**Subject: Air Quality Support – CalEEMod Air Quality, Greenhouse Gas, and Noise Study for a Multi-Residential Building Development in Los Angeles, CA**

Dear Mr. Pourbaba:

Yorke Engineering, LLC (Yorke) is pleased to provide this Air Quality (AQ), Greenhouse Gas (GHG), and Noise Letter Report. This AQ/GHG/Noise Letter Report includes CalEEMod emissions estimates, criteria pollutant analysis, localized significance level (LST) analysis, GHG analysis, and Noise analysis for the proposed multi-residential building development in the City of Los Angeles, California (City). These evaluations will support the Applicant's submittal of the Department of City Planning Environmental Assessment Form (EAF) with a CEQA Categorical Exemption or a Mitigated Negative Declaration (MND), as applicable.

## **PROJECT DESCRIPTION**

We understand that Proper Development is proposing to construct a new six-story residential building to be located at 511-517 North Hoover Street in the City of Los Angeles, CA 93004 (the City), which is within the SCAQMD. The proposed project will comprise 40 units with one level of underground parking for 54 vehicles and 44 bicycles. The 22,500-square-foot project site is two blocks south of Melrose Avenue, approximately 700 feet (210 meters) north of the Hollywood Freeway (U.S. 101). To fulfill Los Angeles City Planning application requirements under the Transit Oriented Communities (TOC) Incentive Program, an air quality, GHG, and construction noise impact assessment is required.

## **ASSUMPTIONS**

The following basic assumptions were used in developing the emission estimates for the proposed Project using the California Emissions Estimator Model® (CalEEMod):

- Some project design features including size of the building features were defined by the Applicant.
- Some Project design features such as parking area size were provided by the Applicant.
- Construction equipment, including hours used per data were applied to construction phases of the project.
- During grading and site preparation the project site will be watered twice a day.
- Low VOC paint will be used.

- The parking was assumed to be enclosed with an elevator and is included in the CalEEMod modeling.
- The Project is expected to require up to approximately 16 months of planned work activities (i.e., from mobilization to substantial completion) comprising six construction phases (demolition, grading, site preparation, building construction, and architectural coating).
- Approximately 8,800 square feet of old buildings will be removed during the demolition phase.
- During construction exposed soil will be watered twice daily.

## LIST OF TABLES

The project analyses and results are summarized in the following tables:

- Table 1: Land Use Data for CalEEMod Input – 511-517 North Hoover Street
- Table 2: SCAQMD CEQA Thresholds of Significance
- Table 3: Construction Emissions Summary and Significance Evaluation
- Table 4: Operational Emissions Summary and Significance Evaluation
- Table 5: Construction Localized Significance Threshold Evaluation
- Table 6: Operational Localized Significance Threshold Evaluation
- Table 7: Greenhouse Gas Emissions Summary and Significance Evaluation
- Table 8: Typical Sound Level Characteristics
- Table 9: FHWA Noise Reference Levels and Usage Factors
- Table 10: Estimated Peak Activity Daytime Noise Impacts – Residential Receptors

## AIR QUALITY AND GREENHOUSE GAS IMPACTS ANALYSES

The Air Quality Section of Appendix G of the California Environmental Quality Act (CEQA) Guidelines (Environmental Checklist Form) contains air quality and GHG significance criteria. Where applicable, quantitative significance criteria established by the local air quality management district (AQMD) may be relied upon to make significance determinations based on mass emissions of criteria pollutants and GHGs, as determined in this report.

### Project Emissions Estimation

The construction and operation analysis were performed using CalEEMod® (California Emissions Estimation Model, version 2016.3.2), the official statewide land use computer model designed to provide a uniform platform for estimating potential criteria pollutant and GHG emissions associated with both construction and operations of land use projects under CEQA. The model quantifies direct emissions from construction and operations (including vehicle use), as well as indirect emissions, such as GHG emissions from energy use, solid waste disposal, vegetation planting and/or removal, and water use. The mobile source emission factors used in the model – published by the California Air Resources Board (CARB) – include the Pavley standards and Low Carbon Fuel standards. The model also identifies project design features, regulatory measures, and

mitigation measures to reduce criteria pollutant and GHG emissions along with calculating the benefits achieved from the selected measures. CalEEMod was developed by the California Air Pollution Control Officers Association (CAPCOA) in collaboration with the SCAQMD, the Bay Area Air Quality Management District (BAAQMD), the San Joaquin Valley Air Pollution Control District (SJVAPCD), and other California air districts. Default land use data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) were provided by the various California air districts to account for local requirements and conditions. As the official assessment methodology for land use projects in California, CalEEMod is relied upon herein for construction and operational emissions quantification, which forms the basis for the impact analysis.

Based on information received from the Applicant, land use data used for CalEEMod input is presented in Table 1. The SCAQMD quantitative significance thresholds shown in Table 2 were used to evaluate project emissions impacts (SCAQMD 2019).

### ***Criteria Pollutants from Project Construction***

A project's construction phase produces many types of emissions, generally PM<sub>10</sub> (including PM<sub>2.5</sub>) in fugitive dust and diesel engine exhaust are the pollutants of greatest concern; however, since the project construction consists of interior renovation with additional building on the third floor of the existing structure, fugitive dust emissions are not of concern. Construction activities will include renovation of the existing first and second levels and additional construction of a level 3. Construction-related emissions can cause substantial increases in localized concentrations of PM<sub>10</sub>, as well as affecting PM<sub>10</sub> compliance with ambient air quality standards on a regional basis. The use of diesel-powered construction equipment emits ozone precursors oxides of nitrogen (NO<sub>x</sub>) and reactive organic gases (ROG), and diesel particulate matter (DPM); however, the use of diesel-powered equipment would be minimal. Use of architectural coatings and other materials associated with finishing buildings may also emit ROG and TACs. CEQA significance thresholds address the impacts of construction activity emissions on local and regional air quality. Thresholds are also provided for other potential impacts related to project construction, such as odors and TACs.

The SCAQMD's approach to CEQA analyses of fugitive dust impacts is to require implementation of effective and comprehensive dust control measures rather than to require detailed quantification of emissions; however, due to the nature of project construction, which includes no earth moving activities, it is not necessary to implement any fugitive dust control Best Management Practices (BMPs).

### ***Criteria Pollutants from Project Operation***

The term “project operations” refers to the full range of activities that can or may generate criteria pollutant, GHG, and TAC emissions when the project is functioning in its intended use. For projects, such as office parks, shopping centers, apartment buildings, residential subdivisions, and other indirect sources, motor vehicles traveling to and from the project represents the primary source of air pollutant emissions. For industrial projects and some commercial projects, equipment operation and manufacturing processes, i.e., permitted stationary sources, can be of greatest concern from an emissions standpoint. CEQA significance thresholds address the impacts of operational emission sources on local and regional air quality. Thresholds are also provided for other potential impacts related to project operations, such as odors.

### ***Results of Criteria Emissions Analyses***

Table 3 shows unmitigated and mitigated criteria construction emissions and evaluates mitigated emissions against SCAQMD significance thresholds.

Table 4 shows unmitigated and mitigated criteria operational emissions and evaluates mitigated emissions against SCAQMD significance thresholds.

As shown in Tables 3 and 4, mass emissions of criteria pollutants from construction and operation are below applicable SCAQMD significance thresholds, i.e., Less Than Significant (LTS).

**PROJECTED IMPACT:** Less Than Significant

**ADDITIONAL MITIGATION:** None required

**Table 3: Construction Emissions Summary and Significance Evaluation**

Criteria Pollutants	Unmitigated	Mitigated	Threshold	Significance
	lbs/day	lbs/day	lbs/day

lbs/day are winter or summer maxima for planned land use

LTS - Less Than Significant

### ***Localized Significance Threshold Analysis***

The SCAQMD's Localized Significance Threshold (LST) methodology (2008a) was used to analyze the neighborhood scale impacts of NO<sub>x</sub>, CO, PM<sub>10</sub>, and PM<sub>2.5</sub> associated with project-specific mass emissions. Introduced in 2003, the LST methodology was revised in 2008 to include the PM<sub>2.5</sub> significance threshold methodology and update the LST mass rate lookup tables for the new 1-hour NO<sub>2</sub> standard.

For determining localized air quality impacts from small projects in a defined geographic source-receptor area (SRA), the LST methodology provides mass emission rate lookup tables for 1-acre, 2-acre, and 5-acre parcels by SRA. The tabulated LSTs represent the maximum mass emissions from a project that will not cause or contribute to an exceedance of state or national ambient air quality standards (CAAQS or NAAQS) for the above pollutants and were developed based on ambient concentrations of these pollutants for each SRA in the South Coast Air Basin. (SCAQMD 2008a)

For most land use projects, the highest daily emission rates occur during the site preparation and grading phases of construction; however, since the project would not have a site preparation and grading phase the building construction phase is used for the LST analysis.

Since land use operational emissions – mainly from associated traffic – are dispersed over a wide area, localized impacts from project operation are substantially lower than during project construction. However, an Operational LST analysis was also performed. The land use category “Apartment Mid Rise” assumes that there are many residences commuting to and from the location daily.

The proposed Project site is 0.52 acres in source-receptor area Zone 2 – Northwest Coastal Los Angeles county. The 1-acre screening lookup tables were used to evaluate NO<sub>x</sub>, CO, PM<sub>10</sub>, and PM<sub>2.5</sub> impacts on nearby receptors. The nearest receptor is approximately 25 meters away from the site. Therefore, the impact evaluation was performed using the closest distance within SCAQMD LST tables of 25 meters for construction. (SCAQMD 2008a)

### ***Results of Localized Significance Threshold Analysis***

The LST results provided in Tables 5 and 6 show that on-site emissions from construction and operations would meet the LST passing criteria at the nearest receptors (25 meters). Thus, impacts would be less than significant.

**PROJECTED IMPACT:** Less Than Significant

**ADDITIONAL MITIGATION:** None required

**Table 5: Construction Localized Significance Threshold Evaluation**

Criteria Pollutants	Mitigated	Threshold	Percent of Threshold	Result
	lbs/day	lbs/day		
NO <sub>x</sub>	22.56	103	22%	Pass

***Greenhouse Gas Emissions from Construction and Operation***

Greenhouse gases – primarily carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), and nitrous (N<sub>2</sub>O) oxide, collectively reported as carbon dioxide equivalents (CO<sub>2e</sub>) – are directly emitted from stationary source combustion of natural gas in equipment such as water heaters, boilers, process heaters, and furnaces. GHGs are also emitted from mobile sources such as on-road vehicles and off-road construction equipment burning fuels such as gasoline, diesel, biodiesel, propane, or natural gas (compressed or liquefied). Indirect GHG emissions result from electric power generated elsewhere (i.e., power plants) used to operate process equipment, lighting, and utilities at a facility. Also, included in GHG quantification is electric power used to pump the water supply (e.g., aqueducts, wells, pipelines) and disposal and decomposition of municipal waste in landfills. (CARB 2017)

California's Building Energy Efficiency Standards are updated on an approximately three-year cycle. The 2019 standards improved upon the 2016 standards for new construction of, and additions and alterations to, residential, commercial, and industrial buildings. The 2019 standards went into effect on January 1, 2020 (CEC 2019).

Since the Title 24 standards require energy conservation features in new construction (e.g., high-efficiency lighting, high-efficiency heating, ventilating, and air-conditioning (HVAC) systems,

thermal insulation, double-glazed windows, water conserving plumbing fixtures, etc.), they indirectly regulate and reduce GHG emissions.

Using CalEEMod, direct onsite and offsite GHG emissions were estimated for construction and operation, and indirect offsite GHG emissions were estimated to account for electric power used by the proposed Project, water conveyance, and solid waste disposal.

### ***Results of Greenhouse Gas Emissions Analyses***

The SCAQMD officially adopted an industrial facility mass emissions threshold of 10,000 metric tons (MT) CO<sub>2</sub>e per year (SCAQMD 2019) and has proposed a residential/commercial mass emissions threshold of 3,000 metric tons (MT) CO<sub>2</sub>e per year. (SCAQMD 2008b)

Table 7 shows unmitigated and mitigated GHG emissions and evaluates mitigated emissions against SCAQMD significance thresholds. Operational mitigation measures incorporate typical code-required energy and water conservation features. Off-site traffic impacts are included in these emissions estimates, along with construction emissions amortized over 30 years.

**PROJECTED IMPACT:** Less Than Significant.

**MITIGATION:** None Required.

**Table 7: Greenhouse Gas Emissions Summary and Significance Evaluation**

Greenhouse Gases	Unmitigated	Mitigated	Threshold	Significance
	MT/yr	MT/yr	MT/yr	
CO <sub>2</sub>	513	513	—	—
CH <sub>4</sub>	0.3	0.3	—	—
N <sub>2</sub> O	0.0	0.0	—	—
CO <sub>2</sub> e	524	524	3,000	LTS

**Notes:**

Comprises annual operational emissions plus construction emissions amortized over 30 years

## **NOISE IMPACTS ANALYSES**

### **Noise Analysis Methodology**

The screening-level noise analysis for Project construction was completed based on methodology developed by the U.S. Department of Transportation Federal Highway Administration (DOT FHWA) at the John A. Volpe National Transportation Systems Center and other technical references consistent with CalEEMod™ outputs (equipment utilization). The DOT FHWA methodology uses actual noise measurement data collected during the Boston “Big Dig” project (1991-2006) as reference levels for a wide variety of construction equipment in common use, such as on the proposed Project. This noise analysis did not include field measurements of ambient noise in the vicinity of the Project site.

The FHWA noise model provides relatively conservative predictions because it does not account for site-specific geometry, dimensions of nearby structures, and local environmental conditions that can affect sound transmission, reflection, and attenuation. As a result, actual measured sound

levels at receptors may vary somewhat from predictions, typically lower. Additionally, the impacts of noise upon receptors (persons) are subjective because of differences in individual sensitivities and perceptions.

Noise impacts were evaluated against community noise standards contained in the City or County General Plan or other state or federal agency as applicable to the vicinity of the Project site. For this Project, the City of Los Angeles Municipal Code (LAMC), Chapter XI, Noise Regulation, Sections 112.02, 112.03, 112.05, and 41.40 contain the applicable evaluation criteria. Screening-level Project-generated noise is evaluated in relation to established thresholds of significance. Additionally, the same methods are used to determine noise impacts on the nearest sensitive receptor.

During construction activities, the Project would generate noise due to operation of minimal off-road equipment, portable equipment, and vehicles at or near the Project site. No significant increase in traffic is expected due to this relatively small project. No strong sources of vibrations are planned to be used during construction activities.

Since the Project is near an urban street, the incremental effect of Project operation (possible slightly increased traffic) would not be quantifiable against existing traffic noise (background) in the Project vicinity (i.e., less than significant impact). Also, since no airport is closer than 2 miles from the Project site, evaluation of aircraft noise upon the Project is not required.

## **Environmental Setting**

### ***Noise Descriptors***

Noise is typically described as any unwanted or objectionable sound. Sound is technically described in terms of the loudness (amplitude) and frequency (pitch) of the sound. The standard unit of measurement of the loudness of sound is the decibel (dB). Because the human ear is not equally sensitive to sound at all frequencies, a special frequency-dependent rating scale has been devised to relate noise to human sensitivity, the A-weighted decibel scale (dBA). Table 8 lists common sources of sound and their intensities in dBA.

**Table 8: Typical Sound Level Characteristics**

<b>Pressure</b>	<b>Level</b>	<b>Sound Level Characteristic</b>
<b>N/m<sup>2</sup></b>	<b>dB</b>	
2000	160	Rocket Launch
600	150	Military Jet Plane Takeoff
200	140	Threshold of Pain
60	130	Commercial Jet Plane Takeoff
20	120	Industrial Chipper or Punch Press
6	110	Loud Automobile Horn
2	100	Passing Diesel Truck – Curb Line
0.6	90	Factory - Heavy Manufacturing
0.2	80	Factory - Light Manufacturing
0.06	70	Open Floor Office - Cubicles
0.02	60	Conversational Speech
0.006	50	Private Office - Walled
0.002	40	Residence in Daytime
0.0006	30	Bedroom at Night
0.0002	20	Recording or Broadcasting Studio
0.00006	10	Threshold of Good Hearing - Adult
0.00002	0	Threshold of Excellent Hearing - Child

Sources: Broch 1971, Plog 1988

Notes:

Reference Level  $P_0 = 0.00002 \text{ N/m}^2 = 0.0002 \mu\text{bar}$

$\text{N/m}^2$  = Newtons per square meter (the Newton is the unit of force derived in the metric system); it is equal to the amount of net force required to accelerate one kilogram of mass at a rate of one meter per second squared ( $1 \text{ kg} \cdot 1 \text{ m/s}^2$ ) in the direction of the applied force.

In most situations, a 3-dBA change in sound pressure is considered a “just-detectable” difference. A 5-dBA change (either louder or quieter) is readily noticeable, and 10-dBA change is a doubling (if louder) or halving (if quieter) of the subjective loudness. Sound from a small, localized source (a “point” source) radiates uniformly outward as it travels away from the source in a spherical pattern. The sound level attenuates (drops off) at a rate of 6 dBA for each doubling of the distance.

The duration of noise and the time period at which it occurs are important factors in determining the impact of noise on sensitive receptors. A single number called the equivalent continuous noise level ( $L_{eq}$ ) may be used to describe sound that is changing in level. It is also used to describe the acoustic range of the noise source being measured, which is accomplished through the maximum  $L_{eq}$  ( $L_{max}$ ) and minimum  $L_{eq}$  ( $L_{min}$ ) indicators.

In determining the daily measure of community noise, it is important to account for the difference in human response to daytime and nighttime noise. Noise is more disturbing at night than during the day, and noise indices have been developed to account for the varying duration of noise events over time, as well as community response to them. The Community Noise Equivalent Level (CNEL) adds a 5-dB penalty to the “nighttime” hourly noise levels (HNLs) (i.e., 7:00 p.m. to 10:00

p.m.) and the Day-Night Average Level ( $L_{dn}$ ) adds a 10-dB penalty to the evening HNLs (Caltrans 2013, FTA 2006).

### ***Vibration Descriptors***

Vibration is a unique form of noise because its energy is carried through structures and the earth, whereas noise is carried through the air. Thus, vibration is generally felt rather than heard. Typically, ground borne vibration generated by manmade activities attenuates rapidly as distance from the source of the vibration increases. Actual human and structural response to different vibration levels is influenced by a combination of factors, including soil type, distance between the source and receptor, duration, and the number of perceived events.

While not a direct health hazard, the energy transmitted through the ground as vibration may result in structural damage, which may be costly to repair and dangerous in the event of structural failure. To assess the potential for structural damage associated with vibration, the vibratory ground motion in the vicinity of the affected structure is measured in terms of point peak velocity/peak particle velocity (PPV) in the vertical and horizontal directions (vector sum). A freight train passing at 100 feet may cause PPVs of 0.1 inch per second, while a strong earthquake may produce PPVs in the range of 10 inches per second. Minor cosmetic damage to buildings may begin in the range of 0.5 inch per second (Caltrans 2013, FTA 2006).

### ***Existing Noise Environment***

The Project site is in the City of Los Angeles, Los Angeles County, in a characteristically urban and densely populated area subject to noise from local traffic on public streets (North Hoover Street, North Commonwealth Avenue, Bellevue Avenue, and Imogen Avenue), buses, trains, construction, and small power equipment (e.g., lawn mowers, edger, etc.). The FHWA noise model puts the expected daytime ambient noise from known sources at about 68 dBA at the nearest sensitive receptor to the proposed Project. This model is based on traffic from North Hoover Street and North Commonwealth Avenues as well as a general 40 dBA urban background noise.

### ***Sensitive Receptors***

Some land uses are generally regarded as being more sensitive to noise than others due to the types of population groups or activities involved. Sensitive population groups include children and the elderly. The City of Los Angeles Noise Element also includes residential areas as noise-sensitive land uses. Other sensitive land uses generally include hospitals, schools, childcare facilities, senior facilities, libraries, churches, and parks.

The nearest schools to the Project site are the Dayton Heights Early Education Center, approximately 1,000 feet (305 meters) northwest of the site and the Camino Nuevo Charter Academy approximately 1,040 feet (317 meters) south of the site. Interceding building, and other multi-story buildings, would substantially shield all the schools from construction noise. The nearest residential receptors are west of the site, approximately 83 feet (25 meters) from the central construction zone; and, for consistency with LST, a source-receptor distance of 25 meters (82 feet) was used. All construction activities would be short-term and temporary. All construction work is planned to be conducted during daylight hours; no nighttime work is planned to be performed. Upon completion of construction, construction generated noise would permanently cease. Since the proposed project is located in a dense urban area and not within 500 feet of a major freeway,

no significant additional long-term traffic is expected, and therefore no additional Project-related noise is expected over the long term.

## **Regulatory Setting**

### ***California***

The State of California does not promulgate statewide standards for environmental noise but requires each city and county to include a noise element in its general plan [California Government Code Section 65302(f)]. In addition, Title 4 of the CCR has guidelines for evaluating the compatibility of various land uses as a function of community noise exposure. In general, the guidelines require that community noise standards:

- Protect residents from the harmful and annoying effects of exposure to excessive noise;
- Prevent incompatible land uses from encroaching upon existing or programmed land uses likely to create significant noise impacts; and
- Encourage the application of state-of-the-art land use planning methodologies in the area of managing and minimizing potential noise conflicts.

Construction vibration is regulated at the state level in accordance with standards established by the *Transportation and Construction-Induced Vibration Guidance Manual* issued by Caltrans in 2004. Continuous sources include the use of vibratory compaction equipment and other construction equipment that creates vibration other than in single events. Transient sources create a single isolated vibration event, such as blasting. Thresholds for continuous sources are 0.5 and 0.1 inch per second PPV for structural damage and annoyance, respectively. Thresholds for transient sources are 1.0 and 0.9 PPV for structural damage and annoyance, respectively (Caltrans 2013).

### ***City of Los Angeles Municipal Code – Chapter XI, Noise Regulation***

For this Project, the City of Los Angeles Municipal Code (LAMC), Chapter XI, Noise Regulation, Sections 112.02, 112.03, 112.05, and 41.40 contain the applicable evaluation criteria.

Operational on-site stationary sources of mechanical noise are required to comply with the LAMC Section 112.02, which prohibits noise from air conditioning, refrigeration, heating, pumping, and filtering equipment from exceeding the ambient noise level on the premises of other occupied properties, e.g., nearby residential buildings, by more than 5 dBA. Modern roof-mounted mechanical equipment is designed to meet this standard.

LAMC Section 112.03 references Section 41.40 which regulates noise from construction activities. Outdoor construction activities that generate noise are prohibited between the nighttime hours of 9:00 pm and 7:00 am Monday through Friday, and between 6:00 pm and 8:00 am on Saturdays and national holidays. Construction activities are prohibited on Sundays. The construction activities associated with the proposed Project would comply with these LAMC requirements.

Per Section 112.05, construction noise impacts would be significant if noise from powered equipment or powered hand tools used for construction within 500 feet (150 meters) of a residential zone exceeds 75 A-weighted decibels (dBA) at a distance of 50 feet (15 meters) from the noise source between the hours of 7:00 am and 10:00 pm. However, this noise limitation does not apply where compliance is technically infeasible. Technically infeasible means that the 75 dBA

limitation cannot be complied with despite the use of mufflers, shields, sound barriers and/or any other noise reduction device or techniques during the operation of the equipment. However, the burden of proof of technical infeasibility is placed upon the person or persons generating the noise, i.e., the contractor and owner or owner's agent.

### **Results of Screening Noise Analysis**

The proposed Project can be characterized as development of a new multi-residential building with below ground parking. Most noise would occur during the demolition, grading, site preparation and building construction when heavy equipment would be operating.

During each of the six construction phases there would be a different mix of equipment operating and cumulative noise levels would vary based on the amount of equipment in operation and the location of each activity at the Project site. In general, use of off-road equipment and portable equipment would generate noise due to engine mechanicals, engine exhaust, driveline mechanicals, shaft-driven devices and accessories, hydraulics operation, ground friction and displacement, and gravity drops (dumping, unloading).

Since no intense percussive actions (e.g., hard rock-breaking, large pile-driving) are planned to occur during the site work, no strong groundborne vibrations are expected to be generated that could affect nearby structures or be noticeable to their occupants.

Types of equipment (FHWA 2006) to be used during the Project and noise-emitting characteristics (i.e., usage factors, reference dBA, and percussive source) are shown in Table 9 consistent with CalEEMod outputs (Attachment 1).

The Project is expected to require up to approximately 16 months of planned work activities (i.e., from mobilization to substantial completion) comprising six construction phases:

- 1) Demolition
- 2) Site Preparation
- 3) Grading
- 4) Building construction
- 5) Paving
- 6) Architectural coating.

Deviations from this schedule would not affect the noise analysis because noise does not persist or accumulate in the environment.

**Table 9: FHWA Noise Reference Levels and Usage Factors**

CalEEMod Construction Detail			FHWA Equipment Type	Ref.	Usage Factor	Ref. Level	Percussive Source
Phase Name	Equipment Description	Qty.			percent	dBA	Yes/No
Demolition (1)	Concrete/Industrial Saws	1	Concrete Saw	1	20%	90	No

Table 10 shows a comparison of: screening-level estimated daytime exterior noise impacts for peak construction activities at designated receptors, and the CEQA thresholds outlined in LAMC Chapter XI, using FHWA attenuation algorithms. If the threshold is not exceeded, then this project should be considered acceptable.

**Table 10: Estimated Peak Activity Daytime Noise Impacts – Residential Receptors (mitigated)<sup>c, d</sup>**

Notes:<sup>a</sup> Cumulative impacts include existing street traffic and ambient background noise sources<sup>b</sup> LAMC 112.05<sup>c</sup> Residential receptor is 25 meters (82 feet) west of the construction zone perimeter<sup>d</sup> Mitigation comprises noise barriers on site perimeter (see Discussion)**Discussion*****Construction Noise – LAMC Sections 112.03 and 112.05***

Construction noise impacts would be significant if, as defined by Los Angeles Municipal Code (LAMC) Section 112.05, noise from powered equipment or powered hand tools used for construction within 500 feet (150 meters) of a residential zone exceeds 75 A-weighted decibels (dBA) at a distance of 50 feet (15 meters) from the noise source between the hours of 7:00 am and 10:00 pm. However, this noise limitation does not apply where compliance is technically infeasible. Technically infeasible means that the 75 dBA limitation cannot be complied with despite the use of mufflers, shields, sound barriers and/or any other noise reduction device or techniques during the operation of the equipment. However, the burden of proof of technical infeasibility is placed upon the person or persons generating the noise, i.e., the contractor and owner or owner's agent.

LAMC Section 112.03 references Section 41.40 which regulates noise from construction activities. Outdoor construction activities that generate noise are prohibited between the nighttime hours of 9:00 pm and 7:00 am Monday through Friday, and between 6:00 pm and 8:00 am on Saturdays and national holidays. Construction activities are prohibited on Sundays. The construction activities associated with the proposed Project would comply with these LAMC requirements.

Although the estimated construction-related exterior noise levels associated with the proposed Project are modeled to normally be below the 75 dBA threshold, there may be times when the construction activities could intermittently and marginally exceed the 75 dBA threshold at 50 feet from the noise source. To minimize impacts, the Project will implement technically feasible mitigation measures in compliance with the standards set forth in LAMC Section 112.05. Specifically, the use of deflectors/barriers such as plywood construction fencing (½-inch thickness), flexible sound-absorbing curtains, or existing intervening buildings, can reduce line-of-sight exterior noise levels by approximately 5 to 15 dBA, depending on the applied physical configuration (FHWA 2006). The estimated noise impacts shown in Table 10 incorporate these mitigation measures.

With the application of construction noise mitigation measures exterior noise levels would be reduced by approximately 10 dBA, possibly up to 15 dBA. Therefore, based on the provisions set forth in LAMC 112.05, implementation of the LAMC-required noise control measures described below would enable the proposed Project to comply with the LAMC, and construction noise impacts would be less than significant.

The construction noise control measures required by LAMC 112.05 would include the following:

- 1) The Project shall comply with the City of Los Angeles Noise Ordinance No. 161,574 (see LAMC Section 112.05), and any subsequent ordinances (*et seq*), which prohibit the emission or creation of noise beyond certain levels.
- 2) Construction shall be restricted to the hours of 7:00 am to 9:00 pm Monday through Friday, and 8:00 am to 6:00 pm on Saturdays or national holidays. No construction work shall be performed at any time on Sundays.
- 3) Construction activities shall be scheduled to avoid operating several pieces of large equipment simultaneously, which can cumulatively cause higher noise levels.
- 4) Noise-generating equipment operated at the Project site shall be equipped with the most effective and technologically feasible noise control devices, such as mufflers, lagging (enclosures for exhaust pipes), and/or motor enclosures. All equipment shall be properly maintained to assure that no additional noise, due to worn or improperly maintained parts, would be generated.
- 5) Noise-generating equipment, where its location on the site may be flexible (e.g., air compressors, generators, cement and mortar mixers, and materials deliveries), shall be placed as far as practical from the nearest noise sensitive land uses. Natural and/or manmade barriers (e.g., trees, fencing, curtains) shall be used to screen propagation of noise from such activities toward these land uses to the maximum extent possible.
- 6) For outside work, the Project shall implement noise barriers comprising plywood construction fencing and/or flexible sound-absorbing curtains as practicable. The noise barriers shall be erected around the perimeter of the construction site to minimize the transmission of construction noise toward nearby noise-sensitive land uses. The noise barriers shall be at least 8 feet in height and constructed of materials achieving an Insertion Loss (IL) coefficient of at least 5 dBA for flexible curtains, 8 dBA for rigid plywood fencing, or 10 dBA in combination (FHWA 2006).
- 7) The Project shall comply with the City of Los Angeles Building Regulations Ordinance No. 178,048 (see LAMC Section 91.106.4.8), which requires a construction site notice to be provided that includes the following information: job site address, permit number, name and phone number of the contractor and owner or owner's agent, hours of construction allowed by code or any discretionary approval for the site, and City telephone numbers where violations can be reported. The notice shall be posted and maintained at the construction site prior to the start of construction and displayed in a location that is readily visible to the public, i.e., in plain sight.

### ***Operational Noise – LAMC Section 112.02***

Upon completion of construction and occupancy of the proposed Project, on-site operational noise would be generated mainly by heating, ventilation, and air conditioning (HVAC) equipment installed on the roof of the new building. However, the overall noise levels generated by the new HVAC equipment are not expected to be substantially greater than generated by older HVAC equipment installed on existing buildings near the Project site. As such, the new HVAC equipment associated with the proposed Project would not represent a substantially new type or source of noise in the general vicinity. In addition, the operation of this and any other on-site stationary sources of mechanical noise would be required to comply with the LAMC Section 112.02, which prohibits noise from air conditioning, refrigeration, heating, pumping, and filtering equipment from exceeding the ambient noise level on the premises of other occupied properties, e.g., nearby residential buildings, by more than 5 dBA. Such equipment is designed to meet this standard.

No adverse impacts are expected from, and no noise mitigation measures would be required for, the operation of the proposed project. Therefore, the operational noise impacts of the proposed Project would be less than significant.

Interior areas of the completed Project would not be adversely impacted by ambient (outdoor) urban noise because the Project would be constructed to meet applicable California Code of Regulations (CCR) Title 24 Parts 6 and 11 building energy efficiency standards (CEC 2019). Thermal insulation, e.g., fiberglass batting in exterior walls and double-pane windows, also attenuates sound transmission and thus would provide an acceptable interior noise environment, which is particularly important for sensitive land uses. Specifically, the proposed Project would be designed and constructed to maintain interior noise levels at or below a Community Noise Equivalent Level (CNEL) of 45 dBA in any normally occupied space of the Project with no other sources of interior noise operating, such as HVAC, appliances, power tools, or office equipment. As such, interior noise impacts of the proposed Project would be less than significant.

This study predicts a less than significant impact in accordance with the LAMC. As described above, temporary noise barriers may need to be installed as a mitigation measure during the early stages of construction where demolition activities are conducted.

**PROJECTED IMPACT:** Less Than Significant

**ADDITIONAL MITIGATION:** None Required

## CLOSING

Thank you very much for the opportunity to be of assistance to Proper Development. Should you have any questions, please contact me at (805) 217-4947 (mobile).

Sincerely,

## Proper Development - South Coast AQMD Air District, Winter

**Project Characteristics -**

Land Use - The total lot area for the project is 22,500 sqft or 0.517 acres and the total sqft of the project is 60,265, from the site plans. The parking area will encompass the below ground floor.

Construction Phase - Demolition will take approximately 7 day, this is due to the small size of the three homes on the project site.

Demolition - The three houses are approximately 135 x 65 feet or 8,775 sqft.

Woodstoves - The project will not have any woodstoves or fireplaces.

**Area Coating -**

Stationary Sources - Emergency Generators and Fire Pumps -

Stationary Sources - Process Boilers -

Construction Off-road Equipment Mitigation -

Area Mitigation -

## Proper Development - South Coast AQMD Air District, Summer

### Project Characteristics -

Land Use - The total lot area for the project is 22,500 sqft or 0.517 acres and the total sqft of the project is 60,265, from the site plans. The parking area will encompass the below ground floor.

Construction Phase - Demolition will take approximately 7 day, this is due to the small size of the three homes on the project site.

Demolition - The three houses are approximately 135 x 65 feet or 8,775 sqft.

Woodstoves - The project will not have any woodstoves or fireplaces.

### Area Coating -

Stationary Sources - Emergency Generators and Fire Pumps -

Stationary Sources - Process Boilers -

Construction Off-road Equipment Mitigation -

Area Mitigation -

## Proper Development - South Coast AQMD Air District, Annual

## Project Characteristics -

Land Use - The total lot area for the project is 22,500 sqft or 0.517 acres and the total sqft of the project is 60,265, from the site plans. The parking area will encompass the below ground floor.

Construction Phase - Demolition will take approximately 7 day, this is due to the small size of the three homes on the project site.

Demolition - The three houses are approximately 135 x 65 feet or 8,775 sqft.

Woodstoves - The project will not have any woodstoves or fireplaces.

## Area Coating -

Stationary Sources - Emergency Generators and Fire Pumps -

Stationary Sources - Process Boilers -

Construction Off-road Equipment Mitigation -

Area Mitigation -

### 1.3 User Entered Comments & Non-Default Data

## Proper Development - South Coast AQMD Air District, Winter

## Project Characteristics -

Land Use - The total lot area for the project is 22,500 sqft or 0.517 acres and the total sqft of the project is 60,265, from the site plans. The parking area will encompass the below ground floor.

Construction Phase - Demolition will take approximately 7 day, this is due to the small size of the three homes on the project site.

Demolition - The three houses are approximately 135 x 65 feet or 8,775 sqft.

Woodstoves - The project will not have any woodstoves or fireplaces.

## Area Coating -

## Construction Off-road Equipment Mitigation -

## Area Mitigation -

## Stationary Sources - Emergency Generators and Fire Pumps -

## Stationary Sources - Process Boilers -

Vehicle Trips - The one mile trip length characterizes the local environment.

## Proper Development - South Coast AQMD Air District, Summer

## Project Characteristics -

Land Use - The total lot area for the project is 22,500 sqft or 0.517 acres and the total sqft of the project is 60,265, from the site plans. The parking area will encompass the below ground floor.

Construction Phase - Demolition will take approximately 7 day, this is due to the small size of the three homes on the project site.

Demolition - The three houses are approximately 135 x 65 feet or 8,775 sqft.

Woodstoves - The project will not have any woodstoves or fireplaces.

## Area Coating -

## Construction Off-road Equipment Mitigation -

## Area Mitigation -

## Stationary Sources - Emergency Generators and Fire Pumps -

## Stationary Sources - Process Boilers -

Vehicle Trips - The one mile trip length characterizes the local environment.
