Re: Response to SAFER Comment Letter dated June 2, 2023 and Carpenters Comment Letter dated June 6, 2023 re Sustainable Communities Project Exemption, 905 Beacon Avenue Project (ENV-2020-7605-SCPE)

Dear Honorable PLUM Committee Members:

We represent DHS Investment Company, LLC in conjunction with its proposal to construct a new mixed-use residential building with ground floor commercial uses ("Project") at 905 Beacon Avenue ("Site") in the City of Los Angeles ("City"). Supporters Alliance for Environmental Responsibility ("SAFER") submitted a letter dated June 2, 2023 ("SAFER Letter") regarding the Sustainable Communities Project Exemption ("SCPE") analysis and findings prepared for the Project pursuant to California Environmental Quality Act ("CEQA").¹ In addition, the Southwest Mountain States Regional Council of Carpenters ("Carpenters") submitted a letter dated June 6, 2023 ("Carpenters Letter") also regarding the Project's SCPE. Please note that the Project's SCPE, originally prepared in October 2022 ("October 2022 SCPE") has been clarified and reissued ("2023 SCPE").

I. The SAFER Letter

The SAFER Letter alleges that the Project does not qualify for the use of a SCPE because 1) the Project's SCPE does not incorporate mitigation measures of the Southern California Association of Governments ("SCAG") 2020-2045 Regional Transportation Plan / Sustainable Communities Strategy ("RTP/SCS") Environmental Impact Report ("EIR") related to noise and indoor air quality; and 2) the SCPE does not incorporate the appropriate substantive analysis related to noise and indoor air quality. Finally, the SAFER Letter recommends mitigation related to indoor air quality.

To address SAFER's comments regarding potential impacts on noise and indoor air quality, CAJA Environmental Services, LLC ("CAJA") prepared responses confirming the Project's CEQA analysis and

¹ See Pub. Res. Code § 21155.1.

findings that the Project would not result in any potentially significant noise and indoor air quality impacts. (See **Exhibit A**, CAJA Response Memo.) The CAJA SAFER Response Memo first responds to the SAFER Letter's claims related to noise. It is true that a SCPE must incorporate "Any applicable mitigation measures or performance standards or criteria set forth in the prior environmental impact reports, and adopted in findings." However, the Mitigation Monitoring and Reporting Program of SCAG's 2020-2045 RTP/SCS Program EIR ("SCAG MMRP") explicitly allows the City to determine the applicability of the SCAG mitigation measures to projects and to choose not to apply SCAG mitigation measures when existing regulations are equal to or more effective than the SCAG mitigation measures. As noted in Table G-1 (Applicability of 2020-2045 RTP/SCS Final EIR Mitigation Measures) in Appendix G of the October 2022 SCPE, the City incorporated all *applicable* components of Mitigation Measure PMM NOISE-1, in addition to complying with existing regulations that are equal to or more effective than components of Mitigation Measure PMM NOISE-1. While the October 2022 SCPE supports this determination, clarifications have been made to the 2023 SCPE's Table G-1 to make clear the Project will incorporate *all* components of Mitigation Measure PMM NOISE-1 as described in Response to Comment No. 3 in the CAJA SAFER Response Memo.

Further, regarding the comments that a more in-depth noise analysis is required, all the requirements for qualifying for a SCPE are outlined in Section 2 (Sustainable Communities Strategy Criteria) of the SCPE. As shown there, a noise impact analysis is not listed as one of the requirements, and therefore is not required to qualify for a SCPE. Pursuant to applicable case law involving statutory exemptions, the sole question is whether the project fits within the language of the exemption.² The California Supreme Court explained: "As a practical matter, the statutory exemptions have in common only this: the *Legislature* determined that each promoted an interest important enough to justify forgoing the benefits of environmental review."³ Given the purposes of statutory exemptions are not necessarily in harmony with CEQA's general purpose, the general rule that CEQA provisions must be interpreted to give the fullest possible protection to the environment does not control the interpretation of a statutory exemption.⁴

Regarding the indoor air quality, the CAJA SAFER Response Memo demonstrates that the Project would comply with all applicable regulations designed to address indoor air quality and potential toxic materials, including but not limited to the California Green Building Standards Code ("CALGreen")⁵, which addresses chemical emissions from indoor building materials installed in new buildings, and CARB's Airborne Toxic Control Measure to Reduce Formaldehyde Emissions from Composite Wood Products, which applies to composite wood products sold and supplied in California.⁶ These measures assure that all building materials and furnishings manufactured, distributed, imported and used in new construction in California meet the maximum allowable concentrations that assure healthful indoor air quality. Therefore, the Project's SCPE analysis and the CAJA SAFER Response Memo provide substantial evidence that the Project would not result in potentially significant indoor air quality impacts.

³ *Napa Valley Wine Train, Inc. v. PUC*, *supra*, at 382.

⁴ *Sunset Sky Ranch Pilots Association v. County of Sacramento* (2009) 47 C.4th 902, 907; *Napa Valley Wine Train, Inc. v. PUC*, *supra*.

⁵ California Green Building Standard Code: <https://ww2.arb.ca.gov/our-work/programs/building-decarbonization/building-standards-code>, accessed August 2, 2022.

⁶ CARB, Composite Wood Products Airborne Toxic Control Measure: <https://ww2.arb.ca.gov/our-work/programs/composite-wood-products-program>, accessed August 2, 2022.

Further, the SCPE criteria does not require a more in-depth air quality analysis. As discussed above, a project that meets the criteria contained “within the language of the exemption,” is exempt despite any potential environmental impacts. Further, to the extent the SAFER Letter is alleging impacts to future residents and users of the Project, such effects are not considered CEQA “impacts” and need not be analyzed.⁷

II. The Carpenters Letter

The Carpenters Letter alleges that the Project does not qualify for a SCPE because 1) the City needs to consider utilizing local workforce policies to mitigate impacts; 2) the City should adopt additional requirements to mitigate COVID-19 related public health risks from the Project’s construction activities; 3) the SCPE does not provide evidence that there are sufficient utilities to serve the Project or that the Project would comply with the SCPE criteria related to energy and water efficiency; and 4) the City should have required a Preliminary Endangerment Assessment (“PEA”) or Phase I report. Finally, the Carpenters Letter alleges that the Project does not comply with the Commercial Corner Development provisions of the Los Angeles Municipal Code (“LAMC”).

To address the Carpenters Letter, CAJA prepared responses confirming the Project’s CEQA analysis and findings, and its compliance with the LAMC. (See **Exhibit A**, CAJA Response Memo.) The CAJA Carpenters Response Memo first addresses the Carpenters’ arguments related to local workforce policies and COVID-19 related health risks. As discussed therein, the provision of community benefits and the prevention of the spread of COVID-19 and other infectious diseases are not requirements of CEQA. Additionally, all the statutory requirements established by Public Resources Code Sections 21155 and 21155.1 to qualify for a SCPE are outlined in Section 2 (Sustainable Communities Strategy Criteria) of the SCPE. Incorporation of other measures, such as those presented by the commentator, is not necessary. The commentator provides no evidence to the contrary, and thus this comment is completely speculative.

Regarding the Carpenters comments related to utilities, the CAJA Carpenters Response Memo reiterates that Appendix C of the SCPE demonstrates that the existing capacity of energy, water, sewer, and storm drain infrastructure are adequate to accommodate the Project. Similarly, Appendix F of the SCPE demonstrates that the Project will be 15 percent more energy efficient than required by Chapter 6 of Title 24 of the California Code of Regulations and is designed to achieve 25 percent less water usage than the average household use in the region. The commentator provides no evidence demonstrating any deficiency in these analyses, and thus these comments are completely speculative.

The CAJA Carpenters Response Memo also addresses the Carpenters’ allegations that the Project did not submit a required PEA or Phase I report. However, Appendix E of the SCPE consists of a Phase I ESA report that concluded that there are no recognized environmental conditions at the Project Site, and no further environmental investigation is required at this time. While the SCPE criteria uses the term “preliminary endangerment assessment,” it does so merely to describe the required inquiry regarding hazardous conditions at a proposed project site, not to fulfill the distinct PEA requirements

⁷ *California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369.

identified by the HSC and DTSC, which are not applicable to the inquiry required to be prepared in connection with a SCPE.⁸

Finally, the Carpenters incorrectly claim that the Project is a commercial corner development subject to the regulations of LAMC Section 12.22.A.23. However, as reflected by the Project's application materials and pursuant to LAMC Section 12.22.A.23(d)(1), the Project is exempt from commercial corner development regulations because it meets the definition of a Mixed-Use Project pursuant to LAMC Section 13.09.B.3.

III. Conclusion

As demonstrated herein, the SAFER Letter and Carpenters Letter do not establish any evidence that the Project does not qualify for the SCPE, and the Project's SCPE analysis and the CAJA Response Memos provide substantial evidence that support the findings that the Project qualifies for the SCPE.

Sincerely,

Dave Rand

Re: Response to SAFER Comment Letter dated June 2, 2023 and Carpenters Comment Letter dated June 6, 2023 re Sustainable Communities Project Exemption, 905 Beacon Avenue Project (ENV-2020-7605-SCPE)

Dear Ms. Pichay:

CAJA Environmental Services, LLC (CAJA) has reviewed the letters submitted to the City of Los Angeles (City) by Supporters Alliance for Environmental Responsibility (SAFER) submitted a letter dated June 2, 2023 (SAFER Letter) regarding the Sustainable Communities Project Exemption (SCPE) analysis and findings prepared for the Project pursuant to California Environmental Quality Act (CEQA) and by Southwest Mountain States Regional Council of Carpenters (Carpenters) submitted a letter dated June 6, 2023 (Carpenters Letter) also regarding the Project's SCPE. Responses to the comments in the SAFER Letter and the Carpenters Letter are attached to this memo.

If you require any additional information or would like to discuss, do not hesitate to contact me. Thank you.

Sincerely,

Kerrie Nicholson

Comment No. 1

Dear Chair Harris-Dawson and Members of the Planning and Land Use Committee:

I am writing on behalf of the Supporters Alliance for Environmental Responsibility (“SAFER”), a California nonprofit benefit corporation, regarding the proposed development of a 7-story, 119,508 square foot mixed-use building, located in the City of Los Angeles and known as the 905 Beacon Avenue Project (“Project”). The City has determined that the project is exempt from environmental review under the California Environmental Quality Act (“CEQA”) pursuant to Public Resources Code section 21155.1 (“Section 21155.1”), which provides an exemption for sustainable communities projects. However, the Project does not meet the criteria for a sustainable communities project and, therefore, does not qualify for an exemption from CEQA under Section 21155.1. SAFER respectfully requests that the Planning and Land Use Management Committee not approve the Project, and instead direct staff to prepare necessary environmental documents under CEQA.

This comment has been prepared with the assistance of expert noise consulting firm Wilson Ihrig and Certified Industrial Hygienist, Francis “Bud” Offermann, PE, CIH. Wilson Ihrig’s comments are attached as Exhibit A, and Mr. Offermann’s comments are attached as Exhibit B. We incorporate the Wilson Ihrig and Offermann comments herein by reference.

PROJECT DESCRIPTION

The proposed Project consists of the demolition and removal of the existing surface parking lot from the Project site in order to facilitate the development of a 7-story, 119,508 square foot mixed-use building. The building will include 145 multi-family residential dwelling units, up to 2,000 square feet of neighborhood serving commercial uses, and 1.5 above ground parking levels and 2 underground levels. The Project proponents are requesting site plan review, permission to use base incentives and three additional incentives, and a vesting tentative tract map.

LEGAL STANDARD

CEQA mandates that “the long-term protection of the environment . . . shall be the guiding criterion in public decisions” throughout California. (PRC § 21001(d).) To achieve its objectives of environmental protection, CEQA has a three-tiered structure. (14 CCR § 15002(k); *Committee to Save the Hollywoodland Specific Plan v. City of Los Angeles* (2008) 161 Cal.App.4th 1168, 1185-86.) First, if a project falls into an exempt category, or it can be seen with certainty that the activity in question will not have a significant effect on the

environment, no further agency evaluation is required. (Id.) Second, if there is a possibility the project will have a significant effect on the environment, the agency must perform an initial threshold study. (Id.; 14 CCR § 15063(a).) If the study indicates that there is no substantial evidence that the project or any of its aspects may cause a significant effect on the environment the agency may issue a negative declaration. (Id.; 14 CCR §§ 15063(b)(2), 15070.) Finally, if the project will have a significant effect on the environment, an environmental impact report (“EIR”) is required. (Id.) Here, since the County exempted the Project from CEQA entirely, the first step of the CEQA process applies.

Here, the City is alleging that the proposed Project is exempt from CEQA review under the Sustainable Communities Project exemption (“SCPE”) exemption. (PRC § 21155.1.) PRC 21155.1 applies to transit priority projects which meet certain criteria and are considered sustainable communities projects, and are rendered exempt from CEQA requirements. In order to qualify for a SCPE, a legislative body must find, after public hearing, that the transit priority project meets all of the requirements from PRC 21155.1 subdivision (a) and (b), and one of the requirements of subdivision (c).

Subdivision (a) lists out environmental criteria including requirements that the project can be served by existing utilities, does not impact wildlife habitat, is not included on the Cortese list, does not impact historical resources, is not located on developed open space, and is 15 percent more energy efficient than required under Title 24. Subdivision (a) also lists out specific environmental health hazards that a project cannot be subject to, including “[r]isk of a public health exposure at a level that would exceed the standards established by any state or federal agency.” (PRC § 21155.1(a)(6)(C).)

Subdivision (b) lists out land use criteria that a project must meet, including size requirements, a limit on residential units, and requirements regarding affordable housing, among others. Relevant here, subdivision (b) requires that “[a]ny applicable mitigation measures or performance standards or criteria set forth in the prior environmental impact reports, and adopted in findings, have been or will be incorporated into the transit priority project.” (PRC § 21155.1(b)(5).)

Lastly, subdivision (c) states that the transit priority project must meet at least one of the following three criteria:

- (1) The transit priority project meets both of the following:
 - (A) At least 20 percent of the housing will be sold to families of moderate income, or not less than 10 percent of the housing will be rented to families of low income, or not less than 5 percent of the housing is rented to families of very low income.
 - (B) The transit priority project developer provides sufficient legal commitments to the appropriate local agency to ensure the continued availability and use of the housing units for very low, low-, and moderate-income households at monthly housing costs with an affordable housing cost or affordable rent, as defined in Section 50052.5 or 50053 of the Health and Safety Code, respectively, for the period required by the applicable financing. Rental units shall be affordable for at least 55 years. Ownership units shall be subject to resale restrictions or equity sharing requirements for at least 30 years.

(2) The transit priority project developer has paid or will pay in-lieu fees pursuant to a local ordinance in an amount sufficient to result in the development of an equivalent number of units that would otherwise be required pursuant to paragraph (1).

(3) The transit priority project provides public open space equal to or greater than five acres per 1,000 residents of the project.

(PRC § 21155.1(c).)

As discussed below, the proposed Project does not qualify for a SCPE because it fails to meet one of the criteria of subdivision (a) and one of the criteria in subdivision (b). The exemption is therefore improper, and instead, an initial study should be prepared, followed by the appropriate CEQA document, either an MND or an EIR.

Response to Comment No. 1

Regarding the Project qualifying for a SCPE, the commentator is referred to Response to Comment Nos. 2 through No. 17. Based on the information provided therein, the Project does qualify for a SCPE, and no additional CEQA review is required.

Comment No. 2

DISCUSSION

I. The City Incorrectly Applied CEQA's Sustainable Communities Project Exemption to the Project and Instead an Initial Study is Required.

This Project fails to meet some of the necessary criteria due to its potentially significant noise and indoor air quality impacts. As such, the Project does not qualify for a SCPE and the City must prepare an initial study and either an MND or an EIR for the Project.

Response to Comment No. 2

Regarding the Project's noise and indoor air quality impacts, the commentator is referred to Response to Comment No. 3 through Response to Comment No. 17. Regarding the Project qualifying for a SCPE, the commentator is referred to Response to Comment No. 17. Based on the information provided therein, the Project does qualify for a SCPE, and no additional CEQA review is required.

Comment No. 3

a. The SCPE failed to impose all mitigation measures for noise.

To qualify for a SCPE, a Project must meet certain land use criteria, including that "[a]ny applicable mitigation measures or performance standards or criteria set forth in the prior environmental impact reports,

and adopted in findings, have been or will be incorporated into the transit priority project.” (PRC § 21155.1(b)(5).) The City found that the only applicable EIR for this SCPE was the SCAG 2020-2045 RTP/SCS Program EIR (“RTP/SCS PEIR”), and it applied two of the noise-related mitigation measures from that PEIR to the proposed Project.

Response to Comment No. 3

The Mitigation Monitoring and Reporting Program of SCAG’s 2020-2045 RTP/SCS Program EIR (SCAG MMRP) explicitly allows the City to determine the applicability of the SCAG mitigation measures to projects as well as to choose not to apply SCAG mitigation measures when existing regulations are equal to or more effective than the SCAG mitigation measures:

SCAG has no authority to impose mitigation measures on individual projects for which it is not the lead agency. However, for projects seeking to use CEQA streamlining and/or tier from the Program EIR, project-level mitigation measures included in the Program EIR (or comparable measures) should be required by the local lead agency as appropriate and feasible. Many lead agencies have existing regulations, policies, and/or standard conditions of approval that address potential impacts. Nothing in the Program EIR is intended to supersede existing regulations and policies of individual jurisdictions. Since SCAG has no authority to impose mitigation measures, mitigation measures to be implemented by local jurisdictions are subject to a lead agency’s independent discretion as to whether measures are applicable to projects in their respective jurisdictions. Lead agencies may use, amend, or not use measures identified in the Program EIR as appropriate to address project-specific conditions. The determination of significance and identification of appropriate mitigation is solely the responsibility of the lead agency.¹

As noted in Table G-1 (Applicability of 2020-2045 RTP/SCS Final EIR Mitigation Measures) in Appendix G of the SCPE prepared in October 2022 (October 2022 SCPE), the City determined that the Project would comply with multiple existing noise- and vibration-related regulations that are equal to or more effective than the relevant components of Mitigation Measure PMM NOISE-1 and PMM NOISE-2, respectively. While the October 2022 SCPE’s findings fully support this determination, clarifications have been made to the SCPE in August 2023 (July 2023 SCPE) making it clear that the Project will incorporate all components of Mitigation Measure PMM NOISE-1 and PMM NOISE-2, which include a number of measures intended to reduce construction noise and vibration levels adjacent to sensitive receptors, including the placement of temporary noise barriers between Project construction activities and sensitive receptors. In addition, the Project will continue to be required to comply with all existing regulatory requirements identified by the October 2022 SCPE. Therefore, through incorporation of PMM NOISE-1 and PMM NOISE-2 as well as compliance with all applicable regulatory requirements pertaining to noise and vibration, the Project will continue to meet all applicable statutory criteria for utilization of a SCPE.

Comment No. 4

¹ Available at https://scag.ca.gov/sites/main/files/file-attachments/exhibit-a_connectsocial_peir_revisedmmrp.pdf?1606004474 (last accessed 06.16.23).

Jack Meighan of expert noise consulting firm Wilson Ihrig reviewed the Project and associated documents and found that the Project failed to adequately analyze noise impacts, and therefore failed to impose all applicable mitigation measures from the RTP/SCS PEIR. The Project therefore does not meet the requirements for a SCPE. Mr. Meighan's comments are attached hereto as Exhibit A, and are summarized below.

Response to Comment No. 4

All of the statutory requirements established by Public Resources Code Sections 21155 and 21155.1 for qualifying for a SCPE are outlined in Section 2 (Sustainable Communities Strategy Criteria) of the SCPE. As shown there, preparation of a noise and/or vibration impact analysis is not listed as one of the statutory criteria and thus, is not required in connection with the preparation of a SCPE. Furthermore, while Appendix G of the October 2022 SCPE demonstrates that the City has properly determined that existing regulatory requirements are equal to or more effective than the mitigation measures under PMM NOISE-1 and PMM NOISE-2, the July 2023 SCPE clarifies that the Project incorporates all components of Mitigation Measure PMM NOISE-1 and PMM NOISE-2. Therefore, the Project continues to demonstrate its eligibility for a SCPE through compliance with all applicable statutory criteria.

Comment No. 5

First of all, Mr. Meighan found that the RTP/SCS PEIR does not study operational noise and vibration, and therefore the mitigation measures it proposes and which have been applied to this Project would not serve to mitigate any of the Project's operational noise and vibration impacts. (Ex. A, p. 1.) Therefore, Mr. Meighan concluded that neither the RTP/SCS PEIR nor the SCPE have actually studied operational noise and vibration, and further CEQA review must be conducted to analyze those potential impacts. (Id.)

Response to Comment No. 5

As discussed in Response to Comment No. 4, all of the statutory requirements for qualifying for a SCPE are outlined in Section 2 (Sustainable Communities Strategy Criteria) of the SCPE. As shown therein, preparation of a noise and/or vibration impact analysis is not listed as one of the statutory criteria and thus, is not required. Similarly, the statutory criteria for utilization of a SCPE require the incorporation of prior applicable mitigation measures; the programmatic scope of SCAG'S 2020-2045 RTP/SCS Program EIR is not relevant in determining the applicability of SCAG's mitigation measures to the Project. Furthermore, refer to Response to Comment No. 3 regarding the incorporation of all components of Mitigation Measure PMM NOISE-1 and PMM NOISE-2 into the Project.

Comment No. 6

Next, one of the mitigation measures the Project imposes for noise impacts is to prohibit amplified noises from exceeding ambient noise levels of adjacent properties by more than 5 dBA. However, Mr. Meighan points out that because the SCPE for the Project does not include noise measurements, it is

impossible to identify which measures are necessary to achieve this requirement, and whether such measures are feasible. (Ex. A, p. 1-2.) He notes that “reasonable worse-case construction scenarios may not be able to stay 5 dBA within the ambient at the adjacent property that borders the site directly to the south.” (Id. at 2.) Without this information, the City has failed to demonstrate that the Project meets the requirements of a SCPE, and an initial study should be prepared to adequately measure and document the Project’s ambient noise levels, and determine what specific mitigation is necessary.

Response to Comment No. 6

The “mitigation measure” referenced by the commentator (i.e., prohibition of amplified noises) and identified in the October 2022 SCPE is not a mitigation measure but is part of LAMC Section 112.01 – a regulatory requirement related to amplified sound, such as music, and which does not apply to construction noise. Furthermore, as discussed in Response to Comment No. 4, a noise impact analysis is not listed as one of the statutory criteria for utilizing a SCPE and thus, is not required. In addition, refer to Response to Comment No. 3 regarding the incorporation of all components of Mitigation Measure PMM NOISE-1 and PMM NOISE-2 into the Project, including the provision of temporary noise barriers between Project construction activities and adjacent sensitive receptors.

Comment No. 7

Lastly, Mr. Meighan found that the Project’s noise impact analyses are incomplete. The analysis prepared by the City does not include any calculations showing operational and construction noise and vibration impacts that would result from this Project. (Ex. A, p. 2.) In an effort to estimate potential impacts, Mr. Meighan ran sample calculations from projects with assumptions similar to this Project and used Project-specific details. (Id.) He found that construction noise and vibration would most likely be significant and have the potential to cause damage to nearby buildings. (Id.) The City has therefore failed to demonstrate that it has imposed all applicable mitigation measures for noise from prior EIRs, and the Project does not qualify for a SCPE. An initial study, followed by either an MND or an EIR, must be prepared for this Project.

Response to Comment No. 7

The commentator is referred to Response to Comment No. 4 regarding the preparation of a noise/vibration impact analysis and Response to Comment No. 3 regarding the Project’s incorporation of prior SCAG mitigation measures, including those pertaining to vibration.

Comment No. 8

b. There is Substantial Evidence that the Project Will Have a Significant Health Risk Impact from its Indoor Air Quality Impacts.

The SCPE cannot apply if a project site is subject to “[r]isk of a public health exposure at a level that would exceed the standards established by any state or federal agency.” (PRC § 21155.1(a)(6)(C).)

Here, there is substantial evidence demonstrating that the Project will have public health impacts which exceed state standards. Specifically, the Project will result in significant increased cancer risks from emissions of formaldehyde. Therefore, the Project does not qualify for the SCPE and the City must prepare an initial study to determine the appropriate level of CEQA review for this Project, either an MND or an EIR.

Certified Industrial Hygienist, Francis “Bud” Offermann, PE, CIH, has conducted a review of the proposed Project and relevant documents regarding the Project’s indoor air emissions. Indoor Environmental Engineering Comments (December 12, 2022) (Exhibit B). Mr. Offermann concludes that it is likely that the Project will expose residents and commercial employees of the Project to significant impacts related to indoor air quality, and in particular, emissions of the cancer-causing chemical formaldehyde. Mr. Offermann is a leading expert on indoor air quality and has published extensively on the topic. Mr. Offermann’s expert comments and curriculum vitae are attached as Exhibit B.

Mr. Offermann explains that many composite wood products used in building materials and furnishings commonly found in offices, warehouses, residences, and hotels contain formaldehyde-based glues which off-gas formaldehyde over a very long time period. He states, “[t]he primary source of formaldehyde indoors is composite wood products manufactured with urea-formaldehyde resins, such as plywood, medium density fiberboard, and particleboard. These materials are commonly used in building construction for flooring, cabinetry, baseboards, window shades, interior doors, and window and door trims.” (Ex. B, p. 2-3.)

Formaldehyde is a known human carcinogen. Mr. Offermann states that future residential occupants would be exposed to a cancer risk of 120 in one million, and future commercial employees would be exposed to a cancer risk of 17.7 in one million. (Ex. B, p. 4-5.) These calculations are assuming all materials are compliant with the California Air Resources Board’s formaldehyde airborne toxics control measure. (Id.) These potential exposure levels exceed the South Coast Air Quality Management District’s (“SCAQMD”) CEQA significance threshold for airborne cancer risk of 10 per million. (Id.)

Mr. Offermann concludes that these significant environmental impacts should be analyzed in accordance with CEQA and mitigation measures should be imposed to reduce the risk of formaldehyde exposure. (Id. At 6.) Mr. Offermann identifies mitigation measures that are available to reduce these significant health risks, including the installation of air filters and a requirement that the applicant use only composite wood materials (e.g. hardwood plywood, medium density fiberboard, particleboard) for all interior finish systems that are made with CARB approved no-added formaldehyde (NAF) resins or ultra-low emitting formaldehyde (ULEF) resins in the buildings’ interiors. (Id. At 12-14.)

Because the Project’s formaldehyde emissions constitute a “public health exposure at a level that would exceed” SCAQMD’s significance threshold for increased cancer risk, the Project does not qualify for the SCPE. (See PRC § 21155.1(a)(6)(C).) Therefore, the City must prepare an initial study for the Project and either an MND or EIR to disclose and mitigate the potential environmental impacts to future users of the building.

Response to Comment No. 8

Regarding Mr. Offerman’s review and comments, the commentator is referred to Response to Comment No. 15 through Response to Comment No. 17. For the reasons discussed there, the Project does qualify for a SCPE, and no additional CEQA review of the Project is required.

Comment No. 9

CONCLUSION

In light of the above comments, the Project does not meet the requirements of the SCPE due to its potential noise impacts and public health risk impacts. The City must prepare an initial study followed by an EIR for the Project, or at least an MND, and the draft CEQA document should be circulated for public review and comment in accordance with CEQA. Thank you for considering these comments.

Response to Comment No. 9

For the reasons discussed in Response to Comment No. 1 through Response to Comment No. 17, the Project meets the requirements for a SCPE, and no additional CEQA review of the Project is required.

Comment No. 10

Per your request, I have reviewed the subject matter document for the 905 Beacon Ave. Sustainable Communities Project Exemption (SCPE) in Los Angeles, California. The proposed project involves the construction, use and maintenance of a 119,508-square-foot mixed-use building, which would include 145 multi-family residential dwelling units and up to 2,000 square feet of commercial uses. The Noise Impact Analysis is contained in Appendix G of the SCPE. The Project is surrounded by noise sensitive uses – residences located directly to the south and to the west.

Response to Comment No. 10

As discussed in Response to Comment No. 4, all of the statutory requirements for qualifying for a SCPE are outlined in Section 2 (Sustainable Communities Strategy Criteria) of the SCPE. As shown therein, preparation of a noise and/or vibration impact analysis is not listed as one of the criteria and thus, is not required. As discussed in Response to Comment No. 3, while Appendix G of the October 2022 SCPE demonstrates that the City has properly determined that existing regulatory requirements are equal to or more effective than the mitigation measures under PMM NOISE-1 and PMM NOISE-2, the July 2023 SCPE now incorporates all components of Mitigation Measure PMM NOISE-1 and PMM NOISE-2 into the Project, including the provision of temporary noise barriers between Project construction activities and adjacent noise sensitive uses.

Comment No. 11

1. Analysis Cites Incomplete EIR

The SCPE has identified one prior EIR with mitigation measures that could apply to the Project – SCAG 2020-2045 RTP/SCS Final Program EIR. However, the SCPE states that the EIR “does not include project-level mitigation measures that would be required of the Project. The SCAG MMRP provides a list of

mitigation measures that SCAG determined a lead agency can or should consider, as applicable and feasible.” As such, two mitigation measures are studied in the SCPE, Impact NOISE-1 and Impact NOISE-2. NOISE-1 presents 24 mitigation techniques that can be used to mitigate construction noise, while NOISE-2 presents 6 mitigation techniques that can be used to mitigate construction vibration.

The EIR, however, does not study operational noise and vibration. None of the mitigation measures are meant to mitigate noise or vibration from these sources. As a result, operational noise and vibration are not studied in either the EIR or the SCPE. A more thorough EIR should be conducted to make sure that this project does not create significant noise and vibration impacts to nearby receptors. See Section 3 for a breakdown of potential operational noise issues.

Response to Comment No. 11

Regarding the analysis of noise and vibration impacts of the Project in the SCPE, the commentator is referred to Response to Comment No 4. Regarding the programmatic scope of analysis of the SCAG 2020-2045 RTP/SCS Program EIR, the commentator is referred to Response to Comment No. 5. Regarding the Project’s incorporation of noise and vibration mitigation identified by PMM NOISE-1 and PMM NOISE-2, the commentator is referred to Response to Comment No. 3. No additional CEQA review of the Project is required.

Comment No. 12

2. Baseline Noise Level characterizations are Incomplete

PMM NOISE-1 states “The Project shall prohibit any amplified noises, especially those from outdoor sources, from exceeding the ambient noise levels of adjacent properties by more than 5 dBA, pursuant to LAMC Section 112.01. Any amplified noises would also be prohibited from being audible at any distance greater than 150 feet from the Project’s property line” Without noise measurements, it would be impossible to identify what measures would be necessary to achieve this requirement and whether such measures would be feasible. Reasonable worst-case construction scenarios may not be able to stay 5 dBA within the ambient at the adjacent property that borders the site directly to the south. An example of an operational noise impact is presented in Section 3. The document needs at least to commit to a requirement that an acoustical report addressing noise sources should be submitted for review and approval during the permitting phase. Or, if the analysis is performed using a design goal, there should be a plan explicitly stating monitoring and reporting.

Response to Comment No. 12

The Project includes development of residential uses and neighborhood-serving retail, uses that do not generate significant operational noise levels, including amplified noise. Regarding noise monitoring, as discussed in Response to Comment No. 3, the Project will incorporate PMM NOISE-1, including its components pertaining to the monitoring the effectiveness of implemented noise reduction measures, as well as the regulatory requirements of LAMC Section 112.01. The commentator is also referred to Response to Comment No. 4 regarding the Project’s compliance with all statutory criteria for utilization of a SCPE.

Comment No. 13

3. Impact Analyses are Incomplete

The analysis does not include any calculations. Below are sample calculations, taken from projects with similar assumptions, to show the typical operational and construction noise and vibrations impacts are possible with this project.

Construction Noise

The Federal Highway Administration’s Roadway Construction Noise Model (RCNM) cites noise levels¹ for equipment typically used on construction sites. For the grading phase, typical pieces of equipment include a Grader and a Backhoe. The closest receivers are approximately 20 feet from the construction site. Using the reference levels and usage factors cited in RCNM, the overall Leq is 90 dBA. It is hard to imagine that this level would not be considered an impact. As such, more study should be done to determine mitigation options in a full Environmental Impact Statement.

Table 1: Summary of Typical Construction Noise Calculation

Piece of Equipment	Spec. Lmax @ 50ft (dBA)	Usage Factor
Backhoe	80	40%
Grader	85	40%
All Sources Combine for an Hourly Leq of 90 dBA at 20 feet		

Construction Vibration

Vibration Levels could be over common building damage threshold at the closest point to the new construction in this building, and this was not mentioned in the analysis. The closest building to the south of the project site is roughly 20 feet from heavy construction. A vibratory roller has a cited PPV (Peak Particle Velocity) level of 0.21 in/sec at 25 feet, via the Federal Transit Administration’s Transit (FTA) Noise and Vibration Impact Assessment Manual. At 20 feet, this is 0.29 PPV, which is over the FTA’s suggested threshold of 0.2 PPV for non-engineered timber and masonry buildings. It is worth noting that other criteria exist and can be chosen, and that this document does not directly govern this project. However, there is potential for damage to nearby buildings. As such, there would be a significant impact and mitigation measures, such as a vibration control plan, should be provided in project documents.

Response to Comment No. 13

Regarding the preparation of a noise and vibration impact analysis for the Project, the commentator is referred to Response to Comment No. 4. The SCPE itself and these responses to comments demonstrate that the Project complies with all the required SCPE criteria.

Comment No. 14

Conclusions

There are several errors and omissions in the SCPE noise analysis. Correcting these would potentially identify several significant impacts which require mitigation. Please feel free to contact me with any questions on this information.

Response to Comment No. 14

Regarding a noise analysis being prepared for the Project's SCPE, the commentator is referred to Response to Comment No. 4. Regarding noise mitigation measures, the commentator is referred to Response to Comment No. 3.

Comment No. 15

Indoor Air Quality Impacts

Indoor air quality (IAQ) directly impacts the comfort and health of building occupants, and the achievement of acceptable IAQ in newly constructed and renovated buildings is a well-recognized design objective. For example, IAQ is addressed by major high performance building rating systems and building codes (California Building Standards Commission, 2014; USGBC, 2014). Indoor air quality in homes is particularly important because occupants, on average, spend approximately ninety percent of their time indoors with the majority of this time spent at home (EPA, 2011). Some segments of the population that are most susceptible to the effects of poor IAQ, such as the very young and the elderly, occupy their homes almost continuously. Additionally, an increasing number of adults are working from home at least some of the time during the workweek. Indoor air quality also is a serious concern for workers in hotels, offices and other business establishments.

The concentrations of many air pollutants often are elevated in homes and other buildings relative to outdoor air because many of the materials and products used indoors contain and release a variety of pollutants to air (Hodgson et al., 2002; Offermann and Hodgson, 2011). With respect to indoor air contaminants for which inhalation is the primary route of exposure, the critical design and construction parameters are the provision of adequate ventilation and the reduction of indoor sources of the contaminants.

Indoor Formaldehyde Concentrations Impact. In the California New Home Study (CNHS) of 108 new homes in California (Offermann, 2009), 25 air contaminants were measured, and formaldehyde was identified as the indoor air contaminant with the highest cancer risk as determined by the California Proposition 65 Safe Harbor Levels (OEHHA, 2017a), No Significant Risk Levels (NSRL) for carcinogens.

The NSRL is the daily intake level calculated to result in one excess case of cancer in an exposed population of 100,000 (i.e., ten in one million cancer risk) and for formaldehyde is 40 µg/day. The NSRL concentration of formaldehyde that represents a daily dose of 40 µg is 2 µg/m³, assuming a continuous 24-hour exposure, a total daily inhaled air volume of 20 m³, and 100% absorption by the respiratory system. All of the CNHS homes exceeded this NSRL concentration of 2 µg/m³. The median indoor formaldehyde concentration was 36 µg/m³, and ranged from 4.8 to 136 µg/m³, which corresponds to a median exceedance of the 2 µg/m³ NSRL concentration of 18 and a range of 2.3 to 68.

Therefore, the cancer risk of a resident living in a California home with the median indoor formaldehyde concentration of 36 µg/m³, is 180 per million as a result of formaldehyde alone. The CEQA significance threshold for airborne cancer risk is 10 per million, as established by the South Coast Air Quality Management District (SCAQMD, 2015).

Besides being a human carcinogen, formaldehyde is also a potent eye and respiratory irritant. In the CNHS, many homes exceeded the non-cancer reference exposure levels (RELs) prescribed by California Office of Environmental Health Hazard Assessment (OEHHA, 2017b). The percentage of homes exceeding the RELs ranged from 98% for the Chronic REL of 9 µg/m³ to 28% for the Acute REL of 55 µg/m³.

The primary source of formaldehyde indoors is composite wood products manufactured with urea-formaldehyde resins, such as plywood, medium density fiberboard, and particleboard. These materials are commonly used in building construction for flooring, cabinetry, baseboards, window shades, interior doors, and window and door trims.

In January 2009, the California Air Resources Board (CARB) adopted an airborne toxics control measure (ATCM) to reduce formaldehyde emissions from composite wood products, including hardwood plywood, particleboard, medium density fiberboard, and also furniture and other finished products made with these wood products (California Air Resources Board 2009). While this formaldehyde ATCM has resulted in reduced emissions from composite wood products sold in California, they do not preclude that homes built with composite wood products meeting the CARB ATCM will have indoor formaldehyde concentrations below cancer and non-cancer exposure guidelines.

A follow up study to the California New Home Study (CNHS) was conducted in 2016-2018 (Singer et. al., 2019), and found that the median indoor formaldehyde in new homes built after 2009 with CARB Phase 2 Formaldehyde ATCM materials had lower indoor formaldehyde concentrations, with a median indoor concentrations of 22.4 µg/m³ (18.2 ppb) as compared to a median of 36 µg/m³ found in the 2007 CNHS. Unlike in the CNHS study where formaldehyde concentrations were measured with pumped DNPH samplers, the formaldehyde concentrations in the HENGH study were measured with passive samplers, which were estimated to under-measure the true indoor formaldehyde concentrations by approximately 7.5%. Applying this correction to the HENGH indoor formaldehyde concentrations results in a median indoor concentration of 24.1 µg/m³, which is 33% lower than the 36 µg/m³ found in the 2007 CNHS.

Thus, while new homes built after the 2009 CARB formaldehyde ATCM have a 33% lower median indoor formaldehyde concentration and cancer risk, the median lifetime cancer risk is still 120 per million for homes built with CARB compliant composite wood products. This median lifetime cancer risk is more than 12 times the OEHHA 10 in a million cancer risk threshold (OEHHA, 2017a).

With respect to the 905 Beacon Avenue Project, Los Angeles, CA the buildings consist of residential and commercial spaces.

The residential occupants will potentially have continuous exposure (e.g. 24 hours per day, 52 weeks per year). These exposures are anticipated to result in significant cancer risks resulting from exposures to formaldehyde released by the building materials and furnishing commonly found in residential construction.

Because these residences will be constructed with CARB Phase 2 Formaldehyde ATCM materials, and be ventilated with the minimum code required amount of outdoor air, the indoor residential formaldehyde concentrations are likely similar to those concentrations observed in residences built with CARB Phase 2 Formaldehyde ATCM materials, which is a median of 24.1 $\mu\text{g}/\text{m}^3$ (Singer et. al., 2020).

Assuming that the residential occupants inhale 20 m^3 of air per day, the average 70-year lifetime formaldehyde daily dose is 482 $\mu\text{g}/\text{day}$ for continuous exposure in the residences. This exposure represents a cancer risk of 120 per million, which is more than 12 times the CEQA cancer risk of 10 per million. For occupants that do not have continuous exposure, the cancer risk will be proportionally less but still substantially over the CEQA cancer risk of 10 per million (e.g. for 12/hour/day occupancy, more than 6 times the CEQA cancer risk of 10 per million).

The employees of the commercial spaces are expected to experience significant indoor exposures (e.g., 40 hours per week, 50 weeks per year). These exposures for employees are anticipated to result in significant cancer risks resulting from exposures to formaldehyde released by the building materials and furnishing commonly found in offices, warehouses, residences and hotels.

Because the commercial spaces will be constructed with CARB Phase 2 Formaldehyde ATCM materials, and be ventilated with the minimum code required amount of outdoor air, the indoor formaldehyde concentrations are likely similar to those concentrations observed in residences built with CARB Phase 2 Formaldehyde ATCM materials, which is a median of 24.1 $\mu\text{g}/\text{m}^3$ (Singer et. al., 2020)

Assuming that the employees of commercial spaces work 8 hours per day and inhale 20 m^3 of air per day, the formaldehyde dose per work-day at the offices is 161 $\mu\text{g}/\text{day}$.

Assuming that these employees work 5 days per week and 50 weeks per year for 45 years (start at age 20 and retire at age 65) the average 70-year lifetime formaldehyde daily dose is 70.9 $\mu\text{g}/\text{day}$.

This is 1.77 times the NSRL (OEHHA, 2017a) of 40 $\mu\text{g}/\text{day}$ and represents a cancer risk of 17.7 per million, which exceeds the CEQA cancer risk of 10 per million. This impact should be analyzed in an environmental impact report ("EIR"), and the agency should impose all feasible mitigation measures to reduce this impact. Several feasible mitigation measures are discussed below and these and other measures should be analyzed in an EIR.

In addition, we note that the average outdoor air concentration of formaldehyde in California is 3 ppb, or 3.7 $\mu\text{g}/\text{m}^3$, (California Air Resources Board, 2004), and thus represents an average pre-existing background airborne cancer risk of 1.85 per million. Thus, the indoor air formaldehyde exposures describe above exacerbate this pre-existing risk resulting from outdoor air formaldehyde exposures.

Additionally, the Project site is located in an area with high vehicle traffic. The SCAQMD's Multiple Air Toxics Exposure Study ("MATES V") identifies an existing cancer risk at the site of 730 per million due to the site's elevated ambient air contaminant concentrations, which are due to the area's high levels of vehicle traffic. These impacts would further exacerbate the pre-existing cancer risk to residents, which result from exposure to formaldehyde in both indoor and outdoor air.

Appendix A, Indoor Formaldehyde Concentrations and the CARB Formaldehyde ATCM, provides analyses that show utilization of CARB Phase 2 Formaldehyde ATCM materials will not ensure acceptable cancer risks with respect to formaldehyde emissions from composite wood products.

Even composite wood products manufactured with CARB certified ultra low emitting formaldehyde (ULEF) resins do not insure that the indoor air will have concentrations of formaldehyde that meet the OEHHA cancer risks that substantially exceed 10 per million. The permissible emission rates for ULEF composite wood products are only 11-15% lower than the CARB Phase 2 emission rates. Only use of composite wood products made with no-added formaldehyde resins (NAF), such as resins made from soy, polyvinyl acetate, or methylene diisocyanate can insure that the OEHHA cancer risk of 10 per million is met.

The following describes a method that should be used, prior to construction in the environmental review under CEQA, for determining whether the indoor concentrations resulting from the formaldehyde emissions of specific building materials/furnishings selected exceed cancer and non-cancer guidelines. Such a design analyses can be used to identify those materials/furnishings prior to the completion of the City's CEQA review and project approval, that have formaldehyde emission rates that contribute to indoor concentrations that exceed cancer and non-cancer guidelines, so that alternative lower emitting materials/furnishings may be selected and/or higher minimum outdoor air ventilation rates can be increased to achieve acceptable indoor concentrations and incorporated as mitigation measures for this project.

Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment

This formaldehyde emissions assessment should be used in the environmental review under CEQA to assess the indoor formaldehyde concentrations from the proposed loading of building materials/furnishings, the area-specific formaldehyde emission rate data for building materials/furnishings, and the design minimum outdoor air ventilation rates. This assessment allows the applicant (and the City) to determine, before the conclusion of the environmental review process and the building materials/furnishings are specified, purchased, and installed, if the total chemical emissions will exceed cancer and non-cancer guidelines, and if so, allow for changes in the selection of specific material/furnishings and/or the design minimum outdoor air ventilations rates such that cancer and non-cancer guidelines are not exceeded.

1.) Define Indoor Air Quality Zones. Divide the building into separate indoor air quality zones, (IAQ Zones). IAQ Zones are defined as areas of well-mixed air. Thus, each ventilation system with recirculating air is considered a single zone, and each room or group of rooms where air is not recirculated (e.g. 100% outdoor air) is considered a separate zone. For IAQ Zones with the same construction material/furnishings and design minimum outdoor air ventilation rates. (e.g. hotel rooms, apartments, condominiums, etc.) the formaldehyde emission rates need only be assessed for a single IAQ Zone of that type.

2.) Calculate Material/Furnishing Loading. For each IAQ Zone, determine the building material and furnishing loadings (e.g., m² of material/m² floor area, units of furnishings/m² floor area) from an inventory

of all potential indoor formaldehyde sources, including flooring, ceiling tiles, furnishings, finishes, insulation, sealants, adhesives, and any products constructed with composite wood products containing urea-formaldehyde resins (e.g., plywood, medium density fiberboard, particleboard).

3.) Calculate the Formaldehyde Emission Rate. For each building material, calculate the formaldehyde emission rate ($\mu\text{g}/\text{h}$) from the product of the area-specific formaldehyde emission rate ($\mu\text{g}/\text{m}^2\text{-h}$) and the area (m^2) of material in the IAQ Zone, and from each furnishing (e.g. chairs, desks, etc.) from the unit-specific formaldehyde emission rate ($\mu\text{g}/\text{unit-h}$) and the number of units in the IAQ Zone.

NOTE: As a result of the high-performance building rating systems and building codes (California Building Standards Commission, 2014; USGBC, 2014), most manufacturers of building materials furnishings sold in the United States conduct chemical emission rate tests using the California Department of Health “Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers,” (CDPH, 2017), or other equivalent chemical emission rate testing methods. Most manufacturers of building furnishings sold in the United States conduct chemical emission rate tests using ANSI/BIFMA M7.1 Standard Test Method for Determining VOC Emissions (BIFMA, 2018), or other equivalent chemical emission rate testing methods.

CDPH, BIFMA, and other chemical emission rate testing programs, typically certify that a material or furnishing does not create indoor chemical concentrations in excess of the maximum concentrations permitted by their certification. For instance, the CDPH emission rate testing requires that the measured emission rates when input into an office, school, or residential model do not exceed one-half of the OEHHA Chronic Exposure Guidelines (OEHHA, 2017b) for the 35 specific VOCs, including formaldehyde, listed in Table 4-1 of the CDPH test method (CDPH, 2017). These certifications themselves do not provide the actual area-specific formaldehyde emission rate (i.e., $\mu\text{g}/\text{m}^2\text{-h}$) of the product, but rather provide data that the formaldehyde emission rates do not exceed the maximum rate allowed for the certification. Thus, for example, the data for a certification of a specific type of flooring may be used to calculate that the area-specific emission rate of formaldehyde is less than $31 \mu\text{g}/\text{m}^2\text{-h}$, but not the actual measured specific emission rate, which may be 3, 18, or $30 \mu\text{g}/\text{m}^2\text{-h}$. These area-specific emission rates determined from the product certifications of CDPH, BIFA, and other certification programs can be used as an initial estimate of the formaldehyde emission rate.

If the actual area-specific emission rates of a building material or furnishing is needed (i.e. the initial emission rates estimates from the product certifications are higher than desired), then that data can be acquired by requesting from the manufacturer the complete chemical emission rate test report. For instance if the complete CDPH emission test report is requested for a CDHP certified product, that report will provide the actual area-specific emission rates for not only the 35 specific VOCs, including formaldehyde, listed in Table 4-1 of the CDPH test method (CDPH, 2017), but also all of the cancer and reproductive/developmental chemicals listed in the California Proposition 65 Safe Harbor Levels (OEHHA, 2017a), all of the toxic air contaminants (TACs) in the California Air Resources Board Toxic Air Contamination List (CARB, 2011), and the 10 chemicals with the greatest emission rates.

Alternatively, a sample of the building material or furnishing can be submitted to a chemical emission rate testing laboratory, such as Berkeley Analytical Laboratory (<https://berkeleyanalytical.com>), to measure the formaldehyde emission rate.

4.) Calculate the Total Formaldehyde Emission Rate. For each IAQ Zone, calculate the total formaldehyde emission rate (i.e. $\mu\text{g}/\text{h}$) from the individual formaldehyde emission rates from each of the building material/furnishings as determined in Step 3.

5.) Calculate the Indoor Formaldehyde Concentration. For each IAQ Zone, calculate the indoor formaldehyde concentration ($\mu\text{g}/\text{m}^3$) from Equation 1 by dividing the total formaldehyde emission rates (i.e. $\mu\text{g}/\text{h}$) as determined in Step 4, by the design minimum outdoor air ventilation rate (m^3/h) for the IAQ Zone.

$$C_{in} = \frac{E_{total}}{Q_{oa}} \text{ (Equation 1)}$$

where:

C_{in} = indoor formaldehyde concentration ($\mu\text{g}/\text{m}^3$)

E_{total} = total formaldehyde emission rate ($\mu\text{g}/\text{h}$) into the IAQ Zone.

Q_{oa} = design minimum outdoor air ventilation rate to the IAQ Zone (m^3/h)

The above Equation 1 is based upon mass balance theory, and is referenced in Section 3.10.2 “Calculation of Estimated Building Concentrations” of the California Department of Health “Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers”, (CDPH, 2017).

6.) Calculate the Indoor Exposure Cancer and Non-Cancer Health Risks. For each IAQ Zone, calculate the cancer and non-cancer health risks from the indoor formaldehyde concentrations determined in Step 5 and as described in the OEHHA Air Toxics Hot Spots Program Risk Assessment Guidelines; Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2015).

7.) Mitigate Indoor Formaldehyde Exposures of exceeding the CEQA Cancer and/or Non-Cancer Health Risks. In each IAQ Zone, provide mitigation for any formaldehyde exposure risk as determined in Step 6, that exceeds the CEQA cancer risk of 10 per million or the CEQA non-cancer Hazard Quotient of 1.0.

Provide the source and/or ventilation mitigation required in all IAQ Zones to reduce the health risks of the chemical exposures below the CEQA cancer and non-cancer health risks.

Source mitigation for formaldehyde may include:

- 1.) reducing the amount materials and/or furnishings that emit formaldehyde
- 2.) substituting a different material with a lower area-specific emission rate of formaldehyde

Ventilation mitigation for formaldehyde emitted from building materials and/or furnishings may include:

- 1.) increasing the design minimum outdoor air ventilation rate to the IAQ Zone.

NOTE: Mitigating the formaldehyde emissions through use of less material/furnishings, or use of lower emitting materials/furnishings, is the preferred mitigation option, as mitigation with increased outdoor air ventilation increases initial and operating costs associated with the heating/cooling systems.

Further, we are not asking that the builder “speculate” on what and how much composite materials be used, but rather at the design stage to select composite wood materials based on the formaldehyde emission rates that manufacturers routinely conduct using the California Department of Health “Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers,” (CDPH, 2017), and use the procedure described earlier above (i.e. Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment) to insure that the materials selected achieve acceptable cancer risks from material off gassing of formaldehyde.

Outdoor Air Ventilation Impact. Another important finding of the CNHS, was that the outdoor air ventilation rates in the homes were very low. Outdoor air ventilation is a very important factor influencing the indoor concentrations of air contaminants, as it is the primary removal mechanism of all indoor air generated contaminants. Lower outdoor air exchange rates cause indoor generated air contaminants to accumulate to higher indoor air concentrations. Many homeowners rarely open their windows or doors for ventilation as a result of their concerns for security/safety, noise, dust, and odor concerns (Price, 2007). In the CNHS field study, 32% of the homes did not use their windows during the 24-hour Test Day, and 15% of the homes did not use their windows during the entire preceding week. Most of the homes with no window usage were homes in the winter field session. Thus, a substantial percentage of homeowners never open their windows, especially in the winter season. The median 24-hour measurement was 0.26 air changes per hour (ach), with a range of 0.09 ach to 5.3 ach. A total of 67% of the homes had outdoor air exchange rates below the minimum California Building Code (2001) requirement of 0.35 ach. Thus, the relatively tight envelope construction, combined with the fact that many people never open their windows for ventilation, results in homes with low outdoor air exchange rates and higher indoor air contaminant concentrations.

According to the Sustainable Communities Project Exemption – 905 Beacon Avenue Project (CAJA Environmental Services, 2022) the Project is close to roads with moderate to high traffic (e.g., Beacon Avenue, West Olympic Avenue, James M. Wood Boulevard, South Burlington Avenue, etc.).

As a result of the high outdoor traffic noise levels, the current project will require a mechanical supply of outdoor air ventilation to allow for a habitable interior environment with closed windows and doors. Such a ventilation system would allow windows and doors to be kept closed at the occupant’s discretion to control exterior noise within building interiors.

Response to Comment No. 15

It should be noted at the outset that the alleged impact of formaldehyde on the future residents of the Project is not relevant to CEQA. The Supreme Court’s holding in *California Building Industry Ass’n v. Bay Area Air Quality Mgmt. Dist.* (2015) 62 Cal.4th 369, 386 found that CEQA does not require a project to evaluate the impact of the existing environment on future residents of the Project, unless the Project exacerbates the impact. There is no evidence that there is an existing formaldehyde issue at the Project site or that the Project could result in any exacerbation of any such issue.

Second, an analysis of the Project’s air quality impacts is not a requirement for a SCPE. As discussed in Response to Comment No. 4, all of the requirements for qualifying for a SCPE are outlined in Section 2 (Sustainable Communities Strategy Criteria) of the SCPE. As shown there, an air quality impact analysis is not listed as one of the requirements.

Mr. Offermann claims that the Project would expose residents and commercial employees of the Project to airborne cancer risks in excess of 10 per million due to formaldehyde emissions and that this would constitute a significant impact. In his letter, Mr. Offermann introduces the correlation between indoor formaldehyde concentrations and excess cancer cases by citing the results of the 2009 California New Home Study (CNHS), which he authored. Though this introduction has limited relevance to the comment's claims regarding the Project's alleged airborne cancer risk due to formaldehyde emissions, one statement merits a brief clarifying discussion. Mr. Offermann notes that in his CNHS study of "108 new homes in California," the median indoor formaldehyde concentration was $36 \mu\text{g}/\text{m}^3$. "Therefore," he claims, "the cancer risk of a resident living in a California home with the median indoor formaldehyde concentration of $36 \mu\text{g}/\text{m}^3$, is 180 per million as a result of formaldehyde alone." The wording of this statement comes close to suggesting that the median indoor formaldehyde concentration of a California home is $36 \mu\text{g}/\text{m}^3$. Whether this is the intended meaning or not, such a conclusion would not be supported by the results of Mr. Offermann's CNHS study, which was limited to single-family homes that were built between 2002 and 2004. The study itself refrains from inferring such a broad conclusion, and there is no evidence that such a narrowly tailored selection of study homes – specifically, detached single-family homes constructed over a three-year period nearly 20 years ago – should be broadly representative of statewide conditions.

Mr. Offermann then engages in a series of inaccurate statements and unfounded speculation in his process of surmising the Project's future indoor formaldehyde concentration and the risk it may pose to future Project residents and employees. In this process, Mr. Offermann relies heavily on a 2020 paper by Singer et al.² that presents the methods and results of the Healthy Efficient New Gas Home (HENGH) study. Mr. Offermann is also credited as a co-author to this paper. The discussion below explains why each step in Mr. Offermann's process is variously misguided, erroneous, or unsupported by fact.

Mr. Offermann begins by mischaracterizing critical details of the HENGH study, inaccurately stating that the study "found that median indoor formaldehyde in new homes built after 2009 with CARB Phase 2 Formaldehyde ATCM materials had...median indoor concentrations of $22.4 \mu\text{g}/\text{m}^3$ (18.2 ppb)." This is incorrect: though the study did find that its 70 sample homes had a median indoor formaldehyde concentration of 18.2 ppb, the study offers no evidence, nor does it explicitly express or infer, that sampled homes were built with CARB Phase 2 ATCM materials. The HENGH study assessed 70 sample homes that were built between 2011 and 2017, but the final Phase 2 ATCM rules did not go into effect until January 2014. Thus, not all sampled homes were built after the final Phase 2 ATCM rules went into effect, and it is possible that some homes built after January 2014 were constructed of materials that were purchased prior to this deadline. Therefore, contrary to Mr. Offermann's statement, the HENGH study does not establish – nor could it establish – that median indoor formaldehyde concentrations in new homes built with CARB Phase 2 ATCM materials are $22.4 \mu\text{g}/\text{m}^3$ or 18.2 ppb.

Next, Mr. Offermann further embellishes the results of the HENGH study by applying what he terms is a "correction" to the study's $22.4 \mu\text{g}/\text{m}^3$ (18.2 ppb) median indoor formaldehyde concentration finding, thereby resulting in a "true" median indoor formaldehyde concentration of $24.1 \mu\text{g}/\text{m}^3$. He states that "formaldehyde concentrations in the HENGH study were measured with passive samplers, which were estimated to under-measure the true indoor formaldehyde concentrations by approximately 7.5%." In the paper by Singer et al. that is cited by Mr. Offermann, the authors note that Offermann (this commenter) and Hodgson "have shown

² Singer, B.C., Chan, W.R., Kim, Y., Offermann, F.J., and Walker I.S. 2020. Indoor Air Quality in California Homes with Code-Required Mechanical Ventilation. *Indoor Air*, Vol 30, Issue 5, 885-899.

that sampling rates for...passive monitors start to drop sharply when air velocity falls below about 75 [centimeters per minute].” However, the study subsequently acknowledges other household research that reports how “such low air velocities were infrequent.” The authors then reason that “it is possible that sampling rates could have been lower than the assumed standard values at some times in some homes,” but concede that the HENGH study “did not measure velocities around the passive samplers” or “verify measured concentrations with pumped samples.” Thus, by the study’s own admission, there is no evidence that low air velocities were ever a factor during passive sampling of indoor formaldehyde levels. Contrary to Mr. Offermann’s statement, the application of a 7.5% “correction” is not evident anywhere in the paper by Singer et al. Where the paper reports its findings, it reports the 18.2 ppb figure, which correlates with Mr. Offermann’s original 22.4 µg/m³ figure – not his “corrected” 24.1 µg/m³ figure (See Exhibit 1).

Exhibit 1

HENGH Study Median Formaldehyde (“HCHO”) Concentrations

Table 3. Time-averaged pollutant concentrations in California homes built 2011-2017 (HENGH, current study) and 2002-2005 (CNHS, Offermann, 2009).

Location	HCHO (ppb)		PM _{2.5} (µg/m ³)		NO ₂ (ppb)		CO ₂ (ppm)	
	HENGH	CNHS ¹	HENGH	CNHS ¹	HENGH	CNHS ¹	HENGH	CNHS ²
Indoor	N=68	N=105	N=67	N=28	N=66	N=29	N=69	N=107
Mean	19.8	35.0	7.5	13.4	5.8	5.2	620	610
Median	18.2	29.3	4.8	10.5	4.5	1.6	608	564
10 th -90 th	13-28	11-70	1.6-16	6.0-31	1.1-12	1.4-12	481-770	405-890

Mean	2.2	1.8	9.3, 10.5	7.9	5.4	2.1		
Median	2.3	1.7	6.8, 9.7	8.7	3.6	1.5		
10 th -90 th	1.4-3.1	0.6-2.8	2.7-18.1, 5.3-16.7	5.0-10	0.1-11	1.4-1.7		

As indicated in the red box, Singer et al. reports that median formaldehyde concentrations in HENGH study homes were 18.2 ppb, which correlates with Mr. Offermann’s original 22.4 µg/m³ concentration, not his “corrected” 24.1 µg/m³ figure. (Singer et al.)

Based on his “corrected” 24.1 µg/m³ figure, Mr. Offermann claims that “the median lifetime cancer risk is still 120 per million for homes built with CARB-compliant composite wood products.” This is despite the fact that the original 22.4 µg/m³ figure is based in part on sample homes that were built prior to CARB Phase 2 ATCM rules going into effect, and the “corrected” 24.1 µg/m³ utilized by Mr. Offermann has no evidentiary basis.

Mr. Offermann expands on his analysis when discussing the alleged impact on the Project’s future residents. He starts by stating that “residential occupants will potentially have continuous exposure (e.g., 24 hours per day, 52 weeks per year).” In other words, Mr. Offermann assumes that a Project resident will spend every hour of every day within their apartment. This is clearly an inaccurate assumption, and Mr. Offermann offers no evidence to support it, nor does he acknowledge that his assumption directly contradicts existing

guidance offered by OEHHA regarding “fraction of time at home” or FAH.³ By ignoring this guidance, Mr. Offermann’s continuous exposure assumptions for residential occupants are not tenable.

Mr. Offermann then launches a flurry of speculation, claiming that because the Project “will be constructed with CARB Phase 2 Formaldehyde ATCM materials, and be ventilated with the minimum code required amount of outdoor air, the indoor residential formaldehyde concentrations are likely similar to those concentrations observed in residences built with CARB Phase 2 Formaldehyde ATCM materials, which is a median of 24.1 $\mu\text{g}/\text{m}^3$.” Mr. Offerman cites the paper by Singer et al. in support of this statement. As explained earlier, Singer et al. concedes a lack of evidence surrounding whether low air velocities were ever a factor during the HENGH study’s passive sampling of indoor formaldehyde levels, and the paper’s published findings report a 18.2 ppb figure which correlates with Mr. Offermann’s non-“corrected” 22.4 $\mu\text{g}/\text{m}^3$ figure. The application of a 7.5% “correction” that correlates with Mr. Offermann’s 24.1 $\mu\text{g}/\text{m}^3$ figure is not evident in the paper by Singer et al., and Mr. Offermann’s citation referencing Singer et al. is therefore questionable. Furthermore, and as also explained earlier, the HENGH study addressed by Singer et al. sampled homes that were constructed several years prior to the full rollout of CARB Phase 2 Formaldehyde emission standards. Singer et al. neither explicitly states nor infers that sample homes were built with CARB Phase 2 compliant materials, nor does it suggest that its formaldehyde findings should be interpreted in the manner that Mr. Offermann has undertaken. Therefore, Mr. Offermann’s reasoning that the Project would contain similar indoor residential formaldehyde concentrations as HENGH study sample homes is both inaccurate and unfounded, and Mr. Offermann’s citation referencing Singer et al. in support of this reasoning is once again questionable.

Mr. Offermann speculates further when he states that the Project’s indoor residential formaldehyde concentrations would be “likely similar” to concentrations observed by the HENGH study because the Project “will...be ventilated with the minimum code required amount of outdoor air.” Mr. Offermann demonstrates no understanding of what the “minimum code required amount of outdoor air” would be for the Project, nor does he support his claim that the Project’s ventilation would be no greater than “minimum code” requirements with any evidence. Moreover, Mr. Offermann demonstrates no understanding of what ventilation the HENGH study sample homes achieved. He fails to substantiate why the Project – which proposes a multi-family building with 145 dwelling units as well as ground-floor commercial uses – would have any similarity in ventilation to the 70 detached single-family homes constructed between 2011 and 2017 that were sampled as part of the HENGH study, and he fails to establish why presumably similar ventilation would even contribute to presumably similar indoor residential formaldehyde concentrations in future Project dwelling units. Mr. Offermann’s analysis hinges entirely on the assumption that the Project’s dwelling units would experience similar indoor formaldehyde concentrations as HENGH study sample homes. But, as demonstrated, this assumption is wholly unsupported by fact.

There are additional aspects of the HENGH study that have not been considered by Mr. Offermann which further diminish its comparative value to the Project, as well. First, the HENGH study sample homes were occupied and therefore presumably furnished. This is a critical detail overlooked by Mr. Offermann. Formaldehyde off-gassing occurs not just from composite wood products used in building construction, but also from composite wood products used commonly in furniture construction. Tables, bedframes, dressers,

³ Note that the OEHHA’s recommended FAH value for adult receptors between 16 and 70 years of age is 0.73, or 73% of time spent at home. See OEHHA, *The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*, February 2015.

sofas, chairs, and any other furniture containing composite wood products would also likely emit formaldehyde, possibly at high levels if such furniture was purchased prior to the CARB Formaldehyde ATCM or outside of California. Common indoor sources of formaldehyde also include household products such as glues, paints, caulks, pesticides, fabric softeners, and detergents. Even personal care products and cosmetics such as shampoos, soaps, hair care products, body washes, and nail polish may release formaldehyde. Moreover, many other consumer products also emit VOCs that react with ozone in the air to produce formaldehyde.⁴ The HENGH study did not determine or speculate what proportion of its measured formaldehyde concentrations were resultant from building materials only. Therefore, there is no way of knowing what measured proportion of indoor formaldehyde concentrations were emitted solely by the building construction materials used in HENGH study sample homes. This is a pivotal consideration because formaldehyde emissions from the objects (i.e., composite wood furniture) and actions (i.e., use of pesticides, detergents, or personal care products) of future Project residents, and any impact that they would have on themselves, is entirely speculative and outside the scope of the Project’s CEQA-related impacts. Put another way, the Project is not “on the hook” for any risk that future Project residents may pose to themselves via their own formaldehyde-emitting objects and actions. But, by assuming that future Project residents would experience similar indoor formaldehyde concentrations as measured in the HENGH study, Mr. Offermann puts the Project “on the hook” for an indeterminate amount of formaldehyde emissions that were caused by the objects and actions of HENGH study participants.

Second, it is worth noting that the HENGH study specifically instructed participants not to use windows and doors normally as they might do for routine ventilation (See Exhibit 2). This clearly biases the study’s results in favor of increased indoor formaldehyde concentrations. While such instruction may have been relevant to the purpose of the HENGH study, in real life, it is reasonable to suspect that future Project residents would occasionally open their windows or doors for purposes of natural ventilation.

Exhibit 2

3 appliance use. The participant was provided with an activity log for each day of the study and
4 asked to partake in normal household activities with the exception that windows and doors
5 should not be used for routine ventilation. Most homes were monitored for seven days, five were

The highlighted excerpt indicates that HENGH study participants were instructed to not use windows and doors for “routine ventilation.” (Singer et al.)

Mr. Offermann then assumes that because “residential occupants inhale 20 m³ of air per day,” a claim that he makes without any supporting evidence, “the average 70-year lifetime formaldehyde daily dose is 482 µg/day for continuous exposure in the residences,” which he equates with “a cancer risk of 120 per million.” There are at least three issues with this projection (that are in addition to issues that have been previously identified and discussed).

⁴ CARB, *Formaldehyde Online Fact Sheet*. ww.2.arb.ca.gov/resources/fact-sheets/formaldehyde. May 1, 2020.

First, Mr. Offermann claims that residential occupants would inhale 20 cubic meters of air per day, yet cites no evidence to substantiate this claim. According to the American Lung Association, the average person inhales approximately 2,000 gallons of air per day or roughly 7.57 cubic meters per day.⁵

Second, Mr. Offermann cites no authority in support of his assumed “70-year lifetime” exposure duration. In fact, his assumption of a “70-year lifetime” exposure duration contradicts the 30-year exposure duration that is consistent with OEHHA recommendations for estimating individual cancer risks. This demonstrates, once again, how Mr. Offermann has resorted to speculative assumptions that are unsupported by relevant regulatory guidance.

Third, by assuming that a future Project resident would inhale 482 µg/day of formaldehyde for 70 years (which, as explained, represents two sets of unsupported assumptions), Mr. Offermann overlooks the fact that emissions of formaldehyde gas from composite wood products decrease over time. This is perhaps the most serious deficiency in his analysis. The OEHHA’s Proposition 65 webpage for formaldehyde notes how “the release of formaldehyde gas from composite wood decreases over time.”⁶ The U.S. Consumer Product Safety Commission also notes that for formaldehyde sources, “emissions generally decrease as the product ages.”⁷ CARB explains that “[f]or products that are made with formaldehyde based resins or adhesives, rapid off-gassing of formaldehyde occurs initially when the product is made, and over time the formaldehyde emissions decrease.”⁸ The CDC’s Agency for Toxic Substances and Disease Registry (ATSDR) states that “[m]ost formaldehyde is released from products within 2 years.”⁹ The CDC’s ATSDR raises a particularly salient point because of the 70 homes that were sampled as part of the HENGH study, nearly 70% were 2 years or newer when sampled. This suggests that whatever these homes’ proportion of indoor formaldehyde concentrations from building materials might have been, it would have been relatively elevated at the time of the HENGH study due to the age of these homes.¹⁰ Over time, formaldehyde concentrations associated with these homes’ building materials would be expected to attenuate. Mr. Offermann’s analysis runs contrary to this understanding of formaldehyde emissions. Without accounting for the natural decay of formaldehyde emissions over time, Mr. Offermann assumes that a resident’s exposure to indoor formaldehyde concentrations from the Project’s composite wood building materials would be exactly the same whether it is the first day or the 70th year of their occupancy – a clearly erroneous assumption.

With respect to the alleged impact to future employees of the Project’s commercial spaces, Mr. Offermann’s claims and analysis fall short for similar reasons as those explained previously.

In summary, the following is a review of the various issues associated with Mr. Offermann’s claims and analysis regarding alleged formaldehyde impacts to future Project residents and employees:

1. Contrary to statements made by Mr. Offermann, the HENGH study did not measure indoor formaldehyde concentrations in new homes built only with CARB Phase 2 Formaldehyde ACTM

⁹ Agency for Toxic Substances and Disease Registry (ATSDR), *Formaldehyde in Your Home: What You Need to Know*. atsdr.cdc.gov/formaldehyde/home/index.html. Accessed January 3, 2022.

¹⁰ As explained earlier, Singer et al. did not determine or speculate as to what proportion of its measured formaldehyde concentrations were resultant from building materials only.

materials, and the study does not establish what median indoor formaldehyde concentrations for such homes might be.

2. Mr. Offermann's 7.5% "correction" to the 22.4 $\mu\text{g}/\text{m}^3$ (18.2 ppb) median indoor formaldehyde concentration finding by the HENGH study is unsupported by Singer et al., and Mr. Offermann's "corrected" figure is not evident anywhere in the paper by Singer et al.
3. Mr. Offermann assumes that future Project residents will spend every hour of every day in their apartments, a clearly inaccurate assumption.
4. In making claims about the Project's ventilation, Mr. Offermann demonstrates no understanding of what the Project's ventilation would be or what the HENGH sample homes' ventilation was. Additionally, he fails to substantiate why the Project – which proposes a multi-family building with 145 dwelling units – would have any similarity in ventilation to the 70 detached single-family homes that were sampled as part of the HENGH study.
5. Mr. Offermann overlooks the fact that HENGH study sample homes were occupied and therefore presumably furnished. The HENGH study did not determine or speculate what proportion of its measured formaldehyde concentrations were resultant from building materials only. It also did not determine or speculate what proportion of concentrations were due to consumer product use by sample home occupants. By assigning the median formaldehyde concentrations measured by the HENGH study to the Project, Mr. Offermann compels the Project to consider the impact of formaldehyde emissions that are outside the scope of CEQA relevance (i.e., formaldehyde emissions from the objects and actions of residents – not those that are directly generated by the Project's building materials).
6. The HENGH study specifically instructed participants to not use windows and doors normally as they might do for routine ventilation, a condition that limits the real-world applicability of the study's findings.
7. Mr. Offermann's cancer risk projection for future Project residents relies on a "70-year lifetime" exposure duration, a speculative assumption that is unsupported by existing regulatory guidance.
8. Mr. Offermann disregards the fact that emissions of formaldehyde gas from composite wood products decrease over time.

Given these considerations, Mr. Offermann's analysis offers no substantial evidence as to why the Project's formaldehyde emissions from CARB Phase 2 Formaldehyde ATCM building materials would be expected to result in significant cancer risks to future Project residents and employees. Under Public Resources Code Section 21082.2(c), "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly inaccurate or erroneous, or evidence of social or economic impacts which do not contribute to, or are not caused by, physical impacts on the environment, is not substantial evidence. Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts." Mr. Offermann's inferences from the HENGH study findings are not reasonable, and at times they directly contradict the explicit admissions and published results of the study itself. Mr. Offermann's assumptions are also erroneous, and at times they directly contradict OEHHA guidance. Furthermore, Mr. Offermann's

conclusion that the Project would result in significant cancer risks and that CARB ATCM regulations “do not assure healthful indoor air quality” directly contradict statements from numerous State and Federal agencies regarding formaldehyde emissions, including CARB itself. CARB states that “[f]rom a public health standpoint, the CWP Regulation’s emission standards [i.e., the CARB ATCM] are set at low levels intended to protect public health.” CARB reiterates this elsewhere, stating that “[t]he Composite Wood Products Regulation establishes emission standards at levels intended to protect public health.” The CDC adds that “[f]ormaldehyde exposure from new products or new construction in the home would generally be much lower and would last for less time than the exposures linked to cancer. We estimated the risk of cancer from exposure to typical indoor air levels and it’s low.”

Comment No. 16

PM^{2.5} Outdoor Concentrations Impact. An additional impact of the nearby motor vehicle traffic associated with this project, are the outdoor concentrations of PM^{2.5}. According to the Sustainable Communities Project Exemption – 905 Beacon Avenue Project (CAJA Environmental Services, 2022) the Project is located in the South Coast Air Basin, which is a State and Federal non-attainment area for PM^{2.5}.

Additionally, the SCAQMD’s MATES V study cites an existing cancer risk of 760 per million at the Project site due to the site’s high concentration of ambient air contaminants resulting from the area’s high levels of motor vehicle traffic.

An air quality analyses should to be conducted to determine the concentrations of PM_{2.5} in the outdoor and indoor air that people inhale each day. This air quality analyses needs to consider the cumulative impacts of the project related emissions, existing and projected future emissions from local PM_{2.5} sources (e.g. stationary sources, motor vehicles, and airport traffic) upon the outdoor air concentrations at the Project site. If the outdoor concentrations are determined to exceed the California and National annual average PM_{2.5} exceedence concentration of 12 µg/m³, or the National 24-hour average exceedence concentration of 35 µg/m³, then the buildings need to have a mechanical supply of outdoor air that has air filtration with sufficient removal efficiency, such that the indoor concentrations of outdoor PM_{2.5} particles is less than the California and National PM_{2.5} annual and 24-hour standards.

It is my experience that based on the projected high traffic noise levels, the annual average concentration of PM_{2.5} will exceed the California and National PM_{2.5} annual and 24-hour standards and warrant installation of high efficiency air filters (i.e. MERV 13 or higher) in all mechanically supplied outdoor air ventilation systems.

Response to Comment No. 16

Mr. Offermann states that “An air quality analyses should be conducted to determine the concentrations of PM_{2.5} in the outdoor and indoor air that people inhale each day.” Mr. Offermann should note that as stated in Response to Comment Nos. 4 and 15, preparation of an air quality analysis is not a requirement for a SCPE.

Further, the effect of PM_{2.5} is also not relevant based on *California Building Industry Ass'n v. Bay Area Air Quality Mgmt. Dist.* (2015) 62 Cal.4th 369, 386. CEQA does not require a project to evaluate the impact of the existing environment on future residents of the Project, unless the Project exacerbates the impact. The commentator presents no evidence that there is an existing PM_{2.5} issue at the Project site, and the commentator's speculation regarding PM_{2.5} levels is irrelevant to the legitimacy of the SCPE.

Comment No. 17

Indoor Air Quality Impact Mitigation Measures

The following are recommended mitigation measures to minimize the impacts upon indoor quality:

Indoor Formaldehyde Concentrations Mitigation. Use only composite wood materials (e.g. hardwood plywood, medium density fiberboard, particleboard) for all interior finish systems that are made with CARB approved no-added formaldehyde (NAF) resins (CARB, 2009). CARB Phase 2 certified composite wood products, or ultra-low emitting formaldehyde (ULEF) resins, do not insure indoor formaldehyde concentrations that are below the CEQA cancer risk of 10 per million. Only composite wood products manufactured with CARB approved no-added formaldehyde (NAF) resins, such as resins made from soy, polyvinyl acetate, or methylene diisocyanate can insure that the OEHHA cancer risk of 10 per million is met.

Alternatively, conduct the previously described Pre-Construction Building Material/Furnishing Chemical Emissions Assessment, to determine that the combination of formaldehyde emissions from building materials and furnishings do not create indoor formaldehyde concentrations that exceed the CEQA cancer and non-cancer health risks.

It is important to note that we are not asking that the builder "speculate" on what and how much composite materials be used, but rather at the design stage to select composite wood materials based on the formaldehyde emission rates that manufacturers routinely conduct using the California Department of Health "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers", (CDPH, 2017), and use the procedure described above (i.e. Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment) to insure that the materials selected achieve acceptable cancer risks from material off gassing of formaldehyde.

Outdoor Air Ventilation Mitigation. Provide each habitable room with a continuous mechanical supply of outdoor air that meets or exceeds the California 2016 Building Energy Efficiency Standards (California Energy Commission, 2015) requirements of the greater of 15 cfm/occupant or 0.15 cfm/ft² of floor area. Following installation of the system conduct testing and balancing to insure that required amount of outdoor air is entering each habitable room and provide a written report documenting the outdoor airflow rates. Do not use exhaust only mechanical outdoor air systems, use only balanced outdoor air supply and exhaust systems or outdoor air supply only systems. Provide a manual for the occupants or maintenance personnel, that describes the purpose of the mechanical outdoor air system and the operation and maintenance requirements of the system.

PM^{2.5} Outdoor Air Concentration Mitigation. Install air filtration with sufficient PM^{2.5} removal efficiency (e.g. MERV 13 or higher) to filter the outdoor air entering the mechanical outdoor air supply systems, such that the indoor concentrations of outdoor PM^{2.5} particles are less than the California and National PM^{2.5} annual and 24-hour standards. Install the air filters in the system such that they are accessible for replacement by the occupants or maintenance personnel. Include in the mechanical outdoor air ventilation system manual instructions on how to replace the air filters and the estimated frequency of replacement.

Response to Comment No. 19

Regarding the specific mitigation suggested by Comment No. 19, a SCPE is only required to incorporate “Any applicable mitigation measures or performance standards or criteria set forth in the prior environmental impact reports, and adopted in findings.”. As noted in Table G-1 (Applicability of 2020-2045 RTP/SCS Final EIR Mitigation Measures) in Appendix G of the October 2022 SCPE, the City determined that the Project would comply with multiple existing air quality-related regulations that are equal to or more effective than the relevant components of Mitigation Measure PMM AQ-1. While the October 2022 SCPE’s findings fully support this determination, the July 2023 SCPE clarifies that the Project incorporates all components of Mitigation Measure PMM AQ-1. Therefore, through incorporation of PMM AQ-1 as well as the Project’s compliance with all applicable regulatory requirements pertaining to air quality and local emissions, the Project will continue to meet all applicable statutory criteria for utilization of a SCPE.

Response to Southwest Mountain States Regional Council of Carpenters (Carpenters) Letter dated June 6, 2023

Comment No. 1

Dear City of Los Angeles Planning and Land Use Committee,

On behalf of the Southwest Mountain States Regional Council of Carpenters (“The Carpenters” or “SWMSRCC”), my Office is submitting these comments regarding the 905-923 Beacon Ave. project (“Project”).

The Project proposes demolition and removal of an existing surface parking lot from the Project Site and development of the site with a seven-story, 119,508- square-foot mixed-use building, which would include 145 multi-family residential dwelling units and up to 2,000 square feet of neighborhood-serving commercial uses.

SWMSRCC is a labor union representing 50,000 union carpenters in six states, including California, and has a strong interest in well ordered land use planning and addressing the environmental impacts of development projects. Individual members of the Southwest Carpenters live, work and recreate in the City and surrounding communities and would be directly affected by the Project’s environmental impacts.

SWMSRCC expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearings and proceedings related to this Project. Cal. Gov. Code § 65009(b); Cal. Pub. Res. Code § 21177(a); Bakersfield Citizens for Local Control v. Bakersfield (2004) 124 Cal. App. 4th 1184, 1199-1203; see Galante Vineyards v. Monterey Water Dist. (1997) 60 Cal. App. 4th 1109, 1121.

SWMSRCC incorporates by reference all comments raising issues regarding the Project’s environmental review submitted prior to approval of the Project. Citizens for Clean Energy v. City of Woodland (2014) 225 Cal. App. 4th 173, 191 (finding that any party who has objected to the Project’s environmental documentation may assert any issue timely raised by other parties).

SWMSRCC also requests that the City provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act (“CEQA”), Cal Public Resources Code (“PRC”) § 21000 et seq, and the California Planning and Zoning Law (“Planning and Zoning Law”), Cal. Gov’t Code §§ 65000–65010. California Public Resources Code Sections 21092.2, and 21167(f) and Government Code Section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency’s governing body.

Response to Comment No. 1

This comment includes statements about the commentator and is not a comment on the SCPE. The City will provide CARPENTERS with all relevant notices for the Project.

Comment No. 2

I. THE CITY SHOULD REQUIRE THE USE OF A LOCAL WORKFORCE TO BENEFIT THE COMMUNITY'S ECONOMIC DEVELOPMENT AND ENVIRONMENT

As noted in our previous letters, the City should require the Project to be built using a local workers who have graduated from a Joint Labor-Management Apprenticeship Program approved by the State of California, have at least as many hours of on-the-job experience in the applicable craft which would be required to graduate from such a state-approved apprenticeship training program, or who are registered apprentices in a state-approved apprenticeship training program.

Community benefits such as local hire can also be helpful to reduce environmental impacts and improve the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project site can reduce the length of vendor trips, reduce greenhouse gas emissions, and provide localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

[A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board and the University of California, Berkeley Center for Labor Research and Education concluded:

[L]abor should be considered an investment rather than a cost—and investments in growing, diversifying, and upskilling California's workforce can positively affect returns on climate mitigation efforts. In other words, well-trained workers are key to delivering emissions reductions and moving California closer to its climate targets.¹

Furthermore, workforce policies have significant environmental benefits given that they improve an area's jobs-housing balance, decreasing the amount and length of job commutes and the associated greenhouse gas ("GHG") emissions. In fact, on May 7, 2021, the South Coast Air Quality Management District found that that the "[u]se of a local state-certified apprenticeship program" can result in air pollutant reductions.²

Locating jobs closer to residential areas can have significant environmental benefits. As the California Planning Roundtable noted in 2008:

People who live and work in the same jurisdiction would be more likely to take transit, walk, or bicycle to work than residents of less balanced communities and their vehicle trips would be shorter. Benefits would include potential reductions in both vehicle miles traveled and vehicle hours traveled.³

Moreover, local hire mandates and skill-training are critical facets of a strategy to reduce vehicle miles traveled ("VMT"). As planning experts Robert Cervero and Michael Duncan have noted, simply placing jobs

near housing stock is insufficient to achieve VMT reductions given that the skill requirements of available local jobs must match those held by local residents.⁴ Some municipalities have even tied local hire and other workforce policies to local development permits to address transportation issues. Cervero and Duncan note that:

In nearly built-out Berkeley, CA, the approach to balancing jobs and housing is to create local jobs rather than to develop new housing. The city's First Source program encourages businesses to hire local residents, especially for entry- and intermediate-level jobs, and sponsors vocational training to ensure residents are employment-ready. While the program is voluntary, some 300 businesses have used it to date, placing more than 3,000 city residents in local jobs since it was launched in 1986. When needed, these carrots are matched by sticks, since the city is not shy about negotiating corporate participation in First Source as a condition of approval for development permits.

Recently, the State of California verified its commitment towards workforce development through the Affordable Housing and High Road Jobs Act of 2022, otherwise known as Assembly Bill No. 2011 ("AB2011"). AB2011 amended the Planning and Zoning Law to allow ministerial, by-right approval for projects being built alongside commercial corridors that meet affordability and labor requirements.

The City should consider utilizing local workforce policies and requirements to benefit the local area economically and to mitigate greenhouse gas, improve air quality, and reduce transportation impacts.

Response to Comment No. 2

The provision of community benefits is not a requirement of CEQA. Additionally, all of the statutory requirements established by Public Resources Code Sections 21155 and 21155.1 for qualifying for a SCPE are outlined in Section 2 (Sustainable Communities Strategy Criteria) of the SCPE. As shown there, the Project is required to incorporate "...applicable mitigation measures or performance standards or criteria set forth in the prior environmental impact reports, and adopted in findings..." Incorporation of other measures, such as those presented by the commentator, is not necessary.

Comment No. 3

II. THE CITY SHOULD IMPOSE TRAINING REQUIREMENTS FOR THE PROJECT'S CONSTRUCTION ACTIVITIES TO PREVENT COMMUNITY SPREAD OF COVID-19 AND OTHER INFECTIOUS DISEASES

Construction work has been defined as a Lower to High-risk activity for COVID-19 spread by the Occupations Safety and Health Administration. Recently, several construction sites have been identified as sources of community spread of COVID-19.⁵

Southwest Mountain States Carpenters recommend that the City adopt additional requirements to mitigate public health risks from the Project's construction activities. SWMSRCC requests that the City require safe on-site construction work practices as well as training and certification for any construction workers on the Project Site.

In particular, based upon Southwest Mountain States Carpenters' experience with safe construction site work practices, SWMSRCC recommends that the City require that while construction activities are being conducted at the Project Site:

Construction Site Design:

- The Project Site will be limited to two controlled entry points.
- Entry points will have temperature screening technicians taking temperature readings when the entry point is open.
- The Temperature Screening Site Plan shows details regarding access to the Project Site and Project Site logistics for conducting temperature screening.
- A 48-hour advance notice will be provided to all trades prior to the first day of temperature screening.
- The perimeter fence directly adjacent to the entry points will be clearly marked indicating the appropriate 6-foot social distancing position for when you approach the screening area. Please reference the Apex temperature screening site map for additional details.
- There will be clear signage posted at the project site directing you through temperature screening.
- Provide hand washing stations throughout the construction site.

Testing Procedures:

- The temperature screening being used are non-contact devices.
- Temperature readings will not be recorded.
- Personnel will be screened upon entering the testing center and should only take 1-2 seconds per individual.
- Hard hats, head coverings, sweat, dirt, sunscreen or any other cosmetics must be removed on the forehead before temperature screening.
- Anyone who refuses to submit to a temperature screening or does not answer the health screening questions will be refused access to the Project Site.
- Screening will be performed at both entrances from 5:30 am to 7:30 am.; main gate [ZONE 1] and personnel gate [ZONE 2]
- After 7:30 am only the main gate entrance [ZONE 1] will continue to be used for temperature testing for anybody gaining entry to the project site such as returning personnel, deliveries, and visitors.
- If the digital thermometer displays a temperature reading above 100.0 degrees Fahrenheit, a second reading will be taken to verify an accurate reading.

- If the second reading confirms an elevated temperature, DHS will instruct the individual that he/she will not be allowed to enter the Project Site. DHS will also instruct the individual to promptly notify his/her supervisor and his/her human resources (HR) representative and provide them with a copy of Annex A.

Planning

- Require the development of an Infectious Disease Preparedness and Response Plan that will include basic infection prevention measures (requiring the use of personal protection equipment), policies and procedures for prompt identification and isolation of sick individuals, social distancing (prohibiting gatherings of no more than 10 people including all-hands meetings and all-hands lunches) communication and training and workplace controls that meet standards that may be promulgated by the Center for Disease Control, Occupational Safety and Health Administration, Cal/OSHA, California Department of Public Health or applicable local public health agencies.⁶

The United Brotherhood of Carpenters and Carpenters International Training Fund has developed COVID-19 Training and Certification to ensure that Carpenter union members and apprentices conduct safe work practices. The City should require that all construction workers undergo COVID-19 Training and Certification before being allowed to conduct construction activities at the Project Site.

Southwest Mountain States Carpenters has also developed a rigorous Infection Control Risk Assessment (“ICRA”) training program to ensure it delivers a workforce that understands how to identify and control infection risks by implementing protocols to protect themselves and all others during renovation and construction projects in healthcare environments.⁷

ICRA protocols are intended to contain pathogens, control airflow, and protect patients during the construction, maintenance and renovation of healthcare facilities.

ICRA protocols prevent cross contamination, minimizing the risk of secondary infections in patients at hospital facilities.

The City should require the Project to be built using a workforce trained in ICRA protocols.

Response to Comment No. 3

“Prevention of the spread of COVID-19 and other infectious diseases” is well outside the scope of CEQA. Additionally, all of the statutory requirements established by Public Resources Code Sections 21155 and 21155.1 for qualifying for a SCPE are outlined in Section 2 (Sustainable Communities Strategy Criteria) of the SCPE. Incorporation of other measures, such as those presented by the commentator, is not necessary.

Comment No. 4

III. THE CITY SHOULD PREPARE AN ENVIRONMENTAL IMPACT REPORT FOR THE PROJECT

CEQA is a California statute designed to inform decision makers and the public about the potential, significant environmental effects of a project. 14 California Code of Regulations (“CEQA Guidelines”) § 15002(a)(1).⁸ At its core, “[i]ts purpose is to inform the public and its responsible officials of the environmental consequences of their decisions before they are made.” *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal. 3d 553, 564.

To achieve this purpose, CEQA mandates preparation of an Environmental Impact Report (“EIR”) for projects so that the foreseeable impacts of pursuing the project can be understood and weighed. *Communities for a Better Environment v. Richmond* (2010) 184 Cal. App. 4th 70, 80. The EIR requirement “is the heart of CEQA.” CEQA Guidelines, § 15003(a).

A strong presumption in favor of requiring preparation of an EIR is built into CEQA. This presumption is reflected in what is known as the “fair argument” standard, under which an agency must prepare an EIR whenever substantial evidence in the record supports a fair argument that a project may have a significant effect on the environment. *Quail Botanical Gardens Found., Inc. v. City of Encinitas* (1994) 29 Cal. App. 4th 1597, 1602; *Friends of “B” St. v. City of Hayward* (1980) 106 Cal. 3d 988, 1002.

The fair argument test stems from the statutory mandate that an EIR be prepared for any project that “may have a significant effect on the environment.” Public Resources Code (“PRC”) § 21151; *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal. App. 3d 68, 75; *Jensen v. City of Santa Rosa* (2018) 23 Cal. App. 5th 877, 884. Under this test, if a proposed project is not exempt and may cause a significant effect on the environment, the lead agency must prepare an EIR. PRC §§ 21100(a), 21151; CEQA Guidelines § 15064(a)(1), (f)(1). An EIR may be dispensed with only if the lead agency finds no substantial evidence in the initial study or elsewhere in the record that the project may have a significant effect on the environment. *Parker Shattuck Neighbors v. Berkeley City Council* (2013) 222 Cal. App. 4th 768, 785. In such a situation, the agency must adopt a negative declaration. PRC § 21080(c)(1); CEQA Guidelines §§

15063(b)(2), 15064(f)(3).

“Significant effect upon the environment” is defined as “a substantial or potentially substantial adverse change in the environment.” PRC § 21068; CEQA Guidelines § 15382. A project “may” have a significant effect on the environment if there is a

“reasonable probability” that it will result in a significant impact. *No Oil, Inc. v. City of Los Angeles*, 13 Cal. 3d at 83 fn. 16; *Sundstrom v. County of Mendocino* (1988) 202 Cal. App. 3d 296, 309. If any aspect of the project may result in a significant impact on the environment, an EIR must be prepared even if the overall effect of the project is beneficial. CEQA Guidelines § 15063(b)(1). See *County Sanitation Dist. No. 2 v. County of Kern* (2005) 127 Cal. App. 4th 1544, 1580.

This standard sets a “low threshold” for preparation of an EIR. *Consolidated Irrig. Dist. v. City of Selma* (2012) 204 Cal. App. 4th 187, 207; *Nelson v. County of Kern* (2010) 190 Cal. App. 4th 252; *Pocket Protectors v. City of Sacramento* (2004) 124 Cal. App. 4th 903, 928; *Bowman v. City of Berkeley* (2004) 122 Cal. App. 4th 572, 580; *Citizen Action to Serve All Students v. Thornley* (1990) 222 Cal. App. 3d 748, 754; *Sundstrom v. County of Mendocino* (1988) 202 Cal. App. 3d 296, 310. If substantial evidence in the record supports a fair argument that the project may have a significant environmental effect, the lead agency must prepare an

EIR even if other substantial evidence before it indicates the project will have no significant effect. See *Jensen v. City of Santa Rosa*

(2018) 23 Cal. App. 5th 877, 886; *Clews Land & Livestock v. City of San Diego* (2017) 19 Cal. App. 5th 161, 183; *Stanislaus Audubon Soc'y, Inc. v. County of Stanislaus* (1995) 33 Cal. App. 4th 144, 150; *Brentwood Ass'n for No Drilling, Inc. v. City of Los Angeles* (1982) 134 Cal. App. 3d 491; *Friends of "B" St. v. City of Hayward* (1980) 106 Cal. App. 3d 988; CEQA Guidelines § 15064(f)(1).

As the Project does not qualify for the sustainable communities project exemption from CEQA as explained below, the low threshold is met and the City must prepare an EIR for the Project.

Response to Comment No. 4

Regarding preparation of EIR for the Project and the Project's qualification for a SCPE, the commenter does not present any evidence, let alone substantial evidence, of potential significant impacts or any deficiency in the Project's SCPE. The commentator is referred to Responses to Comments No. 6 through No. 9. Based on the information provided therein, the Project does qualify for a SCPE, and no additional CEQA review is required.

Comment No. 5

IV. THE PROJECT IS NOT SUBJECT TO THE SUSTAINABLE COMMUNITIES PROJECT EXEMPTION

PRC Section 21155.1 provides that a project is statutorily exempt from CEQA if it qualifies as a transit priority project and it:

- 1) Can be adequately served by existing utilities, and the transit priority project applicant has paid, or has committed to pay, all applicable in-lieu or development fees;
- 2) Does not contain wetlands or riparian areas, does not have significant value as a wildlife habitat, does not harm any species protected by the federal Endangered Species Act or Native Plant Protection Act, and does not cause the destruction or removal of any species protected by a local ordinance;
- 3) Is not included on any list of hazardous waste sites compiled pursuant to Section 65962.5 of the Government Code;
- 4) Is subject to a preliminary endangerment assessment prepared by an environmental assessor to determine the existence of any release of a hazardous substance on the site and to determine the potential for exposure of future occupants to significant health hazards from any nearby property or activity;
- 5) Does not have a significant effect on historical resources pursuant to Section 21084.1;

- 6) Is not a wildland fire hazard, does not have an unusually high risk of high risk of fire or explosion, is not a landslide hazard, and does not have seismic risk as a result of being within a delineated earthquake fault zone;
- 7) Is not located on developed open space;
- 8) Is 15 percent more energy efficient than required by Chapter 6 of Title 24 of the California Code of Regulations and designed to achieve 25 percent less water usage than the average household use in the region;
- 9) Is not more than eight acres in total area;
- 10) Does not contain more than 200 residential units;
- 11) Does not result in any net loss in the number of affordable housing units within the project area;
- 12) Does not include any single level building that exceeds 75,000 square feet;
- 13) Incorporates any applicable mitigation measures or performance standards or criteria set forth in a prior environmental impact report and adopted in findings;
- 14) Is determined not to conflict with nearby operating industrial uses;
- 15) Is located within one-half mile of a rail transit station or a ferry terminal included in a regional transportation plan or within one-quarter mile of a high-quality transit corridor included in a regional transportation plan; and
- 16) It meets one of the following three factors:
 - (i) At least 20 percent of the housing is sold to families of moderate income, or not less than 10 percent of the housing will be rented to families of low income, or not less than 5 percent of the housing is rented to families of very low income and the project developer provides sufficient legal commitments to the appropriate local agency to ensure the continued availability and use of the housing units for very low, low-, and moderate-income households at monthly housing costs with an affordable housing cost or affordable rent, for the period required by the applicable financing;
 - (ii) The developer has paid or will pay in-lieu fees pursuant to a local ordinance in an amount sufficient to result in the development of an equivalent number of units that would otherwise be required; or
 - (iii) It provides public open space equal to or greater than five acres per 1,000 residents of the project.

Here, the Project fails to satisfy all these requirements and therefore is not eligible for the Sustainable Communities Project Exemption (“SCPE”).

Response to Comment No. 5

Regarding Project's qualification for a SCPE, the commentator is referred to Responses to Comments No. 6 through No. 9. Based on the information provided therein, the Project does qualify for a SCPE, and no additional CEQA review is required.

Comment No. 6

A. There Is Insufficient Evidence that the Project May Be Adequately Served by Existing Utilities

There is insufficient evidence that the Project site is equipped to handle the additional energy, water, and waste consumption of 145 new residential units as well as commercial and retail space in place of a single parking lot. In fact, the evidence points to the opposite conclusion since the sewer availability and waste drainage subsections of the Project permit have not yet been cleared by the Bureau of Engineering.⁹ Accordingly, the Project must not qualify for the SCPE exemption.

Response to Comment No. 6

The commentator is referred to Appendix C of the SCPE that includes the *Utility Infrastructure Technical Report: Water, Wastewater, and Energy Report*, which demonstrates that the existing capacity of energy, water, sewer, and storm drain infrastructure is adequate to accommodate the Project. The commentator provides no evidence to the contrary, and thus this comment is completely speculative.

Permit clearance is not required to demonstrate that utilities are adequate to accommodate a Project.

The administrative record, including Appendix C of the SCPE, demonstrates that the Project qualifies for a SCPE and no additional CEQA review is required.

Comment No. 7

B. The Project Construction May Pose Significant Public Health and Safety Impacts

The Project seeks to demolish the existing parking lot structure on the site, thereby subjecting the neighboring multi-unit residential buildings and their sensitive receptors to significant dust and debris emission which may negatively impact their health and must be analyzed and quantified. (See, Exhibit E [Zimas Parcel Report for 923 S. Beacon Ave.] and Exhibit F [Zimas Parcel Report for the Neighboring Site at 927 1-18 S. Beacon Ave., 18-unit multi-family building next to the Project site].)

Moreover, based on the Project's permit application (Exhibit D), the Project involves construction near power lines and work adjacent to public way, which may in turn result in impacts on the public services and utilities for the nearby especially residential structures.

Also, to the extent the Project's staging of heavy construction equipment may foreseeably occur on top of utility connections, the Project may also have significant safety impacts which also must be assessed in an EIR. Thus, for this reason too, SCPE is inapplicable.

Response to Comment No. 7

The commentator provides no evidence of impacts, and thus this comment is completely speculative. Regarding dust and debris emissions during the Project's construction phase, Table G-1 on page G-8 in Appendix G of the July 2023 SCPE clarifies that the Project would incorporate SCAG 2020-2045 RTP/SCS PMM AQ-1, which includes measures related to dust and debris emissions.

Regarding "construction near power lines and work adjacent to the public way," the City is highly urbanized, and "construction near power lines and adjacent to the public way" are common occurrences that do not result in "impacts on the public services and utilities." Prior to any such activities, the Applicant would be required to obtain the appropriate permits from the City to allow for these activities.

Regarding heavy construction equipment on top of utility connections resulting in safety impacts, the commentator does not provide any information that explains the commentator's concern. Thus, no further response can be provided.

Comment No. 8

C. There Is Insufficient Evidence that the Project Is 15% More Energy Efficient than required by Chapter 6 of Title 24 of the California Code of Regulations and Designed to Achieve 25% Less Water Usage than the Average Household Use in the Region

Yet another reason why the SCPE cannot apply is because there is insufficient evidence that the Project will be 15% more energy efficient than required by Chapter 6 of Title 24 of the California Code of Regulations and is designed to achieve 25% less water usage than the average household use in the region, as required. Rather, the Project application merely provides that passive or natural heating and cooling opportunities are feasible.¹⁰ However, such statement fails to in fact provide any evidence or quantification of the Project's estimated energy and water consumption.

Thus, under CEQA Guidelines § 15126.2(b):

"(b) Energy Impacts. If analysis of the project's energy use reveals that the project may result in significant environmental effects due to wasteful, inefficient, or unnecessary consumption use of energy, or wasteful use of energy resources, the EIR shall mitigate that energy use. This analysis should include the project's energy use for all project phases and components, including transportation-related energy, during construction and operation. In addition to building code compliance, other relevant considerations may include, among others, the project's size, location, orientation, equipment use and any renewable energy features that could be incorporated into the project. (Guidance on information that may be included in such an analysis is presented in Appendix F.) This analysis is subject to the rule of reason and shall focus on energy use that is caused by the project. This analysis may be included in related analyses of air quality, greenhouse gas emissions, transportation or utilities in the discretion of the lead agency." (Emph. added.)

There is no pertinent information provided for the Project to verify if the above-noted detailed analysis took place and to fill in the analytical gap to support the agency's conclusion in this case that the Project will indeed not have energy impacts. Compounding this lack of specificity in the City's findings, the Project is

proposed on what appears to have been historically a vacant site and therefore its energy usage as compared with the present uses will be significant. As such, it appears that the City failed to consider the Project's size and orientation, as well as the location, when concluding that the Project will be 15 percent more energy-efficient than required.

Absent this detailed and specific information required by CEQA Guidelines and Appendix G referenced therein, the City's conclusion that the Project will be 15% more energy efficient than required by Chapter 6 of Title 24 of the California Code of Regulations and is designed to achieve 25% less water usage than the average household use in the region is merely speculative, rendering the SCPE inapplicable.

Response to Comment No. 8

Regarding the Project's energy and water efficiency, the commentator is referred to Appendix F of the SCPE that includes the memorandum entitled *CEQA SCPE Energy and Water Efficiency Compliance for 905 Beacon prepared by Zinner Consultants*, which demonstrates that the Project would be 15% more energy efficient and 25% more water efficient than Title 24. The commentator provides no evidence to the contrary.

The administrative record including Appendix F of the SCPE, demonstrates that the Project qualifies for a SCPE, and no additional CEQA review is required.

Comment No. 9

D. There Appears to Be No Preliminary Endangerment Assessment Prepared for the Project to Assess Hazardous Substance Exposure

Finally, the Project should not be eligible for the SCPE because it appears that there is no "preliminary endangerment assessment prepared by an environmental assessor to determine the existence of any release of a hazardous substance on the site and to determine the potential for exposure of future occupants to significant health hazards from any nearby property or activity". PRC § 21155.1(a)(4).

Rather, the Project application blanketly concludes that there are not public health concerns stemming from hazardous materials because the Project will comply with applicable law for asbestos abatement. However, determinations that regulatory compliance will be sufficient to prevent significant adverse impacts must be based on a project-specific analysis of potential impacts and the effect of regulatory compliance. See *Californians for Alternatives to Toxics v. Department of Food & Agric.* (2005) 136

Cal.App.4th 1; Ebbetts Pass Forest Watch v Department of Forestry & Fire Protection (200⁸) 43 Cal.App.4th 936, 956. The Project cannot rely upon regulatory compliance to conclude that its eligible for the SCPE without assessing the Project's anticipated hazardous waste exposure in a preliminary endangerment assessment.

Moreover, even though the City's findings are completely silent on the issue of Preliminary endangerment assessment ("PEA"), it does not even provide any information as to any Environmental Site Assessment ("ESA"). Yet, to the extent an ESA was prepared or is to be prepared by the Applicant, it must be noted that an ESA cannot be substituted for a PEA.

An ESA is not the same as a PEA. See, *City of Maywood v. Los Angeles Unified Sch. Dist.* (2012) 208 Cal.App.4th 362, 427. A “preliminary endangerment assessment” is statutorily defined at Health and Safety Code section 25319.5. It is required to be

“conducted in a manner that complies with the guidelines published by the department [of Toxic Substances Control] entitled “Preliminary Endangerment Assessment: Guidance Manual.” The Guidance Manual also makes clear that the requirements of a PEA go beyond those of a Phase I ESA:

“[O]verall PEA requirements are more comprehensive than requirements for the PA/SI and Phase I Assessments Specific requirements of the PEA that are not typically required for these other types of investigations include the site specific human health and ecological screening evaluations, public participation requirements, data collection, and scoping activities.” Department of Toxic Substances Control, California Environmental Protection Agency, Preliminary Endangerment Assessment: Guidance Manual (rev’d October 2015) pp. iv-v.¹²

A PEA meeting the statutory requirements must analyze the potential for exposure to future occupants to health hazards from “any nearby property or activity.” PRC § 21155.1(a)(4).

The Applicant here provided no PEA or ESA to ascertain whether the Project indeed qualifies for the claimed CEQA exemption. This omission is critical since the Project site appears to have been historically used as a parking structure and therefore may have been subject to releases, leaks or spills of hazardous chemicals, including petroleum or oil, with the potential to affect the future residents’ health.

On this basis, too, the Project does not meet the requirements for the respective TPP exemption.

Response to Comment No. 9

The commentator incorrectly claims that the SCPE did not include either a preliminary endangerment assessment (PEA) or an environmental site assessment (ESA); in fact, Appendix E of the October 2022 SCPE consists of a Phase I ESA report that assesses the potential existence of any release of a hazardous substance on the Project Site as well as the potential for exposure of future Project Site occupants to significant health hazards. As concluded by the Phase I ESA as well as the findings provided on pages 2-13 and 2-14 of the October 2022 SCPE (and pages 2-10 through 2-12 of the July 2023 SCPE), no recognized environmental conditions exist at the Project Site, and no further environmental investigation is required at this time.

The commentator further asserts that for the Project’s SCPE to achieve compliance with Public Resources Code (PRC) Section 21155.1(a)(4), a PEA must be prepared that meets the statutory requirements of Health and Safety Code (HSC) Section 25319.5 as well as guidance promulgated by the Department of Toxic Substances Control (DTSC). The commentator is mistaken, as PRC Section 21155.1(a)(4) uses the term “preliminary endangerment assessment” merely to describe the required inquiry regarding hazardous conditions at a proposed project site, and not a requirement to fulfill the distinct PEA requirements identified by the HSC and DTSC.¹¹ Had the California Legislature intended to require an HSC-compliant PEA be prepared in connection with a SCPE, it would have included a statutory citation to HSC Section 25319.5 as

¹¹ See *Concerned Citizens of Beverly Hills/Beverly Grove v. City of Los Angeles* (Los Angeles Superior Court, Case No. BS168228, January 5, 2018 judgment, pp. 7-8).

part of PRC Section 21155.1(a)(4); however, it did not do so. Moreover, the DTSC itself agrees that PRC Section 21155.1(a)(4) does not require compliance with the HSC's PEA requirements, as the agency commented on Senate Bill (SB) 375, which created PRC Section 21155.1, by noting that SB 375 "does not envision any role for a regulatory agency such as DTSC" nor does it "mandate regulatory oversight by a regulatory agency such as DTSC."¹² Because DTSC *always* plays an oversight role in the HSC's PEA process, the agency's comments on SB 375 reflect its position that PRC Section 21155.1(a)(4) does not trigger the HSC's PEA requirements.

Finally, even if the Legislature had intended to trigger the HSC's PEA process in connection with a proposed SCPE, the Phase I ESA prepared for the Project would satisfy that requirement. This is due to the fact that a Phase I ESA is the first step in preparing an HSC-compliant PEA but can also be the concluding step when it discloses no hazardous conditions warranting continuation of the PEA process, as the Project's Phase I ESA did here. For the above reasons, the commentator fails to identify any deficiency in the SCPE's assessment of potentially hazardous conditions at the Project Site.

Comment No. 10

E. The City's Findings Fail to Acknowledge or Analyze the Project's Specific Adverse Impacts on Human Beings In Light of the Project's Being a Commercial Corner Development.

Finally, based on the Project's permit information, the Project is a commercial corner development ("CDD") and therefore is subject to additional development regulations. However, the City's findings are silent on this issue and whether the Project is indeed consistent with the respective development and restrictions of a CDD¹³ and whether a conditional use permit ("CUP") is required or whether the Project qualifies for same.

This omission is critical as it indicates that the Project may have a significant specific adverse impact on human beings, including health and safety impacts, and therefore the Project may not qualify for either a density bonus or the exemption it claims.

The City must identify all the Project's inconsistencies with the applicable plans and policies and must provide good faith disclosures before it can make any determination as to whether the Project indeed qualifies for the density bonus/incentives it requests or whether it qualifies for the CEQA exemption.

Response to Comment No. 10

The commentator incorrectly claims that the Project is a commercial corner development. Pursuant to the Los Angeles Municipal Code (LAMC) Section 12.22.A.23(d)(1), the Project is exempt from commercial corner development regulations because it meets the definition of a Mixed-Use Project pursuant to LAMC Section 13.09 B.3. Specifically, the Project's land use application submitted to the City includes an architectural plan set which contains a diagram on sheet 8 to demonstrate compliance with the Mixed-Use Project definition.

¹² DTSC, *Enrolled Bill Report on Senate Bill 375 (2007-2008 Regular Session)*, September 8, 2008, p.9.

In summary, the Project qualifies as a Mixed-Use Project because there is a separate, ground floor entrance to the residential component accessible from Beacon Avenue, and a pedestrian entrance to the retail space is directly accessible from a public street James M. Wood Boulevard. The retail space will be open during the normal business hours posted by the business. The Project will provide 35% of the ground floor building frontage abutting James M. Wood Boulevard, excluding driveways or pedestrian entrances, to a depth of 25 feet. As such, the Project is not a commercial corner development.

Comment No. 11

V. CONCLUSION

In sum, SMSWRCC requests that the City require a local workforce, that the City impose training requirements for the Project's construction activities to prevent community spread of COVID-19 and other infectious diseases, and that the City determine that the Project is not subject to the Sustainable Communities Project Exemption and that it prepare an EIR for the Project. If the City has any questions, feel free to contact my Office.

Response to Comment No. 11

Regarding the commentator's closing statements, which are a summary of the comments made throughout the comment letter, the commentator is referred to Responses to Comments No. 2 through No. 10.

**Re: Comment on Sustainable Communities Project Exemption
905 Beacon Ave. Project (ENV-2020-7605-SCPE)**

Dear Chair Harris-Dawson and Members of the Planning and Land Use Committee:

I am writing on behalf of the Supporters Alliance for Environmental Responsibility (“SAFER”), a California nonprofit benefit corporation, regarding the proposed development of a 7-story, 119,508 square foot mixed-use building, located in the City of Los Angeles and known as the 905 Beacon Avenue Project (“Project”). The City has determined that the project is exempt from environmental review under the California Environmental Quality Act (“CEQA”) pursuant to Public Resources Code section 21155.1 (“Section 21155.1”), which provides an exemption for sustainable communities projects. However, the Project does not meet the criteria for a sustainable communities project and, therefore, does not qualify for an exemption from CEQA under Section 21155.1. SAFER respectfully requests that the Planning and Land Use Management Committee not approve the Project, and instead direct staff to prepare necessary environmental documents under CEQA.

This comment has been prepared with the assistance of expert noise consulting firm Wilson Ihrig and Certified Industrial Hygienist, Francis “Bud” Offermann, PE, CIH. Wilson Ihrig’s comments are attached as Exhibit A, and Mr. Offermann’s comments are attached as Exhibit B. We incorporate the Wilson Ihrig and Offermann comments herein by reference.

PROJECT DESCRIPTION

The proposed Project consists of the demolition and removal of the existing surface parking lot from the Project site in order to facilitate the development of a 7-story, 119,508 square foot mixed-use building. The building will include 145 multi-family residential dwelling units, up to 2,000 square feet of neighborhood serving commercial uses, and 1.5 above ground parking levels and 2 underground levels. The Project proponents are requesting site plan review, permission to use base incentives and three additional incentives, and a vesting tentative tract map.

LEGAL STANDARD

CEQA mandates that “the long-term protection of the environment . . . shall be the guiding criterion in public decisions” throughout California. (PRC § 21001(d).) To achieve its objectives of environmental protection, CEQA has a three-tiered structure. (14 CCR § 15002(k); *Committee to Save the Hollywoodland Specific Plan v. City of Los Angeles* (2008) 161 Cal.App.4th 1168, 1185-86.) First, if a project falls into an exempt category, or it can be seen with certainty that the activity in question will not have a significant effect on the environment, no further agency evaluation is required. (*Id.*) Second, if there is a possibility the project will have a significant effect on the environment, the agency must perform an initial threshold study. (*Id.*; 14 CCR § 15063(a).) If the study indicates that there is no substantial evidence that the project or any of its aspects may cause a significant effect on the environment the agency may issue a negative declaration. (*Id.*; 14 CCR §§ 15063(b)(2), 15070.) Finally, if the project will have a significant effect on the environment, an environmental impact report (“EIR”) is required. (*Id.*) Here, since the County exempted the Project from CEQA entirely, the first step of the CEQA process applies.

Here, the City is alleging that the proposed Project is exempt from CEQA review under the Sustainable Communities Project exemption (“SCPE”) exemption. (PRC § 21155.1.) PRC 21155.1 applies to transit priority projects which meet certain criteria and are considered sustainable communities projects, and are rendered exempt from CEQA requirements. In order to qualify for a SCPE, a legislative body must find, after public hearing, that the transit priority project meets all of the requirements from PRC 21155.1 subdivision (a) and (b), and one of the requirements of subdivision (c).

Subdivision (a) lists out environmental criteria including requirements that the project can be served by existing utilities, does not impact wildlife habitat, is not included on the Cortese list, does not impact historical resources, is not located on developed open space, and is 15 percent more energy efficient than required under Title 24. Subdivision (a) also lists out specific environmental health hazards that a project cannot be subject to, including “[r]isk of a public health exposure at a level that would exceed the standards established by any state or federal agency.” (PRC § 21155.1(a)(6)(C).)

905 Beacon Ave. Project
Sustainable Communities Project Exemption
June 2, 2023
PLUM Hearing

Subdivision (b) lists out land use criteria that a project must meet, including size requirements, a limit on residential units, and requirements regarding affordable housing, among others. Relevant here, subdivision (b) requires that “[a]ny applicable mitigation measures or performance standards or criteria set forth in the prior environmental impact reports, and adopted in findings, have been or will be incorporated into the transit priority project.” (PRC § 21155.1(b)(5).)

Lastly, subdivision (c) states that the transit priority project must meet at least one of the following three criteria:

(1) The transit priority project meets both of the following:

(A) At least 20 percent of the housing will be sold to families of moderate income, or not less than 10 percent of the housing will be rented to families of low income, or not less than 5 percent of the housing is rented to families of very low income.

(B) The transit priority project developer provides sufficient legal commitments to the appropriate local agency to ensure the continued availability and use of the housing units for very low, low-, and moderate-income households at monthly housing costs with an affordable housing cost or affordable rent, as defined in Section 50052.5 or 50053 of the Health and Safety Code, respectively, for the period required by the applicable financing. Rental units shall be affordable for at least 55 years. Ownership units shall be subject to resale restrictions or equity sharing requirements for at least 30 years.

(2) The transit priority project developer has paid or will pay in-lieu fees pursuant to a local ordinance in an amount sufficient to result in the development of an equivalent number of units that would otherwise be required pursuant to paragraph (1).

(3) The transit priority project provides public open space equal to or greater than five acres per 1,000 residents of the project.

(PRC § 21155.1(c).)

As discussed below, the proposed Project does not qualify for a SCPE because it fails to meet one of the criteria of subdivision (a) and one of the criteria in subdivision (b). The exemption is therefore improper, and instead, an initial study should be prepared, followed by the appropriate CEQA document, either an MND or an EIR.

DISCUSSION

I. The City Incorrectly Applied CEQA’s Sustainable Communities Project Exemption to the Project and Instead an Initial Study is Required.

1
(Cont.)

2

This Project fails to meet some of the necessary criteria due to its potentially significant noise and indoor air quality impacts. As such, the Project does not qualify for a SCPE and the City must prepare an initial study and either an MND or an EIR for the Project.

2
(Cont.)

a. The SCPE failed to impose all mitigation measures for noise.

To qualify for a SCPE, a Project must meet certain land use criteria, including that “[a]ny applicable mitigation measures or performance standards or criteria set forth in the prior environmental impact reports, and adopted in findings, have been or will be incorporated into the transit priority project.” (PRC § 21155.1(b)(5).) The City found that the only applicable EIR for this SCPE was the SCAG 2020-2045 RTP/SCS Program EIR (“RTP/SCS PEIR”), and it applied two of the noise-related mitigation measures from that PEIR to the proposed Project.

3

Jack Meighan of expert noise consulting firm Wilson Ihrig reviewed the Project and associated documents and found that the Project failed to adequately analyze noise impacts, and therefore failed to impose all applicable mitigation measures from the RTP/SCS PEIR. The Project therefore does not meet the requirements for a SCPE. Mr. Meighan’s comments are attached hereto as Exhibit A, and are summarized below.

4

First of all, Mr. Meighan found that the RTP/SCS PEIR does not study operational noise and vibration, and therefore the mitigation measures it proposes and which have been applied to this Project would not serve to mitigate any of the Project’s operational noise and vibration impacts. (Ex. A, p. 1.) Therefore, Mr. Meighan concluded that neither the RTP/SCS PEIR nor the SCPE have actually studied operational noise and vibration, and further CEQA review must be conducted to analyze those potential impacts. (*Id.*)

5

Next, one of the mitigation measures the Project imposes for noise impacts is to prohibit amplified noises from exceeding ambient noise levels of adjacent properties by more than 5 dBA. However, Mr. Meighan points out that because the SCPE for the Project does not include noise measurements, it is impossible to identify which measures are necessary to achieve this requirement, and whether such measures are feasible. (Ex. A, p. 1-2.) He notes that “reasonable worst-case construction scenarios may not be able to stay 5 dBA within the ambient at the adjacent property that borders the site directly to the south.” (*Id.* at 2.) Without this information, the City has failed to demonstrate that the Project meets the requirements of a SCPE, and an initial study should be prepared to adequately measure and document the Project’s ambient noise levels, and determine what specific mitigation is necessary.

6

Lastly, Mr. Meighan found that the Project’s noise impact analyses are incomplete. The analysis prepared by the City does not include any calculations showing operational and construction noise and vibration impacts that would result from this Project. (Ex. A, p. 2.) In an effort to estimate potential impacts, Mr. Meighan ran sample calculations from projects with assumptions similar to this Project and used Project-specific details. (*Id.*) He found that construction noise and vibration would most likely be significant and have the potential to cause damage to nearby buildings. (*Id.*) The City has therefore failed to demonstrate that it has

7

imposed all applicable mitigation measures for noise from prior EIRs, and the Project does not qualify for a SCPE. An initial study, followed by either an MND or an EIR, must be prepared for this Project.

7
(Cont.)

b. There is Substantial Evidence that the Project Will Have a Significant Health Risk Impact from its Indoor Air Quality Impacts.

The SCPE cannot apply if a project site is subject to “[r]isk of a public health exposure at a level that would exceed the standards established by any state or federal agency.” (PRC § 21155.1(a)(6)(C).)

Here, there is substantial evidence demonstrating that the Project will have public health impacts which exceed state standards. Specifically, the Project will result in significant increased cancer risks from emissions of formaldehyde. Therefore, the Project does not qualify for the SCPE and the City must prepare an initial study to determine the appropriate level of CEQA review for this Project, either an MND or an EIR.

Certified Industrial Hygienist, Francis “Bud” Offermann, PE, CIH, has conducted a review of the proposed Project and relevant documents regarding the Project’s indoor air emissions. Indoor Environmental Engineering Comments (December 12, 2022) (Exhibit B). Mr. Offermann concludes that it is likely that the Project will expose residents and commercial employees of the Project to significant impacts related to indoor air quality, and in particular, emissions of the cancer-causing chemical formaldehyde. Mr. Offermann is a leading expert on indoor air quality and has published extensively on the topic. Mr. Offermann’s expert comments and curriculum vitae are attached as Exhibit B.

8

Mr. Offermann explains that many composite wood products used in building materials and furnishings commonly found in offices, warehouses, residences, and hotels contain formaldehyde-based glues which off-gas formaldehyde over a very long time period. He states, “[t]he primary source of formaldehyde indoors is composite wood products manufactured with urea-formaldehyde resins, such as plywood, medium density fiberboard, and particleboard. These materials are commonly used in building construction for flooring, cabinetry, baseboards, window shades, interior doors, and window and door trims.” (Ex. B, p. 2-3.)

Formaldehyde is a known human carcinogen. Mr. Offermann states that future residential occupants would be exposed to a cancer risk of 120 in one million, and future commercial employees would be exposed to a cancer risk of 17.7 in one million. (Ex. B, p. 4-5.) These calculations are assuming all materials are compliant with the California Air Resources Board’s formaldehyde airborne toxics control measure. (*Id.*) These potential exposure levels exceed the South Coast Air Quality Management District’s (“SCAQMD”) CEQA significance threshold for airborne cancer risk of 10 per million. (*Id.*)

Mr. Offermann concludes that these significant environmental impacts should be analyzed in accordance with CEQA and mitigation measures should be imposed to reduce the

905 Beacon Ave. Project
 Sustainable Communities Project Exemption
 June 2, 2023
 PLUM Hearing

risk of formaldehyde exposure. (*Id.* at 6.) Mr. Offermann identifies mitigation measures that are available to reduce these significant health risks, including the installation of air filters and a requirement that the applicant use only composite wood materials (e.g. hardwood plywood, medium density fiberboard, particleboard) for all interior finish systems that are made with CARB approved no-added formaldehyde (NAF) resins or ultra-low emitting formaldehyde (ULEF) resins in the buildings' interiors. (*Id.* at 12-14.)

8
(Cont.)

Because the Project's formaldehyde emissions constitute a "public health exposure at a level that would exceed" SCAQMD's significance threshold for increased cancer risk, the Project does not qualify for the SCPE. (*See* PRC § 21155.1(a)(6)(C).) Therefore, the City must prepare an initial study for the Project and either an MND or EIR to disclose and mitigate the potential environmental impacts to future users of the building.

CONCLUSION

In light of the above comments, the Project does not meet the requirements of the SCPE due to its potential noise impacts and public health risk impacts. The City must prepare an initial study followed by an EIR for the Project, or at least an MND, and the draft CEQA document should be circulated for public review and comment in accordance with CEQA. Thank you for considering these comments.

SUBJECT: Comments on 905 Beacon Ave. Project Noise Analysis

Dear Ms. Fuentes,

Per your request, I have reviewed the subject matter document for the 905 Beacon Ave. Sustainable Communities Project Exemption (SCPE) in Los Angeles, California. The proposed project involves the construction, use and maintenance of a 119,508-square-foot mixed-use building, which would include 145 multi-family residential dwelling units and up to 2,000 square feet of commercial uses. The Noise Impact Analysis is contained in Appendix G of the SCPE. The Project is surrounded by noise sensitive uses –residences located directly to the south and to the west.

10

1. Analysis Cites Incomplete EIR

The SCPE has identified one prior EIR with mitigation measures that could apply to the Project – SCAG 2020-2045 RTP/SCS Final Program EIR. However, the SCPE states that the EIR “does not include project-level mitigation measures that would be required of the Project. The SCAG MMRP provides a list of mitigation measures that SCAG determined a lead agency can or should consider, as applicable and feasible.” As such, two mitigation measures are studied in the SCPE, Impact NOISE-1 and Impact NOISE-2. NOISE-1 presents 24 mitigation techniques that can be used to mitigate construction noise, while NOISE-2 presents 6 mitigation techniques that can be used to mitigate construction vibration.

11

The EIR, however, does not study operational noise and vibration. None of the mitigation measures are meant to mitigate noise or vibration from these sources. As a result, operational noise and vibration are not studied in either the EIR or the SCPE. A more thorough EIR should be conducted to make sure that this project does not create significant noise and vibration impacts to nearby receptors. See Section 3 for a breakdown of potential operational noise issues.

2. Baseline Noise Level characterizations are Incomplete

PMM NOISE-1 states “The Project shall prohibit any amplified noises, especially those from outdoor sources, from exceeding the ambient noise levels of adjacent properties by more than 5 dBA, pursuant to LAMC Section 112.01. Any amplified noises would also be prohibited from being audible

12

at any distance greater than 150 feet from the Project's property line" Without noise measurements, it would be impossible to identify what measures would be necessary to achieve this requirement and whether such measures would be feasible. Reasonable worst-case construction scenarios may not be able to stay 5 dBA within the ambient at the adjacent property that borders the site directly to the south. An example of an operational noise impact is presented in Section 3. The document needs at least to commit to a requirement that an acoustical report addressing noise sources should be submitted for review and approval during the permitting phase. Or, if the analysis is performed using a design goal, there should be a plan explicitly stating monitoring and reporting.

12
(Cont.)

3. Impact Analyses are Incomplete

The analysis does not include any calculations. Below are sample calculations, taken from projects with similar assumptions, to show the typical operational and construction noise and vibrations impacts are possible with this project.

Construction Noise

The Federal Highway Administration's Roadway Construction Noise Model (RCNM) cites noise levels¹ for equipment typically used on construction sites. For the grading phase, typical pieces of equipment include a Grader and a Backhoe. The closest receivers are approximately 20 feet from the construction site. Using the reference levels and usage factors cited in RCNM, the overall Leq is 90 dBA. It is hard to imagine that this level would not be considered an impact. As such, more study should be done to determine mitigation options in a full Environmental Impact Statement.

Table 1: Summary of Typical Construction Noise Calculation

Piece of Equipment	Spec. Lmax @ 50ft (dBA)	Usage Factor
Backhoe	80	40%
Grader	85	40%
All Sources Combine for an Hourly Leq of 90 dBA at 20 feet		

13

Construction Vibration

Vibration Levels could be over common building damage threshold at the closest point to the new construction in this building, and this was not mentioned in the analysis. The closest building to the south of the project site is roughly 20 feet from heavy construction. A vibratory roller has a cited PPV (Peak Particle Velocity) level of 0.21 in/sec at 25 feet, via the Federal Transit Administration's Transit (FTA) Noise and Vibration Impact Assessment Manual². At 20 feet, this is 0.29 PPV, which is over the FTA's suggested threshold of 0.2 PPV for non-engineered timber and masonry buildings. It is worth noting that other criteria exist and can be chosen, and that this document does not directly govern this project. However, there is potential for damage to nearby buildings. As such, there would be a significant impact and mitigation measures, such as a vibration control plan, should be provided in project documents.

¹ https://www.fhwa.dot.gov/Environment/noise/construction_noise/rcnm/rcnm01.cfm#table1

² https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf

Conclusions

There are several errors and omissions in the SCPE noise analysis. Correcting these would potentially identify several significant impacts which require mitigation.

Please feel free to contact me with any questions on this information.

Very truly yours,

WILSON IHRIG

Subject: Indoor Air Quality: 905 Beacon Avenue Project, Los Angeles, CA
(IEE File Reference: P-4652)

Pages: 19

Indoor Air Quality Impacts

Indoor air quality (IAQ) directly impacts the comfort and health of building occupants, and the achievement of acceptable IAQ in newly constructed and renovated buildings is a well-recognized design objective. For example, IAQ is addressed by major high-performance building rating systems and building codes (California Building Standards Commission, 2014; USGBC, 2014). Indoor air quality in homes is particularly important because occupants, on average, spend approximately ninety percent of their time indoors with the majority of this time spent at home (EPA, 2011). Some segments of the population that are most susceptible to the effects of poor IAQ, such as the very young and the elderly, occupy their homes almost continuously. Additionally, an increasing number of adults are working from home at least some of the time during the workweek. Indoor air quality also is a serious concern for workers in hotels, offices and other business establishments.

The concentrations of many air pollutants often are elevated in homes and other buildings relative to outdoor air because many of the materials and products used indoors contain and release a variety of pollutants to air (Hodgson et al., 2002; Offermann and Hodgson,

2011). With respect to indoor air contaminants for which inhalation is the primary route of exposure, the critical design and construction parameters are the provision of adequate ventilation and the reduction of indoor sources of the contaminants.

Indoor Formaldehyde Concentrations Impact. In the California New Home Study (CNHS) of 108 new homes in California (Offermann, 2009), 25 air contaminants were measured, and formaldehyde was identified as the indoor air contaminant with the highest cancer risk as determined by the California Proposition 65 Safe Harbor Levels (OEHHA, 2017a), No Significant Risk Levels (NSRL) for carcinogens. The NSRL is the daily intake level calculated to result in one excess case of cancer in an exposed population of 100,000 (i.e., ten in one million cancer risk) and for formaldehyde is 40 µg/day. The NSRL concentration of formaldehyde that represents a daily dose of 40 µg is 2 µg/m³, assuming a continuous 24-hour exposure, a total daily inhaled air volume of 20 m³, and 100% absorption by the respiratory system. All of the CNHS homes exceeded this NSRL concentration of 2 µg/m³. The median indoor formaldehyde concentration was 36 µg/m³, and ranged from 4.8 to 136 µg/m³, which corresponds to a median exceedance of the 2 µg/m³ NSRL concentration of 18 and a range of 2.3 to 68.

Therefore, the cancer risk of a resident living in a California home with the median indoor formaldehyde concentration of 36 µg/m³, is 180 per million as a result of formaldehyde alone. The CEQA significance threshold for airborne cancer risk is 10 per million, as established by the South Coast Air Quality Management District (SCAQMD, 2015).

Besides being a human carcinogen, formaldehyde is also a potent eye and respiratory irritant. In the CNHS, many homes exceeded the non-cancer reference exposure levels (RELs) prescribed by California Office of Environmental Health Hazard Assessment (OEHHA, 2017b). The percentage of homes exceeding the RELs ranged from 98% for the Chronic REL of 9 µg/m³ to 28% for the Acute REL of 55 µg/m³.

The primary source of formaldehyde indoors is composite wood products manufactured with urea-formaldehyde resins, such as plywood, medium density fiberboard, and

15
(Cont.)

particleboard. These materials are commonly used in building construction for flooring, cabinetry, baseboards, window shades, interior doors, and window and door trims.

In January 2009, the California Air Resources Board (CARB) adopted an airborne toxics control measure (ATCM) to reduce formaldehyde emissions from composite wood products, including hardwood plywood, particleboard, medium density fiberboard, and also furniture and other finished products made with these wood products (California Air Resources Board 2009). While this formaldehyde ATCM has resulted in reduced emissions from composite wood products sold in California, they do not preclude that homes built with composite wood products meeting the CARB ATCM will have indoor formaldehyde concentrations below cancer and non-cancer exposure guidelines.

A follow up study to the California New Home Study (CNHS) was conducted in 2016-2018 (Singer et. al., 2019), and found that the median indoor formaldehyde in new homes built after 2009 with CARB Phase 2 Formaldehyde ATCM materials had lower indoor formaldehyde concentrations, with a median indoor concentrations of $22.4 \mu\text{g}/\text{m}^3$ (18.2 ppb) as compared to a median of $36 \mu\text{g}/\text{m}^3$ found in the 2007 CNHS. Unlike in the CNHS study where formaldehyde concentrations were measured with pumped DNPH samplers, the formaldehyde concentrations in the HENGH study were measured with passive samplers, which were estimated to under-measure the true indoor formaldehyde concentrations by approximately 7.5%. Applying this correction to the HENGH indoor formaldehyde concentrations results in a median indoor concentration of $24.1 \mu\text{g}/\text{m}^3$, which is 33% lower than the $36 \mu\text{g}/\text{m}^3$ found in the 2007 CNHS.

Thus, while new homes built after the 2009 CARB formaldehyde ATCM have a 33% lower median indoor formaldehyde concentration and cancer risk, the median lifetime cancer risk is still 120 per million for homes built with CARB compliant composite wood products. This median lifetime cancer risk is more than 12 times the OEHHA 10 in a million cancer risk threshold (OEHHA, 2017a).

With respect to the 905 Beacon Avenue Project, Los Angeles, CA the buildings consist of residential and commercial spaces.

15
(Cont.)15
16

The residential occupants will potentially have continuous exposure (e.g. 24 hours per day, 52 weeks per year). These exposures are anticipated to result in significant cancer risks resulting from exposures to formaldehyde released by the building materials and furnishing commonly found in residential construction.

Because these residences will be constructed with CARB Phase 2 Formaldehyde ATCM materials, and be ventilated with the minimum code required amount of outdoor air, the indoor residential formaldehyde concentrations are likely similar to those concentrations observed in residences built with CARB Phase 2 Formaldehyde ATCM materials, which is a median of 24.1 $\mu\text{g}/\text{m}^3$ (Singer et. al., 2020).

Assuming that the residential occupants inhale 20 m^3 of air per day, the average 70-year lifetime formaldehyde daily dose is 482 $\mu\text{g}/\text{day}$ for continuous exposure in the residences. This exposure represents a cancer risk of 120 per million, which is more than 12 times the CEQA cancer risk of 10 per million. For occupants that do not have continuous exposure, the cancer risk will be proportionally less but still substantially over the CEQA cancer risk of 10 per million (e.g. for 12/hour/day occupancy, more than 6 times the CEQA cancer risk of 10 per million).

The employees of the commercial spaces are expected to experience significant indoor exposures (e.g., 40 hours per week, 50 weeks per year). These exposures for employees are anticipated to result in significant cancer risks resulting from exposures to formaldehyde released by the building materials and furnishing commonly found in offices, warehouses, residences and hotels.

Because the commercial spaces will be constructed with CARB Phase 2 Formaldehyde ATCM materials, and be ventilated with the minimum code required amount of outdoor air, the indoor formaldehyde concentrations are likely similar to those concentrations observed in residences built with CARB Phase 2 Formaldehyde ATCM materials, which is a median of 24.1 $\mu\text{g}/\text{m}^3$ (Singer et. al., 2020)

Assuming that the employees of commercial spaces work 8 hours per day and inhale 20

15

~~16~~
(Cont.)

m³ of air per day, the formaldehyde dose per work-day at the offices is 161 µg/day.

Assuming that these employees work 5 days per week and 50 weeks per year for 45 years (start at age 20 and retire at age 65) the average 70-year lifetime formaldehyde daily dose is 70.9 µg/day.

This is 1.77 times the NSRL (OEHHA, 2017a) of 40 µg/day and represents a cancer risk of 17.7 per million, which exceeds the CEQA cancer risk of 10 per million. This impact should be analyzed in an environmental impact report (“EIR”), and the agency should impose all feasible mitigation measures to reduce this impact. Several feasible mitigation measures are discussed below and these and other measures should be analyzed in an EIR.

In addition, we note that the average outdoor air concentration of formaldehyde in California is 3 ppb, or 3.7 µg/m³, (California Air Resources Board, 2004), and thus represents an average pre-existing background airborne cancer risk of 1.85 per million. Thus, the indoor air formaldehyde exposures describe above exacerbate this pre-existing risk resulting from outdoor air formaldehyde exposures.

Additionally, the Project site is located in an area with high vehicle traffic. The SCAQMD’s Multiple Air Toxics Exposure Study (“MATES V”) identifies an existing cancer risk at the site of 730 per million due to the site’s elevated ambient air contaminant concentrations, which are due to the area’s high levels of vehicle traffic. These impacts would further exacerbate the pre-existing cancer risk to residents, which result from exposure to formaldehyde in both indoor and outdoor air.

Appendix A, Indoor Formaldehyde Concentrations and the CARB Formaldehyde ATCM, provides analyses that show utilization of CARB Phase 2 Formaldehyde ATCM materials will not ensure acceptable cancer risks with respect to formaldehyde emissions from composite wood products.

15

~~16~~
(Cont.)

Even composite wood products manufactured with CARB certified ultra low emitting formaldehyde (ULEF) resins do not insure that the indoor air will have concentrations of formaldehyde that meet the OEHHA cancer risks that substantially exceed 10 per million. The permissible emission rates for ULEF composite wood products are only 11-15% lower than the CARB Phase 2 emission rates. Only use of composite wood products made with no-added formaldehyde resins (NAF), such as resins made from soy, polyvinyl acetate, or methylene diisocyanate can insure that the OEHHA cancer risk of 10 per million is met.

The following describes a method that should be used, prior to construction in the environmental review under CEQA, for determining whether the indoor concentrations resulting from the formaldehyde emissions of specific building materials/furnishings selected exceed cancer and non-cancer guidelines. Such a design analyses can be used to identify those materials/furnishings prior to the completion of the City's CEQA review and project approval, that have formaldehyde emission rates that contribute to indoor concentrations that exceed cancer and non-cancer guidelines, so that alternative lower emitting materials/furnishings may be selected and/or higher minimum outdoor air ventilation rates can be increased to achieve acceptable indoor concentrations and incorporated as mitigation measures for this project.

Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment

This formaldehyde emissions assessment should be used in the environmental review under CEQA to assess the indoor formaldehyde concentrations from the proposed loading of building materials/furnishings, the area-specific formaldehyde emission rate data for building materials/furnishings, and the design minimum outdoor air ventilation rates. This assessment allows the applicant (and the City) to determine, before the conclusion of the environmental review process and the building materials/furnishings are specified, purchased, and installed, if the total chemical emissions will exceed cancer and non-cancer guidelines, and if so, allow for changes in the selection of specific material/furnishings and/or the design minimum outdoor air ventilations rates such that cancer and non-cancer guidelines are not exceeded.

15

~~10~~
(Cont.)

1.) Define Indoor Air Quality Zones. Divide the building into separate indoor air quality zones, (IAQ Zones). IAQ Zones are defined as areas of well-mixed air. Thus, each ventilation system with recirculating air is considered a single zone, and each room or group of rooms where air is not recirculated (e.g. 100% outdoor air) is considered a separate zone. For IAQ Zones with the same construction material/furnishings and design minimum outdoor air ventilation rates. (e.g. hotel rooms, apartments, condominiums, etc.) the formaldehyde emission rates need only be assessed for a single IAQ Zone of that type.

2.) Calculate Material/Furnishing Loading. For each IAQ Zone, determine the building material and furnishing loadings (e.g., m² of material/m² floor area, units of furnishings/m² floor area) from an inventory of all potential indoor formaldehyde sources, including flooring, ceiling tiles, furnishings, finishes, insulation, sealants, adhesives, and any products constructed with composite wood products containing urea-formaldehyde resins (e.g., plywood, medium density fiberboard, particleboard).

3.) Calculate the Formaldehyde Emission Rate. For each building material, calculate the formaldehyde emission rate (µg/h) from the product of the area-specific formaldehyde emission rate (µg/m²-h) and the area (m²) of material in the IAQ Zone, and from each furnishing (e.g. chairs, desks, etc.) from the unit-specific formaldehyde emission rate (µg/unit-h) and the number of units in the IAQ Zone.

NOTE: As a result of the high-performance building rating systems and building codes (California Building Standards Commission, 2014; USGBC, 2014), most manufacturers of building materials furnishings sold in the United States conduct chemical emission rate tests using the California Department of Health “Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers,” (CDPH, 2017), or other equivalent chemical emission rate testing methods. Most manufacturers of building furnishings sold in the United States conduct chemical emission rate tests using ANSI/BIFMA M7.1 Standard Test Method for Determining VOC Emissions (BIFMA, 2018), or other equivalent chemical emission rate testing methods.

15
~~16~~
(Cont.)

CDPH, BIFMA, and other chemical emission rate testing programs, typically certify that a material or furnishing does not create indoor chemical concentrations in excess of the maximum concentrations permitted by their certification. For instance, the CDPH emission rate testing requires that the measured emission rates when input into an office, school, or residential model do not exceed one-half of the OEHHA Chronic Exposure Guidelines (OEHHA, 2017b) for the 35 specific VOCs, including formaldehyde, listed in Table 4-1 of the CDPH test method (CDPH, 2017). These certifications themselves do not provide the actual area-specific formaldehyde emission rate (i.e., $\mu\text{g}/\text{m}^2\text{-h}$) of the product, but rather provide data that the formaldehyde emission rates do not exceed the maximum rate allowed for the certification. Thus, for example, the data for a certification of a specific type of flooring may be used to calculate that the area-specific emission rate of formaldehyde is less than $31 \mu\text{g}/\text{m}^2\text{-h}$, but not the actual measured specific emission rate, which may be 3, 18, or $30 \mu\text{g}/\text{m}^2\text{-h}$. These area-specific emission rates determined from the product certifications of CDPH, BIFA, and other certification programs can be used as an initial estimate of the formaldehyde emission rate.

If the actual area-specific emission rates of a building material or furnishing is needed (i.e. the initial emission rates estimates from the product certifications are higher than desired), then that data can be acquired by requesting from the manufacturer the complete chemical emission rate test report. For instance if the complete CDPH emission test report is requested for a CDHP certified product, that report will provide the actual area-specific emission rates for not only the 35 specific VOCs, including formaldehyde, listed in Table 4-1 of the CDPH test method (CDPH, 2017), but also all of the cancer and reproductive/developmental chemicals listed in the California Proposition 65 Safe Harbor Levels (OEHHA, 2017a), all of the toxic air contaminants (TACs) in the California Air Resources Board Toxic Air Contamination List (CARB, 2011), and the 10 chemicals with the greatest emission rates.

Alternatively, a sample of the building material or furnishing can be submitted to a chemical emission rate testing laboratory, such as Berkeley Analytical Laboratory (<https://berkeleyanalytical.com>), to measure the formaldehyde emission rate.

15

~~16~~

(Cont.)

4.) Calculate the Total Formaldehyde Emission Rate. For each IAQ Zone, calculate the total formaldehyde emission rate (i.e. $\mu\text{g}/\text{h}$) from the individual formaldehyde emission rates from each of the building material/furnishings as determined in Step 3.

5.) Calculate the Indoor Formaldehyde Concentration. For each IAQ Zone, calculate the indoor formaldehyde concentration ($\mu\text{g}/\text{m}^3$) from Equation 1 by dividing the total formaldehyde emission rates (i.e. $\mu\text{g}/\text{h}$) as determined in Step 4, by the design minimum outdoor air ventilation rate (m^3/h) for the IAQ Zone.

$$C_{in} = \frac{E_{total}}{Q_{oa}} \quad (\text{Equation 1})$$

where:

C_{in} = indoor formaldehyde concentration ($\mu\text{g}/\text{m}^3$)

E_{total} = total formaldehyde emission rate ($\mu\text{g}/\text{h}$) into the IAQ Zone.

Q_{oa} = design minimum outdoor air ventilation rate to the IAQ Zone (m^3/h)

The above Equation 1 is based upon mass balance theory, and is referenced in Section 3.10.2 “Calculation of Estimated Building Concentrations” of the California Department of Health “Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers”, (CDPH, 2017).

6.) Calculate the Indoor Exposure Cancer and Non-Cancer Health Risks. For each IAQ Zone, calculate the cancer and non-cancer health risks from the indoor formaldehyde concentrations determined in Step 5 and as described in the OEHHA Air Toxics Hot Spots Program Risk Assessment Guidelines; Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2015).

7.) Mitigate Indoor Formaldehyde Exposures of exceeding the CEQA Cancer and/or Non-Cancer Health Risks. In each IAQ Zone, provide mitigation for any formaldehyde exposure risk as determined in Step 6, that exceeds the CEQA cancer risk of 10 per million or the CEQA non-cancer Hazard Quotient of 1.0.

Provide the source and/or ventilation mitigation required in all IAQ Zones to reduce the

health risks of the chemical exposures below the CEQA cancer and non-cancer health risks.

Source mitigation for formaldehyde may include:

- 1.) reducing the amount materials and/or furnishings that emit formaldehyde
- 2.) substituting a different material with a lower area-specific emission rate of formaldehyde

Ventilation mitigation for formaldehyde emitted from building materials and/or furnishings may include:

- 1.) increasing the design minimum outdoor air ventilation rate to the IAQ Zone.

NOTE: Mitigating the formaldehyde emissions through use of less material/furnishings, or use of lower emitting materials/furnishings, is the preferred mitigation option, as mitigation with increased outdoor air ventilation increases initial and operating costs associated with the heating/cooling systems.

Further, we are not asking that the builder “speculate” on what and how much composite materials be used, but rather at the design stage to select composite wood materials based on the formaldehyde emission rates that manufacturers routinely conduct using the California Department of Health “Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers,” (CDPH, 2017), and use the procedure described earlier above (i.e. Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment) to insure that the materials selected achieve acceptable cancer risks from material off gassing of formaldehyde.

Outdoor Air Ventilation Impact. Another important finding of the CNHS, was that the outdoor air ventilation rates in the homes were very low. Outdoor air ventilation is a very important factor influencing the indoor concentrations of air contaminants, as it is the primary removal mechanism of all indoor air generated contaminants. Lower outdoor air exchange rates cause indoor generated air contaminants to accumulate to higher indoor air

concentrations. Many homeowners rarely open their windows or doors for ventilation as a result of their concerns for security/safety, noise, dust, and odor concerns (Price, 2007). In the CNHS field study, 32% of the homes did not use their windows during the 24-hour Test Day, and 15% of the homes did not use their windows during the entire preceding week. Most of the homes with no window usage were homes in the winter field session. Thus, a substantial percentage of homeowners never open their windows, especially in the winter season. The median 24-hour measurement was 0.26 air changes per hour (ach), with a range of 0.09 ach to 5.3 ach. A total of 67% of the homes had outdoor air exchange rates below the minimum California Building Code (2001) requirement of 0.35 ach. Thus, the relatively tight envelope construction, combined with the fact that many people never open their windows for ventilation, results in homes with low outdoor air exchange rates and higher indoor air contaminant concentrations.

According to the Sustainable Communities Project Exemption – 905 Beacon Avenue Project (CAJA Environmental Services, 2022) the Project is close to roads with moderate to high traffic (e.g., Beacon Avenue, West Olympic Avenue, James M. Wood Boulevard, South Burlington Avenue, etc.).

As a result of the high outdoor traffic noise levels, the current project will require a mechanical supply of outdoor air ventilation to allow for a habitable interior environment with closed windows and doors. Such a ventilation system would allow windows and doors to be kept closed at the occupant's discretion to control exterior noise within building interiors.

PM_{2.5} Outdoor Concentrations Impact. An additional impact of the nearby motor vehicle traffic associated with this project, are the outdoor concentrations of PM_{2.5}. According to the Sustainable Communities Project Exemption – 905 Beacon Avenue Project (CAJA Environmental Services, 2022) the Project is located in the South Coast Air Basin, which is a State and Federal non-attainment area for PM_{2.5}.

15

~~17~~

(Cont.)

16

~~18~~

Additionally, the SCAQMD's MATES V study cites an existing cancer risk of 760 per million at the Project site due to the site's high concentration of ambient air contaminants resulting from the area's high levels of motor vehicle traffic.

An air quality analyses should to be conducted to determine the concentrations of PM_{2.5} in the outdoor and indoor air that people inhale each day. This air quality analyses needs to consider the cumulative impacts of the project related emissions, existing and projected future emissions from local PM_{2.5} sources (e.g. stationary sources, motor vehicles, and airport traffic) upon the outdoor air concentrations at the Project site. If the outdoor concentrations are determined to exceed the California and National annual average PM_{2.5} exceedence concentration of 12 µg/m³, or the National 24-hour average exceedence concentration of 35 µg/m³, then the buildings need to have a mechanical supply of outdoor air that has air filtration with sufficient removal efficiency, such that the indoor concentrations of outdoor PM_{2.5} particles is less than the California and National PM_{2.5} annual and 24-hour standards.

It is my experience that based on the projected high traffic noise levels, the annual average concentration of PM_{2.5} will exceed the California and National PM_{2.5} annual and 24-hour standards and warrant installation of high efficiency air filters (i.e. MERV 13 or higher) in all mechanically supplied outdoor air ventilation systems.

Indoor Air Quality Impact Mitigation Measures

The following are recommended mitigation measures to minimize the impacts upon indoor quality:

Indoor Formaldehyde Concentrations Mitigation. Use only composite wood materials (e.g. hardwood plywood, medium density fiberboard, particleboard) for all interior finish systems that are made with CARB approved no-added formaldehyde (NAF) resins (CARB, 2009). CARB Phase 2 certified composite wood products, or ultra-low emitting formaldehyde (ULEF) resins, do not insure indoor formaldehyde concentrations that are below the CEQA cancer risk of 10 per million. Only composite wood products

16

~~18~~

(Cont.)

17

~~19~~

manufactured with CARB approved no-added formaldehyde (NAF) resins, such as resins made from soy, polyvinyl acetate, or methylene diisocyanate can insure that the OEHHA cancer risk of 10 per million is met.

Alternatively, conduct the previously described Pre-Construction Building Material/Furnishing Chemical Emissions Assessment, to determine that the combination of formaldehyde emissions from building materials and furnishings do not create indoor formaldehyde concentrations that exceed the CEQA cancer and non-cancer health risks.

It is important to note that we are not asking that the builder “speculate” on what and how much composite materials be used, but rather at the design stage to select composite wood materials based on the formaldehyde emission rates that manufacturers routinely conduct using the California Department of Health “Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers”, (CDPH, 2017), and use the procedure described above (i.e. Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment) to insure that the materials selected achieve acceptable cancer risks from material off gassing of formaldehyde.

Outdoor Air Ventilation Mitigation. Provide each habitable room with a continuous mechanical supply of outdoor air that meets or exceeds the California 2016 Building Energy Efficiency Standards (California Energy Commission, 2015) requirements of the greater of 15 cfm/occupant or 0.15 cfm/ft² of floor area. Following installation of the system conduct testing and balancing to insure that required amount of outdoor air is entering each habitable room and provide a written report documenting the outdoor airflow rates. Do not use exhaust only mechanical outdoor air systems, use only balanced outdoor air supply and exhaust systems or outdoor air supply only systems. Provide a manual for the occupants or maintenance personnel, that describes the purpose of the mechanical outdoor air system and the operation and maintenance requirements of the system.

17
~~19~~
(Cont.)

PM_{2.5} Outdoor Air Concentration Mitigation. Install air filtration with sufficient PM_{2.5} removal efficiency (e.g. MERV 13 or higher) to filter the outdoor air entering the mechanical outdoor air supply systems, such that the indoor concentrations of outdoor PM_{2.5} particles are less than the California and National PM_{2.5} annual and 24-hour standards. Install the air filters in the system such that they are accessible for replacement by the occupants or maintenance personnel. Include in the mechanical outdoor air ventilation system manual instructions on how to replace the air filters and the estimated frequency of replacement.

APPENDIX A

INDOOR FORMALDEHYDE CONCENTRATIONS AND THE CARB FORMALDEHYDE ATCM

With respect to formaldehyde emissions from composite wood products, the CARB ATCM regulations of formaldehyde emissions from composite wood products, do not assure healthful indoor air quality. The following is the stated purpose of the CARB ATCM regulation - *The purpose of this airborne toxic control measure is to “reduce formaldehyde emissions from composite wood products, and finished goods that contain composite wood products, that are sold, offered for sale, supplied, used, or manufactured for sale in California”*. In other words, the CARB ATCM regulations do not “assure healthful indoor air quality”, but rather “reduce formaldehyde emissions from composite wood products”.

Just how much protection do the CARB ATCM regulations provide building occupants from the formaldehyde emissions generated by composite wood products? Definitely some, but certainly the regulations do not “*assure healthful indoor air quality*” when CARB Phase 2 products are utilized. As shown in the Chan 2019 study of new California homes, the median indoor formaldehyde concentration was of 22.4 $\mu\text{g}/\text{m}^3$ (18.2 ppb), which corresponds to a cancer risk of 112 per million for occupants with continuous exposure, which is more than 11 times the CEQA cancer risk of 10 per million.

Another way of looking at how much protection the CARB ATCM regulations provide building occupants from the formaldehyde emissions generated by composite wood products is to calculate the maximum number of square feet of composite wood product that can be in a residence without exceeding the CEQA cancer risk of 10 per million for occupants with continuous occupancy.

For this calculation I utilized the floor area (2,272 ft^2), the ceiling height (8.5 ft), and the number of bedrooms (4) as defined in Appendix B (New Single-Family Residence Scenario) of the Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers, Version 1.1, 2017, California

Department of Public Health, Richmond, CA. <https://www.cdph.ca.gov/Programs/CCDPHP/DEODC/EHLB/IAQ/Pages/VOC.aspx>.

For the outdoor air ventilation rate I used the 2019 Title 24 code required mechanical ventilation rate (ASHRAE 62.2) of 106 cfm (180 m³/h) calculated for this model residence. For the composite wood formaldehyde emission rates I used the CARB ATCM Phase 2 rates.

The calculated maximum number of square feet of composite wood product that can be in a residence, without exceeding the CEQA cancer risk of 10 per million for occupants with continuous occupancy are as follows for the different types of regulated composite wood products.

Medium Density Fiberboard (MDF) – 15 ft² (0.7% of the floor area), or
Particle Board – 30 ft² (1.3% of the floor area), or
Hardwood Plywood – 54 ft² (2.4% of the floor area), or
Thin MDF – 46 ft² (2.0 % of the floor area).

For offices and hotels the calculated maximum amount of composite wood product (% of floor area) that can be used without exceeding the CEQA cancer risk of 10 per million for occupants, assuming 8 hours/day occupancy, and the California Mechanical Code minimum outdoor air ventilation rates are as follows for the different types of regulated composite wood products.

Medium Density Fiberboard (MDF) – 3.6 % (offices) and 4.6% (hotel rooms), or
Particle Board – 7.2 % (offices) and 9.4% (hotel rooms), or
Hardwood Plywood – 13 % (offices) and 17% (hotel rooms), or
Thin MDF – 11 % (offices) and 14 % (hotel rooms)

Clearly the CARB ATCM does not regulate the formaldehyde emissions from composite wood products such that the potentially large areas of these products, such as for flooring, baseboards, interior doors, window and door trims, and kitchen and bathroom cabinetry,

could be used without causing indoor formaldehyde concentrations that result in CEQA cancer risks that substantially exceed 10 per million for occupants with continuous occupancy.

Even composite wood products manufactured with CARB certified ultra low emitting formaldehyde (ULEF) resins do not insure that the indoor air will have concentrations of formaldehyde that meet the OEHHA cancer risks that substantially exceed 10 per million. The permissible emission rates for ULEF composite wood products are only 11-15% lower than the CARB Phase 2 emission rates. Only use of composite wood products made with no-added formaldehyde resins (NAF), such as resins made from soy, polyvinyl acetate, or methylene diisocyanate can insure that the OEHHA cancer risk of 10 per million is met.

If CARB Phase 2 compliant or ULEF composite wood products are utilized in construction, then the resulting indoor formaldehyde concentrations should be determined in the design phase using the specific amounts of each type of composite wood product, the specific formaldehyde emission rates, and the volume and outdoor air ventilation rates of the indoor spaces, and all feasible mitigation measures employed to reduce this impact (e.g. use less formaldehyde containing composite wood products and/or incorporate mechanical systems capable of higher outdoor air ventilation rates). See the procedure described earlier (i.e. Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment) to insure that the materials selected achieve acceptable cancer risks from material off gassing of formaldehyde.

Alternatively, and perhaps a simpler approach, is to use only composite wood products (e.g. hardwood plywood, medium density fiberboard, particleboard) for all interior finish systems that are made with CARB approved no-added formaldehyde (NAF) resins.

Education

M.S. Mechanical Engineering (1985)
Stanford University, Stanford, CA.

Graduate Studies in Air Pollution Monitoring and Control (1980)
University of California, Berkeley, CA.

B.S. in Mechanical Engineering (1976)
Rensselaer Polytechnic Institute, Troy, N.Y.

Professional Experience

President: Indoor Environmental Engineering, San Francisco, CA. December, 1981 - present.

Direct team of environmental scientists, chemists, and mechanical engineers in conducting State and Federal research regarding indoor air quality instrumentation development, building air quality field studies, ventilation and air cleaning performance measurements, and chemical emission rate testing.

Provide design side input to architects regarding selection of building materials and ventilation system components to ensure a high quality indoor environment.

Direct Indoor Air Quality Consulting Team for the winning design proposal for the new State of Washington Ecology Department building.

Develop a full-scale ventilation test facility for measuring the performance of air diffusers; ASHRAE 129, Air Change Effectiveness, and ASHRAE 113, Air Diffusion Performance Index.

Develop a chemical emission rate testing laboratory for measuring the chemical emissions from building materials, furnishings, and equipment.

Principle Investigator of the California New Homes Study (2005-2007). Measured ventilation and indoor air quality in 108 new single family detached homes in northern and southern California.

Develop and teach IAQ professional development workshops to building owners, managers, hygienists, and engineers.

Air Pollution Engineer: Earth Metrics Inc., Burlingame, CA, October, 1985 to March, 1987.

Responsible for development of an air pollution laboratory including installation a forced choice olfactometer, tracer gas electron capture chromatograph, and associated calibration facilities. Field team leader for studies of fugitive odor emissions from sewage treatment plants, entrainment of fume hood exhausts into computer chip fabrication rooms, and indoor air quality investigations.

Staff Scientist: Building Ventilation and Indoor Air Quality Program, Energy and Environment Division, Lawrence Berkeley Laboratory, Berkeley, CA. January, 1980 to August, 1984.

Deputy project leader for the Control Techniques group; responsible for laboratory and field studies aimed at evaluating the performance of indoor air pollutant control strategies (i.e. ventilation, filtration, precipitation, absorption, adsorption, and source control).

Coordinated field and laboratory studies of air-to-air heat exchangers including evaluation of thermal performance, ventilation efficiency, cross-stream contaminant transfer, and the effects of freezing/defrosting.

Developed an *in situ* test protocol for evaluating the performance of air cleaning systems and introduced the concept of effective cleaning rate (ECR) also known as the Clean Air Delivery Rate (CADR).

Coordinated laboratory studies of portable and ducted air cleaning systems and their effect on indoor concentrations of respirable particles and radon progeny.

Co-designed an automated instrument system for measuring residential ventilation rates and radon concentrations.

Designed hardware and software for a multi-channel automated data acquisition system used to evaluate the performance of air-to-air heat transfer equipment.

Assistant Chief Engineer: Alta Bates Hospital, Berkeley, CA, October, 1979 to January, 1980.

Responsible for energy management projects involving installation of power factor correction capacitors on large inductive electrical devices and installation of steam meters on physical plant steam lines. Member of Local 39, International Union of Operating Engineers.

Manufacturing Engineer: American Precision Industries, Buffalo, NY, October, 1977 to October, 1979.

Responsible for reorganizing the manufacturing procedures regarding production of shell and tube heat exchangers. Designed customized automatic assembly, welding, and testing equipment. Designed a large paint spray booth. Prepared economic studies justifying new equipment purchases. Safety Director.

Project Engineer: Arcata Graphics, Buffalo, N.Y. June, 1976 to October, 1977.

Responsible for the design and installation of a bulk ink storage and distribution system and high speed automatic counting and marking equipment. Also coordinated material handling studies which led to the purchase and installation of new equipment.

SPECIAL CONSULTATION

Provide consultation to the American Home Appliance Manufacturers on the development of a standard for testing portable air cleaners, AHAM Standard AC-1.

Served as an expert witness and special consultant for the U.S. Federal Trade Commission regarding the performance claims found in advertisements of portable air cleaners and residential furnace filters.

Conducted a forensic investigation for a San Mateo, CA pro se defendant, regarding an alleged homicide where the victim was kidnapped in a steamer trunk. Determined the air exchange rate in the steamer trunk and how long the person could survive.

Conducted *in situ* measurement of human exposure to toluene fumes released during nailpolish application for a plaintiffs attorney pursuing a California Proposition 65 product labeling case. June, 1993.

Conducted a forensic *in situ* investigation for the Butte County, CA Sheriff's Department of the emissions of a portable heater used in the bedroom of two twin one year old girls who suffered simultaneous crib death.

Consult with OSHA on the 1995 proposed new regulation regarding indoor air quality and environmental tobacco smoke.

Consult with EPA on the proposed Building Alliance program and with OSHA on the proposed new OSHA IAQ regulation.

Johnson Controls Audit/Certification Expert Review; Milwaukee, WI. May 28-29, 1997.

Winner of the nationally published 1999 Request for Proposals by the State of Washington to conduct a comprehensive indoor air quality investigation of the Washington State Department of Ecology building in Lacey, WA.

Selected by the State of California Attorney General's Office in August, 2000 to conduct a comprehensive indoor air quality investigation of the Tulare County Court House.

Lawrence Berkeley Laboratory IAQ Experts Workshop: "Cause and Prevention of Sick Building Problems in Offices: The Experience of Indoor Environmental Quality Investigators", Berkeley, California, May 26-27, 2004.

Provide consultation and chemical emission rate testing to the State of California Attorney General's Office in 2013-2015 regarding the chemical emissions from e-cigarettes.

 Em: clerk.plumcommittee@lacity.org

RE: 905-923 Beacon Ave. Project [ENV-2020-7605-SCPE]

Dear City of Los Angeles Planning and Land Use Committee,

On behalf of the Southwest Mountain States Regional Council of Carpenters (“**The Carpenters**” or “**SWMSRCC**”), my Office is submitting these comments regarding the 905-923 Beacon Ave. project (“**Project**”).

The Project proposes demolition and removal of an existing surface parking lot from the Project Site and development of the site with a seven-story, 119,508- square-foot mixed-use building, which would include 145 multi-family residential dwelling units and up to 2,000 square feet of neighborhood-serving commercial uses.

SWMSRCC is a labor union representing 50,000 union carpenters in six states, including California, and has a strong interest in well ordered land use planning and addressing the environmental impacts of development projects. Individual members of the Southwest Carpenters live, work and recreate in the City and surrounding communities and would be directly affected by the Project’s environmental impacts.

SWMSRCC expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearings and proceedings related to this Project. Cal. Gov. Code § 65009(b); Cal. Pub. Res. Code § 21177(a); *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal. App. 4th 1184, 1199-1203; see *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal. App. 4th 1109, 1121.

SWMSRCC incorporates by reference all comments raising issues regarding the Project’s environmental review submitted prior to approval of the Project. *Citizens for Clean Energy v. City of Woodland* (2014) 225 Cal. App. 4th 173, 191 (finding that any

party who has objected to the Project’s environmental documentation may assert any issue timely raised by other parties).

SWMSRCC also requests that the City provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act (“**CEQA**”), Cal Public Resources Code (“**PRC**”) § 21000 *et seq.*, and the California Planning and Zoning Law (“**Planning and Zoning Law**”), Cal. Gov’t Code §§ 65000–65010. California Public Resources Code Sections 21092.2, and 21167(f) and Government Code Section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency’s governing body.

I. THE CITY SHOULD REQUIRE THE USE OF A LOCAL WORKFORCE TO BENEFIT THE COMMUNITY’S ECONOMIC DEVELOPMENT AND ENVIRONMENT

As noted in our previous letters, the City should require the Project to be built using a local workers who have graduated from a Joint Labor-Management Apprenticeship Program approved by the State of California, have at least as many hours of on-the-job experience in the applicable craft which would be required to graduate from such a state-approved apprenticeship training program, or who are registered apprentices in a state-approved apprenticeship training program.

Community benefits such as local hire can also be helpful to reduce environmental impacts and improve the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project site can reduce the length of vendor trips, reduce greenhouse gas emissions, and provide localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

[A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board

and the University of California, Berkeley Center for Labor Research and Education concluded:

[L]abor should be considered an investment rather than a cost—and investments in growing, diversifying, and upskilling California’s workforce can positively affect returns on climate mitigation efforts. In other words, well-trained workers are key to delivering emissions reductions and moving California closer to its climate targets.¹

Furthermore, workforce policies have significant environmental benefits given that they improve an area’s jobs-housing balance, decreasing the amount and length of job commutes and the associated greenhouse gas (“**GHG**”) emissions. In fact, on May 7, 2021, the South Coast Air Quality Management District found that that the “[u]se of a local state-certified apprenticeship program” can result in air pollutant reductions.²

Locating jobs closer to residential areas can have significant environmental benefits. As the California Planning Roundtable noted in 2008:

People who live and work in the same jurisdiction would be more likely to take transit, walk, or bicycle to work than residents of less balanced communities and their vehicle trips would be shorter. Benefits would include potential reductions in both vehicle miles traveled and vehicle hours traveled.³

Moreover, local hire mandates and skill-training are critical facets of a strategy to reduce vehicle miles traveled (“**VMT**”). As planning experts Robert Cervero and Michael Duncan have noted, simply placing jobs near housing stock is insufficient to achieve VMT reductions given that the skill requirements of available local jobs must

2
(Cont.)

match those held by local residents.⁴ Some municipalities have even tied local hire and other workforce policies to local development permits to address transportation issues. Cervero and Duncan note that:

In nearly built-out Berkeley, CA, the approach to balancing jobs and housing is to create local jobs rather than to develop new housing. The city’s First Source program encourages businesses to hire local residents, especially for entry- and intermediate-level jobs, and sponsors vocational training to ensure residents are employment-ready. While the program is voluntary, some 300 businesses have used it to date, placing more than 3,000 city residents in local jobs since it was launched in 1986. When needed, these carrots are matched by sticks, since the city is not shy about negotiating corporate participation in First Source as a condition of approval for development permits.

Recently, the State of California verified its commitment towards workforce development through the Affordable Housing and High Road Jobs Act of 2022, otherwise known as Assembly Bill No. 2011 (“**AB2011**”). AB2011 amended the Planning and Zoning Law to allow ministerial, by-right approval for projects being built alongside commercial corridors that meet affordability and labor requirements.

The City should consider utilizing local workforce policies and requirements to benefit the local area economically and to mitigate greenhouse gas, improve air quality, and reduce transportation impacts.

II. THE CITY SHOULD IMPOSE TRAINING REQUIREMENTS FOR THE PROJECT’S CONSTRUCTION ACTIVITIES TO PREVENT COMMUNITY SPREAD OF COVID-19 AND OTHER INFECTIOUS DISEASES

Construction work has been defined as a Lower to High-risk activity for COVID-19 spread by the Occupations Safety and Health Administration. Recently, several

⁴ Cervero, Robert and Duncan, Michael (2006) Which Reduces Vehicle Travel More: Jobs-Housing Balance or Retail-Housing Mixing? Journal of the American Planning Association 72 (4), 475-490, 482, available at <http://reconnectingamerica.org/assets/Uploads/UTCT-825.pdf>.

construction sites have been identified as sources of community spread of COVID-19.⁵

Southwest Mountain States Carpenters recommend that the City adopt additional requirements to mitigate public health risks from the Project’s construction activities. SWMSRCC requests that the City require safe on-site construction work practices as well as training and certification for any construction workers on the Project Site.

In particular, based upon Southwest Mountain States Carpenters’ experience with safe construction site work practices, SWMSRCC recommends that the City require that while construction activities are being conducted at the Project Site:

Construction Site Design:

- The Project Site will be limited to two controlled entry points.
- Entry points will have temperature screening technicians taking temperature readings when the entry point is open.
- The Temperature Screening Site Plan shows details regarding access to the Project Site and Project Site logistics for conducting temperature screening.
- A 48-hour advance notice will be provided to all trades prior to the first day of temperature screening.
- The perimeter fence directly adjacent to the entry points will be clearly marked indicating the appropriate 6-foot social distancing position for when you approach the screening area. Please reference the Apex temperature screening site map for additional details.
- There will be clear signage posted at the project site directing you through temperature screening.

3
(Cont.)

⁵ Santa Clara County Public Health (June 12, 2020) COVID-19 CASES AT CONSTRUCTION SITES HIGHLIGHT NEED FOR CONTINUED VIGILANCE IN SECTORS THAT HAVE REOPENED, available at <https://www.sccgov.org/sites/covid19/Pages/press-release-06-12-2020-cases-at-construction-sites.aspx>.

- Provide hand washing stations throughout the construction site.

Testing Procedures:

- The temperature screening being used are non-contact devices.
- Temperature readings will not be recorded.
- Personnel will be screened upon entering the testing center and should only take 1-2 seconds per individual.
- Hard hats, head coverings, sweat, dirt, sunscreen or any other cosmetics must be removed on the forehead before temperature screening.
- Anyone who refuses to submit to a temperature screening or does not answer the health screening questions will be refused access to the Project Site.
- Screening will be performed at both entrances from 5:30 am to 7:30 am.; main gate [ZONE 1] and personnel gate [ZONE 2]
- After 7:30 am only the main gate entrance [ZONE 1] will continue to be used for temperature testing for anybody gaining entry to the project site such as returning personnel, deliveries, and visitors.
- If the digital thermometer displays a temperature reading above 100.0 degrees Fahrenheit, a second reading will be taken to verify an accurate reading.
- If the second reading confirms an elevated temperature, DHS will instruct the individual that he/she will not be allowed to enter the Project Site. DHS will also instruct the individual to promptly notify his/her supervisor and his/her human resources (HR) representative and provide them with a copy of Annex A.

Planning

- Require the development of an Infectious Disease Preparedness and Response Plan that will include basic infection prevention measures (requiring the use of personal protection equipment), policies and procedures for prompt identification and isolation of sick individuals, social distancing (prohibiting gatherings of no more than 10 people including all-hands meetings and all-hands lunches) communication and training and workplace controls that meet standards that may be promulgated by the Center for Disease Control, Occupational Safety and Health Administration, Cal/OSHA, California Department of Public Health or applicable local public health agencies.⁶

The United Brotherhood of Carpenters and Carpenters International Training Fund has developed COVID-19 Training and Certification to ensure that Carpenter union members and apprentices conduct safe work practices. The City should require that all construction workers undergo COVID-19 Training and Certification before being allowed to conduct construction activities at the Project Site.

Southwest Mountain States Carpenters has also developed a rigorous Infection Control Risk Assessment (“**ICRA**”) training program to ensure it delivers a workforce that understands how to identify and control infection risks by implementing protocols to protect themselves and all others during renovation and construction projects in healthcare environments.⁷

ICRA protocols are intended to contain pathogens, control airflow, and protect patients during the construction, maintenance and renovation of healthcare facilities.

⁶ See also The Center for Construction Research and Training, North America’s Building Trades Unions (April 27 2020) NABTU and CPWR COVID-19 Standards for U.S. Construction Sites, available at https://www.cpwr.com/sites/default/files/NABTU_CPWR_Standards_COVID-19.pdf; Los Angeles County Department of Public Works (2020) Guidelines for Construction Sites During COVID-19 Pandemic, available at https://dpw.lacounty.gov/building-and-safety/docs/pw_guidelines-construction-sites.pdf.

⁷ For details concerning Southwest Carpenters’s ICRA training program, see <https://icrahealthcare.com/>.

ICRA protocols prevent cross contamination, minimizing the risk of secondary infections in patients at hospital facilities.

The City should require the Project to be built using a workforce trained in ICRA protocols.

3
(Cont.)

III. THE CITY SHOULD PREPARE AN ENVIRONMENTAL IMPACT REPORT FOR THE PROJECT

CEQA is a California statute designed to inform decision makers and the public about the potential, significant environmental effects of a project. 14 California Code of Regulations (“**CEQA Guidelines**”) § 15002(a)(1).⁸ At its core, “[i]ts purpose is to inform the public and its responsible officials of the environmental consequences of their decisions *before* they are made.” *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal. 3d 553, 564.

To achieve this purpose, CEQA mandates preparation of an Environmental Impact Report (“**EIR**”) for projects so that the foreseeable impacts of pursuing the project can be understood and weighed. *Communities for a Better Environment v. Richmond* (2010) 184 Cal. App. 4th 70, 80. The EIR requirement “is the heart of CEQA.” CEQA Guidelines, § 15003(a).

4

A strong presumption in favor of requiring preparation of an EIR is built into CEQA. This presumption is reflected in what is known as the “fair argument” standard, under which an agency must prepare an EIR whenever substantial evidence in the record supports a fair argument that a project may have a significant effect on the environment. *Quail Botanical Gardens Found., Inc. v. City of Encinitas* (1994) 29 Cal. App. 4th 1597, 1602; *Friends of “B” St. v. City of Hayward* (1980) 106 Cal. 3d 988, 1002.

The fair argument test stems from the statutory mandate that an EIR be prepared for any project that “may have a significant effect on the environment.” Public Resources Code (“**PRC**”) § 21151; *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal. App. 3d 68, 75; *Jensen v. City of Santa Rosa* (2018) 23 Cal. App. 5th 877, 884. Under this test, if a

⁸ The CEQA Guidelines, codified in Title 14 of the California Code of Regulations, section 15000 *et seq.*, are regulatory guidelines promulgated by the state Natural Resources Agency for the implementation of CEQA. (Cal. Pub. Res. Code § 21083.) The CEQA Guidelines are given “great weight in interpreting CEQA except when . . . clearly unauthorized or erroneous.” *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 62 Cal. 4th 204, 217.

proposed project is not exempt and may cause a significant effect on the environment, the lead agency must prepare an EIR. PRC §§ 21100(a), 21151; CEQA Guidelines § 15064(a)(1), (f)(1). An EIR may be dispensed with only if the lead agency finds no substantial evidence in the initial study or elsewhere in the record that the project may have a significant effect on the environment. *Parker Shattuck Neighbors v. Berkeley City Council* (2013) 222 Cal. App. 4th 768, 785. In such a situation, the agency must adopt a negative declaration. PRC § 21080(c)(1); CEQA Guidelines §§ 15063(b)(2), 15064(f)(3).

"Significant effect upon the environment" is defined as "a substantial or potentially substantial adverse change in the environment." PRC § 21068; CEQA Guidelines § 15382. A project "may" have a significant effect on the environment if there is a "reasonable probability" that it will result in a significant impact. *No Oil, Inc. v. City of Los Angeles*, 13 Cal. 3d at 83 fn. 16; *Sundstrom v. County of Mendocino* (1988) 202 Cal. App. 3d 296, 309. If any aspect of the project may result in a significant impact on the environment, an EIR must be prepared even if the overall effect of the project is beneficial. CEQA Guidelines § 15063(b)(1). See *County Sanitation Dist. No. 2 v. County of Kern* (2005) 127 Cal. App. 4th 1544, 1580.

This standard sets a "low threshold" for preparation of an EIR. *Consolidated Irrig. Dist. v. City of Selma* (2012) 204 Cal. App. 4th 187, 207; *Nelson v. County of Kern* (2010) 190 Cal. App. 4th 252; *Pocket Protectors v. City of Sacramento* (2004) 124 Cal. App. 4th 903, 928; *Bowman v. City of Berkeley* (2004) 122 Cal. App. 4th 572, 580; *Citizen Action to Serve All Students v. Thornley* (1990) 222 Cal. App. 3d 748, 754; *Sundstrom v. County of Mendocino* (1988) 202 Cal. App. 3d 296, 310. If substantial evidence in the record supports a fair argument that the project may have a significant environmental effect, the lead agency must prepare an EIR even if other substantial evidence before it indicates the project will have no significant effect. See *Jensen v. City of Santa Rosa* (2018) 23 Cal. App. 5th 877, 886; *Clews Land & Livestock v. City of San Diego* (2017) 19 Cal. App. 5th 161, 183; *Stanislaus Audubon Soc'y, Inc. v. County of Stanislaus* (1995) 33 Cal. App. 4th 144, 150; *Brentwood Ass'n for No Drilling, Inc. v. City of Los Angeles* (1982) 134 Cal. App. 3d 491; *Friends of "B" St. v. City of Hayward* (1980) 106 Cal. App. 3d 988; CEQA Guidelines § 15064(f)(1).

As the Project does not qualify for the sustainable communities project exemption from CEQA as explained below, the low threshold is met and the City must prepare an EIR for the Project.

IV. THE PROJECT IS NOT SUBJECT TO THE SUSTAINABLE COMMUNITIES PROJECT EXEMPTION

PRC Section 21155.1 provides that a project is statutorily exempt from CEQA if it qualifies as a transit priority project and it:

- (1) Can be adequately served by existing utilities, and the transit priority project applicant has paid, or has committed to pay, all applicable in-lieu or development fees;
- (2) Does not contain wetlands or riparian areas, does not have significant value as a wildlife habitat, does not harm any species protected by the federal Endangered Species Act or Native Plant Protection Act, and does not cause the destruction or removal of any species protected by a local ordinance;
- (3) Is not included on any list of hazardous waste sites compiled pursuant to Section 65962.5 of the Government Code;
- (4) Is subject to a preliminary endangerment assessment prepared by an environmental assessor to determine the existence of any release of a hazardous substance on the site and to determine the potential for exposure of future occupants to significant health hazards from any nearby property or activity;
- (5) Does not have a significant effect on historical resources pursuant to Section 21084.1;
- (6) Is not a wildland fire hazard, does not have an unusually high risk of high risk of fire or explosion, is not a landslide hazard, and does not have seismic risk as a result of being within a delineated earthquake fault zone;
- (7) Is not located on developed open space;
- (8) Is 15 percent more energy efficient than required by Chapter 6 of Title 24 of the California Code of Regulations and designed to achieve 25 percent less water usage than the average household use in the region;
- (9) Is not more than eight acres in total area;
- (10) Does not contain more than 200 residential units;
- (11) Does not result in any net loss in the number of affordable housing units within the project area;

- (12) Does not include any single level building that exceeds 75,000 square feet;
- (13) Incorporates any applicable mitigation measures or performance standards or criteria set forth in a prior environmental impact report and adopted in findings;
- (14) Is determined not to conflict with nearby operating industrial uses;
- (15) Is located within one-half mile of a rail transit station or a ferry terminal included in a regional transportation plan or within one-quarter mile of a high-quality transit corridor included in a regional transportation plan; and
- (16) It meets one of the following three factors:
 - (i) At least 20 percent of the housing is sold to families of moderate income, or not less than 10 percent of the housing will be rented to families of low income, or not less than 5 percent of the housing is rented to families of very low income and the project developer provides sufficient legal commitments to the appropriate local agency to ensure the continued availability and use of the housing units for very low, low-, and moderate-income households at monthly housing costs with an affordable housing cost or affordable rent, for the period required by the applicable financing;
 - (ii) The developer has paid or will pay in-lieu fees pursuant to a local ordinance in an amount sufficient to result in the development of an equivalent number of units that would otherwise be required; or
 - (iii) It provides public open space equal to or greater than five acres per 1,000 residents of the project.

5
(Cont.)

Here, the Project fails to satisfy all these requirements and therefore is not eligible for the Sustainable Communities Project Exemption (“SCPE”).

A. There Is Insufficient Evidence that the Project May Be Adequately Served by Existing Utilities

There is insufficient evidence that the Project site is equipped to handle the additional energy, water, and waste consumption of 145 new residential units as well as commercial and retail space in place of a single parking lot. In fact, the evidence

6

points to the opposite conclusion since the sewer availability and waste drainage subsections of the Project permit have not yet been cleared by the Bureau of Engineering.⁹ Accordingly, the Project must not qualify for the SCPE exemption.

6
(Cont.)

B. The Project Construction May Pose Significant Public Health and Safety Impacts

The Project seeks to demolish the existing parking lot structure on the site, thereby subjecting the neighboring multi-unit residential buildings and their sensitive receptors to significant dust and debris emission which may negatively impact their health and must be analyzed and quantified. (See, **Exhibit E** [Zimas Parcel Report for 923 S. Beacon Ave.] and **Exhibit F** [Zimas Parcel Report for the Neighboring Site at 927 1-18 S. Beacon Ave., 18-unit multi-family building next to the Project site].)

7

Moreover, based on the Project's permit application (**Exhibit D**), the Project involves construction near power lines and work adjacent to public way, which may in turn result in impacts on the public services and utilities for the nearby especially residential structures.

Also, to the extent the Project's staging of heavy construction equipment may foreseeably occur on top of utility connections, the Project may also have significant safety impacts which also must be assessed in an EIR. Thus, for this reason too, SCPE is inapplicable.

C. There Is Insufficient Evidence that the Project Is 15% More Energy Efficient than required by Chapter 6 of Title 24 of the California Code of Regulations and Designed to Achieve 25% Less Water Usage than the Average Household Use in the Region

Yet another reason why the SCPE cannot apply is because there is insufficient evidence that the Project will be 15% more energy efficient than required by Chapter 6 of Title 24 of the California Code of Regulations and is designed to achieve 25% less water usage than the average household use in the region, as required. Rather, the Project application merely provides that passive or natural heating and cooling

8

⁹See **Exhibit D** [Permit info as of 6-5-2023 from the Los Angeles Department of Building and Safety Permit Information, also available at <https://www.ladbsservices2.lacity.org/OnlineServices/PermitReport/PcisPermitDetail?id1=20010&id2=10000&id3=01124>].

opportunities are feasible.¹⁰ However, such statement fails to in fact provide any evidence or quantification of the Project’s estimated energy and water consumption.

Thus, under CEQA Guidelines § 15126.2(b):

“(b) **Energy Impacts.** If analysis of the project’s energy use reveals that the project **may** result in significant environmental effects due to **wasteful, inefficient, or unnecessary** consumption use of energy, or wasteful use of energy resources, the EIR shall mitigate that energy use. This analysis should include the project’s energy use for **all project phases and components**, including **transportation-related** energy, during **construction and operation**. **In addition** to building code compliance, **other relevant considerations** may include, among others, the project’s **size, location, orientation, equipment use** and any **renewable energy** features that could be incorporated into the project. (Guidance on information that may be included in such an analysis is presented in Appendix F.) This analysis is subject to the rule of reason and shall focus on **energy use** that is caused by the project. This analysis may be included in related analyses of air quality, greenhouse gas emissions, transportation or utilities in the discretion of the lead agency.” (Emph. added.)

There is no pertinent information provided for the Project to verify if the above-noted detailed analysis took place and to fill in the analytical gap to support the agency’s conclusion in this case that the Project will indeed not have energy impacts. Compounding this lack of specificity in the City’s findings, the Project is proposed on what appears to have been historically a vacant site and therefore its energy usage as compared with the present uses will be significant. As such, it appears that the City failed to consider the Project’s size and orientation, as well as the location, when concluding that the Project will be 15 percent more energy-efficient than required.

Absent this detailed and specific information required by CEQA Guidelines and Appendix G referenced therein, the City’s conclusion that the Project will be 15% more energy efficient than required by Chapter 6 of Title 24 of the California Code of Regulations and is designed to achieve 25% less water usage than the average household use in the region is merely speculative, rendering the SCPE inapplicable.

¹⁰ Proposed Project findings at 37, available at <https://planning.lacity.org/pdiscaseinfo/document/ODQ1ODI0/4596a256-522b-4c94-acc5-77ce1b3c8ef1/esubmit>.

D. There Appears to Be No Preliminary Endangerment Assessment Prepared for the Project to Assess Hazardous Substance Exposure

Finally, the Project should not be eligible for the SCPE because it appears that there is no “preliminary endangerment assessment prepared by an environmental assessor to determine the existence of any release of a hazardous substance on the site and to determine the potential for exposure of future occupants to significant health hazards from any nearby property or activity”. PRC § 21155.1(a)(4).

Rather, the Project application blanketly concludes that there are not public health concerns stemming from hazardous materials because the Project will comply with applicable law for asbestos abatement.¹¹ However, determinations that regulatory compliance will be sufficient to prevent significant adverse impacts must be based on a project-specific analysis of potential impacts and the effect of regulatory compliance. See *Californians for Alternatives to Toxics v. Department of Food & Agric.* (2005) 136 Cal.App.4th 1; *Ebbetts Pass Forest Watch v Department of Forestry & Fire Protection* (2008) 43 Cal.App.4th 936, 956. The Project cannot rely upon regulatory compliance to conclude that its eligible for the SCPE without assessing the Project’s anticipated hazardous waste exposure in a preliminary endangerment assessment.

Moreover, even though the City’s findings are completely silent on the issue of Preliminary endangerment assessment (“PEA”), it does not even provide any information as to any Environmental Site Assessment (“ESA”). Yet, to the extent an ESA was prepared or is to be prepared by the Applicant, it must be noted that an ESA cannot be substituted for a PEA.

An ESA is not the same as a PEA. See, *City of Maywood v. Los Angeles Unified Sch. Dist.* (2012) 208 Cal.App.4th 362, 427. A “preliminary endangerment assessment” is statutorily defined at Health and Safety Code section 25319.5. It is required to be “conducted in a manner that complies with the guidelines published by the department [of Toxic Substances Control] entitled “Preliminary Endangerment Assessment: Guidance Manual.” The Guidance Manual also makes clear that the requirements of a PEA go beyond those of a Phase I ESA:

“[O]verall PEA requirements are more comprehensive than requirements for the PA/SI and Phase I Assessments Specific requirements of the PEA that are not typically required for these other types of investigations

¹¹ *Id.* at p. 36.

include the site specific human health and ecological screening evaluations, public participation requirements, data collection, and scoping activities.” Department of Toxic Substances Control, California Environmental Protection Agency, Preliminary Endangerment Assessment: Guidance Manual (rev’d October 2015) pp. iv-v.¹²

A PEA meeting the statutory requirements must analyze the potential for exposure to future occupants to health hazards from “any nearby property or activity.” PRC § 21155.1(a)(4).

The Applicant here provided no PEA or ESA to ascertain whether the Project indeed qualifies for the claimed CEQA exemption. This omission is critical since the Project site appears to have been historically used as a parking structure and therefore may have been subject to releases, leaks or spills of hazardous chemicals, including petroleum or oil, with the potential to affect the future residents’ health.

On this basis, too, the Project does not meet the requirements for the respective TPP exemption.

E. The City’s Findings Fail to Acknowledge or Analyze the Project’s Specific Adverse Impacts on Human Beings In Light of the Project’s Being a Commercial Corner Development.

Finally, based on the Project’s permit information, the Project is a commercial corner development (“CDD”) and therefore is subject to additional development regulations. However, the City’s findings are silent on this issue and whether the Project is indeed consistent with the respective development and restrictions of a CDD¹³ and whether a conditional use permit (“CUP”) is required or whether the Project qualifies for same.

This omission is critical as it indicates that the Project may have a significant specific adverse impact on human beings, including health and safety impacts, and therefore the Project may not qualify for either a density bonus or the exemption it claims.

The City must identify all the Project’s inconsistencies with the applicable plans and policies and must provide good faith disclosures before it can make any determination

¹² https://www.gsweventcenter.com/Appeal_Response_References/2015_10_CalEPA.pdf

¹³ See pp. 225-231, esp. 229 for CDD restrictions, including for height and number of stories at https://www.ladbs.org/docs/default-source/publications/information-bulletins/zoning-code/zoning-code-manual-and-commentary.pdf?sfvrsn=101beb53_27

as to whether the Project indeed qualifies for the density bonus/incentives it requests or whether it qualifies for the CEQA exemption.

10
(Cont.)

V. CONCLUSION

In sum, SMSWRCC requests that the City require a local workforce, that the City impose training requirements for the Project’s construction activities to prevent community spread of COVID-19 and other infectious diseases, and that the City determine that the Project is not subject to the Sustainable Communities Project Exemption and that it prepare an EIR for the Project. If the City has any questions, feel free to contact my Office.

Subject: Local Hire Requirements and Considerations for Greenhouse Gas Modeling

Dear Mr. Tsai,

Soil Water Air Protection Enterprise (“SWAPE”) is pleased to provide the following draft technical report explaining the significance of worker trips required for construction of land use development projects with respect to the estimation of greenhouse gas (“GHG”) emissions. The report will also discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

Worker Trips and Greenhouse Gas Calculations

The California Emissions Estimator Model (“CalEEMod”) is a “statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects.”¹ CalEEMod quantifies construction-related emissions associated with land use projects resulting from off-road construction equipment; on-road mobile equipment associated with workers, vendors, and hauling; fugitive dust associated with grading, demolition, truck loading, and on-road vehicles traveling along paved and unpaved roads; and architectural coating activities; and paving.²

The number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.³

¹ “California Emissions Estimator Model.” CAPCOA, 2017, available at: <http://www.aqmd.gov/caleemod/home>.

² “California Emissions Estimator Model.” CAPCOA, 2017, available at: <http://www.aqmd.gov/caleemod/home>.

³ “CalEEMod User’s Guide.” CAPCOA, November 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

Specifically, the number and length of vehicle trips is utilized to estimate the vehicle miles travelled (“VMT”) associated with construction. Then, utilizing vehicle-class specific EMFAC 2014 emission factors, CalEEMod calculates the vehicle exhaust, evaporative, and dust emissions resulting from construction-related VMT, including personal vehicles for worker commuting.⁴

Specifically, in order to calculate VMT, CalEEMod multiplies the average daily trip rate by the average overall trip length (see excerpt below):

$$\text{“VMT}_d = \Sigma(\text{Average Daily Trip Rate}_i * \text{Average Overall Trip Length}_i)_n$$

Where:

n = Number of land uses being modeled.”⁵

Furthermore, to calculate the on-road emissions associated with worker trips, CalEEMod utilizes the following equation (see excerpt below):

$$\text{“Emissions}_{\text{pollutant}} = \text{VMT} * \text{EF}_{\text{running,pollutant}}$$

Where:

$\text{Emissions}_{\text{pollutant}}$ = emissions from vehicle running for each pollutant

VMT = vehicle miles traveled

$\text{EF}_{\text{running,pollutant}}$ = emission factor for running emissions.”⁶

Thus, there is a direct relationship between trip length and VMT, as well as a direct relationship between VMT and vehicle running emissions. In other words, when the trip length is increased, the VMT and vehicle running emissions increase as a result. Thus, vehicle running emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise.

Default Worker Trip Parameters and Potential Local Hire Requirements

As previously discussed, the number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.⁷ In order to understand how local hire requirements and associated worker trip length reductions impact GHG emissions calculations, it is important to consider the CalEEMod default worker trip parameters. CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act (“CEQA”) requires that such changes be justified by substantial evidence.⁸ The default number of construction-related worker trips is calculated by multiplying the

⁵ “Appendix A Calculation Details for CalEEMod.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 23.

⁶ “Appendix A Calculation Details for CalEEMod.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.

⁷ “CalEEMod User’s Guide.” CAPCOA, November 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

⁸ CalEEMod User Guide, available at: <http://www.caleemod.com/>, p. 1, 9.

number of pieces of equipment for all phases by 1.25, with the exception of worker trips required for the building construction and architectural coating phases.⁹ Furthermore, the worker trip vehicle class is a 50/25/25 percent mix of light duty autos, light duty truck class 1 and light duty truck class 2, respectively.”¹⁰ Finally, the default worker trip length is consistent with the length of the operational home-to-work vehicle trips.¹¹ The operational home-to-work vehicle trip lengths are:

“[B]ased on the *location* and *urbanization* selected on the project characteristic screen. These values were *supplied by the air districts or use a default average for the state*. Each district (or county) also assigns trip lengths for urban and rural settings” (emphasis added).¹²

Thus, the default worker trip length is based on the location and urbanization level selected by the User when modeling emissions. The below table shows the CalEEMod default rural and urban worker trip lengths by air basin (see excerpt below and Attachment A).¹³

Worker Trip Length by Air Basin		
Air Basin	Rural (miles)	Urban (miles)
Great Basin Valleys	16.8	10.8
Lake County	16.8	10.8
Lake Tahoe	16.8	10.8
Mojave Desert	16.8	10.8
Mountain Counties	16.8	10.8
North Central Coast	17.1	12.3
North Coast	16.8	10.8
Northeast Plateau	16.8	10.8
Sacramento Valley	16.8	10.8
Salton Sea	14.6	11
San Diego	16.8	10.8
San Francisco Bay Area	10.8	10.8
San Joaquin Valley	16.8	10.8
South Central Coast	16.8	10.8
South Coast	19.8	14.7
Average	16.47	11.17
Minimum	10.80	10.80
Maximum	19.80	14.70
Range	9.00	3.90

⁹ “CalEEMod User’s Guide.” CAPCOA, November 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

¹⁰ “Appendix A Calculation Details for CalEEMod.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.

¹¹ “Appendix A Calculation Details for CalEEMod.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14.

¹² “Appendix A Calculation Details for CalEEMod.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 21.

¹³ “Appendix D Default Data Tables.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-84 – D-86.

As demonstrated above, default rural worker trip lengths for air basins in California vary from 10.8- to 19.8- miles, with an average of 16.47 miles. Furthermore, default urban worker trip lengths vary from 10.8- to 14.7- miles, with an average of 11.17 miles. Thus, while default worker trip lengths vary by location, default urban worker trip lengths tend to be shorter in length. Based on these trends evident in the CalEEMod default worker trip lengths, we can reasonably assume that the efficacy of a local hire requirement is especially dependent upon the urbanization of the project site, as well as the project location.

Practical Application of a Local Hire Requirement and Associated Impact

To provide an example of the potential impact of a local hire provision on construction-related GHG emissions, we estimated the significance of a local hire provision for the Village South Specific Plan (“Project”) located in the City of Claremont (“City”). The Project proposed to construct 1,000 residential units, 100,000-SF of retail space, 45,000-SF of office space, as well as a 50-room hotel, on the 24-acre site. The Project location is classified as Urban and lies within the Los Angeles-South Coast County. As a result, the Project has a default worker trip length of 14.7 miles.¹⁴ In an effort to evaluate the potential for a local hire provision to reduce the Project’s construction-related GHG emissions, we prepared an updated model, reducing all worker trip lengths to 10 miles (see Attachment B). Our analysis estimates that if a local hire provision with a 10-mile radius were to be implemented, the GHG emissions associated with Project construction would decrease by approximately 17% (see table below and Attachment C).

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO ₂ e)	3,623
Amortized Construction GHG Emissions (MT CO ₂ e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO ₂ e)	3,024
Amortized Construction GHG Emissions (MT CO ₂ e/year)	100.80
% Decrease in Construction-related GHG Emissions	17%

As demonstrated above, by implementing a local hire provision requiring 10 mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips. More broadly, any local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

This serves as an example of the potential impacts of local hire requirements on estimated project-level GHG emissions, though it does not indicate that local hire requirements would result in reduced construction-related GHG emission for all projects. As previously described, the significance of a local hire requirement depends on the worker trip length enforced and the default worker trip length for the project’s urbanization level and location.

¹⁴ “Appendix D Default Data Tables.” CAPCOA, October 2017, available at: http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-85.

Disclaimer

SWAPE has received limited discovery. Village South Specific Plan (Proposed)
Los Angeles-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MW hr)	702.44	CH4 Intensity (lb/MW hr)	0.029	N2O Intensity (lb/MW hr)	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MW hr)	702.44	CH4 Intensity (lb/MW hr)	0.029	N2O Intensity (lb/MW hr)	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

CO2 Intensity (lb/MW hr)	702.44	CH4 Intensity (lb/MW hr)	0.029	N2O Intensity (lb/MW hr)	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MW hr)	702.44	CH4 Intensity (lb/MW hr)	0.029	N2O Intensity (lb/MW hr)	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MW hr)	702.44	CH4 Intensity (lb/MW hr)	0.029	N2O Intensity (lb/MW hr)	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO2e)	3,623
Amortized (MT CO2e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO2e)	3,024
Amortized (MT CO2e/year)	100.80
<i>% Decrease in Construction-related GHG Emissions</i>	17%

EXHIBIT B

Paul Rosenfeld, Ph.D.

Principal Environmental Chemist

Chemical Fate and Transport & Air Dispersion Modeling

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H₂O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Rosenfeld P. E. (March 2007). Blood and Attic Sampling for Dioxin/Furan, PAH, and Metal Exposure in Florida, Alabama. *The AEHS Annual Meeting*. Lecture conducted from San Diego, CA.

Hensley A.R., Scott, A., **Rosenfeld P.E.**, Clark, J.J.J. (August 21 – 25, 2006). Dioxin Containing Attic Dust And Human Blood Samples Collected Near A Former Wood Treatment Facility. *The 26th International Symposium on Halogenated Persistent Organic Pollutants – DIOXIN2006*. Lecture conducted from Radisson SAS Scandinavia Hotel in Oslo Norway.

Hensley A.R., Scott, A., **Rosenfeld P.E.**, Clark, J.J.J. (November 4-8, 2006). Dioxin Containing Attic Dust And Human Blood Samples Collected Near A Former Wood Treatment Facility. *APHA 134 Annual Meeting & Exposition*. Lecture conducted from Boston Massachusetts.

Paul Rosenfeld Ph.D. (October 24-25, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. Mealey's C8/PFOA. *Science, Risk & Litigation Conference*. Lecture conducted from The Rittenhouse Hotel, Philadelphia, PA.

Paul Rosenfeld Ph.D. (September 19, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, *Toxicology and Remediation PEMA Emerging Contaminant Conference*. Lecture conducted from Hilton Hotel, Irvine California.

Paul Rosenfeld Ph.D. (September 19, 2005). Fate, Transport, Toxicity, And Persistence of 1,2,3-TCP. *PEMA Emerging Contaminant Conference*. Lecture conducted from Hilton Hotel in Irvine, California.

Paul Rosenfeld Ph.D. (September 26-27, 2005). Fate, Transport and Persistence of PDBEs. *Mealey's Groundwater Conference*. Lecture conducted from Ritz Carlton Hotel, Marina Del Ray, California.

Paul Rosenfeld Ph.D. (June 7-8, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. *International Society of Environmental Forensics: Focus On Emerging Contaminants*. Lecture conducted from Sheraton Oceanfront Hotel, Virginia Beach, Virginia.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Fate Transport, Persistence and Toxicology of PFOA and Related Perfluorochemicals. *2005 National Groundwater Association Ground Water And Environmental Law Conference*. Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, Toxicology and Remediation. *2005 National Groundwater Association Ground Water and Environmental Law Conference*. Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. and Rob Hesse R.G. (May 5-6, 2004). Tert-butyl Alcohol Liability and Toxicology, A National Problem and Unquantified Liability. *National Groundwater Association. Environmental Law Conference*. Lecture conducted from Congress Plaza Hotel, Chicago Illinois.

Paul Rosenfeld, Ph.D. (March 2004). Perchlorate Toxicology. *Meeting of the American Groundwater Trust*. Lecture conducted from Phoenix Arizona.

Hagemann, M.F., **Paul Rosenfeld, Ph.D.** and Rob Hesse (2004). Perchlorate Contamination of the Colorado River. *Meeting of tribal representatives*. Lecture conducted from Parker, AZ.

Paul Rosenfeld, Ph.D. (April 7, 2004). A National Damage Assessment Model For PCE and Dry Cleaners. *Drycleaner Symposium. California Ground Water Association*. Lecture conducted from Radison Hotel, Sacramento, California.

Rosenfeld, P. E., Grey, M., (June 2003) Two stage biofilter for biosolids composting odor control. *Seventh International In Situ And On Site Bioremediation Symposium Battelle Conference* Orlando, FL.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. (February 20-21, 2003) Understanding Historical Use, Chemical Properties, Toxicity and Regulatory Guidance of 1,4 Dioxane. *National Groundwater Association. Southwest Focus Conference. Water Supply and Emerging Contaminants..* Lecture conducted from Hyatt Regency Phoenix Arizona.

Paul Rosenfeld, Ph.D. (February 6-7, 2003). Underground Storage Tank Litigation and Remediation. *California CUPA Forum*. Lecture conducted from Marriott Hotel, Anaheim California.

Paul Rosenfeld, Ph.D. (October 23, 2002) Underground Storage Tank Litigation and Remediation. *EPA Underground Storage Tank Roundtable*. Lecture conducted from Sacramento California.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Understanding Odor from Compost, *Wastewater and Industrial Processes. Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Using High Carbon Wood Ash to Control Compost Odor. *Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Grey, M. A. (September 22-24, 2002). Biocycle Composting For Coastal Sage Restoration. *Northwest Biosolids Management Association*. Lecture conducted from Vancouver Washington..

Rosenfeld, P.E. and Grey, M. A. (November 11-14, 2002). Using High-Carbon Wood Ash to Control Odor at a Green Materials Composting Facility. *Soil Science Society Annual Conference*. Lecture conducted from Indianapolis, Maryland.

Rosenfeld, P.E. (September 16, 2000). Two stage biofilter for biosolids composting odor control. *Water Environment Federation*. Lecture conducted from Anaheim California.

Rosenfeld, P.E. (October 16, 2000). Wood ash and biofilter control of compost odor. *Biofest*. Lecture conducted from Ocean Shores, California.

Rosenfeld, P.E. (2000). Bioremediation Using Organic Soil Amendments. *California Resource Recovery Association*. Lecture conducted from Sacramento California.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. *Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings*. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., and C.L. Henry. (1999). An evaluation of ash incorporation with biosolids for odor reduction. *Soil Science Society of America*. Lecture conducted from Salt Lake City Utah.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Comparison of Microbial Activity and Odor Emissions from Three Different Biosolids Applied to Forest Soil. *Brown and Caldwell*. Lecture conducted from Seattle Washington.

Rosenfeld, P.E., C.L. Henry. (1998). Characterization, Quantification, and Control of Odor Emissions from Biosolids Application To Forest Soil. *Biofest*. Lecture conducted from Lake Chelan, Washington.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions From Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. \$41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: \$10,000 grant awarded to San Diego State University. Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. \$100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. \$20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: \$10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: \$15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. \$500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

- In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs*, vs. United States Metals Refining Company et. al. *Defendant*.
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019
- In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs*, vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS “Conti Perdido”
Defendant.
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019
- In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019
- In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19
- In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case: No 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018
- In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosiences, LLC, et al., Defendants
Cause No 1923
Rosenfeld Deposition, 11-17-2017
- In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017
- In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017
- In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018
- In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs*, vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants
Case No.: LALA002187
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Jerry Dovico, et al., Plaintiffs vs. Valley View Sine LLC, et al., Defendants
Law No.: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Doug Pauls, et al., et al., Plaintiffs vs. Richard Warren, et al., Defendants
Law No.: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action NO. 14-C-30000
Rosenfeld Deposition, June 2015

In The Third Judicial District County of Dona Ana, New Mexico
Betty Gonzalez, et al. Plaintiffs vs. Del Oro Dairy, Del Oro Real Estate LLC, Jerry Settles and Deward
DeRuyter, Defendants
Rosenfeld Deposition: July 2015

In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015

In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014

In the United States District Court Western District of Oklahoma
Tommy McCarty, et al., Plaintiffs, v. Oklahoma City Landfill, LLC d/b/a Southeast Oklahoma City
Landfill, et al. Defendants.
Case No. 5:12-cv-01152-C
Rosenfeld Deposition: July 2014

In the County Court of Dallas County Texas
Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant*.
Case Number cc-11-01650-E
Rosenfeld Deposition: March and September 2013
Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio
John Michael Abicht, et al., *Plaintiffs*, vs. Republic Services, Inc., et al., *Defendants*
Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)
Rosenfeld Deposition: October 2012

In the United States District Court of Southern District of Texas Galveston Division
Kyle Cannon, Eugene Donovan, Genaro Ramirez, Carol Sassler, and Harvey Walton, each Individually and on behalf of those similarly situated, *Plaintiffs*, vs. BP Products North America, Inc., *Defendant*.
Case 3:10-cv-00622
Rosenfeld Deposition: February 2012
Rosenfeld Trial: April 2013

In the Circuit Court of Baltimore County Maryland
Philip E. Cvach, II et al., *Plaintiffs* vs. Two Farms, Inc. d/b/a Royal Farms, Defendants
Case Number: 03-C-12-012487 OT
Rosenfeld Deposition: September 2013

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

**Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review**

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.

B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist

California Certified Hydrogeologist

Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt’s responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt’s duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, *Oxygenates in Water: Critical Information and Research Needs*.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Hagemann, M.F., 2005. Use of Electronic Databases in Environmental Regulation, Policy Making and Public Participation. Brownfields 2005, Denver, Colorado.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Nevada and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Las Vegas, NV (served on conference organizing committee).

Hagemann, M.F., 2004. Invited testimony to a California Senate committee hearing on air toxins at schools in Southern California, Los Angeles.

Brown, A., Farrow, J., Gray, A. and **Hagemann, M.**, 2004. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to the Ground Water and Environmental Law Conference, National Groundwater Association.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Arizona and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Phoenix, AZ (served on conference organizing committee).

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in the Southwestern U.S. Invited presentation to a special committee meeting of the National Academy of Sciences, Irvine, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a tribal EPA meeting, Pechanga, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a meeting of tribal representatives, Parker, AZ.

Hagemann, M.F., 2003. Impact of Perchlorate on the Colorado River and Associated Drinking Water Supplies. Invited presentation to the Inter-Tribal Meeting, Torres Martinez Tribe.

Hagemann, M.F., 2003. The Emergence of Perchlorate as a Widespread Drinking Water Contaminant. Invited presentation to the U.S. EPA Region 9.

Hagemann, M.F., 2003. A Deductive Approach to the Assessment of Perchlorate Contamination. Invited presentation to the California Assembly Natural Resources Committee.

Hagemann, M.F., 2003. Perchlorate: A Cold War Legacy in Drinking Water. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. From Tank to Tap: A Chronology of MTBE in Groundwater. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. A Chronology of MTBE in Groundwater and an Estimate of Costs to Address Impacts to Groundwater. Presentation to the annual meeting of the Society of Environmental Journalists.

Hagemann, M.F., 2002. An Estimate of the Cost to Address MTBE Contamination in Groundwater (and Who Will Pay). Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to a meeting of the U.S. EPA and State Underground Storage Tank Program managers.

Hagemann, M.F., 2001. From Tank to Tap: A Chronology of MTBE in Groundwater. Unpublished report.

Hagemann, M.F., 2001. Estimated Cleanup Cost for MTBE in Groundwater Used as Drinking Water. Unpublished report.

Hagemann, M.F., 2001. Estimated Costs to Address MTBE Releases from Leaking Underground Storage Tanks. Unpublished report.
