement shall be recognized for purposes of layoff.

Section 12. The selection and number of craft foremen and/or general foremen shall be the responsibility of the Contractor. All foremen shall take orders exclusively from the designated contractor representatives. Craft foremen shall be designated as working foremen at the request of the Contractor.

ARTICLE IV UNION REPRESENTATION AND STEWARDS

Section 1. Authorized representatives of the Union shall have access to the Project, provided that they do not interfere with the work of the employees and further provided that such representatives fully comply with posted visitor and security and safety rules of the Project. It is understood that because of the geographical scope of the Project, and the type of work being undertaken on the Project site, visitors may be limited to certain times, or areas, or to being accompanied at all times while on the Project site; with this in mind, however, the Contractor recognizes the right of access set forth in this Section and such will not be unreasonably withheld from an authorized representative of the Union.

Section 2(a). Each signatory local union shall have the right to dispatch an experienced working journeyman as a steward for each shift, and shall notify the Contractor in writing of the identity of the designated steward or stewards prior to the assumption of such person's duties as steward. Such designated steward or stewards shall not exercise any supervisory

functions. There will be no non-working steward. Stewards will receive the regular rate of their respective crafts.

(b) In addition to his/her work as an employee, the steward shall have the right to receive, but not solicit, complaints or grievances and to discuss and assist in the adjustment of the same with the employee's appropriate supervisor. Each steward shall be concerned with the employees of the steward's Contractor and if applicable, subcontractors, and not with the employees of any other Contractor. The Contractor will not discriminate against the steward in the proper performance of his/her union duties.

(c) When a Contractor has multiple, non-contiguous work locations on the site, the Contractor may request, and the union shall appoint such additional working stewards as the Contractor requests to provide independent coverage of one or more such locations. In such cases a steward may not service more than one work location without the approval of the contractor.

(d) The stewards shall not have the right to determine when overtime shall be worked or who shall work overtime.

Section 3. The Contractor agrees to notify the appropriate union twenty-four (24) hours prior to the layoff of a steward. If a steward is protected against such layoff by the provisions of any Schedule A, such provisions shall be recognized to the extent that the steward possesses the necessary qualifications to perform the work remaining. In any case in which a steward is discharged or disciplined for just cause and prohibited from entering or being on the job site, the appropriate union shall be notified immediately by the Contractor, and such discharge or discipline shall not become final (subject to any later filed grievance) until twenty-four (24) hours after such notice has been given.

Section 4. Personnel of the Department will be working in close proximity to the construction activities. The union agrees that the union representatives, stewards and individual workers will not interfere with such personnel, or with personnel employed by any other employer not a party to this Agreement.

ARTICLE V

MANAGEMENT'S RIGHTS

Section 1. The Contractor retains the full and exclusive authority for the management of its operations. Except as expressly limited by other provisions of this Agreement, the Contractor retains the right to direct the workforce, including, but not limited to, the hiring, promotion, transfer, layoff, discipline or discharge for just cause of its employees; the selection of foremen; the assignment and schedule of work; the promulgation of reasonable work rules; and, the requirement of overtime work, the determination of when it will be worked and the number and identity of employees engaged in such work. No rules, customs, or practices which limit or restrict productivity, efficiency or the individual and/or joint

working efforts of employees shall be permitted or observed. The Contractor may utilize any methods or techniques of construction.

Section 2. There shall be no limitation or restriction by a signatory union upon a Contractor's choice of materials or design, nor, regardless of source or location, upon the full use and utilization of equipment, machinery, packaging, pre-cast, pre-fabricated, pre-finish, or pre-assembled materials, tools, or other labor saving devices. The on-site installation or application of all items shall be performed by the craft having jurisdiction over such work; provided, however, it is recognized that installation of specialty items which may be furnished by the City may be performed by employees employed under this Agreement with the participation of other personnel in a supervisory role, or, in limited circumstances requiring special knowledge of the particular item(s), may be performed by employees of the vendor or other companies where employees working under this Agreement lack the required skills.

Section 3. The use of new technology, equipment, machinery, tools and/or labor saving devices and methods of performing work may be initiated by the Contractor from time-to-time during the Project. The Union agrees that it will not in any way restrict the implementation of such new devices or work methods. If there is any disagreement between the contractor and the union concerning the manner or implementation of such device or method of work, the implementation shall proceed as directed by the Contractor, and the Union shall have the right to grieve and/or arbitrate the dispute as set forth in Article VII of this Agreement.

ARTICLE VI WORK STOPPAGES AND LOCKOUTS

Section 1. There shall be no strikes, picketing, work stoppages, slowdowns or other disruptive activity for any reason (including but not limited to disputes relating to the negotiation or renegotiation of the local collective bargaining agreements which serve as the basis for the Schedule As, economic strikes, unfair labor practices strikes, safety strikes, sympathy strikes, and jurisdictional strikes) by the Union or employees working under this Agreement against any contractor covered under this Agreement or the Project, and there shall be no lockout by the Contractor. Failure of any Union or employee to cross any picket line established by any Union, signatory or non-signatory to the Agreement, or by any other organization or individual at or in proximity to the project construction site is a violation of this Article.

Disputes between the signatory unions and any tenant, concessionaire, renter, or other person or business carrying out its/their normal functions within the boundaries of the Project shall be so handled as not to interfere with the City's business or the work under the Agreement or the business of any other tenant, lessee, concessionaire, or business not a party to such disputes. No picketing or other concerted or disruptive activity against any one or more of the tenants, lessees, concessionaires, persons or businesses operating within the

boundaries of the Project shall be conducted at LAX or near or around the entrance(s) or exit(s) of LAX which adversely affects or disrupts the work under this Agreement, nor shall such activity by any organization not a party to this Agreement be recognized or observed by parties to this Agreement or their members and employees whom they represent.

Section 2. The Contractor may discharge any employee violating Section 1, above, and any such employee will not be eligible for rehire under this Agreement for a period of 180 calendar days. The Agreement Coordinator and the Union shall take all steps necessary to obtain compliance with this Article and neither shall be held liable for conduct for which it is not responsible.

Section 3(a). If the Contractor contends that any Union has violated this Article or the provisions of Article XVII, Section 3, it will notify in writing the International President(s) of the Local Union(s) involved, advising the International President of the fact, with copies of such notice to the Local Union(s) involved and the Building Trades Council. The International President or Presidents will immediately instruct, order and use the best efforts of their office to cause the Local Union or Unions to cease any violation of this Article. An International Union complying with this obligation shall not be liable for unauthorized acts of its Local Union.

(b) If the Union contends that any Contractor has violated this Article, it will notify the Contractor and the Agreement Coordinator setting forth the facts which the Union contends violate the Agreement, at least twenty-four (24) hours prior to invoking the procedures of Section 4.

Section 4. Any party, including the City, which the parties agree is a party to the Agreement for purposes of this Article and an intended beneficiary of this Article, or the Agreement Coordinator, may institute the following procedure, in lieu of or in addition to any other action at law or equity, when a breach of Section 1, above, or Section 3 of Article XIX is alleged:

(a) A party invoking this procedure shall notify **John Kagel**, selected by the negotiating parties, whom the parties agree shall be the permanent arbitrator under this procedure. In the event that the permanent arbitrator is unavailable at any time, he/she shall appoint an alternate. Notice to the arbitrator shall be by the most expeditious means available, with notices to the party alleged to be in violation and to the Los Angeles Council and the BCTD if it is a union alleged to be in violation. For purposes of this Article, written notice may be given by telegram, facsimile, hand delivery or overnight mail but will be deemed effective upon receipt.

(b) Upon receipt of said notice, the arbitrator named above or his/her alternate shall sit and hold a hearing within twenty-four (24) hours if it is contended that the violation still exists, but not sooner than twenty-four (24) hours after the notice has been dispatched to the International President(s) as required by Section 3, above.

(c) The arbitrator shall notify the parties of the place and time chosen for this hearing. Said hearing shall be completed in one session, which, with appropriate recesses at the arbitrator's discretion, shall not exceed 24 hours unless otherwise agreed upon by all parties. A failure of any party or parties to attend said hearings shall not delay the hearing of evidence or the issuance of any award by the arbitrator.

(d) The sole issue at the hearing shall be whether or not a violation of Section 1, above, or of Section 3 of Article XIX, has in fact occurred. The arbitrator shall have no authority to consider any matter in justification, explanation or mitigation of such violation or to award damages, which issue is reserved for court proceedings, if any. The award shall be issued in writing within three (3) hours after the close of the hearing, and may be issued without an opinion. If any party desires a written opinion, one shall be issued within fifteen (15) days, but its issuance shall not delay compliance with, or enforcement of, the Award. The arbitrator may order cessation of the violation of the Article and other appropriate relief, and such Award shall be served on all parties by hand or registered mail upon issuance.

(e) Such award shall be final and binding on all parties and may be enforced by any court of competent jurisdiction upon the filing of this Agreement and all other relevant documents referred to hereinabove in the following manner. Written notice of the filing of such enforcement proceedings shall be given to the other party. In any judicial proceeding to obtain a temporary order enforcing the arbitrator's Award as issued under Section 4(d) of this Article, all parties waive the right to a hearing and agree that such proceedings may be ex parte. Such agreement does not waive any party's right to participate in a hearing for a final order of enforcement. The court's order or orders enforcing the arbitrator's award shall be served on all parties by hand or by delivery to their address as shown on this Agreement (for a Union), as shown on their business contract for work under this Agreement (for a contractor) and to the representing Union (for an employee), by registered mail.

(f) Any rights created by statute or law governing arbitration proceedings inconsistent with the above procedure or which interfere with compliance hereto are hereby waived by the parties to whom they accrue.

(g) The fees and expenses of the arbitrator shall be equally divided between the moving party or parties and the respondent party or parties.

Section 5. The Agreement Coordinator is a party in interest in all proceedings arising under this Article and Articles VII and VIII and shall be sent contemporaneous copies of all notifications required under these articles, and, at its option, may participate as a full party in any proceeding initiated under these articles.

Section 6. If the arbitrator determines in accordance with Section 3(d) above that a work stoppage has occurred, the respondent Union(s) shall, within eight (8) hours of receipt of the award, direct all the employees they represent on the project to immediately return to work.

If the craft(s) involved does not return to work by the beginning of the next regularly scheduled shift following such eight (8) hour period after receipt of the arbitrator's award, and the respondent Union(s) have not complied with their obligation to immediately instruct, order, and use their best efforts to cause a cessation of the violation and return of the employees they represent to work, then the respondent Union(s) shall pay the sum of ten thousand dollars (\$10,000) each as liquidated damages to the City, and shall pay an additional ten thousand dollars (\$10,000) per shift for each shift thereafter on which the craft has not returned to work. Similarly, if the arbitrator determines in accordance with Section 3(d) above that a lock-out has occurred, the respondent Contractor(s) shall, within eight (8) hours of receipt of the award, return all of the affected employees to work on the Project, or otherwise correct the violation as found by the arbitrator. If the respondent contractor does not take such action by the beginning of the next regularly scheduled shift following the eight (8) hour period, the respondent contractor(s) shall pay the sum of ten thousand dollars (\$10,000) as liquidated damages to each affected Union (to be apportioned among the affected employees and the benefit funds upon which contributions are made on their behalf, as appropriate and designated by the arbitrator), and shall pay an additional ten thousand dollars (\$10,000) per shift for each shift thereafter in which compliance by the respondent contractor(s) has not been completed. The arbitrator shall retain jurisdiction to determine compliance for this Section.

ARTICLE VII

DISPUTES AND GRIEVANCES

Section 1 (a). This Agreement is intended to provide close cooperation between management and labor. The Agreement Coordinator and the Los Angeles-Orange County Building and Construction Trades Council, AFL-CIO, shall each assign a representative to this Project for the purpose of assisting the BCTD, the International and Local Unions, together with the Contractor, to complete the construction of the Project economically, efficiently, continuously and without interruption, delays or work stoppages.

(b) PCI, the Contractors, Unions, and employees collectively and individually, realize the importance to all parties to maintain continuous and uninterrupted performance of the work of the Project, and agree to resolve disputes in accordance with the arbitration provisions set forth in this Article.

(c) The Agreement Coordinator shall administer the processing of grievances under this Article, Articles VI and VIII, including the scheduling and arrangement of facilities for meetings, the selection of the arbitrator to hear the case, and any other administrative matters necessary to facilitate the timely disposition of the case; provided, however, it is the responsibility of the principal parties to any pending grievance to insure that time limits and deadlines are met.

Section 2. Any question arising out of and during the term of this Agreement involving its interpretation and application (other than trade jurisdictional disputes or alleged violations of

Article VI, Section 1) shall be considered a grievance and subject to resolution under the following procedures.

- i. **Step 1. Employee Grievances.** When any employee subject to the provisions of this Agreement feels aggrieved by a violation of this Agreement, the employee shall, through his Local Union business representative or job steward, within three (3) working days after the occurrence of the violation, give notice to the work site representative of the involved Contractor stating the provision(s) alleged to have been violated. A business representative of the Local Union or the job steward and the work site representative of the involved Contractor shall meet and endeavor to adjust the matter within three (3) working days after timely notice has been given. If they fail to resolve the matter within the prescribed period, the grieving party may, within forty-eight (48) hours thereafter, pursue Step 2 of the grievance procedure provided the grievance is reduced to writing, setting forth the relevant information concerning the alleged grievance, including a short description thereof, the date on which the grievance occurred, and the provision(s) of the Agreement alleged to have been violated. Grievances and disputes settled at Step 1 shall be non-precedential except as to the parties directly involved unless endorsed by the Agreement Coordinator within five (5) days after resolution has been reached.
- ii. **Union or Contractor Grievance.** Should the Local Union(s) or Agreement Coordinator or any Contractor have a dispute with the other party and, if after conferring within ten (10) working days after the disputing party knew or should have known of the facts or occurrence giving rise to the dispute, a settlement is not reached within three (3) working days, the dispute shall be reduced to writing and proceed to step 2 in the same manner as outlined in 1(a), above, for the adjustment of an employee complaint.

Step 2. The Business Manager of the involved Local Union or his Designee, together with the International Union representative of that union, the site representative of the involved Contractor, and the labor relations representative of the Agreement Coordinator shall meet within seven (7) working days of the referral of the dispute to this second step to arrive at a satisfactory settlement thereof. If the parties fail to reach an agreement, the dispute may be appealed in writing in accordance with the provisions of Step 3 within seven (7) calendar days after the initial meeting at Step 2.

- iii. Step 3(a). If the grievance shall have been submitted but not resolved under Step 2, either party may request in writing to the Agreement Coordinator (with copy(ies) to the other party(ies)) within seven (7) calendar days after the initial Step 2 meeting, that the grievance be submitted to an arbitrator selected from a permanent panel of three (3) arbitrators (**Howard S. Block, William Estes and Michael D. Rappaport**) pre-selected by the negotiating parties to this Agreement. If the panel has not been agreed upon by the parties, arbitrator selection shall be made pursuant to the rules of the American Arbitration Association, which shall also govern the conduct of the arbitration hearing. The decision of the arbitrator shall be final and binding on all parties and the fee and expenses of such arbitrations shall be borne equally by the involved Contractor and the involved Union(s).

(b) Failure of the grieving party to adhere to the time limits established herein shall render the grievance null and void. The time limits established herein may be extended only by written consent of the parties involved at the particular step where the extension is agreed upon. The arbitrator shall have the authority to make decisions only on issues presented and shall not have the authority to change, amend, add to or detract from any of the provisions of this Agreement.

Section 3. No adjustment or decision may provide retroactivity exceeding sixty (60) days prior to the date of the filing of a written grievance.

Section 4. Procedures contained in this Article VII shall not be applicable to any alleged violation of Article VI, with the single exception that any employee discharged for violation of Article VI, Section 1, may resort to the procedures of Article VII to determine only if he/she was, in fact, engaged in that violation.

Section 5. The Agreement Coordinator shall be notified by the involved Contractor of all actions at Steps 2 and 3 and shall, upon its request, be permitted to participate fully in all proceedings at such steps.

ARTICLE VIII

WORK ASSIGNMENTS AND JURISDICTIONAL DISPUTES

Section 1. The assignment of work will be solely the responsibility of the contractor performing the work involved; and such work assignments will be in accordance with the Plan for the Settlement of Jurisdictional Disputes in the Construction Industry (the "Plan") or any successor Plan.

Section 2. All jurisdictional disputes between or among Building and Construction Trades Unions and employees, parties to this Agreement shall be settled and adjusted according to

the present Plan established by the Building and Construction Trades Department or any other plan or method of procedure that may be adopted in the future by the Building and Construction Trades Department. Decisions rendered shall be final, binding and conclusive on the Contractors and Unions, parties to this Agreement.

Section 3. All jurisdictional disputes shall be resolved without the occurrence of any strike, work stoppage, or slowdown of any nature, and the Contractor's assignment shall be adhered to until the dispute is resolved. Individuals violating this section shall be subject to immediate discharge.

Section 4. Each Contractor will conduct a pre-job conference with the appropriate Building and Construction Trades Council prior to commencing work. The Agreement Coordinator will be advised in advance of all such conferences and may participate if it wishes.

ARTICLE IX **WAGES AND BENEFITS**

Section 1. All employees covered by this Agreement shall be classified in accordance with work performed and paid the hourly wage rates for those classifications in compliance with the applicable prevailing federal or state rate determination. If a wage increase negotiated in a local agreement becomes the prevailing wage under state law, the Contractor will pay that rate as of the effective date of the new prevailing rate. If the prevailing wage laws are repealed during the term of this Agreement, the Contractor shall pay the wage rates established under the Schedule As, except as otherwise provided in this Agreement.

Section 2. Contractor is to pay contributions to the established employee benefits funds in the amounts designated in the appropriate Schedule A and to make all employee-authorized deductions in the amounts designated in the appropriate Schedule A; provided, however, that the Contractor and the Union agree that only such bona fide employee benefits as accrue to the direct benefit of the employees (such as pension and annuity, health and welfare, vacation, apprenticeship, training funds, etc.) shall be included in this requirement and required to be paid by the Contractor on this Project; and provided that such contributions shall not exceed the contribution amounts set forth in the applicable prevailing wage determination. Bona fide jointly-trusted benefit plans or authorized employee deduction programs established or negotiated under the applicable Schedule A or by the parties to this Agreement during the life of this Agreement may be added, subject to the limitations upon such negotiated changes contained in Article XVII, Section 2 of this Agreement, and provided that contributions do not exceed contribution amounts set forth in the applicable prevailing wage determination.

The Contractor adopts and agrees to be bound by the written terms of the applicable, legally established, trust agreement(s) specifying the detailed basis on which payments are to be made into, and benefits paid out of, such Trust Funds for his employees. The Contractor authorizes the parties to such Trust Funds to appoint Trustees and successor

Trustees to administer the Trust Funds and hereby ratifies and accepts the Trustees so appointed as if made by the Contractor.

Section 3. All employees covered by this Agreement may be paid by check, paid no later than the end of the work each shift Friday. No more than five (5) days' wages may be withheld in any pay period. Any employee who is discharged or laid off shall be entitled to receive all accrued wages immediately upon discharge or layoff.

Section 4. Wage premiums, including but not limited to pay based on height of work, hazard pay, scaffold pay, and special skill shall not be applicable to work under this Agreement, except to the extent provided for in any applicable prevailing wage determination.

ARTICLE X

HOURS OF WORK, OVERTIME, SHIFTS AND HOLIDAY

Section 1. Work Day and Work Week. Eight (8) hours per day between the hours of 6:00 A.M. and 5:30 P.M., plus one-half (½) hour unpaid for lunch, approximately mid-way through the shift, shall constitute the standard work day. Forty (40) hours per week shall constitute a regular week's work. The work week will start on Monday and conclude on Sunday. The foregoing provisions of this Article are applicable unless otherwise provided in the applicable prevailing wage determination, or unless changes are permitted by law and such are agreed upon by the parties. Nothing herein shall be construed as guaranteeing any employee eight (8) hours per day or forty (40) hours per week, or a Monday through Friday work schedule.

Section 2. Starting Times. Employees shall be at their place of work at the starting time and shall remain at their place of work (as designated by the Contractor) performing their assigned functions until quitting time. The place of work shall be defined as the gang or tool box, or equipment at the employee's assigned work location or the place where the foreman gives instructions. The parties reaffirm their policy of a fair day's work for a fair day's wage. There shall be no pay for time not worked unless the employee is otherwise engaged at the direction of the Contractor.

Section 3. Overtime. Overtime shall be paid in accordance with the requirements of the applicable Prevailing Wage Determination. There will be no restriction on the Contractor's scheduling of overtime or the non-discriminatory designation of employees who will work. There shall be no pyramiding of overtime pay under any circumstances.

Section 4(a). Shifts. Shift work may be performed at the option of the Contractor(s) upon three (3) days' prior notice to the affected Union(s), unless a shorter notice period is provided in the applicable Schedule A, and shall continue for a period of not less than five (5) working days. Saturdays and Sundays, if worked, may be used for establishing the five (5) day minimum work shift. If two shifts are worked, each shall consist of eight (8) hours of continuous work exclusive of a one-half (½) hour non-paid lunch period, for eight (8) hours

straight time pay, without any premium or differential. Any third shift shall consist of six and one half (6½) hours of continuous work exclusive of one-half (½) hour non-paid lunch period for eight (8) hours straight time pay, without any premium or differential.

The last shift starting on or before 6:00 P.M. Friday shall be considered Friday work time; while the first shift ending at or after 6:00 A.M. on Monday shall be considered Monday work time. The shift starting at or after 6:00 A.M. is designated as the first shift, with the second shift following.

(b) Because of operational necessities, the second and/or third shifts may, at the Agreement Coordinator's direction, be scheduled without the preceding shift(s) having been worked. It is recognized the Airport operations may require restructuring of normal work schedules. Except in an emergency, Contractor shall give the affected union(s) at least three (3) days notice of schedule changes.

Section 5. 4-10's. A 4-10 schedule may be worked on the project consistent with the provisions of the Schedule A(s) of the affected Union(s) and the California prevailing wage law.

Section 6. Make-Up Day. A make-up day may be scheduled in a manner consistent with the Schedule A(s) of the affected Union(s) in the California prevailing wage law.

Section 7. Holidays. Holidays shall be those recognized in Schedule "A".

Section 8(a). Reporting Pay. Employees reporting for work and for whom no work is provided, except when given notification not to report to work, shall receive two (2) hours pay at the applicable hourly rate. Employees who are directed to start work shall receive a minimum of four (4) hours of pay at the applicable hourly rate. Employees who work beyond four (4) hours shall be paid for actual hours worked. Whenever reporting pay is provided for employees, they will be required to remain at the Project site available for work for such time as they receive pay, unless released earlier by the principal supervisor of the Contractor(s) or their designated representative. Each employee shall furnish his/her Contractor with his/her current address and telephone number, and shall promptly report any changes in each to the Contractor.

(b) When an employee who is sent to the job site from the union referral facility in response to a request by the Contractor for an employee for one (1) day starts work, the employee will be paid eight (8) hours.

(c) When an employee leaves the job or work location of his own volition or is discharged for cause or is not working as a result of the Contractor's invocation of Article XI, Section 3, the employee shall be paid only for the actual time worked.

Section 9. Call Out Pay. When an employee has completed his scheduled shift and is "called out" to perform special work of a casual, incidental or irregular nature, he shall

receive pay at the appropriate overtime rate for actual hours worked with a minimum guarantee of the wage equivalent of four (4) hours' pay at the employee's straight time rate. This does not apply to time worked as an extension (before or after) of the employee's normal shift.

Section 10. Time Keeping. The Contractor may utilize "brassing" (or similar) systems to check employees in and out. Each employee must check himself in and out. The Contractor will provide adequate facilities for checking in and out in an expeditious manner.

Section 11. Meal Period. The Contractor will schedule a meal period not more than one-half hour duration at the work location approximately midway into the scheduled work shift, consistent with Section 1; provided, however, that the Contractor may, for efficiency of the operation, establish a schedule which coordinates the meal periods of two or more crafts. If an employee is required to work through his meal period, he shall be compensated in a manner established in the applicable Schedule A.

ARTICLE XI APPRENTICES

Section 1. The parties recognize the need to maintain continuing support of programs designed to develop adequate numbers of competent workers in the construction industry, and the special need and obligation to capitalize on the availability of the local workforce in the Los Angeles area, especially minorities and women entering the construction industry. To these ends, the Contractor will employ apprentices in their respective crafts to perform such work as is within their capabilities and which is customarily performed by the craft in which they are indentured. Further, the parties will facilitate and encourage local residents, minorities and women to commence and progress in apprenticeship programs in the construction industry.

Section 2. Apprentices may comprise up to twenty (20) percent of each craft's work force at any time, unless an applicable Schedule A provides for a greater percentage. The Union agrees to cooperate with the Contractor in furnishing apprentices as requested up to the maximum percentage. The apprentice ratio for each craft shall be in compliance with the applicable provision(s) of the Labor Code relating to utilization of apprentices. The City shall encourage such utilization. If the Schedule A and prevailing wage determination permit, other non-journeyman classifications may be utilized at the Contractor's discretion as part of the twenty (20) percent ratio, or other applicable ratio.

Section 3. It is recognized that special procedures may be established by joint agreement of the parties to this Agreement and governmental agencies for the training and employment of persons who have not previously qualified to be employed on construction projects of the type covered by this Agreement. The parties agree that they will make all good faith efforts to assist in the proper implementation of such orders, regulations or agreements for the general benefit of the residents of Los Angeles.

ARTICLE XII
SECURITY, SAFETY, PROTECTION OF PERSON AND PROPERTY

Section 1(a). In accordance with the requirements of the Occupational Safety and Health Act, it shall be the exclusive responsibility of each Contractor on the job site to ensure safe working conditions for its employees and their compliance with any safety rules contained herein or established by the City, the Agreement Coordinator and/or the Contractor. It is understood that the employees have an individual obligation to use diligent care to perform their work in a safe manner and to protect themselves and the property of the Contractor and the City.

(b) Employees shall be bound by the reasonable safety, security and visitor rules established by the Contractor, the Agreement Coordinator and/or the City. These rules will be published and posted in conspicuous places throughout the work site. An employee's failure to satisfy his obligations under this Section will subject him to discipline, including discharge.

(c) The Agreement Coordinator may establish and implement, after consultation with the Union, reasonable substance abuse testing procedures and regulations, which may include pre-hire, reasonable cause, random, and post-accident testing, to the extent permitted by Federal and state law.

Section 2. The inspection of incoming shipments of equipment, machinery and construction materials of every kind shall be performed at the discretion of the Contractor by individuals of its choice.

Section 3. All parties recognize the special security provisions required and mandated by construction work on a major airport, and all parties to the Agreement and all employees under the Agreement will fully comply with all federal, state and city required security rules.

Section 4. A Contractor may suspend all or a portion of the job to protect the life and safety of an employee. In such cases, employees will be compensated only for the actual time worked; provided, however, that where the contractor requests employees to remain at the site and available for work, the employees will be compensated for the standby time at their basic hourly rate of pay.

Section 5. The Contractor shall provide adequate supplies of drinking water and sanitary facilities for all employees.

Section 6. Should the City institute an Owner Controlled Insurance Program (OCIP), and further, as part of that Program, request that medical care delivery and/or ADR programs be instituted under this Agreement pursuant to Section 3201.5 of the Labor Code, the Council parties to this Agreement will meet with the Agreement Coordinator and negotiate in good

faith the appropriate concepts for such provisions and develop for approval by all parties the details of such program for implementation on the project.

ARTICLE XIII **NON-DISCRIMINATION**

Section 1. The Contractor and Union agree that they will not discriminate against any employee or applicant for employment because of race, sex, creed, national origin, color, disability as defined by law, disabled veteran status, Vietnam veteran status, religion, age (40 and above), medical condition, marital status, ancestry, or sexual orientation in any manner prohibited by law or regulation. The Union shall cooperate with the Contractors' obligations to take affirmative action to ensure that applicants are employed, and that employees are treated during employment without regard to such status. Relevant employment actions shall include, but not be limited to the following: employment, upgrading, demotion, or transfer; recruitment or recruitment advertising; layoff or termination; rates of pay or other forms of compensation; and selection for training, including apprenticeship. Any complaints regarding the application of this provision shall be brought to the immediate attention of the involved contractor for consideration and resolution.

Section 2. It is recognized that the City and federal governments have certain policies and commitments for the utilization of business enterprises owned and/or controlled by minorities, women, the disadvantaged or others. The parties shall jointly endeavor to assure that these commitments are fully met and that any provisions of this Agreement which may appear to interfere with any minority, women, disadvantaged or other owned business enterprise successfully bidding for work within the scope of this Agreement shall be carefully reviewed, and adjustments made as may be appropriate and agreed upon among the parties, to assure full compliance with the spirit and letter of the governments' policies and commitments in all applicable federal, state and local rules and regulations relating to employment and utilization of said business enterprises. City's policies and commitments and all applicable Federal, state and local rules and regulations relating to employment and utilization of minorities and minority and/or women owned businesses.

ARTICLE XIV **TRAVEL AND SUBSISTENCE**

Travel expenses, travel time, subsistence allowance and/or zone rates and parking reimbursements shall not be applicable to work under this Agreement except to the extent provided for in any applicable prevailing wage determination.

Section 1. The parties recognize that the Project site is an active International Airport facility, subject to significant traffic and security restrictions. Under these circumstances, it may be impossible for employees to travel independently to their place or work. Therefore, where travelers restricted to transportation supplied by the City or the Contractor, or must be escorted, parking facilities for employees' personal vehicles shall be provided at designated

location(s) for pick-up by the City or Contractor provided transportation or for escort to the work site. Transportation and/or escorted ingress shall be scheduled to permit employees to be at their place of work at the scheduled starting time. Employees arriving at their work location after their normal starting time as the result of any delay in the scheduled arrival of Contractor-furnished transportation shall be compensated from their normal starting time at the appropriate rate.

Section 2. Where employees are required to travel by City or Contractor provided transportation, they shall be compensated with an allowance equal to an amount calculated at their straight time rate of pay for the time spent in transit from the work site to the designated pick-up location at the end of their shift. Time spent in travel to or from the work site shall not constitute time worked.

ARTICLE XV **WORKING CONDITIONS**

Section 1. There will be no rest periods, organized coffee breaks or other non-working time established during working hours. Individual coffee containers will be permitted at the employee's work location.

Section 2. The City and/or the Agreement Coordinator shall establish such reasonable Project rules as the City or Agreement Coordinator deems appropriate and not inconsistent with this Agreement. These rules will be explained at the pre-job conference and posted at the Project site by the Contractor and may be amended thereafter as necessary. Failure to observe these rules and regulations by any employer may be grounds for discipline, including discharge.

Section 3. There shall be no restrictions on the emergency use of any tools by any qualified employee or supervisor; or on the use of any tools or equipment for the performance of work within the jurisdiction, provided the employee can safely use the tools and/or the equipment involved and is in compliance with applicable governmental rules and regulations.

Section 4. Recognizing the nature of the work being conducted on the site, employee access by a private automobile may be restricted to certain roads and/or parking areas.

Section 5. Unless expressly permitted otherwise by the City, all employees working for Contractors signatory to this Agreement are prohibited from utilization of the public areas of LAX, and public facilities of the City, including without limitation, sanitary facilities, eating establishments and parking areas.

Section 6. Certain rules of conduct and security have been established by city, state, and federal governmental agencies which are applicable to all employees under the Agreement and which may change from time to time. Employees will be notified of such rules and must

observe rules at all times. Failure to do so may result in discipline up to and including discharge.

ARTICLE XVI **PRE-JOB CONFERENCES**

Consistent with Article VIII, Section 4, all work assignments shall be disclosed by the Contractor at a pre-job conference held in accordance with industry practice. The Contractor shall notify the Agreement Coordinator at least two weeks before starting work under this Agreement, and the Agreement Coordinator shall coordinate the scheduling of the pre-job conference with the Los Angeles Council, the Contractor(s) and the affected Union(s). Should there be any formal jurisdictional dispute raised under Article VIII, the Agreement Coordinator shall be notified promptly.

ARTICLE XVII **LABOR/MANAGEMENT COOPERATION**

Section 1. The parties to this Agreement will form a joint committee consisting of representatives selected by the BCTD, the Councils, the Crafts, and PCI. The Committee shall be chaired by a representative of PCI and a representative of the Los Angeles Council. The purpose of the Committee shall be to promote harmonious and stable labor-management relations on this Project, to insure effective and constructive communications between labor and management parties, and to advance the proficiency of the workmen in the industry.

Section 2. The Committee shall meet on a monthly basis or at the call of the joint chairs to discuss the administration of the Agreement, the progress of the Project, labor/management problems that may arise, and any other matters consistent with this Agreement. Substantive grievances or disputes arising under Articles VI, VII and/or VIII shall not be reviewed or discussed by this Committee, but shall be processed pursuant to the provisions of the appropriate Article.

The Agreement Coordinator shall be responsible for the scheduling of the meetings, the preparation of the agenda topics for the meeting with input from the Unions, the Contractors and the City. Notice of the date, time and place of the meeting shall be given to the Committee members at least three (3) days prior to the meeting. The City, the Building and Construction Trades Department, AFL-CIO, and the Building and Construction Trades Council of California shall be notified of the meetings and invited to send a representative to participate.

Section 3. The Committee may form sub-committees to consider and advise the full Committee with regard to safety and health issues affecting the Project; general employment issues (including availability of skilled trades and of minority, women, disadvantaged or other individuals who should be assisted with appropriate training for qualification for apprenticeship programs); and similar issues affecting the overall Project, including any

workers compensation program initiated under this Agreement. Further, the Committee, or an appropriate sub-committee, shall regularly review apprentice utilization and provide a quarterly report regarding such to the Commission.

ARTICLE XVIII

SAVINGS AND SEPARABILITY

Section 1. It is not the intention of either the Contractor or the Union parties to violate any laws governing the subject matter of this Agreement. The parties hereto agree that in the event any provisions of the Agreements are finally held or determined to be illegal or void as being in contravention of any applicable law, the remainder of the Agreement shall remain in full force and effect unless the part or parts so found to be void are wholly inseparable from the remaining portions of this Agreement. Further, the Contractor and Union agree that if and when any provisions of this Agreement are finally held or determined to be illegal or void by the court of competent jurisdiction, the parties will promptly enter into negotiations concerning the substance affected by such decision for the purpose of achieving conformity with the requirements or any applicable law and the intent of the parties hereto.

Section 2. The parties recognize the right of the City to withdraw, at its absolute discretion, the utilization of this Agreement as part of any bid specification should a court of competent jurisdiction issue any order, or any applicable statute be invoked which contains any self-applying provision, either of which could result, temporarily or permanently, in delay of the bidding, awarding, and/or construction work on the Project. Notwithstanding such an action by the City, or such court order or statutory provision, the Parties agree that the Agreement shall remain in full force and effect on the Project, to the maximum extent legally possible.

Section 3. The occurrence of events covered by Section 1 and/or 2 above shall not be construed to waive the prohibitions of Article VI.

ARTICLE XIX

DURATION OF THE AGREEMENT

Section 1. Duration. This Project Labor Agreement shall be effective on November 19, 1999, and shall continue in effect until December 31, 2010, and thereafter with regard to any work covered by this Agreement commenced prior to December 31, 2010, but not turned over prior to that date. The Agreement may be extended by mutual agreement of the City and the Unions, for a period not to exceed ten (10) additional years. If either wishes to extend the Agreement they shall notify the other twelve (12) months prior to December 31, 2010.

Section 2(a). Turnover. Construction of any phase, portion, section or segment of the Project shall be deemed complete when such phase, portion, section or segments has been turned over to the City by the Contractor and the City has accepted such phase, portion, section or segment. As areas and systems of the Project are inspected and construction tested

and/or approved by the Agreement Coordinator and accepted by the City or third parties with the approval of the City, the Agreement shall have no further force or effect on such items or areas, except when the Contractor is directed by the Agreement Coordinator or City to engage in repairs or modifications required by its contract(s) with the City or Agreement Coordinator.

(b) Notice. Notice of each final acceptance received by the Contractor will be provided to the Union with a description of what portion, segment, etc. has been accepted. Final acceptance may be subject to a "punch" list, and in such case, the Agreement will continue to apply to each such item on the list until it is completed to the satisfaction of the City and Notice of Acceptance is given by the City to the Contractor. At the request of the Union, complete information describing any "punch" list work, as well as any additional work required of a Contractor at the direction of the City pursuant to Article II, Section 8, involving otherwise turned-over or completed facilities which have been accepted by the City, will be available from the Agreement Coordinator.

(c) Termination. Final termination of all obligations, rights and liabilities and disagreements shall occur upon receipt by the Union of a notice from the Agreement Coordinator or City saying that no work remains within the scope of the Agreement for the Agreement Coordinator or its successor.

Section 3. Schedule As incorporated as part of this Project Agreement shall continue in full force and effect until the contractor and/or union parties to the Collective Bargaining Agreements which are the basis for such Schedule As notify the Agreement Coordinator of mutually agreed upon changes in such Agreements and their effective date(s).

The parties agree to recognize and implement such changes on their effective dates, provided, however, that any provisions negotiated in said collective bargaining agreements will not apply to work covered by this Agreement if such provisions are less favorable to the contractor under the Agreement than those uniformly required of contractors for construction work normally covered by those Agreements; nor shall any provision be recognized or applied if it may be construed to apply exclusively or predominantly to work covered by this Agreement. Any disagreement between the parties over the incorporation into a Schedule A of any such provision agreed upon in the negotiation of the local collective bargaining agreement which serves as the basis for the Schedule A shall be resolved under the procedures established in Article VII. As part of this understanding, the Contractor agrees and consents to pay the increased wages and increased contributions to the relevant jointly administered trust funds pursuant to the provisions of any collective bargaining agreements negotiated by the unions during the work performed on the Project at such time as the increases are incorporated into the applicable prevailing rate determination, as of the effective date of such prevailing rate determination.

Section 4. The Union agrees that there will be no strikes, work stoppages, sympathy strikes, picketing slowdowns, or any other disruptive activity affecting the Project by any union involved in the negotiation of such local collective bargaining agreements and the resulting Schedule As, nor shall there be any lock-out on this Project affecting the Union during the course of such negotiations.

In witness whereof, the parties have caused this Agreement to be executed and effective as of the day and year first above written:

LETTER OF ASSENT

[To be Signed by All Contractors Undertaking **Work Covered**
By the Project Labor Agreement Prior to Commencing Work]

(Contractor Letterhead)

Agreement Coordinator
c/o Parsons Constructors Inc.
100 West Walnut Street
Pasadena, California 91124
Attn: Zavonna Ford

Re: Los Angeles International Airport Project
Labor Agreement – Letter of Assent

Dear Sir:

This is to confirm that (Name of Company) agrees to be a party to and bound by the Los Angeles International Airport Project Labor Agreement (the "Agreement") as entered into by and between Parsons Constructors Inc., its successors or assignees, and the Building and Construction Trades Department, AFL-CIO and other Building and Construction Trades Councils and signatory unions, dated November 19, 1999, as such agreement may, from time to time, be amended by the negotiating parties or interpreted pursuant to its terms.

Such obligation to be a party to and bound by this Agreement shall extend all work covered by the Agreement undertaken by this Company on the (Project Name) Project, and this Company shall require all its subcontractors, or whatever tier, to be similarly bound for all their work within the Scope of the Agreement by signing an identical Letter of Assent.

Sincerely,

(Name of Construction Company)

By:

(Name of Title of Authorized Executive)

Cc: City of Los Angeles, Department of Airports

(Copies of this Letter will be available for inspection or copying on request of the Union).

ADDENDUM 1

The parties to the Los Angeles International Airport Construction Project Labor Agreement (the "Agreement"), effective November 19, 1999, together with the Building and Construction Trades Council of San Bernardino and Riverside Counties and its affiliated unions, having fully considered the terms and conditions of the Agreement, mutually agree that the benefits, rights, duties, and obligations established by that Agreement should be fully available for and applicable to major construction work which may be undertaken in the future at other airports under the control and direction of the City of Los Angeles Department of Airports, acting through the Board of Airport Commissioners; and

Now, therefore, with the signatures of the duly authorized representatives of the Agreement Coordinator and of the Department and its affiliated International Unions, the Councils, and affiliated Local Unions, respectively, the above-referenced Project Labor Agreement is hereby amended as follows:

1. The Agreement shall be known as the "Los Angeles Department of Airports Construction Project Labor Agreement";

2. Article II, Section 1 is revised to read as follows:

Section 1. The Project is generally defined as, and limited to:

(a) The renovation, rehabilitation and improvement of the Tom Bradley International Terminal Facility, Los Angeles International Airport, in an approximately 285,000 square foot infill area of that Terminal, and which will include the renovation of airline and public lounge area, baggage claim

facilities, and the Federal Inspection Service and Department administrative offices; and

(b) Such other major construction, rehabilitation, and renovation projects involving airport-related facilities at Los Angeles International Airport (LAX), Van Nuys Airport, Palmdale Airport, and/or Ontario Airport, as are designated by the City to be covered by this Agreement.

It is understood by the parties that the City may at any time and at its sole discretion determine to build segments of the Project under this Agreement not currently proposed, or to modify or not build any one or more of the particular segments proposed to be covered;

3. Article XIV, Section 1 is revised by deleting the word "International" from the first sentence.

4. All references in the Agreement to LAX shall refer to all Airports covered under this Agreement at which work covered within the scope of this Agreement is being performed.

5. All references in the Agreement to the Building and Construction Trades Council of Los Angeles-Orange County or the Los Angeles-Orange County Building and Construction Trades Council, AFL-CIO or the Los Angeles Council shall include and refer to both the Los Angeles/Orange Counties Council and the San Bernardino and Riverside Counties Council.

6. Further, the undersigned understand that Parsons Constructors Inc. has not been, and may or may not be, awarded the contract to administer the Agreement upon its

implementation, and therefore agree that, as appropriate, references to "PCI" shall be considered as references to the then current "Agreement Coordinator."

7. Finally, the undersigned agree to replace Attachment 1 (Letter of Assent) to the Agreement, with Attachment 1 (Letter of Assent) attached hereto.

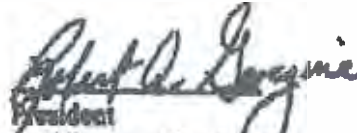

It is agreed that there are no further changes to the remainder of the Agreement.

Effective the 1st day of May, 2000.

Re: Los Angeles International Airport Project
 Labor Agreement - Permanent Arbitrators

Gentlemen:

Enclosed for your information is a copy of the Project Labor Agreement negotiated between Parsons Constructors Inc. and the Building and Construction Trades Department, AFL-CIO, the Building and Construction Trades Council of California, the Los Angeles/Orange Counties Building and Construction Trades Council, the San Bernardino/Riverside Counties Building and Construction Trades Council, and the Southern California District Council of Carpenters for work to be undertaken at Los Angeles International Airport. This is expected to be a multi-year, multi-billion dollar construction program. It is critical to all parties and to the citizens of Greater Los Angeles that any and all differences, disputes, and grievances be resolved peacefully under the procedures established by the Agreement. To help meet this goal, the parties have agreed to request your services as permanent arbitrators.

You will recognize the enclosed as similar in many ways to the Agreements negotiated on behalf of The Metropolitan Water District of Southern California, under which each of you already serves as a permanent arbitrator. It is the desire of the parties that each of you fill the same roles under the LAX Agreement; specifically, for disputes arising under Article II, Section 4(b) and as a member of the Panel from which an arbitrator is selected for disputes arising under Article VIII, Howard S. Block; for disputes arising under Article VI, John Kagel; and as additional members of the Panel under Article VIII, William Estes and Michael D. Rappaport. We hope you will agree to serve.

Re: Los Angeles International Airport – Project Labor Agreement -
Redi-Mix Concrete, Sand and Gravel, and Aggregate Delivery

Dear Dick:

In our negotiations for the captioned Project Labor Agreement, the Teamsters raised concerns about the coverage of the above-referenced work under the Agreement. After discussions and consultation with counsel, the parties recognized and agreed that the limitations of Federal Labor Law do not permit the inclusion of such deliveries under the terms of the Project Labor Agreement because they do not typically constitute work to be performed at the site of the construction within the meaning of the National Labor Relations Act.

Under these circumstances, and recognizing the importance of labor stability for the work covered by this Agreement, the Department of Airports has agreed that it will advise and remind contractors working under the Agreement of the importance of maintaining labor peace and harmony on the Project. These contractors will be encouraged to consider the potential effect on such labor stability when contracting for delivery of redi-mix, sand and gravel, and aggregate.

Should the suppliers or contractors not act in a manner consistent with the spirit and intent of this letter and the Agreement, the Department will take action appropriate to the situation and its legal rights.

Sincerely,

Michael W. D'Antuono
President
Parsons Constructors Inc.
Agreement Coordinator for the Department of Airports

Re: Los Angeles International Airport Project Labor Agreement

Gentlemen:

Consistent with our discussion as part of the negotiations for the above-referenced Agreement, it is understood and agreed that the International Union of Elevator Constructors and its Local 18 will execute the Project Labor Agreement. In consideration thereof, Parsons Constructors Inc. and the Unions specifically agree that where there is a conflict, the terms and conditions of the Project Labor Agreement shall supersede and override the terms and conditions of any and all other national, area or local collective bargaining agreements, except that the work of the International Union of Elevator Constructors within the scope of this Project Labor Agreement shall be performed under the terms of its national agreements, with the exception of Articles VI, VII and VIII, which shall apply to such work; and with the further understanding that work within the scope of the Agreement will be awarded consistent with the terms of the Project Labor Agreement provided that the successful contractor (and subcontractors of whatever tier) agree to execute the Letter of Assent (Attachment A) to the Agreement; and finally with the understanding that all employees working within the scope of the Agreement and within the craft jurisdiction of the International Union of Elevator Constructors shall be referred and/or employed in a manner consistent with Article III of the Project Labor Agreement.

Edward C. Sullivan
Ernie Brown
December 9, 1999
Page 2

If you are in agreement with the above understandings, we would appreciate your execution of a copy of this letter and returning the executed copy to the undersigned.

Thank you for your cooperation in this manner. The City of Los Angeles, its Department of Airports, and Parsons Constructors Inc. look forward to working with the International Union of Elevator Constructors under this Agreement.

Sincerely,

Michael W. D'Antuono

International Union of Elevator Constructors

ADDENDUM 6

AMENDMENT OF THE LOS ANGELES WORLD AIRPORTS PROJECT LABOR AGREEMENT

The Parties agree that Section 1 of Article XIX of the Project Labor Agreement is hereby amended as follows:

Section 1(a). Duration. The Project Labor Agreement shall be effective on November 19, 1999, and shall continue in effect until December 31, 2010, and thereafter with regard to any work covered by this Agreement commenced prior to December 31, 2010, but not turned over prior to that date. The Agreement may be extended by mutual agreement of the City and the Unions, for a period not to exceed ten (10) additional years. If either wishes to extend the Agreement they shall notify the other twelve (12) months prior to December 31, 2010.

Section 1(b) The signatory parties mutually agree this 3rd day of December, 2010, to extend the existing Agreement effective January 1, 2011, for an additional ten (10) years, through December 31, 2020. This Agreement shall apply to all Project designated construction work awarded through December 31, 2020, for work meeting conditions established in Article II, Section 1(a)(b), and shall continue in effect until December 31, 2020, and thereafter with regard to any work covered by this Agreement commenced prior to December 31, 2020, but not turned over prior to that date. The Agreement may be extended by mutual agreement of the City and the Unions with twelve (12) months notice to the other party.

This Amendment may be executed in one or more counterparts, each of which shall be deemed an original, but all which together shall constitute one and the same instrument. Facsimile signatures are to be deemed equivalent to original "wet ink" signatures under this Amendment.

ADDENDUM 7

LOS ANGELES INTERNATIONAL AIRPORT CONSTRUCTION PROJECT LABOR AGREEMENT

CLARIFICATION

To All Contractors, Subcontractors and Signatory Unions

The parties of the Agreement had several meetings during the course of the year to discuss and finally arrive at the 10 year extension of the LAWA PLA. The following issues were agreed to further clarify the parties' intent as clarifications/guidance which will assist in the Administration of the LAWA PLA over the next 10 years of the extension.

(1) LAX PLA Article III, Section 6 Contractor Hiring Obligations

It is understood that all contractors and subcontractors ("contractors") awarded contracts or sub-contracts pursuant to proposals, to undertake covered work under the terms of this Agreement and referred for bid after January 1, 2011, are legally obligated pursuant to their commercial contracts relating to such covered work, to maximize the employment of qualified local persons residing within the area of the Project, with the goal that at least 30% of each contractor's employees hired under this Agreement shall be either residents of the cities immediately adjacent to LAX or of the City of Los Angeles ("local residents"). Contractors shall develop a hiring plan and maintain records of their compliance efforts. The contractors and the signatory unions will make every good faith effort to request for referral and to refer, respectively, qualified individuals meeting the local residency requirement.

In recognition of these obligations, the signatory unions, as the prime referral source, as well as the apprenticeship programs in which the signatory unions participate, shall cooperate and work with the contractors, LAWA, the City of Los Angeles, and the organizations designated by LAWA, to assist in the identification and training of local residents for work and the referral of such persons to work opportunities arising under this Agreement.

The contractors and referral systems of the signatory unions will maintain records with regard to all requests for referral, referrals, and employment of local residents. Such records shall be available upon request to the Agreement Coordinator.

(2) Article XI Apprentices – Apprentices, as used in this Agreement shall be those registered and participating in Joint Labor/Management Apprenticeship Programs approved by the State of California Department of Industrial Relations, Division of Apprenticeship Standards.

(3) Article VIII Section 2 – Correction in second line: Change "employees" to "employers."

ADDENDUM 9 (OBSOLETE)

RESOLUTION NO. 24316

WHEREAS, on recommendation of Management, there was presented for approval, designation of certain Los Angeles World Airports Phase II Capital Improvement Program Projects to be covered by a Project Labor Agreement between Parsons Constructors, Inc. and the Building and Construction Trades Department (AFL-CIO), the Building and Construction Trades Council of California and the Building and Construction Trades Council of Los Angeles and Orange Counties, and their affiliated international and local unions or any subsequent Project Labor Agreement; and

WHEREAS, on July 7, 2008, the Board of Airport Commissioners (BOAC) through Resolution 23600 designated the following Phase I Capital Improvement Program Projects for coverage by the Project Labor Agreement (PLA):

- Crossfield Taxiway Project – Taxiway C-13 Construction with Bridge
- Crossfield Taxiway Project – Taxiway D Extension West to Taxiway C-13
- Tom Bradley International Terminal (TBIT) New Large Aircraft (NLA) Gates Project – TBIT South 4 Gates
- TBIT NLA Gates Project – TBIT Apron South 4 Gates
- TBIT NLA Gates Project – Pedestrian Tunnel Structure
- TBIT NLA Gates Project – TBIT Additions (“Bump-out”)
- TBIT NLA Gates Project – TBIT North 3 Gates
- TBIT NLA Gates Project – TBIT Apron North 3 Gates; and

WHEREAS, timely and successful completion of construction work on projects covered by a PLA is critical to Los Angeles World Airports’ (LAWA) safe and efficient movement of passengers and cargo. It is essential that work on these projects be performed in a timely and economical manner that maximizes airport security and safety, without interruption. Labor management stability and cooperation are critical to this. A PLA helps to insure the completion of projects and increases the participation of local residents in Los Angeles International Airport (LAX) development employment opportunities; and

WHEREAS, the following list of Phase II Projects will be covered by a PLA:

	Approximate Cost in Millions
• Taxi Lane T	\$ 75
• Demolition of the AA Low Bay Hanger	TBD
• Partial Demolition and Upgrading of the Former TWA Maintenance Hanger	TBD
• Demolition and Relocation of the AA deluge System	TBD
• Construction of new Remain Over Night (RON) parking positions	TBD
• Central Utilities Plant	\$280
• Runway Safety Area Improvements- Southside	\$ 20
• Interim Taxiway Safety Improvements	\$ 60
• CTA Architectural Enhancements	TBD
• Electrical Network Station	\$ 35
• Terminal 1 Modernization	\$ 50
• Terminal 3 Modernization	\$ 50
• Electrical Systems Upgrades	\$ 50

(Table continued)

• TBIT Connector to T3 and T4	\$200
• Northside Terminal Complex Improvement	\$500
• CTA Utility Distribution – Phase II	\$ 75
• Taxiway B Rehabilitation	\$ 25
• Taxiway C Extension	\$ 35
• LAX CTA Roadway Improvements	TBD
• Century Cargo Complex Improvements	TBD
• AOA Perimeter Fence Improvements	\$ 20
<i>(not including projects whose costs not yet estimated) Total:</i>	
\$1,625,000,000; and	

WHEREAS, the parties to any PLA understand that there is no obligation for LAWA to deliver these projects, but that if and when they are built by LAWA the projects will be covered by a PLA. Beginning in 2013, the BOAC will review all capital project lists for coverage by a PLA every two (2) years; and

WHEREAS, this action, as a continuing administrative and personnel-related activity, is exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Article II Section 2(f) of the Los Angeles CEQA Guidelines; and

WHEREAS, actions taken on this item by the Board of Airport Commissioners will become final pursuant to the provisions of Los Angeles City Charter Section 245;

NOW, THEREFORE, BE IT RESOLVED that the Board of Airport Commissioners determined that this action is exempt from the California Environmental Quality Act requirements, adopted the Staff Report, approved the designation of the above listed Phase II Capital Improvement Program Projects at Los Angeles International Airport for coverage by a Project Labor Agreement, and authorized the Executive Director to provide notification as per the Project Labor Agreement of such coverage.

o0o

I hereby certify that this Resolution No. 24316 is true and correct, as adopted by the Board of Airport Commissioners at its Special Meeting held on Monday, December 6, 2010.

Sandra J. Miller – Secretary
BOARD OF AIRPORT COMMISSIONERS

ADDENDUM NO. 10

DRUG AND ALCOHOL TESTING POLICY

The Parties recognize the problems that drug and alcohol abuse have created in the construction industry and the need to develop drug and alcohol abuse prevention programs. Accordingly, the Parties agree that in order to enhance the safety of the workplace and to maintain a drug and alcohol-free work environment, individual Employers shall require applicants or employees to undergo drug and alcohol testing in accordance with this PLA, hereafter "Agreement" and this policy, Addendum No. 10 – Drug and Alcohol Testing Policy, hereafter "Policy". The term "Employer", as used in this Policy, shall have the same meaning as the term "Contractor", as defined in the Agreement.

1. It is understood that the use, possession, transfer or sale of illegal drugs, narcotics, or other unlawful substances, as well as being under the influence of alcohol and the possession or consuming alcohol is absolutely prohibited while employees are on the Employer's job premises or while working on any jobsite in connection with work performed under the Agreement.
2. No Employer may implement a drug and alcohol testing program that does not conform in all respects to the provisions of this Policy.
3. No Employer may implement drug and alcohol testing at any jobsite unless written notice is given to the Union setting forth the location of the jobsite, a description of the Project under construction, and the name and telephone number of the Employer's project manager. Said notice shall be provided at the pre-job conferences for each Project. Employers shall not commence work on the Project until said notice is given and failure to give said notice shall make any drug and alcohol testing engaged in by the Contractor invalid until such notice is provided. For Employers who fail to give said notice, the Agreement Coordinator shall work with the contracting entity and prime contractor to resolve such violations of this section, to the extent of withholding progress payments for the work performed by the Employer in violation until said notice is given. Any disagreements regarding the interpretation or application of this Policy shall be subject to resolution under the Article 7 grievance procedure.
4. An Employer who elects to implement drug and alcohol testing pursuant to this Policy shall require all employees on the Project to be tested. With respect to individuals who become employed on the Project subsequent to the proper implementation of a valid drug and alcohol testing program, such test shall be administered upon the commencement of employment on the Project, whether by referral from a Union Dispatch Office, transfer from another Project, or another method. Individuals who were employed on the Project prior to the proper implementation of a valid drug and alcohol testing program may only be subjected to testing for the reasons set forth in paragraphs 5(g)(1) through 5(g)(3) and paragraphs 6(a) through 6(e) of this Policy. Refusal to undergo such testing shall be considered sufficient grounds to deny employment on the Project.

5. The following procedure shall apply to all drug and alcohol testing:

- a. The Employer may request urine samples only. The applicant or employee shall not be observed when the urine specimen is given. An applicant or employee, at his or her sole option, shall, upon request, receive a blood test in lieu of a urine test. No employee of the Employer shall draw blood from a bargaining unit employee, touch or handle urine specimens, or in any way become involved in the chain of custody of urine or blood specimens. A Union Business Representative, subject to the approval of the individual applicant or employee, shall be permitted to accompany the applicant or employee to the collection facility to observe the collection, bottling, and sealing of the specimen.
- b. An Employer may request an applicant to perform an alcohol breathalyzer test, at a certified laboratory only and cutoff levels shall be those mandated by applicable state or federal law.
- c. The testing shall be done by a laboratory approved by the Substance Abuse & Mental Health Services Administration (SAMHSA), which is chosen by the Employer and the Union.
- d. An initial test shall be performed using the Enzyme Multiplied Immunoassay Technique (EMIT). In the event a question or positive result arises from the initial test, a confirmation test must be utilized before action can be taken against the applicant or employee. The confirmation test will be by Gas Chromatography/Mass Spectrometry (GC/MS). Cutoff levels for both the initial test and confirmation test will be those established by SAMHSA and this Policy. Should these SAMHSA levels be changed during the course of the Agreement or new testing procedures are approved, then these new regulations will be deemed as part of this existing Policy. Confirmed positive samples will be retained by the testing laboratory in secured long-term frozen storage for a minimum of one (1) year. Handling and transportation of each sample must be documented through strict chain of custody procedures.
- e. In the event of a confirmed positive test result the applicant or employee may request, within forty-eight (48) hours, a sample of his/her specimen from the testing laboratory for purposes of a second test to be performed at a second laboratory, designated by the Union and approved by SAMHSA. The retest must be performed within ten (10) days of the request. Chain of custody for this sample shall be maintained by the Employer between the original testing laboratory and the Union's designated laboratory. Retesting shall be performed at the applicant's or employee's expense. In the event of conflicting test results the Employer may require a third test, at the Employer's expense.
- f. If, as a result of the above testing procedure, it is determined that an applicant or employee has tested positive, this shall be considered sufficient grounds to deny the applicant or employee his/her employment on the Project.

- g. No individual who tests negative for drugs and alcohol pursuant to the above procedure and becomes employed on the Project shall again be subjected to drug and alcohol testing with the following exceptions:
 - 1. Employees who are involved in industrial accidents resulting in damage to plant, property or equipment or injury to him/her or others may be tested for drugs or alcohol pursuant to the procedures stated hereinabove.
 - 2. The Employer may test employees following thirty (30) days' advance written notice to the employee(s) to be tested and to the applicable Union. Notice to the applicable Union shall be sent by certified mail to the affected Union with a copy to the Agreement Coordinator. Such testing shall be pursuant to the procedures stated hereinabove.
 - 3. The Employer may test an employee where the Employer has reasonable cause to believe that the employee is impaired from performing his/her job. Reasonable cause shall be defined as being aberrant or unusual behavior, the type of which is a recognized and accepted symptom of impairment (e.g., slurred speech, unusual lack of muscular coordination.). Such behavior must be actually observed by at least two (2) persons, one (1) of whom shall be a supervisor who has been trained to recognize the symptoms of drug and alcohol abuse or impairment and the other of whom shall be the Job Steward. If the Job Steward is unavailable or there is no Job Steward on the Project the other person shall be a member of the applicable Union's bargaining unit. Testing shall be pursuant to the procedures stated hereinabove. Employees who are tested pursuant to the exceptions set forth in this paragraph and who test positive will be removed from the Employer's payroll.
 - h. Applicants or employees who do not test positive shall be paid for all time lost while undergoing drug and alcohol testing. Payment shall be at the applicable wage and benefit rates set forth in the applicable Union's Master Labor Agreement. Applicants who have been dispatched from the Union and who are not put to work pending the results of a test will be paid waiting time until such time as they are put to work. It is understood that an applicant must pass the test as a condition of employment. Applicants who are put to work pending the results of a test will be considered probationary employees.
6. The Employers will be allowed to conduct periodic jobsite drug and alcohol testing on the Project under the following conditions:
- a. The entire jobsite must be tested, including any employee or sub Employer's employee who worked on that Project three (3) working days before or after the date of the test;
 - b. Jobsite testing cannot commence sooner than fifteen (15) days after start of the work on the Project;

- c. Prior to start of periodic testing, a Business Representative will be allowed to conduct an educational period on company time to explain periodic jobsite testing program to affected employees;
 - d. Testing shall be conducted by a SAMHSA certified laboratory, pursuant to the provisions set forth in paragraph 5 hereinabove.
 - e. Only two (2) periodic tests may be performed in a twelve (12) month period.
- 7. It is understood that the unsafe use of prescribed medication, or where the use of prescribed medication impairs the employee's ability to perform work, is a basis for the Employer to remove the employee from the jobsite.
 - 8. Any grievance or dispute that may arise out of the application of this Policy shall be subject to the grievance and arbitration procedures set forth in the Agreement.
 - 9. The establishment or operation of this Policy shall not curtail any right of any employee found in any law, rule or regulation. Should any part of this Policy be found unlawful by a court of competent jurisdiction or a public agency having jurisdiction over the Parties, the remaining portions of the Agreement shall be unaffected, and the Parties shall enter negotiations to replace the affected provision.
 - 10. Present employees, if tested positive, shall have the prerogative for rehabilitation program at the employee's expense. When such program has been successfully completed the Employer shall not discriminate in any way against the employee. If work for which the employee is qualified exists on the Project, he/she shall be reinstated.
 - 11. The Employer agrees that results of urine and blood tests performed hereunder will be considered medical records held confidential to the extent permitted or required by law. Such records shall not be released to any persons or entities other than designated Employer representatives and the applicable Union. Such release to the applicable Union shall only be allowed upon the signing of a written release by the employee, and the information contained therein shall not be used to discourage the employment of the individual applicant or employee on any subsequent occasion.
 - 12. Employees who seek voluntary assistance for substance abuse may not be disciplined for seeking such assistance. Requests from employees for such assistance shall remain confidential and shall not be revealed to other employees or management personnel without the employee's consent. Employees enrolled in substance abuse programs will be subject to all Employer rules, regulations and job performance standards with the understanding that an employee enrolled in such a program is receiving treatment for an illness.
 - 13. The Employer shall indemnify and hold the Union, City, and Agreement Coordinator harmless against any and all claims, demands, suits, or liabilities that may arise out of the application of this Policy.

14. This Policy shall constitute the only Policy in effect between the Parties concerning drug and alcohol abuse, prevention and testing. Any modifications thereto must be accomplished pursuant to collective bargaining negotiations between the Parties.

APPENDIX A: SPECIMEN REPORTING CRITERIA

Initial Test Analyte	Initial Test Cutoff ¹	Confirmatory Test Analyte	Confirmatory Test Cutoff Concentration
Marijuana metabolites (THCA) ²	50 ng/ml ³	THCA	15 ng/ml
Cocaine metabolite (Benzoylecgonine)	150 ng/ml ³	Benzoylecgonine	100 ng/ml
Codeine/ Morphine	2000 ng/ml	Codeine Morphine	2000 ng/ml 2000 ng/ml
Hydrocodone/ Hydromorphone	300 ng/ml	Hydrocodone Hydromorphone	100 ng/ml 100 ng/ml
Alcohol	See Section 5.b.	Ethanol	See Section 5.b.
Oxycodone/ Oxymorphone	100 ng/ml	Oxycodone Oxymorphone	100 ng/ml 100 ng/ml
6-Acetylmorphine	10 ng/ml	6-Acetylmorphine	10 ng/ml
Phencyclidine	25 ng/ml	Phencyclidine	25 ng/ml
Amphetamine/ Methamphetamine	500 ng/ml	Amphetamine Methamphetamine	250 ng/ml 250 ng/ml
MDMA ⁴ /MDA ⁵	500 ng/ml	MDMA MDA	250 ng/ml 250 ng/ml
Initial Test Analyte	Initial Test Cutoff	Confirmatory Test Analyte	Confirmatory Test Cutoff Concentration
Barbiturates	300 ng/ml	Barbiturates	200 ng/ml
Benzodiazepines	300 ng/ml	Benzodiazepines	300 ng/ml
Methadone ⁶	300 ng/ml	Methadone	100 ng/ml
Methaqualone	300 ng/ml	Methaqualone	300 ng/ml
Propoxyphene	300 ng/ml	Propoxyphene	100 ng/ml

¹For grouped analytes (i.e., two or more analytes that are in the same drug class and have the same initial test cutoff):

Immunoassay: The test must be calibrated with one analyte from the group identified as the target analyte. The cross-reactivity of the immunoassay to the other analyte(s) within the group must be 80 percent or greater; if not, separate immunoassays must be used for the analytes within the group.

Alternate technology: Either one analyte or all analytes from the group must be used for calibration, depending on the technology. At least one analyte within the group must have a concentration equal to or greater than the initial test cutoff or, alternatively, the sum of the analytes present (i.e., equal to or greater than the laboratory's validated limit of quantification) must be equal to or greater than the initial test cutoff.

²An immunoassay must be calibrated with the target analyte, 9-tetrahydrocannabinol-9-carboxylic acid (THCA).

³**Alternate technology (THCA and benzoylecgonine):** The confirmatory test cutoff must be used for an alternate technology initial test that is specific for the target analyte (i.e., 15 ng/ml for THCA, 100 ng/ml for benzoylecgonine).

⁴Methylenedioxymethamphetamine (MDMA)

⁵Methylenedioxymphetamine (MDA)

⁶Employees with a prescription for methadone who are using the medication as prescribed, and are not impaired and can safely perform their work, will not be considered to have violated this Policy.

**SIDE LETTER OF AGREEMENT
TESTING POLICY FOR DRUG ABUSE**

It is hereby agreed between the Parties hereto that an Employer who has otherwise properly implemented drug and alcohol testing, as set forth in the Policy, shall have the right to offer an applicant or employee a "quick" drug screening test. This "quick" screen test shall consist either of the "ICUP" urine screen or similar test or an oral screen test. The applicant or employee shall have the absolute right to select either of the two "quick" screen tests, or to reject both and request a full drug test.

An applicant or employee who selects one of the "quick" screen tests, and who passes the test, shall be put to work immediately. An applicant or employee who fails the "quick" screen test, or who rejects the "quick" screen tests, shall be tested pursuant to the procedures set forth in the Policy. The sample used for the "quick" screen test shall be discarded immediately upon conclusion of the test. An applicant or employee shall not be deprived of any rights granted to them by the Policy as a result of any occurrence related to the "quick" screen test.

EXHIBIT N

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture

Agreement Number: **90009220.SAMPLE2**

QUALITY REQUIREMENTS

This Subcontract shall include, but is not limited to, the items listed below which supplements the articles of the Subcontract. In the event of a conflict between any provision of the Subcontract and any provision of this Exhibit, the more stringent requirement shall apply.

GENERAL

1. Subcontractor shall comply with the quality requirements of the Contract, Technical Provisions, Design Documents, and related standards, specifications and guidelines.
2. Each Subcontractor is responsible for monitoring the quality of its work. The acceptable level of quality is established by the Contract Documents and the Project's Quality Management Plan. Compliance with quality requirements will be determined by Contractor and the Designer of Record. Subcontractor shall submit for Contractor's approval, a Quality Control Program for its work within thirty (30) days of the Subcontract award or if sooner, prior to commencement of work or purchasing of materials and equipment. Subcontractor's Program shall be at least as stringent as the Contractor Program and shall at a minimum include the following:
 - a. Project organization
 - b. Identify competent inspectors
 - c. Procedure for checking and verifying receipt of materials and equipment
 - d. Procedure for monitoring work compliance with approved construction documents
 - e. Testing and inspections procedures
 - f. Documentation process
3. The Subcontractor will not be relieved of any obligation under the quality control provisions of the Contract because of Quality Control Programs administered by Contractor. Thus, Subcontractor's Quality Programs will be in addition to any Quality Control Programs put into effect and monitored by Contractor.

COORDINATION

4. Subcontractor shall designate an onsite Quality Control Representative who shall be onsite full-time and be the primary liaison with Contractor's Construction Quality Assurance Manager for all issues related to quality. Said person may be a working foreman; however, shall have a minimum of five (5) years relevant construction experience, must be available to regularly attend quality control meetings, timely resolve quality control issues, and communicate effectively both verbally and in writing.
5. Subcontractor will prepare Construction Work Plans per the Contractor Quality Management Plan and submit to the Construction Quality Assurance Manager for review. Construction Work Plans shall include:
 - a. Description of the work
 - b. Sequence of the work
 - c. Safety and environmental concerns regarding the work
 - d. All materials required for the work
 - e. Individuals responsible for supervision of the work
 - f. Planned start date of the work, and anticipated duration of the work

EXHIBIT N

Project: **LAWA ATMP ROADWAY IMPROVEMENTS**

Project Number: 90009220

Subcontractor: **FOR EXAMPLE USE ONLY**

Skanska-Flatiron a Joint Venture
Agreement Number: **90009220.SAMPLE2**

- g. Prerequisite activities required
 - h. Submittals required
 - i. Inspection and/or testing requirements
6. Subcontractor shall participate in Pre-Activity (Pre-Construction) Meetings at a location selected by Contractor for each definable feature of its work. These meetings' agendas will include review of the prepared Construction Work Plans as well as the approved construction drawings and specifications.

INSPECTION AND TESTING

7. Subcontractor shall review the critical dimensions and elevations of existing work and shall otherwise verify the conformity of existing work to the Contract Documents and to its suitability for receiving the work of this Subcontract. Subcontractor shall promptly submit a written statement to Contractor noting any discrepancies or unacceptable conditions as they relate to its work. Subcontractor shall not attach to or cover any work that is not properly installed.
8. Subcontractor is responsible for conformance of its Work with the Contract Documents, and shall not cover up or continue to work in areas lacking testing and inspection. Subcontractor shall promptly report any deficiencies to Contractor's Quality Control Manager.
9. Subcontractor shall coordinate its work with Contractor and all testing agencies and will assist with the procurement of required samples, and the inspections of its work. This includes ladders, hoists, scaffold, etc., as required to provide access to the work.
10. Subcontractor will provide Quality Control Testing as required by the Caltrans Standard Specifications pertaining to the scope of work provided by the Subcontractor.

DOCUMENTATION

11. Subcontractor shall complete Contractor's Daily Quality Control Reports and submit these reports to the Contractor's Construction Quality Assurance Manager by 10:00 AM of the next business day.
12. Subcontractor shall provide testing reports for any QC Testing performed to the Construction Quality Assurance Manager.
13. Subcontractor shall provide notice of all permanent materials to be used to the Construction Quality Assurance Manager. Notice shall be provided utilizing the Caltrans CEM-3101DB form. Any product data or backup documentation requested by the Construction Quality Assurance Manager shall be provided.
14. Subcontractor shall provide material documentation (Bill of Lading, Certificate of Compliance, Mill Test Reports, etc.) for all permanent materials that are to be incorporated into the work. All documentation is to be delivered to the Construction Quality Assurance Manager.
15. At the completion of the work of this Subcontract, Subcontractor shall certify that the work has been installed in accordance with the Contract Requirements and provide supporting as-built drawings and requested documentation.
